PLEN1 Keynote Lecture – Vesna Leskošek

KL01 Communicating the welfare state through a discourse on welfare fraud

[Vesna Leskošek](#)¹

¹ University of Ljubljana, Faculty of Social Work, Ljubljana, Slovenia

Given the definition of social order, which is about how institutions, people and values work together to ensure the stability and functioning of society, we could say that the welfare state is the glue that binds everything together. The welfare state can be understood as the way the state functions, ensuring interconnectedness and interdependence by providing common good, such as social security, health care, and education. It also means that people are willing to give up part of their own well-being to share it with others who cannot provide for themselves. This primarily increases social capital, which contributes to general trust in the functioning of the state. However, over the last few decades, we have witnessed the more or less hidden disintegration of the welfare state, as the prevailing ideas are that it limits GDP growth, that it is too expensive, that it hinders globalisation and the free market, and that it hinders development by making people dependent on financial social benefits and incentives. This last idea will be the subject of my speech as it calls into question the foundations of the welfare state and contributes to social disorder as we are abandoning the welfare state and there are no new answers to the growing social inequalities. I will analyse the national campaigns against so-called benefit fraud, which appeared in the Great Britain and Ireland, and are present in other European countries, Slovenia being no exception. These campaigns are about how countries communicate social rights to the public, what they want to achieve and what the results are. Campaigns communicate alleged fraud by stigmatising the recipients of cash benefits, portraying them as social parasites and criminals. Another characteristic is that they are based mostly on very vague and unreliable data on the extent and nature of benefit fraud. Several studies show that the purpose behind has been to reduce the amount of cash benefits and to reduce the redistributive role of the state. However, the effects on social stability are much more dangerous, as these campaigns destabilise the general trust and interconnectedness that are essential for maintaining social order. The consequences of this destabilisation can be seen everywhere in Europe, notably in the rise of populist and far-right ideologies that offer many people a refuge from the risks posed by (among other reasons) the disappearance of the welfare state.

PLEN2 Keynote Lecture – Jelena Kleut

KL02 The interplay of uncertainties in transitional media systems

[Jelena Kleut](#)¹

¹ Faculty of Philosophy- University of Novi Sad, Faculty of Philosophy- Department of Media Studies, Novi Sad, Serbia

The crisis of representative democracy, the rise of populism and far-right actors, prolonged wars, and health and environmental crises are increasingly addressed in communication and media scholarship through various “dises”—disinformation, distrust, disconnection. These symbolic and material disruptions contribute to a growing sense of uncertainty. I differentiate between top-down and bottom-up uncertainties, the first being addressed by, exacerbated or created by the institutional actors, global platforms and structural arrangements in the media, and the second as lived by, navigated around or co-produced by individuals and groups. Although globally shared, uncertainties are not equally distributed, especially when we look at the places in which resources to minimize (the impact of) uncertainties are scarce. Using the results of the vision building exercise conducted by students from six Western Balkan universities, I observe how uncertainties are structurally created and sustained. As they analysed trends and envisioned the future of media in 2040, students projected the framework of certainty for transitional media systems in which uncertainty is a long-lasting trait. To approach bottom-up uncertainties I turn to local news, journalists, and their audiences, examining the attitudes and practices adopted by individuals. Focus group interviews conducted in Serbian municipalities show how citizens navigate between information scarcity and abundance, and how they employ an attitude of uncertainty to assess news sources. By integrating these two perspectives together, I underscore the importance of resources in addressing uncertainties.

SPC02 Advancing the study of opinion expressions in digital media: The OPINION Network approach

SP 01 Studying opinion expression in a comparative cross-platform perspective: Conceptual and methodological challenges and strategies

[Dimitra Milioni](#)¹, [Aleksandra Krstić](#)², [Anna Bączkowska](#)³, [Snežana Bajčeta](#)⁴, [Carlos Cunha](#)⁵, [Valmora Gogo](#)⁶, [Theodoros Kouros](#)⁷, [Tamara Kunić](#)⁸, [Ana Milojević](#)², [Martina Novotna](#)⁹

⁹ Masaryk University Brno, Department of Media Studies and Journalism, Brno, Czech Republic

Social media platforms have become one of the main fields where people express their opinions on current events and various public issues. As an integral part of media studies focusing on the study of digital media, platform studies are a useful entry point to examine the construction and expression of opinion on social media platforms, along with the impact of platforms' modality on public discourse.

The socio-technical approach and focus on platform studies allows us to move beyond the tendency to treat all platforms under one "social media" framework and look into the modalities of various platforms as different channels for opinionated communication and their impact on users' communicating practices regarding specific issues. Conceptually, the ideas of platformativity and framing (grounded in Entman's approach) can be suitable for a comparative analysis of how people express opinions across different social media platforms.

The presentation looks at conceptual, methodological and analytical challenges and strategies when studying the expression of opinions across platforms in a comparative fashion, taking into account the specificities (technically as well as culturally) of different platforms. Specifically, it will focus on how to tackle challenges regarding (a) the development of a conceptual framework to account for a sociotechnical approach (b) data selection, collection and analysis, both computationally and qualitatively, and c) comparability of data, in terms of cross-platform and cross-country approach, reflecting specific attempts to overcome language and cultural differences in both sampling and interpretation of data. Empirically, the study focuses on the expression of opinions of members of the European Parliament and national parliaments across EU and EU candidate countries on the issue of migration. We focus on use of Facebook, Instagram and X (ex-Twitter) in ten countries – Cyprus, Greece, Romania, Croatia, Serbia, Portugal, Poland, Czech Republic, Albania and Lithuania. The study looks at how platforms' affordances allow, drive and constrain expression of political opinion, capturing not only how opinionated communication on specific issues across platforms and countries is framed and developed, but also how the modality of opinion expression is possibly conditioned by the sociotechnical parameters of digital platforms.

SPC02 Advancing the study of opinion expressions in digital media: The OPINION Network approach

SP 02 Opinionated comments on Ukrainian immigration to Poland on Reddit

[Anna Bączkowska](#)¹, [Artur Lipiński](#)²

¹ University of Gdansk, Institute of English and American Studies, Gdansk, Poland

² Adam Mickiewicz University Poznań, Department of Political Theory, Poznan, Poland

This presentation builds upon an ongoing study of comments expressed on the Polish subreddit related to the problem of immigration, specifically the Ukrainian immigrants to Poland as of the outburst of the war in February 2022. Investigating the over-time shifts in expressed evaluative tendencies, it critically discusses key theoretical and methodological challenges of studying opinionated comments posted on social media platforms.

The theoretical framework relies on three templates involving categories typical of media studies discourse analysis, a linguistic approach to incivility and social actors distinguished by Critical Discourse Analysis. Our understanding of opinionated texts relies on the concept of evaluativity, wherein opinions are seen as evaluations encoded by means of evaluative lexical items and, to a lesser extent, syntactic structures. The categories of description are predominantly oriented towards the recognition of offensive language: Given the generally negative sentiment in Europe, it was expected that the majority of comments would express voices discrediting immigrants relative to Poles or even disclosing hostility and/or hatred towards them more often than compassion and sympathy.

The data used in the study were automatically retrieved from Reddit, following a multi-step procedure. Out of ca. 70.000 comments originally retrieved, we composed a sample of about 2.000 documents, using automatic and manual sentiment analysis and manual relevance tagging. All comments are written in English, presumably by Polish Redditors. The analysis was preceded by a pilot study based on a sample of immigration discourse extracted from the Frenk corpus, which is a collection of Facebook comments. Initial results suggest that Redditors

active on the Polish subreddit express both positive and negative opinions to the problem of immigration, with positive evaluations becoming temporarily predominant in the early stages of the war, before a perceptible rise of compassion fatigue.

At the same time, the analysis reveals important theoretical and methodological challenges. Notably, the often fuzzy boundaries of theoretical categories propounded by linguistics and media studies recurrently invite divergent understandings and classifications of social media discourse. This challenge required a radical reduction of descriptive categories, as well as laborious efforts intended to construct discrete, mutually exclusive classification options, at the expense of much nuance in the analysis. For example, "hate speech" – a key category from a conceptual point of view – is regularly defined in conflicting ways, foregrounding different legal, linguistic, or other criteria. Offensive language, which encompasses the conceptually distinctive features of "insults", "slurs", and "slander", overlaps and relates to hate speech in ambiguous ways. Other challenging linguistic categories relate to the identification of various social actors, owing to definitional and operational overlaps that are responsible for coding discrepancies. While there are numerous valuable insights to be gleaned from linguistic research, its translation into effective operational classification strategies reveals numerous ambiguities. The current research is to resolve these problems by presenting non-overlapping categories and/or proposing some core ingredients of key concepts to achieve high inter-coder agreement in future endeavours focusing on mining opinions in social media discourse.

⁷ Adam Mickiewicz University, Department of Political Theory, Poznan, Poland

⁸ Drexel University, Department of Communication, Philadelphia, USA

Digital media ecologies present numerous challenges to established conceptualizations and measures of public opinion: Unbounded publics, uneven participation rates, inauthentic contributions and various algorithmic distortions undermine most inferences regarding the distribution of opinions among discernible communities, and raise important concerns about the possible meanings of census-style big data analyses of digital contents. Moreover, the algorithmically structured, networked discursive spaces on digital media also erode existing notions of public opinion climates, which vary from platform to platform, or even from one user's perspective to another. While digital media constitute a key site where public opinion is formed and negotiated, theoretical conceptualizations remain too fragmentary to effectively guide empirical public opinion research relying on digital media contents.

In the present paper, we argue that there is a need for a comprehensive account of public opinion in digital media environments, which we conceptualize as an ongoing discursive process distributed over numerous digital media sites. Reconnecting to pre-digital theories of public opinion as the public negotiation of publicly acceptable stances, we discuss key implications of this process for the at-scale analysis of digital media in public opinion research. At the core of our argument, we conceptualize digital media discourse as a normative, dynamic and interactive process: By presenting opinion statements and claims in public, participating actors seek to advance, negotiate or challenge specific stances, while simultaneously positioning themselves and others as more or less legitimate, authoritative voices. Through ongoing interactions, which echo memetically across a wide range of sites and platforms, different stances emerge as dominant or marginal, consensual or contested, informing and positioning public perceptions of prevalent opinion climates, as well as any ensuing contributions to the debate. In this distributed debate, any contribution can be qualified in numerous ways – from its visibility and reach, resonance, endorsement and rejection among co-present audiences; to its distinctive positioning via known and observable qualities of its presentation, its author, the site, and other relevant factors.

Drawing upon recent theorizing on political talk in hybrid communication ecologies and memetic political expression in the digital age, we propose four key contingencies that must be considered in the study of public opinion in digital public spheres, namely 1) the discursive positioning of opinion expressions; 2) their socio-technical embedding into networked communication spaces and communication flows; 3) the discursive-interactive resonance of presented claims; and 4) the normative governance of public discourse within interconnected digital communication spaces. Owing to these contingencies, public opinion emerges not as the linear product or aggregation of included contents, but as the outcome of an ongoing dynamic process of the public presentation, endorsement and contestation, negotiation and propagation of opinionated discourse.

With our conceptualization, we identify avenues for empirically studying public opinion negotiation processes in digital media ecologies, both in detail and at scale, aiming to advance both theory and operational research into digital media as a key venue where public opinion is formed in contemporary hybrid communication spaces.

SPC05 IAMCR@ECREA – The future of communication: New and old actors

SP 04 Communicating in Robotic Times

[Cees Hamelink](#)¹

¹ University of Amsterdam, Communication Science, Amsterdam, Netherlands

Our algorithmic steered futures may be uncertain but in all probability humans will continue to communicate with each other. A fascinating question is how human communication will develop in robotic times.

SPC05 IAMCR@ECREA – The future of communication: New and old actors

SP 05 Digital Sovereignty – the EU's search for a new imaginary of global digital connectivity

[Julia Pohle](#)¹

¹ WZB Berlin Social Science Center, Politics of Digitalisation, Berlin, Germany

Over the last decade, "digital sovereignty" has become a key principle in European digital policy debates. In order to better understand the popularity of this concept, in this presentation I link the EU's digital sovereignty claims to different types of dependency that shape our digital world, and to particular shifts in the belief system that underlies our perception of global digital connectivity and data flows. Instead of characterising a politico-economic or geopolitical strategy, I argue that "digital sovereignty" represents a sociotechnical imaginary as it expresses a collective and institutionalised vision of a desirable future built on a particular socio-political and technological order. As such, it differs from the US-inspired liberal socio-technical imaginary of a free, open and decentralised global Internet. Although it is not (yet) formulated as such by European policy-makers, the digital sovereignty debate can hence be interpreted as the first stage in the search for an alternative imaginary of digital interconnectedness. This alternative vision accounts for a more prominent role of states and governments in shaping and steering digital communication, both nationally and on a global scale. But at least in its European variation, the digital sovereignty imaginary also encompasses the protection of human rights and democratic values. However, with the number of liberal democracies being on the decline worldwide, the EU faces a challenge when it seeks to build a normative vision for global digital interconnectedness on the concept of "sovereignty", which is generally associated with control and authority.

SPC05 IAMCR@ECREA – The future of communication: New and old actors

SP 06 Navigating the New Communication Landscape: AI Policy Disparities and the Role of Regional Actors

[Changfeng Chen](#)¹

¹ Tsinghua University, School of Journalism & Communication, Beijing, China

Artificial intelligence promises to revolutionize communication globally. However, the "Future of Communication" faces a significant challenge: the emergence of a "Great Divide" in AI policy approaches driven by differing regional values. This study examines AI policies in the European Union, the United States, and China, focusing on how privacy norms, data governance models, and ethical standards shape communication landscapes. Beyond identifying these complexities, the study explores how these values translate into distinct policy directions. Such discrepancies risk fracturing information environments, restricting international data flow, and hindering AI-driven communication advancements. The research delves into the implications for global AI governance, considering issues like system compatibility, ethical consensus-building, and prospects for multilateral policy alignment. By highlighting the intricate relationship between cultural values and AI policymaking, this study underscores the urgency of cross-cultural dialogue and navigating collaborative action among new and old actors in the evolving communication landscape.

SPC05 IAMCR@ECREA – The future of communication: New and old actors

SP 07 Imaginings of the Future of Conflict and Communication Technologies: A Map of Six Anxiety- and Hope-Driven Scenarios

[Nico Carpentier](#)¹

¹ Charles University, Culture and Communication Research Centre, Prague, Czech Republic

The paper presents an analysis of the construction of future scenarios in relation to conflict and communication technologies, on the basis of Delphi+ workshops and essay-writings sessions. Grounded in a theoretical reflection on the different forms of conflict—distinguishing between armed, grey zone and democratic conflict—in combination with theoretical reflections on the role of communication technologies in conflict, and the future imaginings

of (communication) technologies, the analysis discusses six future imaginaries. Four of these future scenarios are negative, namely a power take-over, the intensification of armed conflict, the intensification of democratic conflict, and the harm inflicted on the environment and society in general. The two positive scenarios are the protective role of supranational organizations and the cultural change. Together, these six scenarios form a map of how European experts are concerned about media/technology and military/technology assemblages, and how they place their hope in supranational political institutions and cultural change.

SPC05 IAMCR@ECREA – The future of communication: New and old actors

SP 08 Decolonial imaginations: Can we think of AI futures for the “common good”?

[Andrea Medrado](#)¹

¹ University of Exeter, Communications- Drama and Film, Exeter, United Kingdom

Let's start imagining. The indigenous thinker Ailton Krenak (2020) shares a legend from the Yanomami people. The legend says that the sky is hanging above our heads, supported by rocks. Now, we are seeing signs that the sky might fall. The earth supports the rocks that support the sky. If the Earth is destroyed, the sky falls. Krenak (2020) says that our imagining and sharing stories are like the rocks holding up the sky. But why should we keep imagining? We talk a lot about the fast pace of technological transformations today. Present continuous – social media; clicking, liking, scrolling down; AI (artificial intelligence) doing our writing, doing our thinking, making our art. How about we pause and imagine? Focusing on social media, algorithms, data and AI, this paper prompts us to imagine futures for the common good. Tech giants often carry out programmes on “tech for social good” to contribute to their corporate social responsibility (CSR) goals. But to what extent is the idea of social good meaningful? Social good for whom? In this paper, we delve into the concept of tech for social good, addressing how it is useful and problematic. The paper asks: Is the notion of “the commons” more useful in helping us understand how we can create fairer and healthier digital ecosystems? To tackle these questions, the paper draws from perspectives on decolonial imagination, critical data studies and intersectional feminism. It establishes dialogues between Global North and South scholars, building upon notions such as empathy, the commons, and pluriversality, and applying them to tech scenarios. Further, the paper draws inspiration from the Latin American tradition of Participatory Action Research (PAR), engaging specifically with plural understandings of autonomy. Here, “autonomia”, in its Spanish language form, emerges as “a struggle for liberation and a new type of society in harmony with other people and cultures” (Escobar, 2018). By embracing this conceptualisation, I argue that it is possible to comprehend autonomy less as an individualistic phenomenon and more as a collective struggle for fairer social realities and tech futures.

SPC07 Dialogue diversified: Contemporary insights of the early-career researchers in Slovene media and communication studies

SP 09 Social and political transformations in the age and context of polycrisis

[Marko Ribač](#)¹

¹ Peace Institute/Faculty of Social Sciences, Communication department, Ljubljana, Slovenia

Marko Ribač will share some important discussions and conclusions as well as address some dilemmas of the empirical research he participated in in the past few years. Those discussions, conclusions and dilemmas are placed at the crossroad of three wide-ranging social and political transformations in the age and context of polycrisis. Transformations encapsulate “affective turn” in politics and in populism, transformation of populism into authoritarianism and illiberalism, especially in Eastern and Central Europe, and the rise of solidaristic forms in various social movement fields. The context of polycrisis encapsulates a newly formed world conditioned by health(care) crisis, rise of armed conflicts, ecological devastation, heightened migratory flows and various local crises exacerbated by capitalist contradictions (housing, food, energy inflation etc.).

SPC07 Dialogue diversified: Contemporary insights of the early-career researchers in Slovene media and communication studies

SP 10 Local radio production practices in a hybrid media environment

[Peter Čakš](#)¹

¹ University of Maribor, Institute of Media Communications, Maribor, Slovenia

Peter Čakš will focus on the journalists' production practices in local radio programs in the digital age. Technological convergence has not only brought new forms of media, but has also changed established work processes and the forms and methods of conveying media content. Radio is not immune to these changes, digitalization in production practices and the delivery of content on multiple channels at the same time has placed it in an environment of responsive, inclusive multimedia digital media products. These trends, new technologies, associated media changes,

and changed expectations of local communities are, to a certain extent, also transferred to the level of local radio programs.

SPC07 Dialogue diversified: Contemporary insights of the early-career researchers in Slovene media and communication studies

SP 11 Media and technology of young people in Slovenia

[Katja Koren Ošljak](#)¹

¹ University of Ljubljana, Department of Communication/Faculty of Social Sciences, Ljubljana, Slovenia

Katja Koren Ošljak will delve into the results of three recent studies that explore the interrelationships between media choices, technological preferences, media education, and the everyday life of young people. On the conceptual background of media repertoires as aggregates of media-related practices, she will present relations between family, school, and peer contexts that frame conditions within which elementary and high-school students are growing up and participating in media education. Then, the presentation will focus on the preliminary results of focus groups about young people's digital needs and compare them against popular digital/media literacy formation approaches

SPC07 Dialogue diversified: Contemporary insights of the early-career researchers in Slovene media and communication studies

SP 12 Navigating emotions: A comprehensive study of Zelensky's populist communication in wartime

[Sofija Sionova](#)¹

¹ University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

Sofia Sionova's presentation will elucidate findings from her master's thesis, delving into the mediatization of the Russo-Ukrainian War in 2022. The focal point of the study is to systematically examine populist communication during this conflict, focusing on selected speeches of Volodymyr Zelensky. Methodologically, the research employs Latent Dirichlet Allocation, an NRC lexicon, and critical discourse analysis to scrutinize the characteristics of populist communication and the mobilization of emotions. Particular attention is given to potential variations in Zelensky's communication when addressing the general Ukrainian populace versus political stakeholders. This study contributes to understanding the nuances of populist communication during wartime, showcasing Zelensky's communication style as a populist actor.

SPC07 Dialogue diversified: Contemporary insights of the early-career researchers in Slovene media and communication studies

SP 13 Technologically mediated dating practices on the mobile dating app Tinder

[Anamarija Šiša](#)¹

¹ Faculty of Social Sciences/University of Ljubljana, Chair of Media Studies, Ljubljana, Slovenia

Anamarija Šiša will present the findings from her doctoral research that delves into technologically mediated dating practices on mobile dating app Tinder and its role in (trans)forming intimate relationships in Ljubljana, Slovenia. The study highlights three key dating practices on Tinder: swiping, mapping and ghosting. These practices modify the spatial and temporal dimensions of dating, reflecting a digital landscape of emotional engagement and disengagement. At the same time, the research conceptualizes dating apps as digital media technologies that redefine dating culture through uncertainty. This analysis contributes to understanding the complex, contingent, and transformative nature of digital communication technologies in intimate interactions.

SPC11 Contemporary issues of the Slovene media system: Problems and regulatory responses

SP 14 Unveiling homogenization trends in news production: A study of content repackaging and ownership structures in Slovenian journalism

[Boris Mance](#)¹, [Ema Brglez](#)², [Luka Kronegger](#)², [Marko Robnik Šikonja](#)³, [Aleš Žagar](#)³, [Igor Vobič](#)²

¹ University of Ljubljana, Department of Communications, Ljubljana, Slovenia

² University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

³ University of Ljubljana, Faculty of Computer and Information Science, Ljubljana, Slovenia

Journalism studies employing diverse theoretical frameworks and methodologies have consistently highlighted significant trends towards homogenization within news. These include the prevalent use of information subsidies, a shift towards desk-bound journalism, and a pronounced tendency towards news recycling. Across various traditions and organizational settings, investigations into news production have revealed a growing inclination towards standardized processes driven by editorial demands for immediacy and frequency, as well as managerial pressures to reduce production costs, reconfiguring social control in the newsroom, journalistic skills and news production

processes. This has resulted in the adoption of highly standardized news production and various forms of second-hand journalism. This study aims to assess the degree of homogenization by examining the interplay between the creation of original content and the repackaging of existing content, often termed "churnalism". By harvesting the daily textual content from approximately 200 Slovenian media outlets of all formats, encompassing websites, print, television, and radio programs, we conduct the analysis by identifying factually identical (or partially modified) news content among them. Furthermore, we explore the extent to which patterns of factual similarity align with the ownership structures of news media outlets that share identical content. Additionally, we also analyze the extent to which identified factual content is attributed to news media outsourcing, either by other news media entities such as news agencies, or by other sources which include boundary news actors, such as commercial, political, or civic entities, which presenting their content through "pseudo-events" in the form of press conferences or press releases.

SPC11 Contemporary issues of the Slovene media system: Problems and regulatory responses

SP 15 Structural transformations of the Slovene press market in the attention economy

Sašo Slaček Brlek¹, Peter Sekloča²

¹ University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

² University of Primorska, Faculty of humanities, Koper, Slovenia

We examine the dynamics that are reshaping the Slovenian media landscape, driven by changes in the global media ecosystem. The integration of the internet into the processes of capital accumulation has redirected advertising revenues to digital platforms. This redirection has had a significant impact on the news media, which has seen a marked decline in revenue despite fewer cost-negative changes in news distribution. The newspaper industry is adapting through downsizing and cost-cutting measures. Despite modest increases in added value, profitability is maintained through pressure on wages.

These trends are also characteristic of the Slovenian newspaper industry, albeit with considerable differences. Revenue trends highlight significant differences between general dailies and more specialized niche publications, with the latter recording slight revenue growth while the circulation of the former continues to decline at an annual rate of about 10%.

Media companies are pursuing two main strategies to compensate for declining revenues in the print market: Diversification into the organization of events and closer cooperation with advertisers, which allows them to leverage their comparative advantages over digital platforms.

SPC11 Contemporary issues of the Slovene media system: Problems and regulatory responses

SP 16 Media law and regulation in a small state on the European periphery: Status quo amid a complex multiplicity of actors and interests

Jernej Kaluža¹, Jernej Amon Prodnik², Nina Žnidaršič², Nana Čemas²

¹ Faculty of Social Sciences – University of Ljubljana, Social Communication Research Centre, Ljubljana, Slovenia

² University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

It is extremely difficult to change media legislation in Slovenia, as the experience of the last twenty years shows. Any such attempt is usually accompanied by criticism from various spectrums of civil society and political polarization, which results in proposals for new media laws not being implemented. Media law is also characterized by extraordinary complexity, as it is an area that touches on many other regulatory systems and legislations from the fields of the economy, public administration, digital transition, criminal law, etc. The same applies to the heterogeneity of the actors involved: representative associations of journalists, media owners, regulators, human rights organizations, media operators and distributors, local politicians, representatives of various citizens' initiatives, etc. In this paper, we present an ongoing work in which we analyze the process of law implementation and the perspectives of the different actors using the example of the current proposal for a new media law (ZMed-1) in Slovenia, which can also be seen in the context of the attempt to implement the European Media Freedom Act (EMFA) into national legislation. The research is based on interviews with the relevant actors and on data analysis of documents (written responses produced during the public debate on the adoption of the law).

ARS01 Activist and protest audiences

PP 0054 Digital lives and identity perceptions of a minority under siege: Social media as routes of protests and activism

Anna Zsubori¹

¹ Loughborough University, School of Social Sciences and Humanities, Loughborough, United Kingdom

This paper examines the significance of social media among Hungarian LGBTQ+ communities who have been exposed to increasing harassment and deterioration of civil rights for over a decade. Investigating such a topic in an anti-LGBTQ+ environment like Hungary is especially challenging, thus this study presents an insightful addition to the field of audience studies.

Although digital media's role among LGBTQ+ people received significant scholarly attention in recent years (Hatchel, Subrahmanyam, & Birkett, 2017), existing research is largely confined to established liberal democracies, and focuses on the way LGBTQ+ members use social media to their own benefit, as a means of coming out, activism, identity and community building (e.g., Ayoub & Garretson, 2017). Much less is known about the limitations and even threats associated with digital and social media use among LGBTQ+ members in authoritarian and 'illiberal' countries, such as Hungary, promoting both nationalistic and anti-LGBTQ+ attitudes (Hume, 2020; Presinkszky, 2021; Rédai, 2012). Also, the social and cultural aspects of the 'illiberal turn' (Štětka, Mihelj, & Tóth, 2020), including its impact on the LGBTQ minority and their everyday lives, have been mostly overlooked by scholars.

By employing a combination of digital ethnography (Hine, 2017) and life-course interviews (Heinz, 2003), this work-in-progress paper addresses this important gap. It focuses on the digital lives of both those Hungarian LGBTQ+ members who fled the country and moved to the West, and of activists who decided to stay in Hungary by examining LGBTQ people's perception of the 'illiberal turn' that took place in Hungary in 2010 and its impact on their social media use. Therefore, on the one hand, this paper reconstructs a Hungarian minority's lived experiences as well as their relationship towards their LGBTQ+ identity. On the other hand, through investigating the long-term societal implication of the current political climate on Hungarian LGBTQ+ communities' national and gender identities, this interdisciplinary study also seeks to deepen the connection between the practices of everyday audiences and macro processes. As a result, this research aims to offer original contributions to audience, communication, cultural, gender, LGBTQ+ and media studies, and to political science.

Keywords: Digital activism, Hungary, LGBTQ+, protest, social media

Short bio:

Dr Anna Zsubori received her PhD at the University of Leicester and currently is a British Academy Postdoctoral Fellow at Loughborough University. Between 2016 and 2021 she was also a YECREA representative to the Audience and Reception Studies section of the European Communication Research and Education Association. Her research focuses on various audiences with projects examining Hungarian LGBTQ+ people use of social media and tweens' understanding of identity.

PP 0055 The "better" influence? A comparison between regular and social activist influencers on Instagram

Christina Seeger¹, Rebecca Scheiber¹

¹ University of Klagenfurt, Department of Media and Communication, Klagenfurt, Austria

Influencers have become an indispensable part of social media, especially in the lives of adolescents and young adults. These communicators use platforms such as YouTube, Instagram, and Tiktok to inform their followers about various topics and to promote products through partnerships with companies. Previous research on influencers has mainly been concerned with marketing and has occasionally examined the spread of problematic beauty ideals. However, over the last couple of years, a new trend in the direction of social activism in influencer communication can be observed, with more and more influencers focusing on political and socially relevant topics such as gender equality, climate justice, and sustainable lifestyles. Although these influencers claim social activism and societal change as their primary motivation, they still finance themselves by advertising commercial products.

Our study set out to investigate how the content of such self-proclaimed social activist influencers differs from those of 'regular' influencers. To this end, we first developed a theory-driven categorization of actors that can distinguish regular influencers from activist influencers, and activist influencers from activists. Second, we conducted a quantitative content analysis to compare the Instagram profiles of regular and activist influencers. We coded the profiles, posts, and stories of 22 social media influencers (11 regulars, 11 social activists) regarding the topics they cover, promotions (products, initiatives/causes, individuals), and activation of followers, resulting in a total of 1,639 coded postings. A list of possible topics was generated using an existing list from prior research combined with the SDG list of the European Union, which resulted in a list of 11 socially relevant topics (e.g., sustainability/climate action, health & well-being, gender equality) and 11 other topics (e.g., beauty/lifestyle, food & drinks, travel/vacation).

Results reveal that while social activist influencers cover socially relevant topics significantly more often compared to regular influencers, only one-third of their postings are about such topics. In addition, social activist influencers engage less often in the promotion of commercial products and more often in the promotion of non-commercial causes (e.g., charities), and they more often advertise for small start-ups and less often for large companies in comparison to regular influencers. However, when advertising commercial products, only a minority of them are framed as sustainable.

Regarding follower activation, both influencer types mostly use polls to activate their followers, but the encouragement of political action/participation is seldom even amongst social activist influencers. The theoretical categorization and empirical results help to shed some light on this new influencer type but also show that the boundaries between influencer types and other actors are fluid. A critical discussion will be included in the presentation.

PP 0056 Advancing the mobilization/reinforcement debate: The role of audience studies

[Sara Machado](#)¹, [Vasco Ribeiro](#)¹, [Raquel Meneses](#)²

¹ Faculty of Arts and Humanities of the University of Porto, CITCEM – Transdisciplinary Research Centre «Culture- Space and Memory», Porto, Portugal

² School of Economics and Management of the University of Porto, Marketing and Strategy Section, Porto, Portugal

The democratic system is undergoing severe disruptions in many countries (Bennett et al., 2018). The economic and political crises put pressure on the social contract, decreasing electoral participation and satisfaction with democracy and opening the door to populism and illiberalism (International IDEA, 2022). Knowing that democracy cannot be taken for granted (Kaase & Newton, 1995), several researchers have tried to understand how digital media can re-engage citizens in politics, mainly focusing on the relationship between younger citizens and institutional political participation.

The literature is divided into two main fringes. The mobilization theory proposes that by significantly reducing participation costs and multiplying opportunities for information consumption, political expression, and interaction, digital media have the potential to mobilize groups traditionally excluded from politics, such as the youth (Norris, 2000). On the contrary, the reinforcement theory suggests that digital platforms struggle to mobilize politically disinterested individuals (Norris, 2001) and that the political use of these platforms is primarily undertaken by previously interested individuals, reinforcing patterns of inequality in political participation (Norris, 2000).

There is “overwhelming research evidence” for the mobilization effect (Matthes, 2022, p. 6), as demonstrated by various meta-analyses (Boulianne, 2009, 2015; Lorenz-Spreen et al., 2023; Skoric et al., 2016), and this effect is thought to be particularly pronounced in the case of youth (Boulianne, 2009; Boulianne & Theocharis, 2020). Even the only meta-analysis that clearly proposes a reinforcement effect acknowledges that the effect on young people may be the opposite (Oser & Boulianne, 2020). However, this poses a paradox: if digital media can mobilize young people politically and if youth are avid social media users, why has youth voter turnout not significantly increased in the last few years (Matthes, 2022)?

We argue that this debate is unresolved partly because it lacks theoretical development. Firstly, although the original formulation of these theories was based on research on media effects (mobilization) and selection effects (reinforcement) (Norris, 2000), few studies establish this connection (Boulianne, 2011; Kruijemeier & Shehata, 2017). Secondly, most studies assume a causal direction from digital media use to political involvement (Boulianne & Theocharis, 2020), although the literature highlights the increasing importance of selection effects in a multiple-choice media environment (Bennett & Iyengar, 2008; Prior, 2005), and where information personalization is powered by the algorithms (Lee & Xenos, 2022; Thorson et al., 2021). The relevance of motivations is even more critical if we consider that young people now view political participation as a personal choice rather than a duty (Boulianne & Shehata, 2022). Thirdly, studies need to consider that most media effects are indirect, acting on (political) behaviors through the influence of cognitive and emotional mediators (Valkenburg et al., 2016).

Based on a comprehensive literature review, we claim this debate will have to be recentered in the context of audience studies. Of particular importance are models that conceptualize media uses as mediators between preexisting orientations and outcome psychological orientations, such as the communication mediation model (Cho et al., 2009; Shah et al., 2007; Yamamoto & Morey, 2019).

PP 0057 Investigating the dimensions of information-oriented media practices and their relation to societal ideals in Germany

[Hannah Immler](#)¹

¹ Leibniz Institute for Media Research – Hans-Bredow-Institut HBI, Communication Science, Hamburg, Germany

The question of how individuals experience society is closely tied to their mediated practices of public communication. These practices enable people to perceive, evaluate and participate in social and political realities and

processes (Hasebrink 2020). Even in egalitarian societies, media use is closely related to aspects of social class such as formal education, financial income or occupational status (Hovden 2023). According to Bourdieu's (1987) sociology of differences, media practices are linked to an individual's living conditions, which are deeply connected to a certain lifestyle and habitus (Lindell 2015). From this perspective, an individual's decision to use (or not use) certain media to get informed about and engage with the public should be understood in relation to their ideals and attitudes towards society as well as their socioeconomic position. The proposed paper is part of a PhD project which empirically investigates patterns of 1) information-oriented media use in combination with 2) perceptions and attitudes towards society in Germany, considering people's 3) economic and cultural resources. Following a Bourdieusian approach, this paper focuses on the first two aspects.

To identify patterns of media use and attitudes towards society as well as the underlying dimensions that constitute them, a representative population survey in Germany (N = 1.001; 2021) was conducted. Respondents were asked to indicate how frequently they consume various types of media for informational purposes, including public broadcasts, regional newspapers, tabloids, social media and more. To measure social media specific news practices, the participation in online discourses such as liking and commenting on news content as well as their preferences to follow social media accounts of e.g. politicians, influencers, news outlets, scientists were covered. Building on the concept of sociocultural cleavages (Lipset & Rokkan 1967), twelve items reflecting the level of agreement with different conceptions of an ideal social coexistence (e.g. 'Living together well means that everyone can live as they wish' or 'All people should share the same traditions') were included in the survey. Multiple correspondence analyses were applied to construct a two-dimensional space using the variables of information-oriented media use. Socioeconomic status and societal ideals were then projected onto this space. By this, correspondences between media practices and societal ideals could be analyzed based on their respective position within the two dimensions.

Preliminary results indicate that two main dimensions for information-oriented media practices can be identified: the level of engagement (frequency of media use and type of participation) and the preference for "traditional" vs. "new" forms of media (e.g. 'public broadcast' vs. 'social media'). Individuals who report lower levels of engagement tend to hold negative opinions towards inclusive societal conceptions, such as the idea that 'different opinions should be discussed to find compromises', and show greater approval towards authoritarian attitudes while having a lower level of formal education.

The findings reveal correlations between individuals' media engagement, media choices and societal ideals. Using multiple correspondence analysis contributes to understanding the multidimensional associations between media practices and broader societal perspectives regarding the overall social order.

PP 0058 (Re)action videos? Exploring audience agency between spectatorship and interactivity

[Simone Mulargia](#)¹, Francesco Nespoli¹, Mael Bombaci¹

¹ LUMSA - Libera Università Maria Ss. Assunta, Human Studies, Rome, Italy

The growing popularity of reaction videos (RVs) on digital media is an emerging and multifaceted phenomenon which has attracted the attention of communication professionals and researchers alike (Antonioni e Farci, 2018; Golding, 2019; McDaniel, 2020; Schankweiler, 2021; Heyne, 2022; Goddard, 2023). Starting from the success of RVs to the Brazilian porno-fetish film "Hungry Bitches", which released in 2007, social media platforms have seen the proliferation of channels and profiles that specialise in the production of various forms of RVs which receive millions of visualisations.

RVs are characterised by the intricate interplay between performance and spectatorship (Abercrombie & Longhurst, 1998). In fact, audience's reception as well as participatory aspects of RVs were frequently emphasised in literature (Weller & Holaschke, 2022; McDaniel, 2020). This includes definition of RVs as user generated content (Goddard, 2023) and the ability of RVs to form online communities based on shared interests and viewers engagement (Xu et. al., 2015). According to some, RVs can also be analysed as a phenomenon at the crossroads of remediation processes, as elucidated by Bolter and Grusin in 1999 (Golding, 2019; Bliss, 2023).

The relationship between users and reaction videos has thus been thematized as twofold. On the one hand, it has been addressed as active, and capable of activating social interactions. On the other hand, the archeological approach implied by the remediation perspective underlines the more immediate aspects of spectatorship, namely the passive and the individual.

To the best of our knowledge, no research was conducted interviewing users instead of the creators. Taking into account what has emerged from the literature, we then carried out a thematic analysis of the narratives produced in relation to the vision of RVs, in order to examine the understanding of RVs implied by the audience's interpretations, the reported modality of consumption of RVs and the relative motivations for consuming RVs. These narratives

were recorded during six focus group interviews, with a total of 36 participants, 18 self-identified females and 18 self-identified males, all aged between 25 and 60.

Participants expressed closeness or distance from reactors' reactions, which take the form of comment/criticism, and/or emotional manifestations.

These two attitudes proved to be particularly interesting in that they seemed to challenge the idea of digital media audiences as interactive and fully characterised by agency (Sundar & Limperos, 2013). Additionally, participants' sensemaking practices related to RVs vision are not directed towards a community dimension, but towards an individual interpretative relationship with the creator.

Therefore, RVs offer an opportunity to rethink the complexity of the relations between spectatorship, and the interactivity of digital media. Indeed, the question remains whether the weak reference to community identity practices among the participants was a cause or an effect of their personal characteristics, as they did not explicitly identify themselves as members of an audience community.

ARS02 Audiences and the news

PP 0074 Finding local news where there is no local media

Lúisa Torre¹, Pedro Jerónimo¹, Tatiana Dourado¹, Inês Amaral², Rita Simões²

¹ University of Beira Interior, LabCom – Comunicação e Artes, Covilhã, Portugal

² University of Coimbra – Faculty of Arts and Humanities, Centre for Social Studies, Coimbra, Portugal

In recent years, the concept of "news deserts" has aroused the curiosity of many scholars and regulators around the world, with the mapping of areas being the recent target of a call for proposals from the European Commission to support local media in communities lacking news. A news desert is defined as communities without a local newspaper or communities where residents face significantly reduced access to the news that feeds the local public sphere and democracy (Abernathy, 2018).

Pioneering in Europe, the "News Deserts Europe 2022: Portugal Report" reveals that 25% of the portuguese municipalities do not have media organizations based in the municipality about which they produce content or have infrequent or unsatisfactory news coverage, with more than half of the municipalities of the country being in a alert situation regarding local news (Jerónimo, Ramos & Torre, 2022). The phenomenon of news deserts is linked to more isolated communities, with less economic dynamism and smaller populations, and is more prevalent in the regions of Trás-os-Montes and Alentejo.

But individuals somehow obtain information in these territories. When there are no journalists reporting on reality, studies show that much of the local information in these territories is obtained through social media, such as Facebook pages and groups (Collier & Graham, 2022; Barclay et al., 2022), which can be a source of misinformation, leaving communities vulnerable (Ardia et al., 2020).

An exploratory case study focused on Manteigas, in the district of Guarda, a municipality in the news desert, confirms these other findings. In 2022, the city faced a major forest fire without any media outlets to provide local news coverage from the start of the incident. One of the main sources of information about this event was the mayor's Facebook page, highlighting the information gap that results from the lack of regional media.

Resourcing to focus groups as methodology, the study found that while information pretty much circulates within neighbors and family networks, with the centrality of Facebook and Whatsapp as main tools for citizens to get information about their local reality, in addition to face-to-face contacts and neighborhooding weekly or monthly newspapers. The city hall is also a power house in distributing useful information about their local reality. Information gaps, however, are felt by citizens, especially when it comes to sports, economics, obituary and independent political news.

Now, it is eager to understand: do these information consumption habits differ from those in small territories that are served with local media? This paper proposes to present the results of a survey applied in six different municipalities, 3 news deserts and 3 outside of the desert, that aims to assess which are these individuals' news consumption habits, the centrality of social media in their information gathering, the information gaps they feel and their relationship with local media and local journalists. The investigation also aims to understand the level of concern these inhabitants have about disinformation and how they build a relationship of trust with the information they consume.

Keywords: local journalism, audiences, news deserts, news consumption, information gaps

PP 0075 It's not (only) what you use, but how you use it. Exploring strategies of media use across media, situations and social classes

Laura Aleman¹, Benjamin Krämer¹, Max Lechner¹, Felix Frey², Celine Dorrani²

¹ Ludwig-Maximilians-Universität München, Institut für Kommunikationswissenschaft und Medienforschung, München, Germany

² Universität Leipzig, Institut für Kommunikations- und Medienwissenschaft, Leipzig, Germany

Typically, in the research field on media use and reception, questions of what people are using, how long and often, why or for what purpose, and with what effect or interpretation, are addressed. However, an important part of the media experience is not getting sufficient attention: how people use media (i.e., the formal patterns of practices, their relation to the social context, or the inner attitudes during reception). Concepts such as styles of media use, or singular constructs like "parasocial interaction" or "binge-watching", are tackling only specific parts of the aforementioned question. This results in a rather fragmented research field. Still, this "how" shapes the whole media experience and its outcomes and should be approached holistically.

The theoretical framework of strategies of media use by Krämer (2013) and this study, as part of a 3-year mixed-methods project, aim to fill this gap. The framework provides an integrative approach, conceptualizing the process of media use from the selection to the post-communicative phase, along ten dimensions. They include inner attitudes during reception (such as skeptical or distanced) and formal patterns of media use (such as the situational arrangement and styles of orientation and selection). Furthermore, the approach considers how practices are socially structured, by incorporating the socio-structural context, based on Bourdieu's concept of habitus and model of social space (1972).

In this study, the results of which we will present at ECREA 2024, we conduct around 30 qualitative, micro-phenomenological interviews (Petitmengin et al., 2019) in which people from diverse relevant social backgrounds are investigated about their use of traditional, online and social media. They are asked to place themselves as far as possible, at best almost physically, in a recently experienced usage situation and describe it in as much detail as possible, guided by questions on how they manage the situation of reception and on their inner attitudes toward the media content. This way, distorting generalizations and rationalization processes should be avoided. The sample is based on a six-fold class scheme (Bourdieu, 1972), combined with further categories such as gender and age.

Initial results reveal interesting patterns hinting to overall strategies and their practical sense. For example, a situational arrangement in which users are sitting straight up with a dimmed light is often part of a strategy of conscious instead of merely habitual media use that also implies high involvement. Or, for example, a high demand for reality, a modality of realistic representation, combined with a critical attitude during reception makes the use of a secondary source of information (in the form of follow-up communication or second screening) more likely.

Once data collection and initial interpretation in terms of elements of strategies have been completed, they will be placed in the context of the respondents' social background. Hence, we aim to contribute to a better understanding of what strategies of media use in different social groups look like, and thus how social inequality is reproduced by patterns of media use that go beyond channel and genre repertoires.

ARS02 Audiences and the news

PP 0076 From crowding-out to crowding-in: Willingness to pay and the use and support of public service news media in the United Kingdom, Denmark, Sweden and Norway

Mads Kæmsgaard Eberholst¹, Mark Blach-Ørsten¹, Kim Schrøder², Ruben Vandenplas³

¹ Roskilde University, Department for Communication and Arts – Journalism Studies, Roskilde, Denmark

² Roskilde University, Department for Communication and Arts – Communication Studies, Roskilde, Denmark

³ Vrije Universiteit Brussel, Studies in Media- Innovation and Technology, Brussels, Belgium

In journalism studies, the term 'crowding-out' refers to the argument that strong public service news media are an economic threat to private commercial media, because they shrink the commercial audience.

While this alleged effect is raised in debates about public service news media, there is no scientific research so far to support the argument. On the contrary, research addressing the issue finds no negative effect, but instead suggest evidence of a modest positive effect. In this paper, we pursue further evidence of this possible positive effect in four countries with a strong tradition for both public service and private news media: The UK, Denmark, Sweden and Norway. Based on media systems theory and economic theory we present the concept of 'crowding-in'. Unlike crowding-out, crowding-in is associated with Keynesian economic theory and suggests that government spending (also) can have positive effects on markets. By extension, the paper argues that you could think of a positive relation between public service news and private news media. Studies of the Nordic countries have suggested as much, since the willingness to pay is amongst the highest in the world, and at the same time public service news media play a significant part in the Nordic media systems.

Based on data from the 2023 Reuters Digital News Report we analyze the relationship between paying for news, personal importance of public service news media and weekly use news of public service news brands. Across all four countries, preliminary results suggest statically significant and positive crowding-in results. This means that people, who already pay for private news, also support public service news media and use public service news media more than people, who do not pay for private news. We also seek confirmation of previous findings from Denmark to the effect that news user who use public service news online are more likely to pay for commercial news online than those who do not. We end the paper by discussing 'the crowding in effect', and what it might mean for countries with strong public service news media.

PP 0077 "Being a journalist? It's very dangerous both there and here": How russian speaking migrants deploy authoritarian folk theories about news media literacy to make sense of democratic news environments

Anna Ryzhova¹

¹ University of Passau, Chair of Political Communication with a Focus on Eastern Europe and the Post-Soviet Region, Passau, Germany

Folk theories are the sets of ideas that people hold, which help them navigate the world and, within journalism, engage with news environments, irrespective of whether journalists and researchers consider those theories well-founded and well-informed (Palmer et al., 2020). The current study focuses on the folk theories related to news media literacy held by Russian speakers in Germany who have moved from a media environment dominated by the Russian authoritarian state media to a democratic media environment in Germany. Based on 42 semi-structured interviews, we find three main folk theories held by the participants, namely (1) "I think it is very dangerous both there and here", (2) "Journalism always belongs to someone", and (3) "I always try to find the middle ground".

We argue that participants often transfer their pre-existing folk theories, fostered by authoritarian media or their previous cultural experiences, to the democratic host society context and vice versa rather than separately assessing the two media environments. This might be problematic, as participants frequently treat news from authoritarian and democratic media environments equally, resulting in general cynism regarding journalists' work and prevailing disbelief in everything despite it being based on their old beliefs, not factual experiences. Namely, all three folk theories show that for the majority of respondents, the context of the difference between German, democratic and Russian media fields is not clear - the biggest difference the majority of participants saw was the 1) softer "approach" to censorship, but still "control" of the government and 2) that the journalists were not killed in Germany in contrast to Russia. The study's findings also suggest evidence that authoritarian states like Russia have their own frameworks of news literacy and attempt to promote them. While existing studies treat migrant populations as a "blank slate" in discussing the media literacy education of the former, we show that migrant populations already possess folk theories and ideas about news literacy from their homeland, which are apparently transferred to the host society. This paradox needs to be addressed in future news literacy education and research.

ARS02 Audiences and the news

PP 0078 Effects of news consumption on Instagram on knowledge about current affairs – A field experiment

Dominique Wirz¹

¹ University of Amsterdam, Amsterdam School of Communication Research ASCoR, Amsterdam, Netherlands

Instagram has become a relevant platform for news consumption, especially among young audiences (Reuters Digital News Report, 2023). News on Instagram are often distributed in the format of stories, an ephemeral format that persists for 24 hours and consists of images, text, and sometimes videos. Further, Instagram stories can contain interactive elements such as quizzes or polls. Given the growing relevance of this news format, the question arises as to what extent these short, and often entertaining, news items can contribute to knowledge about current affairs.

Vermeer & van den Heijkant (2023) found that exposure to Instagram news stories increased political interest among Dutch adolescents, but the presence of interactive elements in the stories did not increase learning about

political issues. The present study expands this research by investigating the effects of interactivity, narration, and dynamic elements in Instagram news stories on knowledge about news issues among Swiss adults who regularly use Instagram ($n = 351$) in a field experiment. Participants were recruited by a market research company and exposed to a manipulated Instagram news account for 5 days using their regular Instagram accounts. In a between-subjects design, the account either posted Instagram stories 1) with interactive polls and emoji sliders, 2) with a narrative structure and an exemplar, 3) with dynamic videos instead of static pictures, 4) with none of these additional elements, and 5) only filler stories that were not related to the target news items as a control. After 5 days, participants completed a knowledge test about the five news issues that they were exposed to (or not exposed to in the case of the control group).

The treatment check was successful, participants perceived the interactive stories as more interactive, the narrative stories as more narrative, and the dynamic stories as more dynamic than any other type of story. Overall, the manipulation had a small but significant effect on knowledge, $F(4,344) = 16.56, p > .001, \eta^2 = .16$. In line with the expectations, participants in the experimental groups had a higher knowledge about the news issues than those in the control group ($p > 0.02$ for all comparisons). Hence, Instagram news contribute to learning about current affairs. There was, however, no difference between the types of news stories (all comparisons *n.s.*). Interactivity, narration, and dynamic elements did thus neither distract from the content nor foster information processing in this context. Theoretical and practical Implications of these findings will be discussed in the presentation.

ARS03 Information disorder from audience studies perspective

PP 0152 Buzz worded but not researched? A systematic literature review on media literacy and online hate

Ruth Wendt¹, Brigitte Naderer², Larissa Leonhard¹, Janina Hagner¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

² Medical University of Vienna, Unit Suicide Research & Mental Health Promotion – Department of Social and Preventive Medicine – Center for Public Health, Vienna, Austria

Being online comes with a substantial risk of being confronted with some sort of hateful content. We define hateful online content as either offensive speech directed in an explicit and rude manner towards individuals, as well as hate speech targeted against individuals as members of a certain social group. When it comes to the question of how to deal with online hate, increasing online users' media literacy is a solution frequently mentioned by educators, government officials, and researchers. Although this idea of media literacy being an important resource against online hate was often proposed, a systematic literature review on the (empirical) state of scientific knowledge on this issue is still missing. With the present study, we address this gap by providing a systematic literature review taking up the question if there is a connection between media literacy and the chances of increasing awareness about online hate, diminishing the amount of this content and increasing social media users' actions against it. To this end, we ask which categories of online hate and media literacy were examined in the existing literature, which conceptualizations were followed, and whether an empirical investigation on the relationship of both constructs has actually been carried out, or whether media literacy was only posed in the discussion section as a solution without providing any empirical evidence.

We searched literature that has been published in scientific, peer-reviewed journals on media literacy and online hate until May 1st 2023. We conducted a Boolean keyword search that included terms related to media and digital literacy and to online hate. In total, the search resulted in 147 records. We then manually checked the records and only included texts that fulfilled the following criteria: 1) empirical studies 2), research published in English 3) title or abstract referred in some way to media or digital literacy in combination with online hate. In total, this resulted in the removal of 23 records. To screen the remaining 124 records concerning their relevance for the systematic literature review based on meta-data like title and abstract, we used the open source tool ASReview.

The final review included 35 empirical studies. The results indicate that the conceptualization of media literacy in extant research is often unclear and that in general there is hardly any empirical evidence on the relationship between media literacy efforts and online hate. In many studies, media literacy is only mentioned as a buzzword in the discussion section without actually examining the concept empirically. Furthermore, the conceptual framework for media literacy is often fuzzy and not specific on the examined elements. In addition, our review points to a lack of established measures of media literacy, a lack of study designs that establish a causal and objective relationship between media literacy and online hate, and a lack of focus on social media users outside of children and adolescents. Ultimately, the study underscores the need for a more nuanced understanding of how media literacy can be implemented to effectively combat online hate.

ARS03 Information disorder from audience studies perspective

PP 0153 Understanding young adults' resilience to disinformation. A cross-national analysis of daily tactics and resources to navigate information

Jülide Kont^{1,2}, Çiğdem Bozdağ¹, Marcel Broersma¹, Wim Elving²

¹ University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

² Hanze University of Applied Sciences, Professorship Communication – Behaviour and the Sustainable Society, Groningen, Netherlands

Resilience is a popularly used but still underdeveloped concept in the emergent field of disinformation. Current definitions and studies mainly focus on intrapersonal factors and cognition to explain and explore resilience, leaving important questions regarding the role of daily practices and meso-social, economic, or cultural environments unanswered (Kont et al., forthcoming). Our cross-national, comparative study addresses this gap and asks:

Which tactics do German and Dutch young adults (18–32) apply for navigating disinformation in daily media practices and conversations?

How do economic, cultural, social, and personal resources shape this process and contribute to resilience to disinformation?

Applying a qualitative study design, we conducted 29 semi-structured interviews with young adults (18–32) in Germany (n = 15) and the Netherlands (n = 14) from November 2022 until April 2023. All interviews were transcribed, and data were analyzed using a grounded theory-based approach of line-by-line coding followed by axial coding.

Based on our results, we developed a taxonomy of tactics for navigating disinformation: (1) distinguishing deceptive strategies, (2) verifying, (3) seeking nuanced representation, (4) self-reflective thinking, (5) avoiding news, (6) avoiding 'risky' outlets, and (7) engaging in conversation. Our comparative analysis shows that the same tactics are applied in both countries despite different contexts and levels of digitalization, pointing to transnational mechanisms of how citizens deal with disinformation.

The results indicate that young adults' personal backgrounds and resources profoundly shape their approach to disinformation and (extent of) employed tactics. For example, social resources manifesting through personal networks prove vital for the participants' access to (high-quality or dis-) information. We also find patterns connecting socio-economic and cultural backgrounds to trust in political and journalistic institutions. Most concerning, our data shows how structural inequalities resulting in fewer resources negatively impact the development of resilience to disinformation.

Our study provides a structural and contextual perspective to the over-individualized debate on resilience to disinformation, which mainly focuses on literacies and places responsibility on the individual. Through connecting daily practices with resources and lived experiences, we provide more nuanced explanations to common questions in the field, such as why (media literacy) tactics do not necessarily lead to resilience. Our shift in analytical perspective highlights underexplored issues, such as the role of structural inequalities, and provides a taxonomy that can be used for future, larger-scale quantitative research.

Keywords: Disinformation, resilience, tactics, taxonomy, resources

PP 0154 Assessing the reach and impact of disinformation narratives in Eastern European countries

Jaume Suau¹, Dren Gërguri²

¹ Ramon Llull University, Blanquerna School of Communication and International Relations, Barcelona, Spain

² University of Prishtina 'Hasan Prishtina', Department of Journalism, Prishtina, Albania

The study of the real impact of disinformation is a complex endeavour. Foreign-sponsored misleading content and anonymous bots and social media profiles mix with domestic actors and content creators (Almenar et al. 2022). Moreover, audiences, as "unwilling crowds" (Starbird et al. 2019) not just passively consume misleading content, but share it, reshape it into a different format, or comment on it, contributing to its dissemination. The goal of disinformation campaigns is precisely to move beyond like-minded audiences to reach broader publics, through multiple kinds of content and spreading strategies, continuously through time and aiming at social reproduction (Flore, 2020). Hence, as stated by Starbird et al. (2019:3) "evaluating disinformation is less about the truth value of one or more pieces of information and more about how those pieces fit together to serve a particular purpose".

We suggest assessing societal impact by researching the spread and truthfulness of disinformation narratives. To do so we conducted an analysis in 4 Eastern European countries (Czech Republic, Poland, Serbia and Kosovo) gathering daily information about fact checks and reported disinformation content, disregarding on/offline origin, during May/June 2023. Material was posteriorly analyzed to cluster similar content into disinformation narratives. A survey was conducted (N = 9.000) to test the impact, spreading patterns and effectiveness of clustered narratives in each country. Results show different levels of reach and impact in different countries, as well as spreading patterns, with a strong presence of Russian-sponsored disinformation content, especially in what regards the war in Ukraine. Also, those narratives more connected to ideological issues are more likely to be spread among the population. Moreover, in most analyzed narratives is observed the "received before effect": citizens are more likely to trust the narrative if they have been exposed to it, especially if this happened multiple times. The "received before" effect seems to have more relevance regarding trusting the narrative rather than ideological positioning of the receiver, although this greatly differs among the different narratives.

ARS03 Information disorder from audience studies perspective

PP 0155 Deepfakes in the context of AI inequality: Analyzing disparities in knowledge and perceptions of deepfakes

Alexander Godulla¹, Christian Pieter Hoffmann¹, Daniel Seibert¹

¹ Leipzig University, Institute for Communication and Media Studies, Leipzig, Germany

Research on digital inequality builds on the assumption that socio-economic inequalities are manifested in unequal access to and participation in the digital world (Hargittai 2002). As technologies evolve, new manifestations of such inequalities emerge – such as the "AI divide" (Carter et al., 2020). While some users show a low affinity for new digital technology, and therefore might miss out on their affordances, others are eager to embrace them – sometimes with beneficial outcomes, but also more exposure to their specific risks (Kurpicz-Briki et al. 2023).

Recently, the AI-based deepfake technology has gained interest in research and practice. Deepfakes pose new challenges to Internet users – due to the high quality of their manipulations (Lee & Shin, 2022) and users' willingness to believe audio-visual content (Fehrensén & Täubner, 2019). While the technology behind deepfakes might also help democratize creativity in content creation and offers opportunities for new digital products and businesses (WDR, 2021), it might be used for fraud, identity theft and reputational damage (Citron & Chesney, 2018).

This study examines to what extent knowledge of and attitudes towards deepfakes reflect characteristics of AI inequalities. First, predictors of deepfake knowledge are analysed (sociodemographics, digital skills, internet and social media use) and second, the impact of deepfake knowledge on users' perceptions of dangers and potentials of deepfakes is examined. A survey among German Internet users was conducted in October 2022 (n = 1.421; quotas defined for gender, age, educational attainment). To assess deepfake knowledge, a quiz was developed providing 13 correct/incorrect statements about deepfakes. Additionally, participants were asked to rate their agreement with 22 statements on risks and opportunities of the technology (based a five-point Likert scale). Respondents also rated their overall perception of deepfakes on a scale from 0 (harmful) to 100 (beneficial). Finally, respondents could provide their thoughts on deepfakes in an open comment field. These remarks were subjected to a qualitative content analysis.

Our findings show that most respondents overall have little knowledge of deepfakes. Digital skills, frequent usage of multiple social media, age, male gender and high educational attainment predict deepfake knowledge. Furthermore, deepfake knowledge significantly predicts users' perceptions of the technology's dangers and potentials. While all respondents express high agreement with perceived risks of deepfakes, respondents with little deepfake knowledge perceive deepfakes as overall more dangerous. In addition, there are significant differences in the perception of their potentials: Respondents with high deepfake knowledge agree more with statements on the technology's advantages. Finally, qualitative data serve for further discussions on the respondents' fear of criminal and political deepfakes.

We argue that deepfakes can and should be examined in the context of AI inequalities, as sociodemographic factors and digital skills affect both users' knowledge of and attitudes towards this emerging technology. Furthermore, deepfake knowledge influences perceptions of the technology's risks and potentials, which is likely to affect behavioral choices. A differentiated understanding of deepfakes could increase the likelihood of achieving beneficial outcomes from using the technology, while understanding its dangers might bolster users' ability to ameliorate some of the technology's risks.

ARS03 Information disorder from audience studies perspective

PP 0156 Incidentally informed? Frequency and motives of news usage on Instagram

Florin Zai¹, Dominique Wirz²

¹ University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland

² University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

Instagram has become a relevant platform for news consumption (Reuters Digital News Report, 2023). While researchers have started to investigate the nature and content of news on Instagram (e.g., Vázquez-Herrero et al. 2019, Hendrickx 2023), little is known about news consumption on Instagram. How often do Instagram users see news content, is news exposure on Instagram purposive or incidental, and what are motivations to actively engage with news content on Instagram?

We address these questions with an online survey ($N = 511$) of Swiss Instagram users. Participants were grouped into *infrequent* ($n = 60$), *moderate* ($n = 121$), and *frequent news consumers* ($n = 313$) based on their general (not Instagram related) news consumption habits. We examine i) how the news consumption on Instagram differs between Instagram users with different levels of general news consumption, ii) to what extent the news consumption on Instagram of these groups is deliberate or incidental, and iii) the motives for (not) using news on Instagram.

A significant proportion of Instagram users do not follow any news sites. However, this differs according to general news consumption. While around 60% of frequent and moderate news consumers follow at least one news site, only 37% of infrequent users do so. The difference in the number of news sites followed is significant ($t(332) = -2.35$, $p < .05$, $d = .35$) between infrequent ($M = .42$, $SD = .99$) and frequent users ($M = 1.04$, $SD = 1.88$). However, these groups do not differ in terms of incidental news exposure on Instagram. Both frequent ($M = 3.36$, $SD = 3.24$) and infrequent users ($M = 3.66$, $SD = 4.07$) incidentally see news content from more news outlets than they intentionally follow.

In decreasing order, participants indicate that they follow news sites on Instagram to be informed incidentally, because they like the content of the outlet, and out of habit. Purposive information and entertainment are less important motives for following. Infrequent and moderate news consumers are less motivated by habit, and both frequent and moderate users follow news sites more to be informed incidentally. The main reason for not following news sites on Instagram is that participants use the platform more for entertainment or social reasons. Only a minority of those who do not follow any outlets say that they do not like the content, are not interested or did not know such accounts existed. Frequent news users are however more interested in news content on Instagram than moderate or infrequent news users.

Overall, the results of this study indicate that news consumption on Instagram is often incidental, and that – other than on Facebook (e.g., Kümpel, 2020), news exposure on Instagram seems to be less dependent on users' interest in news. Future research should thus investigate the effects of incidental news exposure on Instagram on political knowledge or political interest.

ARS04 Algorithms and everyday life

PP 0177 How we navigate through Spotify and what algorithms have to do with it. An exploratory analysis of navigation styles when using algorithmically curated audiovisual content

Max Lechner¹, Benjamin Krämer¹, Laura Aleman¹, Celine Dorrani², Felix Frey²

¹ LMU München, Institut für Kommunikationswissenschaft und Medienforschung IfKW, Munich, Germany

² Universität Leipzig, Institut für Kommunikationswissenschaft und Medienforschung, Leipzig, Germany

Algorithmically curated content permeates much of today's cultural consumption, including entertaining media use, to the point that authors have spoken of "algorithmic culture" (e.g. Striplhas, 2015) or proposed that algorithms take on the functions of structuring cultural practices and reproducing social inequality formerly fulfilled by the human habitus (Airoldi, 2022). Nevertheless, entertainment platforms equipped with recommendation systems provide users with important choices in terms of navigation styles that may or may not rely heavily on algorithmic selections or recommendations. Users can choose traditional structures such as categories or search functions, approaching each with their individual style of navigation. Conversely, recipients have the option of counting on the algorithmic recommendations the platforms provide and engage with them in various ways (Kim, 2014). They might review them meticulously and exhaustively or opt to follow the first recommendation they find sufficiently good. Despite the much-discussed ubiquity of the use of algorithms in, for example, content production and distribution and its potential effects on users, how recipients potentially integrate them into their individual style of use recently received attention, and this research interest has often been overshadowed by studies on the role of algorithms in political media use. Therefore, an overview of navigation styles in algorithm-driven audio(-visual) media is the focus of this contribution. By using technical recordings and surveys, we aim to investigate the styles in a comprehensive and differentiated manner.

For an initial sub-study, we will recruit users of entertainment platforms with a recommendation system who consider the recommendations at least occasionally, using Spotify as an exemplary platform. Participants are tasked with selecting a piece of content (a song or album) on a stationary computer in a laboratory setting at our university and with creating a playlist suitable for a specific occasion such as a party or romantic dinner. The selection process, screen activities, and accompanying think-aloud comments will be recorded. Data will be coded based on theoretical assumptions on the dimensions of navigation styles and openly, developing new categories. Subsequently, participants will be asked to summarize aspects of navigation styles for each navigation process in a standardized questionnaire, enabling comparison and the validation of a resulting new scale for the measurement of navigation styles.

To further validate the scale and enrich the investigation with the highest possible external validity, a second sub-study utilizes mobile experience sampling. Participants will use mobile technology to document Spotify usage episodes over several days, providing deeper insights into navigation styles and algorithm use on the platform. Both studies will be conducted during the next months, with initial findings to be presented at the conference. Results will then reveal how recipients navigate through Spotify, to what extent they may (habitually or deliberately) rely on the help of algorithms, and whether they are even aware of their role.

ARS04 Algorithms and everyday life

PP 0178 "The magical world of the algorithm". Imaginary, perception and interaction of TikTok users with their algorithm

Ellenrose Firth¹, Stefania Parisi¹

¹ Sapienza University of Rome, Communication and social research, Rome, Italy

TikTok has become one of the main platforms through which young(er) generations see and understand the world; the number of people who use the platform to get their news has doubled since 2020 (Pew 2023[1]) and the way in which the platform delivers content to people has been the subject of debate because of the algorithmic curation of the for you page. This has led academics (Boeker, Urman 2022) and organisations (*The Wall Street Journal* 2021[2]) to carry out studies to try and understand how the platform algorithm works.

Because of the relevancy of the platform, as well as current debates on the effects of entirely algorithmic feeds on news acquisition[3] we decided to carry out in-depth interviews with TikTok users aged 18–34 to understand the ways in which they interact with the platform and content they find, as well as the understanding they have of platform affordances and algorithms. We opted for a grounded theory approach in order to let TikTok users guide us towards what was most relevant to them.

What emerged from the thematic analysis of 20 of these interviews is the extent to which users develop algorithmic imaginaries (Bucher 2017) and folk theories (DeVito, Gergle e Birnholtz 2017) in order to understand the platform, which leads them to interact with it in ways that they believe will guarantee a good experience. Moreover, the interviewees used a language that made it apparent that not only they build a relationship with their algorithm, but they include an affective dimension in their domestication processes that leads them to interact with specific types of content to personalise their platform experience.

This confirms the fact that users are not only aware of the algorithm, but they see as an actor with whom to build a relationship and interact. The results of our analysis show that most of our interviewees care about their algorithm (Siles, Meléndez-Moran 2021) enough to engage with content in a way that – in their opinion – allows them to always have a positive experience on the platform. What also emerged is the way in which people react to the idea of having a datafied self, and the idea that a platform like TikTok is collecting information on them in order to provide positive platform experiences: this was not always seen as a negative, as interviewees seemed to be willing to share their data in exchange for good recommendations within the platform.

These results are presented within a folk theories and domestication processes framework, looking at the different ways in which users understand and interact with TikTok.

ARS04 Algorithms and everyday life

PP 0179 How users enact algorithm skills to improve their online experiences

[Gerta Lokaj](#)¹, [Eszter Hargittai](#)¹, [Jessica Han](#)²

¹ University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

² London School of Economics, London School of Economics, London, United Kingdom

Algorithms have become an increasingly important component of digital media, informing the user experience by ordering and filtering information and thus determining to what content users are most readily exposed (Latzer et al., 2016). Some literature has shown that people enact strategies based on their understanding of algorithmic output (Bucher, 2017), for various purposes such as increasing visibility (Cotter, 2018; Klawitter & Hargittai, 2018), shaping content output (Eslami et al., 2016; Kapsch, 2022), and resisting algorithmic control (Karizat et al., 2021). We refer to these practices as *enacted algorithm skills*, that is, the ability to act on one's understanding of algorithms to achieve a desired outcome in the realm of preferred online experiences. This study extends existing literature by interviewing a diverse group of adults from three countries concerning various usage domains, by asking: How do users engage with algorithmic systems to improve their online experiences?

We interviewed 32 adults in Kosovo (11), Switzerland (11), and the United States (10) in 2022 about their experiences using search engines, social media platforms, and YouTube. We recruited participants through our social networks and by posting calls on social media. Both during recruitment and the interviews, we intentionally refrained from using the term "algorithm" to prevent influencing how participants discussed their experiences. To analyze the data, the first author inductively developed a coding scheme from the interview material to identify expressions of enacted algorithm skills, which was regularly shared and discussed within the team.

Enacted algorithm skills manifested themselves as ways to optimize (e.g. liking, adding keywords, or providing more data) or avoid (e.g. blocking accounts) algorithmic output as well as nudging systems to share their content in preferred ways (e.g. adjusting settings). These actions were mostly based on users' experiences with the services, which is consistent with research on folk theories and the algorithmic imaginary (Bucher, 2017; DeVito et al., 2018). Thus, respondents did not necessarily have to know what algorithms are in technical terms to engage in actions intended to influence the selection process. This makes technology, and the information they make available, more accessible.

Moreover, participants' responses showed that context seemed to play a role in people's enacted algorithm skills. For instance, someone who might use social media because of their job or is interested in reaching a big audience might be more incentivized to make use of certain strategies compared to someone who uses the platforms mostly to consume other users' content and to keep in touch with friends.

In sum, although algorithms can have a large influence on people's online experiences, users are not necessarily left without any control over what content they see and hear. Our study shows that people with enacted algorithm skills can strategically make use of their understanding of how the platform's mechanisms work to make their use more efficient supporting their preferences. However, not everyone engages in enacted algorithm skills. People who lack such skills are left more susceptible to information readily presented by the algorithms, thus disadvantaging their uses.

ARS04 Algorithms and everyday life

PP 0180 Perspectives on how young audiences see and handle algorithms

[Maria José Brites](#)¹, [Teresa Sofia Castro](#)¹, [Mariana Muller](#)¹, [Margarida Maneta](#)¹

¹ Lusófona University/CICANT, Communication Sciences, Porto, Portugal

This proposal aims to reflect on how young people perceive algorithmic and filter bubble challenges in the digital era, particularly concerning how they define and deal with algorithms (Swart, 2021) and their implications for information selection processes in their daily lives. E-social contexts and diverse daily life constellations can have implications concerning information diversity, datafication and information disorder (Wardle & Derakhshan, 2017).

To deepen this debate, as part of a funded project on young people, news and digital citizenship, we analysed 42 semi-structured and participatory interviews with young people aged between 15 and 24 (F = 21; M = 21) living in Portugal. Research questions: Q1 – What is their knowledge of algorithms and filter bubbles?, Q2 – How did they learn what they know about them? and Q3 – What implications do they have for diversity issues in everyday life?

The preliminary results indicate 4 distinct profiles of how they view algorithms: profile 1 highlights that "The algorithm is an ethereal entity, endowed with human faculties of action and decision". These participants describe the algorithm as an "acting agent" with decision skills. The familiar contexts found are prevalent in the context of forms of learning, as well as self-learning. This profile recognises that this superhuman image of the algorithm is not without its problems from the point of view of diversity. These participants also associate the algorithm with situations related

to fake news. Profile 2 (the dominant one in terms of the number of respondents) includes those who believe that "Algorithms are not easy to understand". These participants fell into two fundamental spheres. On the one hand, they showed and recognised basic knowledge acquired mainly from friends and individuals. On the other hand, they also included people who didn't know what an algorithm was at all. In the latter cases, the participants recognised that they had gained basic knowledge of what the algorithm is through the interview process. The third profile includes interviewees who believe that "The algorithm is essentially negative". They were particularly concerned about diversity matters, and they believe that the algorithm is targeted and ends up being "selfish" in the restrictions it imposes. These young people learnt about these matters at school, although also in family environments and on an individual basis. Finally, the fourth profile states: "There's no problem if the algorithm gives us what we want to see". This includes people who see advantages in the algorithm, who recognise the importance of diversity, but who demand the power of individual opinion (as Sofia, 18, studying International Relations, points out, "we are all free to have our own opinion"). In this case, it's more favourable for them to be able to have what they want tailored to them (particularly on social networks like TikTok). They have learnt individually and with friends.

These early-stage results pinpoint challenges that democratic societies face nowadays and evidence of self-centred forms of learning in the context of the digital society that prompts a disruptive style of understanding selfhood in the context of a globalized society.

ARS04 Algorithms and everyday life

PP 0181 Making the news your own: Exploring how young adults tailor their online information flows using social media data donations and in-depth interviews

Sarah Vis¹, Daniël Jurg¹, Ike Picone¹

¹ Vrije Universiteit Brussel, SCOM/ SMIT imec, Brussels, Belgium

Young adults increasingly use news and encounter (political) information on social media like Instagram and TikTok, where both journalistic and non-journalistic 'news' curators intertwine (Newman et al., 2022). The entanglement of different information genres in media users' news feed raises important questions on both the credibility young adults assign to these curators and the development of (new) user tactics to navigate their news feeds. Not only have social media reshaped people's engagement with, and perception of 'news' and information, but it also empowered news users' 'do-it-yourself-expertise' and their **selection and curation of information** (Cotter & Thorson, 2022). Social media news users thus become "active architects of their own media worlds" (Thorson & Battocchio, 2023, p. 18), constantly organizing and altering (political) information flows on their social media platforms.

Therefore, the proposed study aims to understand when and **how social media users assign credibility** to both journalistic and non-journalistic accounts to make sense of and interpret information online. Additionally, we ask how and when they apply user tactics (liking, sharing, blocking, skipping, etc.) to 'regulate' their news feed. To capture both perceptions and user actions we combine two data-gathering methods. First, we apply a '**data donations' method** (Boeschoten, et al., 2020), where we invited 30 Belgian social media news users (age: 18–30) to request their data from social media platforms Instagram and TikTok. Using data mirroring techniques, we first quantitatively map the participants' "digital footprints" and engagement with political, activist and news related social media accounts (Mathieu & Pruulmann, 2022). Subsequently, via in-depth interviews, the participants reflect on how they organize their social media news and information feed. Preliminary results suggest that popularity, emotion, and proximity play a key role in the way users assign credibility to non-journalistic curators to tailor the information flows to their mood, viewpoints, and interests.

We conclude by reflecting on the **new ethical and methodological challenges** that come with data donations, while also highlighting the unprecedented insights into news and media usage this method offers.

PN 046 Fangirls, Meme Lovers, Gym Bros and everything in between: A study of TikTok user characteristics

[Amanda Mouritsen](#)¹

¹ Aarhus University, Media and Journalism Studies, Aarhus, Denmark

This paper presents the findings of a qualitative study of the characteristics of young, Danish TikTok users based on data collected through the method of data donation (Ohme et al., 2021; Author, forthcoming a). The paper aims to investigate the differences and similarities between the users and create different characteristics and categories of TikTok users. Coding of the data is ongoing at the time of writing this abstract. The 24 users are studied through their data download packages (Boeschoten et al., 2020) from TikTok, which they have downloaded and donated to this study. More specifically, the data consists of a sample of 100 TikTok videos from each user (2400 videos in all) from their video browsing file, which shows the content they have been presented with on the app and when. The paper builds on a previous study of genres and characteristics of TikTok videos that is based on data from the same dataset (Author, forthcoming b). Firstly, the paper investigates the users on an individual level, e.g., the characteristics of the content they are presented with and how much they use TikTok in their daily lives. Secondly, the paper compares the characteristics of the users, e.g., the prominent genres of the content (ibid.), and to what extent the app's algorithm seems to personalize their For You Page. Lastly, the paper will discuss how the users can be divided into different categories of TikTok users. The preliminary findings show, e.g., that some of the users are being heavily presented with content relating to, what is assumed to be, a specific interest of theirs – so far, they have been named, e.g., the fangirl, the meme lover, and the gym bro. Other users are more similar and are presented with more of a mixture of the different genres of videos. Besides this, the ongoing coding also shows how videos relating to big news stories of the specific time, in this case, the Depp v. Heard trial in 2022, are present in almost every user's data. PN 047 Kids, YouTubers and com(merch)ial confusion: Children's perspectives on sponsored content and merch

Carolina Martinez¹, [Fredrika Thelandersson](#)², Helena Sandberg³

¹ Malmö University, Childhood Education and Society, Malmö, Sweden

² Lund University, Communication and Media, Lund, Sweden

³ Lund University, Communication and Culture, Lund, Sweden

The advertising practices of YouTubers and their impact on the views and comprehension of commercial content by young followers have garnered scholarly attention in recent years (Jakkola, 2022; De Veirman, et al, 2019). While existing studies offer nuanced insights primarily into children's advertising literacy, limitations in previous research emerge from a singular treatment of YouTubers' influencer marketing as a unified phenomenon (Van Dam & Van Reijmersdal, 2019). In contrast to prior work, we distinguish between sponsored content and advertising for merchandise among YouTubers, considering them as two distinct types of advertising. Merch advertising, in particular, is perceived to have a closer connection to the YouTuber as an individual than third-party sponsoring. Building upon this distinction, this study analyzes how children appropriate sponsored content and advertising for merchandise, recognizing them as two elements within the blurred context of the parasocial relationship between the child and the YouTuber. The study relies on group interviews with 19 Swedish children aged 10 to 13. Theoretical frameworks employed in the study encompass concepts of appropriation (du Gay, 2013), moral economy (Silverstone, 1994), and parasocial relations (Lou, 2022) to explore children's engagement with sponsored content and merch advertising. The results reveal differences in children's appropriation, with sponsored content deemed more problematic than advertising for merchandise due to its perceived greater interruptive, pervasive, and deceptive nature. Additionally, discussions on merch advertising center on merchandise as products, addressing both the relevance and problematic dimensions of merchandise in children's everyday lives. These findings underscore the theoretical significance of adopting a more nuanced understanding of YouTubers' advertising practices in research involving children, YouTubers, and advertising. Additionally, we anticipate implications for policy and encourage policymakers to incorporate the concept of a more fine-grained understanding of YouTubers' commercial content in their future

developments of advertising labeling (disclosure) and codes of ethics for influencer marketing (Ortová, Hejlová & Weiss, 2023)

ARS05 Young audiences as media users, target groups and creative partners

PN 048 Viscerality, mood control, and media literacy: children's perceptions of quality in films and series

[Pia Majbritt Jensen](#)¹, Christa Lykke Christensen²

¹ Aarhus University, Media and Journalism Studies, Aarhus, Denmark

² University of Copenhagen, Communication, Copenhagen, Denmark

This paper presents the methodology and findings of a mobile ethnographic study on how Danish 8-17-year-old children and adolescents perceive quality and relevance when it comes to their media use with a focus on series and films. Theoretically, our point of departure is that films and series have a 'cultural value' that is attributed by the beholder (Carnwath and Brown 2014), and these are the values we are interested in pinpointing, albeit from the perspectives of the children, and not from adult perspectives such as high and low culture, artistic quality, or good and bad taste (Drotner 1999). We collected the data using the method of mobile ethnography, in our case via a qualitative research tool app called Indeemo. Through this method we gave the informants various tasks relating to their media use – communicated via short online videos and text – that they in turn completed with a combination of 'selfie' videos, text and images gathered in the Indeemo app. The result of this was a rich, but still structured, qualitative data collection that took place in the comfort of their own home and, importantly, was removed from too much adult researcher interference. Hence, the method is different from traditional qualitative methods such as focus groups, observations, experimental settings, and in-depth interviews, in which the researcher is relatively conspicuous and – as previous research has established (Coulter 2021; Rooney 2017) – may therefore influence the children's behaviours and answers. The results show that the children's media diets and preferences – and media usage patterns in general – are extremely diverse. Although we see overarching tendencies, such as age and gender differences, a preference for US films and series, and a large consumption on global streaming platforms, preferences are extremely individualised among the children, even within the same families. Results also show that 'quality' is associated with content that is emotionally relatable and stimulates the senses, and the children often choose content for its 'visceral' – rather than cognitive and cinematic – qualities. They want to feel the films and series (through surprise, enjoyment, fear, disgust, sadness, etc.) rather than intellectually appreciate them. At the same time, they are highly reflective about what content they can use for achieving specific moods and feelings, as well as extremely media literate when they accurately talk about cinematic qualities (such as acting, budget, plot lines, special effects, etc.) of the films and series they watch. The children do not settle for series and films that in their opinion are second-rate, and from the age of 12, start orienting themselves toward content made for (young) adults and are thus no longer inclined to watch children's content. ARS05 Young audiences as media users, target groups and creative partners

PN 049 Who knows the audience best: Scandinavian media institutions' production and use of audience data

[Jakob Freudendal](#)¹

¹ Aarhus University, Media Studies and Journalism, Aarhus, Denmark

The 2010s have seen a growing ambition of connecting production and audience studies to investigate how specific meanings are embedded during the encoding stage of cultural production and how these meanings are

interpreted by audiences during the decoding stage (Hill 2018; Redvall 2020). This development has, amongst other things, been prompted by the media industries' increased focus on harnessing audience input to guide production (Redvall and Christensen 2021; Freudental 2023). In this paper, I contribute to this connection by exploring the audience turn in screen production for young audiences from the outset of the Danish film and television industries. I focus on the encoding stage by presenting a typology of the multifaceted audience research methods used in these industries and the different types of data they yield. I draw on Ien Ang's seminal work (1991) by critically examining institutionally produced audience research as a tool for power and control. I aim to discuss if the increased focus on audience data allows the young audiences influence on audiovisual media made for them, or whether it is ultimately used to legitimize media institutions' relevance to the public. I pay particular attention to the difference between 'creation of data points' and 'capture of data traces' (Kammer 2023), and how small nation media industries primarily have access to the former, creating a power imbalance between small nation media ecologies and global platforms in the quest for audience insights. The methods used by the industry include qualitative mobile ethnography, quantitative semantic analysis based on AI-powered social media scraping, and various forms of tests, including biometric analysis. Methodologically, I draw on extensive fieldwork in the Danish film industry spanning empirical data from 10+ qualitative interviews with exclusive informants (Bruun 2016), and critical document analysis of audience reports and data commissioned by media institutions. Ang, I (1991), *Desperately seeking the audience*. Taylor & Francis. ARS05 Young audiences as media users, target groups and creative partners

PN 050 Reaching young audiences through engaging with influencers in public service TV fiction

[Eva Novrup Redvall](#)¹

¹ University of Copenhagen, Communication, Copenhagen, Denmark

Making film and television for children and adolescents has always been defined by making content for a very particular audience segment (Potter and Steemers 2021). However, general industry notions have historically taken this audience somewhat for granted, based on the common-sensical idea that we have all been children once and thus have knowledge about what it means to be a child (Redvall 2023). While there have been various forms of audience research and reception studies among the youngest demographics over the years, the interest in acquiring detailed knowledge about not only the media use and preferences of young audiences, but also their life worlds and general interests, increased remarkably in the Scandinavian screen industries in the 2020s, e.g. through the emergence of still more segmentation and new audience reports (DFI 2023). Theoretically, the paper discusses this 'audience-centric approach' to making content as an example of bringing audience and production studies closer together (e.g. Hill 2019) and – in relation to this year's conference theme – discusses the wider implications of these attempts to base creative communication strategies targeting them on orderly data. The paper explores how this 'audience turn' has led to major changes in the approaches to screenwriting and production of live action television fiction targeting tweens and teens. Not only by involving ordinary children during writing and production (as explored in Redvall & Christensen 2021), but also by tapping into the popularity of famous children to use their followers to reach new audiences in the influencer industry (Hund 2023). Based on observations at industry events, qualitative interviews, and analysis of audience reports, the paper investigates how the popular DR series *Klassen* (The Class, running since 2016 and now in its 15th season) has worked with child content creator Naja Münster in various ways in the 2020s and mirrors this in other attempts to build fictional content around influencers, such as the series *Helt ny* ('Completely New'), set in an influencer agency, or *Fodboldhaderne* ('The Football Haters') with influencers who hate football, made as a lead-in to the series *En for holdet* ('One for the Team'). The paper ends by discussing the pros and cons of this strategy that has, for instance, the potential to reach young audiences on platforms where DR is not allowed to be present (like TikTok) but comes with many ethical strings attached.

PP 0271 Gendered differences in digital disconnection – A survey analysis

Victoria A. E. Kratel¹

¹ Kristiania University College, Institute for Communication, Oslo, Norway

Gendered differences in digital disconnection – A survey analysis

This survey-based study investigates the behaviors and attitudes of digital disconnection among 1142 respondents in everyday life in Norway. The primary research focus is to examine gender differences among the 552 women and 590 men who participated in the survey. [1]

In recent years, scholars have increasingly studied digital disconnection, focusing on different practices of voluntary media non-use (Lomborg & Ytre-Arne, 2021). This surge in interest stems from the growing effort among media users to strike a balance between the online and offline spheres in everyday life (Vanden Abeele, 2020). Their pursuits go beyond simply avoiding specific devices or platforms in the long term; they involve nuanced actions, like silencing phones or establishing guidelines for different situations, to navigate this complex dynamic (Nguyen & Hargittai, 2023).

Regarding the ECREA theme of communication and social (dis)order, it is important to note that individuals from diverse sociodemographic backgrounds have distinct ways of engaging in digital disconnection. This also extends to the impact of socially constructed gender norms. In essence, men, typically associated with independence, are presumed to have more leeway in diverging from established connectivity norms (Beattie, 2020; Portwood-Stacer, 2014). Conversely, societal expectations have expanded women's domestic roles to include online engagement in fostering relationships, resulting in heightened pressure for continual accessibility while avoiding excessive consumption (Fast, 2021). Nonetheless, empirical evidence supporting these conceptual contributions is limited, prompting the focus of this study.

The questionnaire gathered data on respondents' online time assessment and explored behaviors across diverse scenarios, including social settings with family and friends, as well as in spatial and temporal contexts like nature and holidays. It also probed perceptions of responsibility in digital disconnection.

The findings reveal distinct gender dynamics: women provide more critical assessments of screen time, frequently reporting that they spend too much time on smartphones and offering higher estimates of their online duration compared to men. Nevertheless, women exhibit a greater tendency to engage in digital disconnection within the listed settings than men. While men also report mindfulness about their behavior, they often exhibit a more relaxed approach, considering digital media use a personal matter and expressing more reluctance towards external interventions compared to women.[2]

ARS06 Audiences and contexts of disconnection

PP 0272 Young adults' experiences and coping with digital violence

[Christina Seeger](#)¹, Marlis Stubenvoll¹

¹ University of Klagenfurt, Department of Media and Communications, Klagenfurt am Wörthersee, Austria

The increased use of digital media and social platforms in society is multiplying the opportunities to commit digital violence. Around three-quarters of German internet users state that they have already observed hate online, and one in three has already experienced digital violence (Reset/Pollytix 2021). Young adults of Generation Z in particular are affected by digital violence, but according to the German NGO HateAid, they are also the group least likely to seek help from professional services. Based on the Transactional Model of Stress and Coping (TMSC, Lazarus & Folkman, 1984), this project sheds light on this paradox by investigating a) how this age group experiences digital violence, b) how they appraise the threat of digital violence and their ability to cope, and c) which coping strategies they resort to in comparison to other generational cohorts.

We conducted a quota-based quantitative survey among German internet users ($N = 3.367$) via a professional survey institute. As adult Generation Z was the focus of our interest, we sampled $n = 1.868$ respondents aged 18 to 27 years. To gain insights into generational differences, we additionally recruited participants from the generational cohorts of adolescents of Generation Z (14 to 17, $n = 501$), Millennials (28 to 42, $n = 498$), and Generation X and older (43 or older, $n = 500$).

Confirming earlier findings, chi-square tests show that young adults of Generation Z are most likely to have seen digital violence (63.1%), followed by adolescents of Generation Z (54.5%), Millennials (46.8%), and Generation X and older (25.2%). Furthermore, they are significantly more likely to experience digital violence (29.6%) as compared to adolescent Generation Z (23.0%) and Generation X or older (9.2%), while showing similar levels to Millennials (26.3%).

A series of ANCOVA models revealed unique patterns in how adult Generation Z appraised digital violence. Specifically, they perceived higher levels of threat to their reputation and showed more self-blame when experiencing digital violence (threat appraisal) as compared to older generational cohorts. At the same time, they reported significantly lower levels of self-efficacy across a range of coping behaviors (coping appraisal).

Lastly, we assessed how often adult Generation Z used different coping strategies on a scale from 1 – *Never* to 4 – *Regularly*. Technical coping, such as blocking or reporting messages, emerged as the most common form of coping ($M = 2.87$, $SD = 0.79$), followed by seeking out support from friends and family ($M = 2.45$, $SD = 0.97$). Seeking help from helplines or the police ranked lowest ($M = 1.51$, $SD = 0.70$). We found no significant differences in coping behaviors between the generations.

Consequently, while adult Generation Z appears to be most affected by digital violence, they have not developed a more active coping repertoire. Based on the TMSC, threat and coping appraisals might explain this pattern: While adult Generation Z acknowledges the threat caused by digital violence, self-blame and low efficacy beliefs might hinder them from coping more actively with digital violence.

ARS06 Audiences and contexts of disconnection

PP 0273 Media-saturated teen lives: No space or time for non-media moments (and being bored)?

[Marika Lüders](#)¹

¹ University of Oslo, Department of media and communication, Oslo, Norway

For teens in the global north, the media-saturated reality – composed of smartphones, platforms, and legacy media – is by and large taken for granted. Digital disconnection may have surfaced as a countercultural response and a research field (Agai, 2022), but for most teens, media remain a ubiquitous element of daily life (Hasebrink & Paus-Hasebrink, 2022).

The present study picks up on a societal concern: that the media-saturated lives of teens leave little room for being bored as a meaningful and constructive state of being. The study elucidates the various functions of media, and if and how these functions tie in with (escaping) a state of boredom. I apply a regulatory theory of boredom, which understands the state of boredom as a functional emotion, equipped to inform us of an unpleasant situation and to push us to pursue and re-establish a meaningful or satisfactory situation (Elpidorou, 2018).

Empirically, I rely on qualitative interviews with 24 Norwegian adolescents (aged 15–19). Participants were asked about the platforms, media, and types of content they have habituated, and to reflect on their experiences of the roles and functions these played.

The analysis delineates the functions of media by identifying three types of media experiences, and how these relate to (escaping) boredom: (1) Ambient media experiences are characterised by the pervasive presence of media in daily life. This is exemplified by the recurring phrase, "I listen to music all the time" or by the practice of playing

YouTube-videos in the background while doing other activities. The opportunity to add media as a layer to everyday situations reflect how non-media moments per se indicate a state of boredom. (2) Atomized media experiences involve brief, disconnected bits of content (and sociability) suitable for filling in-between-moments. Scrolling social media feeds exemplify how these experiences consist of disparate short pieces, tailored to a wandering mind, often serving as a default escape from boredom. (3) Attentive media experiences demand a level of effort, attention, and immersion. They often – but not exclusively – connect to legacy media like books, films, and TV-series. Typically ritualized and highly valued for the flow-like states of being they activate; the function of these media experiences is not primarily to escape boredom, but some participants report feeling bored if the content is too demanding.

The findings portray how media always represent a potential way out of boredom. I conclude by discussing what they offer in terms of escape and argue that neither ambient, atomized nor attentive media experiences by default result in teens no longer being able of tolerating or reaping creative rewards of boredom.

PP 0274 Coping with news doubt. Exploring user-driven tactics to deal with uncertainty about the news

Ike Picone¹, Nathalie Van Raemdonck¹, Hanne Peeters², Michaël Opgenhaffen³

¹ Vrije Universiteit Brussel, Communication Sciences, Brussels, Belgium

² Universiteit Gent, Communication Studies, Gent, Belgium

³ KULeuven, Communication Sciences, Leuven, Belgium

Hate speech, disinformation, information overload... our networked news environment can feel increasingly overwhelming for news users. One element contributing to that feeling is uncertainty about the extent to which information is factually correct, objective or telling the whole story, which we have previously explored and labelled **news doubt** (Authors, in review). The research at hand seeks to explore **how news users deal with doubt in the news**. We seek to broaden the focus on verification, authentication and the efficacy of fact-checks often found in disinformation studies (Tandoc et al. 2018) by zooming in on the **coping tactics news users develop** themselves.

Existing studies have started to shed light on some of the tactics that users adopt to navigate the news landscape, such as **generally being sceptical** about online, algorithmically selected information (Fletcher & Nielsen, 2019) or **pragmatically trusting** certain sources of news (Schwarzenegger, 2020). Our study builds on these insights but seeks to focus more specifically on the critical moment of feeling uncertain about the factuality or neutrality of news stories.

Therefore, the article builds on a series of **31 in-depth interviews** conducted in two rounds between February and September 2023 in Belgium. In the first round, we selected people purposefully based on the extent to which they doubt about the news; in the second round, we selected only people aged 16 to 24. We also aimed for diversity of respondents in terms of political preferences.

The results suggest that news users adopt several **energy preservation tactics** to cope with doubt. Participants showed various paths of least resistance, be it by moving on and treating doubt as a passing feeling or by adopting doubt as a useful sentiment keeping them on their toes when using news. The tactics participants would adopt seemed mainly determined by their attachment to the topic. How they experienced feelings of doubt – as a positive, negative or neutral 'part of life' – was also a factor in which tactic they employed. Finally, we observed that some participants were quite open to verification tactics but were not sufficiently aware on how to find relevant ones when they were experiencing doubt towards a news item, or expected fact-checks to 'find them' in networked environments.

We conclude by reflecting on how insights in these coping tactics to deal with doubt can offer inspiration for **new forms of media literacy interventions** that are grafted on and aimed at strengthening bottom-up user tactics to navigate the news environment.

ARS06 Audiences and contexts of disconnection

PP 0275 Audiences of alternative news sites in Germany – Patterns of overlap and fragmentation in comparative perspective

[Baoning Gong](#)¹, Annett Heft¹

¹ Freie Universität Berlin and Weizenbaum Institute for the Networked Society, Weizenbaum Institute, Berlin, Germany

The German media landscape has witnessed the rise of a variety of new media outlets online that establish themselves as “alternatives” to a media mainstream (Holt et al. 2019, Heft et al. 2020, Schwaiger 2022). Most pronounced is the emergence of sites with a right-wing ideological stance and sites focussing on conspiracy theories and esoteric topics. Alternative German online news sites with pronounced left-wing ideology are rather in decline. A fourth type refrains from displaying an explicit political stance but emerges as professional, topic-driven alternatives vis-à-vis commercialized mass media (Schwaiger 2022), while another type of alternative stands out by its pro-Russian stance. The new diversity of sources spurred concerns about audience fragmentation into homogeneous ‘echo chambers’ in which audiences are primarily exposed to content that conforms to their existing beliefs (Pariser 2011, Rau & Stier 2019). While research on general audience’s media repertoires and overlaps has shown that they have a diverse repertoire and exhibit cross-partisan media exposure (Rau & Stier 2019, Dubois & Blank, 2018), research has scarcely focused on audiences of the variety of alternative news sites, which could form a particular segment of the population more likely to self-select into partisan communities (Dubois & Blank, 2018; Bruns, 2017). We argue that research on audience fragmentation and overlap patterns needs to consider the diversity of alternative news sources and their particular user communities. In addition, research has not accounted for the intensity of media usage. We address these gaps by a twofold comparative study across the users of different types of alternative media and frequent and occasional users. We ask to what extent users of different types of alternative media integrate legacy media sources into their media repertoire and how ideologically coherent the usage patterns are (RQ1). In addition, we scrutinize whether and how frequent and occasional users of alternative media differ in their patterns of usage fragmentation or overlap (RQ2).

We expect distinct patterns of audience overlap and fragmentation per alternative media types, given that audiences of left-wing and right-wing alternative media differ in their media trust and mainstream media cynicism (Jackob et al., 2019; Schindler et al., 2018; Cardenal et al. 2019). In addition, we expect differences in the patterns of centralization or fragmentation between frequent and occasional users of alternative news. We test these assumptions based on a novel online survey among over 2.000 alternative media users in Germany. Building on the network approach to study audience overlap (Webster & Ksiazek, 2012; Mukerjee et al., 2018), we compare degrees of audience fragmentation and ideological segregation versus overlap across 14 legacy newspapers and TV news shows and 32 popular alternative online media representing distinct alternative media types, which were used for political news. This methodology conceptualizes media outlets as nodes, with the co-occurrence of two outlets within a user’s media repertoire forming a tie (Ksiazek, 2011). Centrality scores are subsequently employed to ascertain how much a media outlet shares its audience with other outlets (Fletcher & Nielsen, 2017; Mukerjee et al., 2018).

ARS07 Audiences and audiovisual identities

PP 0356 Cultural diversity and representation of film and audiovisual production from small European countries on the catalogues of major streaming platforms in Europe

[Manuel Jose Damásio](#)¹, André Graça², Rita Grácio²

¹ Universidade Lusófona, CICANT, Lisbon, Portugal

² Lusófona University, Cicant, Lisbon, Portugal

This paper departs from ongoing research in the scope of the HORIZON EU-funded project CresCine, which aims to study audiences’ preferences in order to help increasing the competitiveness of the film and audiovisual industries from small European countries while ensuring cultural diversity and choice is protected across Europe as foreseen in all European treaties. Our research is focused on the degree of diversity depicted by the catalogues of major streaming platforms in Europe on what concerns the level of representation of production coming from the six small European countries studied in the project (Denmark, Portugal, Estonia, Lithuania, Croatia, Belgium). We regard these six countries as exemplary of the rich diversified European audiences and production landscape but also exemplary of the challenges the promotion of media diversity faces in a context where audiences are catered for by global platforms regardless of national borders, cultural or linguistic specificity and with little concern for the promotion of diversity. Our research design both covers the in depth of the catalogues from both major and minor OTT streaming platforms in six European countries, in order to assess to what extent these catalogues include contents from those nations and the qualitative collection of data amongst different audience segments across these countries in view

of assessing perceptions of diversity, actual integration of diversity in the catalogues and consequences of this for audiences perceptions of diversity in what concerns film and audiovisual content use and consumption in Europe. Systematic searches in these catalogues (which, although the provider may be international, differ from region to region or country to country) provide not only a means for assessing the presence of productions from small European nations, but also insight regarding issues such as discoverability, usefulness of the dedicated search engines of those platforms and taxonomy/categorisation of archiving. Contrasting this data with the actual perceptions of audiences gives us a better understanding, not only of the actual efficiency of different policies geared towards the protection of diversity in Europe, in particular the AVMSD – Audiovisual Media services Directive – but also how audiences perceptions and behaviors are molded by the curation strategies different platforms adopt in the design and maintenance of their catalogues. The presentation will make an overview of the state of affairs regarding the film and audiovisual market in Europe to then delve into the main research question. After describing the methodology of the searches we shall present the results and proceed to their subsequent discussion. The ultimate goal is to present original research and contribute to ongoing discussions about demand and supply in the film and audiovisual market, at a time when streaming services are changing the paradigm of consumption and the cultural and creative industries are undergoing deep transformations as a result of the convergence of the widespread of these novel technologies and long-lasting issues concerning financing, production, circulation and exhibition, not to mention the key role AI has in segmenting audiences and ensuring the curation of these catalogues.

ARS07 Audiences and audiovisual identities

PP 0357 Migrations, film and memory activism: Reception studies with youth students

[Isabel Macedo](#)¹, Luiza Lins¹, Rosa Cabecinhas¹

¹ University of Minho, Communication and Society Research Centre, Braga, Portugal

Memory cannot be conceived outside its socio-political context (Halbwachs, 1994). Although migration is an international phenomenon, the situation for migrants varies from country to country according to specificities of legislation, attitudes, and media debates (Brunow, 2021). In the Portuguese context, conflicts related to the colonial past are unavoidable regarding current migration experiences. For a long time, the propagation of myths and stereotypes legitimized colonialism as a positive endeavor. These persistent discourses are still inscribed in the public arena, influencing the opportunities of migrants and minority groups (Cabecinhas, 2023; Macedo et al., 2023). Today, many people who occupy a place of otherness in Portuguese society are immigrants from the former colonies and their descendants, many of whom are Portuguese citizens who do not have their citizen status socially recognized and are the target of discrimination.

This paper aims to discuss the potential of films to memory activism through the process of reception. The strategic discussion of the past through images and narratives of otherness is a powerful way to combat the asymmetrical circulation of stories and the forgetting or erasure of some people from hegemonic media discourses (Gutman & Wüstenberg, 2023; Macedo et al., 2023). This research used the focus group as a data collection technique. This technique has great potential, especially in action research, since the participants not only present their discourse on a given topic but also interact and are confronted with the discourses of others. A total of 62 students participated in 10 focus groups. Most were Portuguese (90.3%), followed by Brazilian (4.8%). Ages ranged from 14 to 19 years ($M = 16$; $SD = 1.0$); the majority of participants, 40 (65.6%), identified themselves as female.

The students saw the film *Nha Shu* (José Magro, 2021), which portrays the daily life of Issa, a Bissau-Guinean footballer who plays in Portugal, exposing the voices and representation of the others behind the camera. It is a faux documentary that discusses the daily difficulties immigrants such as Issa, whose citizen status is not socially recognized, face in Portugal. The form it represents migrants is a metaphor for the stereotypical modes of representation we see in Portuguese society, and the narrative exacerbates it. After watching the film, the students were divided into subgroups with an average of six participants and discussed the film shown, film viewing habits, and the topics of migration and colonialism, among others.

When long-silenced stories of discriminated people and social groups, such as the story of Issa in *Nha Sunhu*, “come to light”, cinema can be a space for memory activism. Focus groups enabled the debate on young students’ perceptions about migrants and colonialism, showing how stereotypes persist in their discourses, but also the contestation to hegemonic narratives and deep-rooted prejudices, with moments of conflicting perceptions among them. The dialogues about the film contents can contribute to combatting the asymmetric circulation of stories and memories. Practices of remembering are the goal and means of memory activism. By engaging with other stories, young students can contribute to mnemonic change, transforming society.

PP 0358 RuPaul's Drag Race and everyday life in Europe

[Vincent Doyle](#)¹

¹ IE University, IE Business School, Madrid, Spain

RuPaul's Drag Race (RPDR) is a US competition reality TV show that has gained global popularity and spawned many franchises in Europe since 2009. The audience for RPDR consists mainly of cisgender gay men in their 20s to 40s and young cisgender women (Cracker, 2017). Scholarship on RPDR is dominated by textual and discourse analyses from an American perspective, with few audience studies and only one focusing on a European country (Chronaki 2017). This presentation reports on work in progress that examines cisgender female and cisgender gay male fans of RPDR living in Europe. It is part of a collaborative project that uses interviews in Finnish, English, Spanish, or French to explore the role and importance of RPDR in the everyday lives of fans in Europe, their show-related viewing and communication practices (including on social media), and their accounts of how their personal and collective identities have been influenced by their fandom.

This project follows Cavalcante, Press, and Sender (2023) who argue that in a "post-audience age" marked by the blurring of boundaries between public and private, production and consumption, and the work, leisure, and domestic spheres, reception scholarship should return to "everyday life as a privileged site of audience research" (5). Therefore, the semi-structured small group interviews conducted so far in Finland and Spain have been with naturally occurring dyads and triads, that is, couples or small groups of friends who identify as fans of RPDR and often watch the show together. This allows for a richer and more detailed exploration of the show's significance in the everyday lives of participants than would be possible using the more common strategy of convening focus groups with strangers. So far, 4 small group discussions have taken place with 9 participants. By the time of the ECREA conference, at least 8 more interviews (balanced between cisgender gay male fans and cisgender female fans) are expected to be completed.

The analysis so far suggests that the show plays different roles in the everyday lives of the two types of fans. The cisgender female participants expressed admiration for drag queens and a desire to perform femininities that would be seen as strange in their social contexts. The show appeals to them because it enables them to imagine taking liberties with gender expression that are not normally available to them. For cisgender gay male participants, RPDR fandom functions like what some of them called "gay soccer," a lingua franca of the gay social world that provides a common language and reference points across cultures. These initial findings point to some of the directions that further data collection will pursue until data saturation is reached.

The study depicts RPDR fandom in the everyday lives of cis gay men and young cis women in several European cities. In relation to the conference theme of social (dis)order, it will offer insight into cultural beliefs and values about gender and sexuality at a time when so-called "gender ideology" is under attack by far right politics in Europe (Kötting et al., 2017).

PP 0359 Trust in Czech public service television before and during the time of polycrisis

[Lukáš Slavík](#)¹, [Lucie Čejková](#)¹, [Jakub Macek](#)¹, [Klára Smejkal](#)¹

¹ Masaryk University – Faculty of Social Studies, Department of Media Studies and Journalism, Brno, Czech Republic

In our study using data from three representative surveys of Czech adults conducted in 2019, 2020, and 2022, we focus on how the two recent major crises, the COVID-19 pandemic and the Russian invasion of Ukraine, affected the trust of the Czech audiences in the Czech public service television (CT).

Public service media (PSM) are seen as key high-quality news providers (Van Aelst et al., 2021) and integrative institutions (Donders, 2012; Holtz-Bacha, 2021), and these roles become even more important in crises. In Europe, PSM were essential by continuously reporting on both crises (EBU, 2020; Mihelj et al., 2022; Newman et al., 2022). However, the roles and functions of media, including PSM, depend on the audiences' trust (Fawzi et al., 2021; Strömbäck et al., 2020). According to existing evidence, trust in PSM in crisis may grow (de León et al., 2022; Newman et al., 2022) due to increased media dependency and the need for orientation or the "rally 'round the flag" effect. An increased trust may persist (Knudsen et al., 2023; Newman et al., 2022; Vozab et al., 2023) or decline (Adam et al., 2023; Newman et al., 2022), for example, due to crisis news fatigue and the media cooperative role. Yet, these conclusions do not tackle the situation of subsequent and overlapping crises. Therefore, we explore the involvement of trust in CT and changes in its selected predictors from the pre-crisis period through the period of polycrisis. Since conditions taking part in shaping trust in media are complex and contextualized (see Fawzi et al., 2021; Tsfati & Ariely, 2014), the predictors we assess include audiences' socio-demographics, media consumption habits, media-related attitudes, political attitudes and social trusts.

Our findings may fruitfully contribute to the debate on the role of PSM (Donders, 2012, 2023). Firstly, in contrast to our expectations, our data show CT trust levels as stable in all three observed years, neither demonstrating increases due to the "rally 'round the flag" effect nor showing declines due to crisis news fatigue or overload. Secondly, CT maintained trust across socio-demographic groups and political attitudes. Thus, though CT played a cooperative role during the pandemic (Motal, 2022), it did not lose its general relevance or was not perceived as "part of the people's troubles" during the polycrisis, except for anti-system viewers. Thirdly, on the contrary, the data suggest that trust in CT acted as a substitute for declining interpersonal trust, which was particularly important for pandemic management (Stefaniak et al., 2022). Fourth, a nexus of trust (Hanitzsch et al., 2018) in other media entities (journalists, media in general, individually important media) implies that well-functioning PSM can act as so-called guardian of trust (Mehta, 2007) in entities in the media field and the field itself. Furthermore, fifthly, the independence of trust in CT from news consumption shows the vital importance of the educational and entertainment function for PSM's ability to maintain audiences' trust (Donders, 2012, 2023; Urbániková & Smejkal, 2023).

ARS07 Audiences and audiovisual identities

PP 0360 Nation-binding or nation-building? Evaluation of the public service mission of Basque public broadcasting over time (2009–2020)

Lidia Valera-Ordaz¹, Jaume Doménech-Beltrán¹

¹ University of Valencia, Theory of Languages and Communication Sciences, Valencia, Spain

The role of public broadcasting is to provide quality information to citizens and to expose them to diversity, two functions that are not always fulfilled by media markets. Its mission is based on the principles of professional autonomy and political independence, although public broadcasters show different levels of politicisation (Brüggemann et al., 2014). In polarised pluralistic systems such as Spain's, public media are often politicised (Arriaza-Ibarra, 2013), and are perceived as such by the audience (Azurmendi et al., 2019). In addition to the national public broadcaster (RTVE), there are 13 regional public broadcasters in Spain, created as a result of decentralisation to reinforce regional identities and promote minority languages.

Studies show that consumption of Spanish national public television is driven by ideology and partisanship (Humanes, 2014; Humanes & Valera-Ordaz, 2023), and that Catalan public television is consumed much more significantly by Catalan independence supporters and those who declare a Catalan national identity (Valera-Ordaz, 2023), so that there is a clear national segmentation of news audiences. However, most regional public television channels have not yet been explored.

This paper fills this gap in the literature and analyses the factors that predict the consumption of Basque public television (EITB) over a period of 11 years (2009–2020), using four post-electoral studies related to the Basque elections of 2009, 2012, 2016 and 2020. Using multivariate analysis, we explore how national identity, voting for Basque nationalist parties and mother tongue influence EITB consumption, controlling for age, social class, gender, educational level and ideology on the left-right axis. The results show that voting for Basque nationalist parties and feeling exclusively Basque are the most important predictors of EITB consumption -above cultural traits such as the mother tongue-, so that cross-sectional exposure to EITB is significantly compromised. Finally, we discuss the normative implications of these results in light of public broadcasters' mission to promote both political diversity and regional identities.

ARS08 The platformisation of everyday life

PP 0476 Rethinking Platform Studies: The ontological and epistemological challenges of researching platforms and the case for renewing ethnomethodology

Hossein Derakhshan¹

¹ London School of Economics and Political Science, Media and communications, London, United Kingdom

If media have traditionally been studied in three aspects, i.e. production, media text and reception, algorithms have now become the *de facto* equivalent of the media text in the age of mass automated personalization.

Ontologically, three features of algorithms complicate researching them:

- 1) *Hyper-modulation*: Unlike older objects of media studies such as films, news, songs, photographs, novels, TV shows, etc., algorithms do not have a fixed textuality. Thus, most empirical attempts at studying them face validity issues. For example, a film's audience may interpret it differently, but they all view the same film, even if at different time and space. But an Instagram feed is almost unique to each user at a specific time and space. No user or researcher can experience the same algorithmic flow twice.
- 2) *Invisibility*: Algorithms are infrastructural to platforms and thus invisible to users. E.g. people may be able to speak of their experiences with their toaster, television set, or hairdryer, but not of their underlying enabler, electricity. Even when it is disrupted, they may still talk about their frustrations with why they cannot use many of their electric devices rather than the electricity itself.
- 3) *Inextricability*: Algorithms are tightly interwoven with one another, with platforms' core codes, and with the user data; they cannot be experienced on their own. As an analogy, people watch films as a whole; they do not experience directing, script, cinematography, set and costume design, and acting separately. In a similar way, users experience platforms, not as the sum of isolated aspects of encryption, content servers, personalized feeds, graphical interface, etc.

Given the distinct and disruptive ontology of algorithms and the challenges of a presentative epistemology, this paper proposes a pragmatist epistemology and thereby a conceptual model which views platforms as social figurations with two embedded processes at its core: *datafication* and *personalization*.

Datafication consists of *surveillance* and *categorization* and it is oriented to the present time. Surveillance links human life to digits, resulting in an ever-modulating relation which can be called *life-digits* or data. Categorisation is linking these *life-digits*(data) to each other in the present time.

Personalization is oriented to the near future and consists of two sub-processes of *prediction* and *allocation*. *Prediction* is a re-categorization toward the future; it is a speculative reconfiguration of the links between life-digits, or data relations based on the existing categories. *Allocation*, on the other hand, is a future-oriented reversal of surveillance, a process in which predictions (which are themselves relations between data relations) are disentangled down toward life qualities and materialities.

This cyclic and processual model of platforms opens up possibilities for different research methods. Given how platforms have become infrastructures of sociality, the paper concludes with proposing a renewal of ethnomethodological breaching experiments (Garfinkel, 1967) which disrupt the platforms' personalized affordances in order to enrich user experiences of them and thereby the qualitative research methods.

ARS08 The platformisation of everyday life

PP 0477 Struggles over curation: A communication framework for analysing user-generated content on social media platforms

David Mathieu¹

¹ Roskilde University, Department of Communication and Arts, Roskilde, Denmark

This paper develops a communication framework to the analysis of user-generated content (UGC) on social media platforms. Taking the metaphor of "curation" as a starting point (Hogan, 2010), I suggest a framework that attends to the communication dynamics between three actors – service providers, account owners and followers – involved in a "struggle to curate" UGC on social media platforms.

Understood as an emergent form of cultural expression on social media, curation is fundamentally different than forms of public communication that predate social media, such as deliberation. On social media, public communication should not be seen as a dialogue from which consensus emerge, as in the Habermasian public sphere (Habermas & Burger, 2008). Rather, communication on these platforms is a performance where actors are strategically trying to influence the line to be maintained (Goffman, 1982).

The framework emphasises the struggle between three actors – service providers, account owners and followers – in the maintenance of curated spaces. Inspired by Hall (1980), who conceived media consumption as a site of struggle over meaning between senders and audiences, we look at these actors and their struggle over curation in

a similar fashion. The framework proposes three dimensions by which the struggle over curation can be observed – platform curation, brand curation and social curation – and define actors' roles accordingly. 1) Platform curation is the realm of affordances, interface and roles (as defined by technology). 2) Brand curation concerns itself with the visibility and exposure of the actors. 3) Social curation pertains to the social, interactive and normative behaviors of the actors. These three dimensions allow the dynamic mapping of the socio-technical (i.e. symbolic-material) power for each actor in concrete situations of communication and are effectively sites of struggle over curation that can be studied empirically.

Regarding the materiality of curated spaces, with Facebook as an example, platform providers can censor or hierarchize UGC, giving them more or less visibility. Page owners can introduce UGC or hide them, while users can only respond or share. Symbolically, platform providers can provide terms of service to regulate UGC, page owners can encourage norms of conduct, while users can police other users, even page owners, for their inappropriate behavior on the curated space. Material and symbolic contestation or support constitute the main dynamics of curation. As such, curated spaces are either normative or contested spaces depending on how the performances of the three actors align or not with one another.

To understand communication on social media, and avoid considering UGC as decontextualized artifacts, we need to consider not only the medium and technology, but also pay attention to meanings and social uses, user expectations and mutual orientations, norms and conventions, that is, a host of dynamics that are too often excluded in the analysis of social media (Lomborg, 2011).

ARS08 The platformisation of everyday life

PP 0478 Vulnerability as a resource for tacit agency in datafied environments

[Karoliina Talvitie-Lamberg](#)¹, [Anne Soronen](#)², [Sanna Valtonen](#)³

¹ University of Jyväskylä, Department of Language and Communication, Jyväskylä, Finland

² University of Tampere, Dep of Information and Communication, Tampere, Finland

³ University of Tampere, Dep of Information Technology and Communication, Tampere, Finland

In this study, we aim to understand people's sense-making of their lived experiences in datafied environments as a combination of technological aspects of platformed media and varying modes of affective agency. Everyday datafication and how we live with data means living in a world of uncertainty, where vulnerability is taken for granted. Individuals try to cope in these environments and make the data "feel all right" (Pink et al. 2018). The prevalent narrative paradigm surrounding digital infrastructures suggests that the future they project through data is inevitable, and people feel locked into it. It seems that algorithmic operational environments cannot be resisted if one intends to remain on digital platforms (Markham 2020). Individuals make increasingly sense of the world through relations they live on digital platforms. But at the same time, this causes a constant balancing between invisibility/visibility, since datafied environments are based on the thrive for constant presence and visibility (Treré 2021). Environments are also hard to resist (since to log-out would mean risking one's presence – not only in platforms but through them also in digital (welfare) society. Thus, people are aware of their vulnerable positions as they act and make sense of the world through and on digital platforms.

We draw from the literature review in which we mapped research literature on vulnerability, in the context of datafication from 2015 to 2020 (authors 2021). For the literature review, we searched the material from databases and digital libraries of social and communication sciences. Based on our literary review, we utilize the concept of vulnerability as a theoretical tool to analyze the possibilities and constraints caused by algorithmic power of social media platforms for modes of agency and relations between self and others. Our empirical dataset consists of diary-interview data, collected in Finland in 2020–21 among three different participant groups: unemployed persons, undocumented migrants, and professional actors. The total number of participants was 63. These groups vary in their levels of predetermined vulnerabilities and precarious positions, as well as their motivations for participating in digital environments. However, they all face a fundamental obligation to the digital presence, and their affective experiences have many similar features. We argue that vulnerability operates as a way of managing and enduring uncertain algorithmic conditions but simultaneously, it also may function as a basis for making decisions or doing ethical assessments.

Our data shows that presence and agency on social media platforms demand vulnerability, and at the same time vulnerability operates as an ethical resource for interpreting and justifying one's own and others' action. The imbalance between platform power and individual opportunities for the agency is striking, but still, individuals cope and make sense of their every day, in and through these uncertain and ambiguous environments. However, due to their vulnerabilities, our participants were able to take the position of tacit agency that may seem minor but entails continuous orientations and choices in one's daily life (Honkasalo 2018).

ARS08 The platformisation of everyday life

PP 0479 The platformization of attention

[Kari Spjeldnes](#)¹

¹ Kristiania University College, Department of Communication, Oslo, Norway

The forthcoming paper explores how development in platform-based services and the mechanisms intrinsic to these services influence reading attention.

New modes of media consumption have emerged due to the fast and vast growth in digital content available through platform-based services. The changes following in the wake of digitalization and the implications to the media audiences are thoroughly explored and recognized in a range of works, each of them emphasizing different perspectives, such as the power structures emerging under *Platform Capitalism* (Srnicek, 2016), the societal order and temporality in *The Mediated Construction of Reality* (Couldry & Hepp, 2017), the mechanisms in *The Platform Society* (Dijck et al., 2018), and the care for a balanced media consumption through the emerging need of a *Digital Detox* (Syvertsen, 2020).

I seek to understand better how ubiquitous digital connectivity influences long-form reading – on the premise that long-form reading is an act of prolonged attention. My exploration of reading in the context of this paper relates to sustaining attention despite continuous digital connection. The aim is to identify some poignant traits in how the systematic, algorithm-based structures influence the daily practices of the reading audiences: the routines, the motivation, and the concentration necessary to perform long-form reading.

The empirical material demonstrates a pointed influence, especially from two types of competing media to the literary content: TV series and social media. In a thematic analysis (Braun & Clarke, 2006), I will apply the concepts of datafication, selection and commodification, recognized as driving forces in platform-based services (Dijck et al., 2018). Thus, in the analysis, I will follow up on perspectives like the nuances in impact, the meaning of physical surroundings, the consequences on reading concentration, and the precautions to go on reading.

For now, I state two key findings: To ensure limited periods of digital disconnection turns out essential to acquire sustained concentration. Thus, 'the disconnected presence' creates an advantage for keeping cognitive attention over time. Further, the readers' motivation and ability to stay focused seem deeply intertwined with grown habits and personal values. Hence, 'the habit of concentration' emerges as a striking advantage in matters that need prolonged attention.

ARS08 The platformisation of everyday life

PP 0480 AI-generated pictures and their influence on epistemic emotions, perception and online engagement on X (Twitter)

[Elena Steiger Salvador](#)¹, [Jana Weintz](#)¹, [Jule Degenhardt](#)¹, [Klara Langmann](#)¹

¹ Johannes Gutenberg University Mainz, Department of Communication, Mainz, Germany

Since the large language model ChatGPT and generative AIs like Midjourney launched, concerns about the use of AI-generated content for political disinformation have risen. The easy accessibility of the software enables users to produce and spread false information on a large scale resulting in a threat for modern democracies. So far, there is little research investigating the effects of AI-generated political content on recipients. This includes the crucial role of emotions and in particular epistemic emotions. Epistemic emotions are related to knowledge and its acquisition, e.g. curiosity or confusion. They are most often evoked when new information contradicts one's existing knowledge. This could be the case particularly when confronted with AI-generated pictures due to the varying degrees of authenticity. The potential cognitive incongruity that could be caused by such pictures could lead to specific epistemic emotions which in turn could affect how political disinformation is perceived.

Therefore, we conducted an online experiment ($N = 138$) with four groups to test whether AI-generated pictures would affect the participants' epistemic emotions, perception, and online engagement. All participants were presented a fictitious X (fka. Twitter) post about activist Greta Thunberg traveling on a private jet. One group had a real picture of Thunberg attached to the tweet. Two groups saw an AI-generated picture showing Thunberg at an airport, where both AI-pictures varied in terms of authenticity. The low authenticity condition contained clear indications that the image was produced by AI, e.g., distorted angles and perspectives or a lack of sharp facial contours. The reference group didn't receive a picture. The variables queried were: the epistemic emotions curiosity, surprise and confusion, the perception of Thunberg, the likelihood of engaging with the post, the interest to seek further information and the perceived credibility of the post.

Results showed that epistemic emotions significantly increased the interest in further information seeking ($p < .001$, $R^2 = 0.195$, $\beta = .441$), especially curiosity ($p < .001$, $M = 2.824$, $SD = 1.065$), whereas surprise mediated between the stimulus and interest [effect = .109, bootstrap SE = .063, 95% CI [0.1089, 0.2533]]. Nevertheless, there were no significant differences between the four group's perception of Thunberg, epistemic emotions, likelihood of engaging with the post, or perceived post credibility. These results indicate that participants did not notice that they were exposed to AI-generated pictures – even when exposed to a rather unauthentic picture that should be detected as a fake more easily.

The results highlight the potential danger of AI-usage for democratic processes due to their impact on the reception of political information. Participants showed no significant differences regarding their epistemic emotions as well as the perceived post credibility. This could be dangerous in that epistemic emotions did not act as an 'early warning system' alerting a person to possible inconsistencies and a lack of authenticity in social media content. Future research needs to study the potential influence of epistemic emotions in greater detail and explore their impact on the reception of political disinformation.

ARS09 Dimensions of news avoidance

PP 0588 Rethinking Informative Content and Journalistic Actors on visual Platforms: An Audience Perspective

[Lion Wedel](#)¹

¹ Weizenbaum Institute for the Networked Society, Digital News Dynamics, Berlin, Germany

Among young adults, visual platforms are crucial for information dissemination (Newman et al., 2023). Consequently, TikTok, Instagram & YouTube have been declared as very large online platforms (VLOPs) by the European Commission, highlighting their significance in the European Union's information landscape (DSA, 2023). Understanding how news is disseminated and received on those platforms is essential. Information dynamics experience an ongoing disruption through (visual) social media platforms. To explore information dissemination on such platforms, researchers need to understand what and whom users perceive as news and information. Only then can one correctly assess the impact such information has on users through cognitive heuristics being triggered (e.g., trust).

Past work undermines that need, finding that for younger generations, news and informative content are defined by the content rather than its source and broadly defined than for older generations (Schneiders, 2023; Swart, 2021). Initial studies employed the 'news-ness' concept as a theoretical concept to explore news use and news content on social media (Anter & Kümpel, 2023; Vraga & Edgerly, 2023). Following this line of research, the current study aims to expand our knowledge of what actors and what content young adults perceive as informative on visual social media platforms. Such content and actor-focused perspective with an emphasis on visual social media is missing so far. We explore what role age, gender, level of education, and the platform play in the respective perceptions.

This paper employs the *news-ness* concept, focusing on audience definitions and viewing *news-ness* as a spectrum (Edgerly & Vraga, 2020). Like Anter & Kümpel (2023), we reinterpret *news-ness* as *informative-ness* to work with a concept that includes the multi-faceted idea of news but leaves space for participants to think beyond traditional and narrow news definitions.

We conducted eight focus groups, with each group consisting of six participants with equal gender distribution ($N = 48$) living in Germany. The groups composition controls for age and level of education. Each participant did at-home tasks beforehand, giving us an initial list of the actors participants perceive a) from the top of their heads, b) when scrolling through their feed, and c) when specifically thinking of informative actors. We asked the participants to order their collected actors regarding their *informative-ness*. Those answers were summarized in a figure – presenting group-specific actor groups ordered based on *informative-ness*. The figures served as a basis for discussion during the group discussion – to explore the reasoning behind participants' perceptions of what actors are informative. *The same procedure was conducted with content types.*

The analysis is a work in progress and is based on the initial homework answers, the discussion transcripts, and the final figures. It will result 1) in a taxonomy of informative content and actors and 2) explain how and why young

adults perceive and classify certain content and actors on visual platforms as informative. The project contributes novel insights to the audience perspective research, and the taxonomy can serve as the basis for subsequent quantitative work connected with digital trace data and supervised machine learning – making audience research scalable.

ARS09 Dimensions of news avoidance

PP 0589 Avoiding the news but still feeling connected? A typology of news users based on the role of news for their connection to different publics

[Julia Behre](#)¹, Lisa Merten¹, Uwe Hasebrink¹

¹ Leibniz Institute for Media Research, Transformation of Public Communication, Hamburg, Germany

Democratic theory places the public sphere at the core of a functional democratic society (Dahlgren, 2009; Habermas, 1989 [1962]). While expectations about citizens' contributions to public spheres vary between theories, the shared ideal is that of an "informed" or "engaged" citizen using news for political learning and participation (Carpini & Keeter, 1996). However, the overwhelming amount of (mostly negative) information available can burden citizens. This is evident in the increasing number of news avoiders (Newman et al., 2023). Simultaneously, shifts in media production, distribution, and consumption enable citizens to connect to public spheres through communication practices beyond hard news consumption.

Facing these trends of news avoidance and the reconceptualization of "news-ness" (Edgerly & Vraga, 2020), our goal is to explore whether the consumption of journalistic news sources remains crucial for individuals to feel connected to various public spheres. This research is grounded in the concept of public connection repertoires, individuals' structured patterns of connection to different publics (Hasebrink, Merten, & Behre, 2023). Individuals may connect to the polity publics of their home country, and/or the more localized public of their hometown, an interest group dedicated to a specific topic, or a group of people sharing a particular aspect of identity (e.g., the Taylor Swift fan community). In this paper, we introduce a typology of news users based on the personal importance of news for their individual public connection.

Our typology stems from the analysis of 99 qualitative interviews with 59 participants (aged 18–90 years) in Germany from 2019 to 2022. The main recruiting approach aimed at maximum diversity to cover the full range of public connection practices. In a second recruiting step, we included participants who describe themselves as news avoiders or news omnivores. In the interviews, adopting an individual-centric perspective and starting from the general concept of public connection instead of news use, all communicative practices crucial for a person's public connection were considered, including non-media sources like interpersonal communication. Public connection was analyzed across affective (e.g., sense of belonging to a respective public), cognitive (e.g., perceived self-efficacy to participate in the public), motivational (e.g., interest in information about the public), and action-oriented (e.g., participation) dimensions.

The analysis is ongoing, but we can already identify news avoiders who, despite not relying on traditional journalistic sources, still rate highly in terms of their affective, motivational connection to public spheres and employ action-oriented media practices to connect to local or national publics. These results challenge the assumption that a broad and diverse news repertoire is a precondition for a strong sense of belonging to public spheres. Our typology considers different news consumption practices, incidental news exposure, news-finds-me perceptions, and trust when connecting to various publics, aiming to contribute to differentiating practices and effects of news consumption.

ARS09 Dimensions of news avoidance

PP 0590 Masculinization and urbanization of news avoidance: The case of young people in Portugal

[Rita Figueiras](#)¹, Maria José Brites²

¹ Universidade Católica Portuguesa, Faculdade de Ciências Humanas, Lisbon, Portugal

² Universidade Lusófona, Ciências da Comunicação, Porto, Portugal

News consumption is shaped by the most profound ideals of democracy. Consuming news is linked to a deep sense of being informed and interested in the civic realm as well as to a sense of learning about public issues. However, citizens are increasingly feeling the need to break from news. Negative reasons to avoid or reject depressing news are often associated to a moment in life or to specific issues, such as violence or politics. People opt out from disturbing and disappointing news, even if they feel guilty about thinking in this way, since they have internalized that one must consume news to be a "good citizen". In addition, news consumption, and news about politics, has been traditionally more associated to men in urban contexts.

In turn, resistance studies, and the work developed by Louise Woodstock in particular, have been identifying news resistance as a form of political and civic action as well as an act of democratic engagement – proposing an alternative perspective to the normative news-democracy narrative.

Furthermore, news avoidance tends to be characterized as the opposite of news consumption – that is, this practice is predominantly conceptualized as a dichotomizing stance (i.e., consumption vs. avoidance). This paper aims to move beyond this approach, by looking at what we call facets of news avoidance: a behavior of limited use of news that integrates consumption and avoidance in a spectrum of daily life intermittencies. This approach points to multiple dimensions – such as social and technological contexts and generational influences – that make the news avoidance a prismatic and complex field that needs to go under further discussion both as a concept and as an act of citizenship.

With this in mind, we rely on a representative survey on news consumption and digital citizenship conducted in Portugal with 1300 young people (15–24 years), under a project on Youth, news and digital citizenship. This is still work in progress. However, early results point to two surprising results: contrary to what the literature has been saying for a long time, much more boys than girls actively avoid the news and don't find interest in such a content; and these avoiders are mainly residents in urban areas, mainly metropolitan Lisbon and Oporto. This group points to news avoiders that feel that they are well informed through family and friends, with a special importance given to digital influencers and entertainment professionals in their non-conventional information habits. These findings raise relevant questions around new dynamics of information and politization of this group, which sets them apart from previous generations of News consumers. Together with such empirical interest, our findings also interrogate the literature in novel and defying ways.

PP 0591 Incidental digital news consumption of young adults: A mixed methods approach with a representative online survey and focus groups

Eduardo Antunes¹, Inês Amaral², [Ana Marta Moreira Flores](#)³, Rita Basílio de Simões²

¹ University of Coimbra, Faculty of Arts and Humanities, Coimbra, Portugal

² University of Coimbra/Centre for Social Studies, Faculty of Arts and Humanities, Coimbra, Portugal

³ University of Coimbra/ICNOVA University of Lisbon, Faculty of Arts and Humanities, Coimbra, Portugal

Today's digital media ecosystem poses several questions to journalism that, despite not entirely unprecedented, have taken on new dimensions, including how people interact with information as a branch of media content (Murphy, 2023). An array of studies argues that there is an information disconnection between traditional news consumption and the younger generations, which shows reduced concerns in following and engaging with 'serious' societal and global issues (Johnson & Kaye, 2014; Silveira & Amaral, 2018). Another tackled aspect of news consumption by youth concerns the exposure to it being mainly done through social media in a frequently incidental way (Bergström & Jervelycke Belfrage, 2018; Boczkowski et al., 2018). It is mainly through those technologies that young adults get in contact with the news and even share their opinions regarding the covered issues (Ohme, 2020). Studies tend to focus on qualitative-based approaches, sometimes interlaced with quantitative studies, typically, without representative samples. Our study is focused on the following research question: how are young adults' information practices intricately with social media and news apps' usages? This work presents a mixed method strategy, intending to distinguish bigger behaviours with the quantitative method, while possibly identifying reasons that contextualise those behaviours with the qualitative approach. Firstly, an online survey was conducted, characterised by a representative sample of the Portuguese population (N = 1500) aged 18 to 30 years, and according to the country's distribution of diverse socio-demographic factors. Our sample is normally distributed (p-value = 0.95 on the Shapiro-Wilk test), with a margin of error of ±2.53% at the 95% confidence level. The survey was a structured one, had an estimated duration of 30 minutes, and data were analysed with the IBM SPSS software, focusing on descriptive and inferential (bivariate) statistical analysis. Secondly, regarding the qualitative method, a series of six remote focus groups were conducted online, fostering interaction, to a total convenience sample of 31 young adults. Quantitative results revealed that, when having to select their three most used app categories, social media was considered their most used – 1350 times (90.0%). Nonetheless, news apps were selected only 68 times (4.5%). Interestingly, when respondents were asked to rate the perceived importance of app categories on a Likert scale, social media (33.8%) and news apps (34.9%) showed similar percentages. They are two of the three categories with the highest rates of 'Agree' responses. Regarding the focus groups, young adults do not seem to have completely separated news consumption from TV consumption, especially because both are rooted in family interactions with established media patterns. However, most affirm consuming the majority of the news from their social media scrolls, in an incidental way, apart from a few that search for podcasts, when intending to get informed regarding a specific topic. While we encourage future work to deepen our findings, this mixed methods approach revealed that young adults are aware of the need to be informed, even if the consumption tends to be incidental in nature, and typically not based on news apps.

ARS09 Dimensions of news avoidance

PP 0592 The platformization of democracy: Unveiling Generation Z's news consumption in Switzerland

[Friederike Vinzenz](#)¹, Diana Ingenhoff¹, Jérôme Chariatte¹, Nabila Patwari¹, Alexandra Feddersen¹

¹ Université de Fribourg – Universität Freiburg, Departement of Communication and Media Research, Fribourg, Switzerland

Summary

This study explores Switzerland's Generation Z's digital news consumption habits, particularly their interaction with political information, trust in news sources, and the media's influence on their views. It examines the "news-finds-me" trend and the notion that Gen Z is "news-deprived." The research includes an app-based study and a three-wave survey during the Swiss national elections in 2023, with 475 participants. Findings indicate that Gen Z uses both traditional and social media, with preferences for YouTube, Instagram, and TikTok, and favors concise, video-based political news. They often feel overwhelmed by the news volume and exhibit a gender difference in news quality assessment confidence. The study offers insights into Gen Z as digital natives in a platform-dominated era.

Introduction

Generation Z in Switzerland shows a "news-finds-me" attitude and diminishing news interest, an international trend noted by Reuters (Newman et al., 2022) and observations in Switzerland (foeg, 2023). The digital and platform-centric nature of information brings challenges like misinformation. This study aims to understand Gen Z's political information sources, trust in news, and media's impact on their political views.

State of Art

Young adults tend to avoid news and exhibit selective exposure, leading to "incidental consumption" and reliance on social media and influencers for news (Antunovic et al., 2018; Bergström & Belfrage, 2018; Boczkowski et al., 2018; Park & Kaye, 2020; Haim et al., 2021). This results in fragmented consumption and reduced trust in traditional media (Vogler et al., 2022; Russmann & Hess, 2015; Marquart et al., 2020; Sawalha & Karnowski, 2022).

Method

Our study employs an innovative method: An app-based study coupled with a three-wave survey before, during, and after the Swiss national election campaign. This approach captures comprehensive data on media consumption behavior from N = 475 (331 female, 144 male) participants born between 1996 and 2012, circumventing previous study limitations and focusing on emerging news consumption patterns.

Results

Gen Z engages with traditional and social media, strongly favoring platforms like Instagram, Snapchat, YouTube, and TikTok. They spend significant time on Instagram and TikTok, considering news following on these platforms as important as traditional newspapers. Gen Z values concise summaries and visual storytelling in political content and sources information from traditional news organizations, personal networks, and digital platforms. They incidentally encounter news but often feel overwhelmed by the quantity and complexity of political news. There is a gender gap in confidence in assessing news quality, with males expressing greater confidence than females.

Outlook

Understanding Gen Z's media consumption is crucial for comprehending their political opinions and engagement. The study sheds light on the platformization of news and its effects on Gen Z's media interaction, informing future research and policy on media literacy and democratic participation.

ARS10 Generations and families

PP 0682 Digital platforms and family life across generations: A literature review

Ola Erstad¹, Kristinn Hegna¹, Sonia Livingstone², Oana Negru-Subtirica³, [Mariya Stoilova](#)²

¹ University of Oslo, Education, Oslo, Norway

² London School of Economics and Political Science, Department of Media and Communications, London, United Kingdom

³ Babeş-Bolyai University, Psychology, Cluj-Napoca, Romania

Data-driven digital platforms mark a major transformation over the last decade, with family practices seemingly characterised by diversity, choice and negotiation, with digital platforms becoming a vital route to entertainment, work, education and elder care (van Dijck, Poell, & De Waal, 2018). During present times of polarization within and between societies and communities there is a need to better understand how basic units in society such as the family changes over time due to transformations in digital mediation practices (Livingstone & Blum-Ross, 2020).

This paper draws on an ongoing European project titled '*Platforming Families: Tracing digital transformations in everyday life across generations (PlatFAMs)*' (2022–2025) studying three generation families (children, parents, grandparents) in five European countries (Estonia, Norway, Romania, Spain, UK). In this paper we present results from a scoping review of two- and three-generation studies of how families are adjusting to the everyday use of

today's heavily commercialised and globally networked platforms (Plantin, Lagoze, Edwards & Sandvig, 2018). The main research question for this paper is: *In which ways can the existing literature and empirical studies on families, generations and digital technologies inform us about relational aspects of family life?*

Our 'relational lens' (Emirbayer, 1997) refers to the internal and external interpersonal dynamics through which families are constituted, together with the contexts within which they are simultaneously embedded and which they co-construct. This means looking beyond the generally well-researched focus on individual motivations, beliefs and activities to examine the variously collaborative or conflictual negotiation of relationships. Rather than focusing on (media) generations (Bolin, 2023) per se, the aim was to include articles on intergenerational relations with a broad scope of digital media and technologies. Following the screening, 53 studies were included in the final sample for analysis. These were analysed using a coding framework developed specifically for the study, including information about the multigenerational, relational and technological perspective, as well as basic information about the methods, sample and citation details.

While considerable research examines individual uses of social media, we apply a relational lens to reveal the reconfiguration of agency and autonomy within families. Some findings are:

- § Most studies have focused on parent-child relationships, with few studies of older people, or about the relations among the generations. So, we do not yet know much about how families use, imagine or talk about digital platforms.
- § Research does show ways in which family intimacy, belonging, care, conflict and power struggles are now negotiated through using digital platforms.
- § The platformisation of family life creates new opportunities for children and parents to 'do' family, but can create inequalities and also marginalise older people.

Regarding relationality, studies tend to concentrate on 'intimacy' – and how digital technologies reinforce rather than displace traditional forms of contact and care – or on domestic power struggles, increasingly triggered by digital practices. We discuss the potential for a wider research agenda for today's platform society.

ARS10 Generations and families

PP 0683 Support and knowledge exchange between media generations in the appropriation of digital media: Warm expert relationships between older and younger family members

Jutta Roesser¹, Jacqueline Reimer¹, Jo Marie Dominiak¹

¹ University of Muenster, Department of Communication IfK, Muenster, Germany

Older people in particular often find it difficult to keep up with the fast-paced media changes in a mediatized world (Hepp, Berg & Roitsch, 2017). Older media generations need help in adopting digital media and communication technologies and receive this support particularly within the family, as recent Scandinavian studies have shown (Taipale, 2019; Olsson & Viscovi, 2018). Theoretically, the domestication approach and especially the "warm expert"-concept regain relevance in this context: In the early 2000s, Bakardjieva (2005) found that helpers from close social circles played an important role in providing people with access to the internet. Our project analyzes how such warm expert relationships in families, especially between grandparents and grandchildren, present themselves today and to what extent they contribute to the participation of older people in the digital society.

Based on qualitative interviews with grandparents and grandchildren, we focused our research on the support systems that are practiced in families between the generations in the appropriation of digital media technologies. Each of the ten guided interviews was conducted simultaneously with a grandparent and a helping grandchild. This constellation allowed the warm expert relationship to emerge and be analyzed in the interview itself. (In contrast, most studies in the field interviewed only one generation). Furthermore, we deliberately included families of grandparents with migratory background: We suspected that cross-generational support would be particularly and urgently sought by these elders in order to communicate transnationally with family members abroad.

In the lecture, we present three areas based on our findings and case studies:

1. Support network: It is not just a single person who helps the elderly, but there is a whole network of helpers within the families consisting of children and grandchildren, i.e. 2nd and 3rd generation warm experts. These helpers practice a division of labor that corresponds to their particular media-generational experiences (e.g. grandchildren for smartphones and social media, children for PCs). In the migrant families, help is often seen exclusively as a family matter, while in the other families help is occasionally obtained from outside.

2. Family solidarity and media generations: Grandchildren show high levels of willingness to support their grandparents in media appropriation matters and grandparents gladly accept it. The younger generations emphasize that they want to reciprocate the care that they themselves experienced from their grandparents. While grandchildren patiently deal with their grandparents' need for help, they are far more critical approaching their parents' need for support: due to a media-generational positioning, they expect more media literacy from their parents, who belong to the second media generation, as from their analogue-socialized grandparents.

3. Migrant families: In families with a history of migration, the warm expert relationship is attributed an even higher and in some cases almost existential significance. The grandchildren see themselves as enablers, because it is (only) through their help that the grandparents are capable of maintaining closer communication with family abroad. They also explicitly see themselves as mediators between the grandparents and the (digital) world, enabling societal participation.

PP 0684 Oscillating parenting in the digital age – The order and disorder of screen time negotiations in Swedish parents everyday life

Magnus Johansson¹

¹ Lund University, Department of Communication and Media, Lund, Sweden

'Screen time' has become a catch-all concept for debates on people's dependence of digital devices in general, and children's use of media technology in particular, almost exclusively focusing on negative consequences. While children and young people more often than not are at the center of debates around screen time, parents and their everyday practices are held accountable for monitoring, regulating and controlling their children's screen use. Through 23 in-depth interviews with parents living in Sweden (in two separate rounds of field work during 2019/20 and 2023), this paper explores how parents understand and handle screen time in their daily life. In the empirical material, it quickly becomes apparent that screen time is a dense moral issue, in which parents navigate and negotiate both the values and their related practices in an everyday that is lived in, with and through media technology (in what Couldry and Hepp refer to as "deep mediatization" (2016)). The parents are forced to handle a constant oscillation between order and disorder, continuously assessing and reassessing what they imagine as right or wrong, good or bad. While these parents everyday stories differ in at times fundamental ways, their reference points of what screen time is and the related "best practices" uncover a "shared sense of legitimacy" (Taylor 2004). In many ways, the parents negotiations are situated in "grey areas", where recommendations of screen time and screen use (from, for example, the state, WHO and/or medical associations) come into conflict with the lived everyday. Understanding these grey areas become paramount in unpacking what kind of impact issues around screen time actually has on the social world. The concept of imaginaries (Taylor 2004; Dant 2012; Chambers 2016) is used as a framework to understand parents and their negotiations and practices, which brings light to the complex moral layers the parents describe.

PP 0685 Connected social media platforms as new generational (dis)orders: "Platform repertoires" among the Slovenian youth

Tanja Oblak Črnič¹, Dejan Jontes¹, Barbara Brečko²

¹ University of Ljubljana, Department of Communication/Faculty of Social Sciences, Ljubljana, Slovenia

² University of Ljubljana, Department of Sociology/Faculty of Social Sciences, Ljubljana, Slovenia

The media repertoire model, with its attention to everyday media use and social and communicative figurations, is valuable for understanding how biographical events might influence media use. Some of the more recent research on young audiences' media repertoires suggests that the technological specificity and uses of a medium are not as important for understanding young audiences as conceptualising digital media as an integrated communicative environment. At the same time, research confirms that young people do not assign media to specific functions, but use platforms multifunctionally, especially as they get older (Wimmer & Wurm, 2021). As young people begin to develop their media habits in early adolescence (Buckingham, 2000; Marchi, 2012; Russo & Stattin, 2017), understanding their media preferences at a broader level and within specific social contexts can also explain an anticipation of their future media habits (LaRose, 2010; Peil & Spaviero, 2017). Some studies show that the development of information media resembles a patchwork process in which not only peer groups but also family and school environments are important contextual factors. However, media repertoires as individually constructed media constellations are not fixed and unchangeable formations. But even within the generationally narrow younger media audiences, some young people manifest their own significant preferences in ways that may confirm the process of social ordering through the expressed media choices in the context of their everyday life.

With the above theoretical considerations in mind, the paper aims to critically examine how the diversity of young people's media choices, on the one hand, and specific communication, cultural and social choices, on the other, construct some new patterns of relatively stable and distinctive media repertoires among young people. In its search for answers, the paper refers to the results of an intensive quantitative study of media repertoires, based on a quantitative survey of a sample of more than 3000 young people aged 12 to 19, conducted in spring 2022. First, the five dominant categories of social media platform preferences are presented, which nicely confirm how some media platform uses go well together and exclude other forms of use: while some social media users are primarily viewers, others are heavy communicators, content creators or intensive players. At a descriptive level, such an analysis extracts the individual elements of media devices, communication patterns and also their content, as well as the contextual backgrounds of everyday circumstances through which such internal differences emerge between an otherwise fairly homogeneous group of young people and their 'social platform repertoires'.

According to our findings, gender, news media practices, attitudes towards books and reading, and active sports participation seem to be the most important differentiating factors that play a role in creating new social boundaries within the teenage groups. Such findings challenge the current understanding of social platforms as general social infrastructures (Bucher 2020) and also help to identify the dominant social and cultural factors that emerge as important generational differences beyond media repertoires as such.

PP 0686 Media displacement among older internet users: A cross-national longitudinal study

Rinat Lifshitz¹, Dennis Rosenberg², Galit Nimrod³

¹ The Max Stern Academic College of Emek Yezreel, Community Gerontology, Emek Yezreel, Israel

² Hebrew University of Jerusalem, School of Social Work and Social Welfare, Jerusalem, Israel

³ Ben-Gurion University of the Negev, Communication Studies, Beer Sheva, Israel

Numerous studies explored older internet users and various aspects of Information and Communication Technology (ICT) use in later life. Some of these studies suggested a gradual media displacement, in which the use of traditional media declines over time and is replaced by new media. Nonetheless, most previous research overlooked the parallel use of traditional and digital media, and none explored patterns of media displacement over time and in multiple national contexts. As a result, understanding the mechanism (displacement or complementation) of using the digital equivalents of traditional media among older audiences remained limited.

Using data from the three waves of the Ageing + Communication + Technologies (ACT) cross-national longitudinal study, the present research tracked trends in media displacement among 3,483 internet users aged 60 years and older from six countries (Austria, Canada, Israel, The Netherlands, Romania, and Spain) between 2016 and 2020. The data were analyzed using repeated measures ANOVA and linear regression models.

The analysis indicated relatively high levels of displacement in print media, especially newspapers and magazines, that significantly increased during the COVID-19 pandemic. Traditional TV and radio displacement levels were low and did not change significantly over time. Being a man, younger age, higher education, and a greater variety of online activities were associated with higher levels of displacement. In addition, Spanish nationality was associated with more displacement, and Austrian nationality with less displacement.

These findings align with the results of previous studies underscoring the older adults' tendency to adhere to familiar media practices. In addition, they show that even the most common newspaper displacement is a relatively slow process and that older internet users replace the device they use to consume mass media content only when the new medium demonstrates a clear advantage over the traditional one. The findings also support previous notions of *selective media displacement* among older adults and reveal the existence of *responsive displacements*, wherein media habits change in response to external stimuli. In the current study, the catalyst was the COVID-19 pandemic. Both phenomena seem universal and call for changing the prominent ageist view of older adults as conservative and technophobe media users to perceiving them as sophisticated consumers who can adjust their media habits when needed. Improving older adults' digital literacy may yield a higher level of media displacement and consequently impact the successful pursuit and maintenance of personal goals in later life.

PP 0790 Shame 2.0: experiencing poverty-related shame on social media

Rune Søholt¹

¹ University of Bergen, Department of information science and media studies, Bergen, Norway

This paper asks the overarching questions: *How do poverty-inflicted people experience shame and stigmatization on social media? And how does shame and stigmatization further shape their use of social media?*

Feelings of shame and stigmatization are often part of the experience of living in conditions of poverty. What is more, shame and stigmatization have long been central issues in poverty research and policy development, due

to their debilitating effects of furthering social exclusion and withdrawal. While media have long been held as a central culprit in framing and communicating stigmatization towards people experiencing poverty, little effort has been made to investigate issues of poverty-related shame and stigmatization on social media. Thus, we have little knowledge about the role of everyday social media use in furthering or alleviating issues of poverty-related shame among social media users in this group. Building on a large-scale qualitative study, this paper explores how poverty-related shame and stigmatization is experienced on social media. The paper is based on two rounds of in-depth interviews with 40 informants living in conditions of poverty in Norway. The informants in this study were recruited from three different socio-demographic groups which are overrepresented in statistics of long-term poverty in Norway. These are social benefit recipients, single parents, and immigrants with non-Western backgrounds. The paper provides case examples of different ways poverty related shame are experienced through social media, how shame is overtly or tacitly expressed, and how shame shapes the use of social media among informants. Furthermore, the paper identifies significant variations in how shame is experienced between the different groups of informants. In this way, this study is important as it sheds light on two interrelated issues. First, it contributes new empirical insights into the processes where shame and stigmatization are encountered on social media. Second, this paper discusses how such encounters shape social media practices among people who experience poverty. In this way, the paper aims to contribute to theoretical discussions about online participation and inhibition within this demographic. Further, it also aims to provide impetus to discussions about the role of poverty-related shame in furthering inequalities of participation on social media, as well as other online spaces.

PP 0791 Digital divides revisited: Homelessness, leisure and the framing of media research

Maren Hartmann¹

¹ Berlin University of the Arts, College of Media- Architecture and Design, Berlin, Germany

The digital divide concept has long been one of the few more concerted efforts in media and communication research to address social inequalities reflected in digital media use (with the knowledge gap hypotheses as a related concept or basis) (see, e.g., van Dijk, 2020; Katz & Rice, 2002). Originally used to describe differences in media use between what was then called the first and the third worlds, the digital divide concept pointed to the potential (negative) consequences of such differences and was later proclaimed to exist in each society. Research has since shown a shift from the access divide to a 'second-level' usage divide (e.g. van Deursen & van Dijk, 2014). Some major critiques have been about the concept's polysemia, its binary structure as well as the underlying technological determinism (e.g. Gunkel, 2003).

For research on the media use of people experiencing homelessness, the digital divide is one of the few concepts that offers an acknowledgement of social injustice that often accompanies – or actually forms – their media use. We recently completed one such project (see e.g. Klocke, Lowis & Hartmann, 2022) and have since been trying to make sense of the material gathered (drawn from a survey on media use of homeless people in Berlin, on ethnographic material gathered over three years and from a mobile phone hand-out and accompanying measures). The material offers problematic material with regard to the digital divide concept, especially in regard to potential policy work. This discrepancy is the basis of the discussion offered in this paper.

Our research has shown that media use in the context of homelessness is often characterized by leisure pursuits, which does not conform to the normative expectation of using media to better one's life (van Deursen & van Dijk, 2014). The gap that supposedly needs closing is caused by societal expectations concerning the 'right use' and ultimately 'the right life.' Here, we use Payal Arora's concept of the 'leisure divide' (Arora, 2019) – the assumption that the 'third world' should not "come out to play" but come out to work (digitally) – since this concept is potentially equally applicable to precarious/homeless lives.

The paper will introduce the research project and talk more generally about work on homeless people's media use, before it uses the digital divide debate to ask about homeless people's agency and practices on the one hand and the normative expectations of life improvement on the other. It subsequently addresses yet another tension between the researchers' aims and the research outcomes, especially in policy relevant work.

ARS11 Invisible audiences

PP 0792 Exploring the impact of mediated intergroup interaction quality and expectations on attitude change towards individuals with autism

Anastasia Schnitzer¹, Andreas Fahr¹

¹ Université de Fribourg, Department of Communication and Media Research, Fribourg, Switzerland

Individuals on the autism spectrum are generalized as outgroup members in the media, perpetuating stigmatizing attitudes (Kim, 2020). However, multi-faceted media portrayals of those individuals are also considered as an intervention strategy to combat stigma (Mittmann et al., 2023). Research shows that mediated contact to those "outgroup characters" (parasocial contact) but also identification with ingroup characters who are engaged in interactions with outgroup characters (vicarious contact) can decrease stigmatizing attitudes. Although the Integrated Mediated Intergroup Contact Model (IMIC) connects parasocial and vicarious contact within one model (Wong et al., 2022), it does not consider detailed quality conditions within the intergroup interaction dynamic.

Expanding the IMIC, we assume that identification with an ingroup member who interacts with an outgroup member increases the experienced quality of vicarious interaction (QoVI), subsequently leading to an increase in the parasocial relationship (PSR) (**H1**). Considering that expectations towards outgroup members are influenced by the quality of previous bonds, PSR should be considered as a mechanism, acting as an effective substitute for real-life friendships (Wong et al., 2022). Research also shows that the generalization of positive contact to outgroup attitudes is influenced by the expected quality of contact with outgroup members (QoEC) (Schäfer et al., 2021). Extending these results, we propose that QoVI increases QoEC, increasing positive attitudes (**H2**). We assume PSR leads to an increase in QoEC (**H3**). QoEC predicts increase in positive attitudes (**H4**), suggesting QoEC as a mediator influencing positive attitudes (**H5**). Based on prior longitudinal approaches, we propose changes in attitudes over time (**H6**).

We conducted a longitudinal online field study using a within-subject design to test the hypotheses. Using the third season of the Netflix-show *Atypical* as a stimulus, which depicted Sam with autism and his social environment. Participants (N = 136) completed a primary survey (t1) and post-viewing questionnaires (t2-t4). Autism attitudes, the PSR to Sam, ingroup identification, QoVI (e.g. Sam + "perceived ingroup character", and QoEC were assessed ($\alpha = .78$ to $\alpha = .88$). Results of path analyses show significant effect of identification through QoVI on PSR ($t(1) = 2.214$, $\beta = .06$, $p = .02$), confirming H1. QoVI over QoEC increase attitudes ($t(1) = 4.325$, $\beta = .182$, $p < .001$), supporting H2. Significant paths from PSR to QoEC ($t(1) = 6.859$, $\beta = .46$, $p < .001$), QoEC to attitudes ($t(1) = 4.575$, $\beta = .40$, $p < .001$) and a mediation from PSR through QoEC to attitudes ($t(1) = 3.900$, $\beta = .18$, $p < .001$) confirm H3 to H5. Latent change modeling slope and the intercept become significant, $Z_1(1) = 79.77$, $p < .001$, $\beta_1 = .67$; $Z_3(1) = 5.19$, $p < .001$, $\beta_1 = .05$, supporting H6.

Longitudinal results reveal that "Atypical" supports ingroup identification, enhancing the perceived interaction quality and increasing the PSR to Sam. Moreover, our attitudes towards autism are influenced by the PSR with characters like Sam, the intergroup interactions, and expectations regarding future interactions with the "outgroup". This study supports that engaging with complex, long-term narratives about autism can be beneficial for educational purposes.

ARS11 Invisible audiences

PP 0793 Framing the narrative: How media reporting on intimate partner violence against women affects the understanding of the problem

Christine E. Meltzer¹

¹ University of Music- Drama and Media Hanover, Department of Journalism and Communication studies, Hanover, Germany

Globally intimate partner violence (i.e. violence perpetrated by current intimate partners or ex-partners, IPV) is one of the most pronounced forms of violence against women. Media reporting on IPV is criticized for often focusing on individual cases, neglecting structural problems such as the extent of violence against women and lack of places in support services (e.g., Sutherland et al. 2019). Such an individualistic perspective isolates single incidents from another, focusing on providing only the facts of the case and does not situate them in a larger, structural context (episodic framing). This way of reporting suggests that the violence occurred dependent on situational factors and the respective persons involved in it (Cullen et al., 2019). Consequently, violent acts are seen as singular events rather than as a part of larger patterns and structures. In contrast, thematic frames place issues into a broader societal context, focusing on gendered power relations in society and social tolerance toward violence against women (Karlsson et al. 2020). A second, frequently criticized point about reporting on violence against women is that it hardly ever refers to support services (e.g., Sutherland et al. 2019). This could also be recognized by readers as an indication of the size of the problem in society. To test the effect of framing of media reporting on IPV and the mention of support services, an experiment was conducted.

The experiment employed a 3 x 2 between-subjects design (N = 188), creating three fictional journalistic articles: a single case description (episodic framing), a purely thematic report based on real statistics (thematic framing), and a hybrid version. Each article version included a version with and without an infobox featuring references to real support services. Dependent variables included perception of the extent of violence against women, perception of the problem's urgency (Gracia, 2006), and attributions of responsibility using the Domestic Violence Blame Scale (DVBS), which distinguishes between four different blame factors. Sexism was included as a control (Rollero, Glick & Tartaglia, 2014).

Results indicate no effect of the stimuli on the estimated prevalence of IPV in society. In terms of perceived urgency of the problem, physical, psychological and sexual violence was perceived as most severe in the thematic version of the article, as opposed to the episodic or hybrid form. Against expectation, this specifically happened in the article version without support services. When looking at who is to blame for violence, a different pattern emerged: No differences between stimuli were found for societal blame, victim blame, or perpetrator blame for IPV. However, situational blame was perceived highest by participants who read the hybrid form of the article. The presence of support services showed no effect regarding blame. The presentation will address into both the intricacies of the methodological design and the implications of the findings for refining media reporting practices to address the understanding of the societal problem in the audience.

PP 0794 Making sense of mortality. A qualitative analysis of media users' meaningful experiences with media portrayals of death and dying

Julia Bartsch¹, Christal Bürgel¹, Anne Bartsch¹

¹ University of Leipzig, Institute for Communication and Media Studies, Leipzig, Germany

Terror management theory (TMT, Greenberg et al., 1986) assumes that humans avoid thinking or talking about death. However, media users willingly expose themselves to media content addressing the topic of death and mortality. A possible explanation for this paradox is that individuals might use media content as an opportunity to reflect on and make sense of death, rather than completely avoiding the topic. As Das (2022) has argued, eudaimonic media experiences (i.e., meaningful, moving and thought-provoking experiences) can help viewers to find meaning in mortality and to transcend their fear of death. Previous studies have found that meaningful movies can encourage viewers to reflect on death and emotionally process their fear (Wong, 2007; Khoo, 2018; Das & te Hennepe, 2022).

Our study aims to advance this line of research by analyzing the types of death-related media content associated with eudaimonic experiences as well as the content of reflective thoughts about the topic. We conducted a secondary analysis of 166 qualitative interviews about meaningful media experiences and coded all passages related to death and mortality. In these passages, participants discussed different content features (e.g. authenticity, realism, explicitness) and meaning contexts (e.g. death of a loved one, fatal illness) that can prompt reflective thoughts about media portrayals of death and mortality. In addition, participants described their meaningful, moving, and thought-provoking responses and the content of their thoughts – including factual and emotional learning experiences, gratitude for one's own life circumstances, values, virtues as well as social and cultural implications.

In conclusion, our study suggests that meaningful portrayals of mortality and death can be accompanied by eudaimonic entertainment experiences and that they can help individuals to make sense of mortality. Our findings provide initial evidence and a basis for further exploring the potential of media portrayals to reduce the taboo around death and dying.

ARS12 The conceptual revival of audience research: Questions of affect, identity, media entanglement, semiotics and framing, journalists and their audiences

PN 124 Representation, affect, identity and the conceptual revival of audience research

[Joke Hermes](#)¹

¹ Inholland University, Media Studies, Diemen, Netherlands

While audience research has been conducted for almost a century now, the extent to which it has a prominent place in communication and media studies has differed. Defining moments suggest that different planes of change (policy, political, economic, technological) have all had important implications for how we understand audiences and their relation to media, as well as how to research them. This paper will focus on (the tradition of) qualitative audience research and suggest a short conceptual history in which representation, affect and identity are central terms. Representation in many ways was qualitative audience research's answer to studies of media effects and impact. Its political load worked well with such notions as the 'active' audience and agency as the other side to structure. In today's world of platformized media and amateur content producers, representation has become an unwieldy term, best left to studies of well-defined media texts: movies, tv shows, games. How might we regain it as a powerful tool to speak to the different kinds of politics involved in the use and production of media and in the particular forms and shapes that media content takes? Affect, secondly, is a conceptual late-comer to audience research. The dominance of forms of critical discourse analysis from the late 1990s onwards in audience research worked against a non-psychological understanding of emotion, feeling and the energy and forces that beset our relationship with media. Of course, these are and always have been part of understanding processes of meaning-making. In today's world recouping 'affect' as a key term is all the more important given what can be summarized as polarization and hate speech. This leads immediately to the third key term in the history of qualitative audience research (when that history is tilted towards the last half century). Identity is the social sense of who we are (and who we are not), the ways in which we want to be part of some groups at some points in time and in specific places rather than others. It may well be the case that 'identity' has been overburdened when it comes to understanding investments, pleasures, uses, feelings to do with using and making media. While rituals of media use, the spending of empty time, posting something silly 'just for the lulz' are all part of the canon of audience research, they may be difficult to give their due. In a way, they undermine theorization and our pleasure as researchers in studying and working with audiences. Overall then, this paper's short history aims to argue in favour of a critically contextualized use of the best tools of the trade so that we can meet the challenges of understanding ever deeper mediatized practices of everyday life. The question 'how media matter' after all is still an open one.

ARS12 The conceptual revival of audience research: Questions of affect, identity, media entanglement, semiotics and framing, journalists and their audiences

PN 125 Relationship status of journalists with their audiences on social media: it's complicated

Petra Kovacevic¹, [Iva Nenadic](#)²

¹ University of Zagreb, Department of Journalism and Media Production, Zagreb, Croatia

² European University Institute, Department of Strategic Communication, Florence, Italy

Audiences are central to journalism, but they have rarely had the opportunity to directly engage with journalists in their work. Throughout almost the entire history of journalism, journalists had no detailed insights into their audiences, so they imagined them. Journalists imagined their audiences' needs and interests when producing journalism in different formats. Audiences are also key to the financial viability of journalism. Therefore, for journalism to fulfil its purpose and to survive, "journalists have traditionally balanced providing what the public needs and what the audience wants" (Tandoc Jr. 2015, 782). Journalists have always had a special relationship with the audience – a status that could best be described by a phrase derived from social media: 'it's complicated'. If it was complicated before, what happened when social media entered the relationship between journalists and their audiences? Has this relationship ended, or does it make for a better relationship? This paper explores the potential of social media affordances to bring audiences closer to journalists, through a better understanding of the audience: who they are, what they want, and what their involvement is in the process of producing journalism. Centred on two case studies from Croatia and the United Kingdom, this paper explores how journalists imagine their audiences and the evolution of the journalist-audience relationship within the social media sphere. Social media platforms have positioned themselves as intermediaries between audiences and journalists, making the audience more visible. Yet social media form a somewhat unwelcome element that editors are compelled to factor into their decision-making, and journalists into their work. Journalists seek to retain their role as gatekeepers to command the news production process and to uphold the authority and integrity of their profession, despite social media platforms' potential to facilitate increased interactions between journalists and their audiences, and to enhance newsrooms'

comprehension of audience behaviours. The chapter explores the value and meanings of this unrealized potential to enable journalistic familiarisation and greater engagement with their audiences. With a focus on the conditions imposed by social media's architecture, the case studies reveal how journalists interact with audience members on Twitter and Facebook including the extent of this interaction. Addressing the ways in which journalists seek to lift or guard the boundaries of their professional and societal roles, the paper sheds light on journalists' audience imaginaries and the conditions for being a news audience on social media.

ARS12 The conceptual revival of audience research: Questions of affect, identity, media entanglement, semiotics and framing, journalists and their audiences

PN 126 Slow Reality TV and Chinese Audiences

Yunyi Liao¹, Annette Hill²

¹ Yunyi Liao, Media and Communication, Loughborough, United Kingdom

² Jönköping University, Media and Communication, Jönköping, Sweden

The slow reality television show *Back to the Field* offers critical insights into effect and meaning making for Chinese audiences and their social environments. We use qualitative interviews with a selected sample of audiences who are the target market for the series, e.g., young urban millennials. This empirical material grounds our understanding of affect in audience research for non-Western contexts. We create dynamic connections between the cultural text of the reality genre and the text of our interviews in order to understand audience meaning making as a form of affect which is shaped in and through this slow reality show. Our Chinese audiences reflect on their affective relations with 'slow' representations in reality television and how this makes them feel in their social environment. We define the emergent concept of 'slow affect' as mood work which is dynamically connected to the situated and material conditions of audiences. In particular, we identify the affective energies of pressure and promise in audiences' critical reflections on the 'pressures' of urban living and stressful working conditions in their lives and the 'promise' of a slower rural lifestyle, as imagined in the series and slow lifestyle trends.

PN 127 The felt experience of atmosphere: Implications for audience research

Peter Lunt¹

¹ University of Leicester, Arts- Media and Communication, London, United Kingdom

This paper explores audience experience as the felt experience of atmospheres, drawing on the work of Gernot Böhme on architecture as felt spaces and Schmitz's phenomenology. The paper introduces ideas from the analysis of architectural spaces as atmospheres that are the product of spatial features of place and the experience of immersion. I review examples of the way that Böhme's work has been applied in the study of the production and experience of playing video games and film, followed by a reinterpretation of media analysis of media events, live-ness and participation in audience discussions in the light of the relationship between experience and felt spaces. The paper finishes with some reflections on the implications for the phenomenological understanding audiences.

PP 0901 Imagining audiences, imagining work – What is imagined through Google Analytics audience data?

Pille Pruulmann-Vengerfeldt¹, Asko Kauppinen¹

¹ Malmö University, School of Arts and Communication, Malmö, Sweden

Website analytics from Google and other platforms has become the key performance indicators for communication practitioners. The omnipresence of different metrics, mediated through data dashboards, has an important impact on the world of communication. However, little is known of the imaginaries inscribed in these platforms, yet these imaginaries also govern the understanding of digital communication as a professional activity. We work with the theoretical idea of sociotechnical imaginaries, that is, a set of visions sustained by infrastructures, practices, and more or less shared meanings of social life (Jasanoff & Kim, 2015). Similarly, the technical imaginaire (Flichy, 2007), algorithmic imaginaries (Bucher, 2017), and data imaginaries (Tupasela et al., 2020) are emerging as collectively held understandings of what technology, data and algorithms do.

In our paper, we discuss Google's switch from the analytics platform Universal Analytics to Google Analytics 4 (GA4). We conduct a semiotic analysis of the analytics dashboards and map the related environment of instructional pages, videos and tutorials to uncover the imaginaries. While the surface-level argument claims GA4 to be better, the discontinuation of third-party cookies and change of user-tracking possibilities means that Google will often have to operate with much less data about the audiences than in Universal Analytics. The related environment of

instructional pages, videos and tutorials demonstrates a diverse ecosystem of actors who are seeking to capitalise on Google's data collection interest and support the imaginary with their promotional materials directed towards communication practitioners.

The data dashboard is imagined as the one-stop site for an overview of the audiences, their interest and engagement; data is supposed to be precise, immediate, and actionable. However, there is also a clear link to imagining the work of the communication – success or failure in digital communication and reaching the audiences is imagined through the data on the dashboard. The role of AI and algorithms as supporting imaginaries related to audiences confirms the expectation of unlimited digital surveillance but also indicates the limitations of the data collection of the GA4. Communication practitioners in different fields rely on the data from Google and other platform players to help them understand the reach of their messages. But we find that in the ecology of complex relationships, messy data and diversity of actors looking to capitalise on the data provisions, the idea of the audiences is diluted and abstract. The research fills the gap in audience studies, demonstrating that despite the promises and fears Google Analytics is still supporting desperately seeking audiences (Ang, 1991).

ARS13 Making sense of mediated citizenship

PP 0993 Journalism and young audiences in a hyper-digitalized and polarized society

Marisa Torres Da Silva¹, Ana Filipa Pereira Oliveira²

¹ NOVA University of Lisbon NOVA FCSH- Portugal, Instituto de Comunicação da NOVA – ICNOVA, Lisbon, Portugal

² Lusófona University, Centro de Investigação em Comunicação Aplicada- Cultura e Novas Tecnologias – CICANT, Porto, Portugal

In this paper we aim to theoretically reflect upon the ever-difficult relationship between journalism and audiences, considering, among other aspects, the new challenges brought about by the current hyper-digitalized society. If, on the one hand, and historically, journalism keeps a distance from its audience, on the other hand, the transformations prompted by the digitalization processes confront it with challenges that entail paradigm shifts.

Taking as points of departure reflections based on the pluralization of the public sphere, the democratization of information, and the connection between journalism and audiences (in particular, younger generations), we explore the new dynamics arising from the digital and societal evolution that has been ongoing, especially in the last decade. The proliferation of new formats, platforms, devices, and sources arising from the digital era has stimulated, in parallel, the emergence of a new phase in journalism studies, less focused on producers and products of journalism and more focused on audiences and their experiences, until then merely a marginal object of study in this scientific field (Meijer & Kormelink, 2019; Meijer, 2020).

These transformations entail a new set of challenges for citizen participation, and for this reason, they have been gaining growing attention from research. Clark and Marchi (2017), as well as Meijer (2020), have underlined however a disruption between the needs of young news audiences and what journalism provides to them. Hence, recent studies emphasize the importance of considering young people's understandings of "news" and what they find relevant and informative, as these implicit and emotional factors can influence judgments about the accuracy and reliability of information (Swart & Broersma, 2023).

A multi-method study performed in three European countries (Finland, Czech Republic, and Belgium) revealed that most participants were aware of social media logics, but only to some extent (more technical than critical), presenting a vague understanding of algorithmic curation, recommendation, and personalisation for news (Vissenberg et al., 2022). Younger generations may consider that algorithms facilitate the search for information but there are concerns about their negative impacts on information access and pluralism (Brites et al., 2023).

The intersection between youth, news, and citizenship therefore represents a crucial domain that aims to delve into the ways in which young people engage with news media and how this engagement bolsters their active participation in democratic processes. We thus advocate the interconnection of traditional methods with a participatory approach through digital methods, to better capture the meanings of what the news is for young people and the democratic meaning it has in their lives. In the same line we also reflect on the need to better understand young news audiences in their participative approaches to the news (Clark and Marchi, 2017), even if they don't follow the

professional/traditional rules of journalism when they act as "journalists". These can positively contribute to engaging young audiences in processes of self-reflection and self-discovery about their place as young citizens and to capture their lives, experiences, and expectations towards media contexts, democratic polarization, and participation.

ARS13 Making sense of mediated citizenship

PP 0994 Beyond resigned bystanders? How people make sense of climate issues in the news: Background knowledge, moral compasses, and environmental values

Hallvard Moe¹, Brita Ytre-Arne¹, Solveig Høegh-Krohn¹, Håvard Haarstad²

¹ University of Bergen, Department of Information Science and Media Studies, Bergen, Norway

² University of Bergen, Centre for Climate and Energy Transformation, Bergen, Norway

This paper analyses how people make sense of climate issues in the news, contributing to understand audience interpretations of mediated communication on important societal transformations. Climate change is a topic fraught with feelings of futility, and such sentiments are reflected in the ways people engage with news on the issue. Climate communication scholarship has underlined persistent problems regarding the perceived complexity and vast scope of the issue, also as a hindrance for individual and societal action (Moser 2010, Schafer 2017, Bushell 2017). Clearly, journalism on climate change faces a difficult challenge in engaging audiences.

Media psychologists approach this challenge as concerning psychological distance, while political scientists see the problem as low efficacy (Campbell et al., 1971), and have used quantitative survey or experiment data to test the effect of distinct components of media messaging. We approach the issue differently, with a focus on sense-making in everyday life. To understand what climate-related news people avoid or relate to, we dig into what audiences make of actual climate news they encounter, while maintaining an everyday life context. In our study, we therefore opt for a qualitative approach to explore connections between different characteristics of climate journalism, different climate-related issues, and audiences' sense-making. With this intent, our research question is: *How do people make sense of climate issues in the news?*

To answer this research question, we designed a three-step data collection process, based on a small panel of informants (N = 30) living in Norway. Lifeworld interviews (step 1) were followed up with a qualitative online survey (step 2) in which the informants commented on three different news stories from recent Norwegian media, followed by new interviews (step 3) with selected informants, to allow for elaboration on the chosen examples. Based on insights from previous research (Bødker & Morris, 2022; Jensen, 2017), we chose news stories that differed concerning (1) spatial grounding from the local via the national to the global; (2) the extent to which the story concerned an issue with a clear solution; and (3) the extent to which the story presented political disagreement or controversy.

We did find lack of involvement, a bystander attitude, and resignation connected to media criticism. Beyond that, we show what resources people draw on when they actually grapple with the issues in the stories: We argue that although spatial grounding, solutions and political disagreement matters, the mobilization of *background knowledge*, a *moral compass*, and *environmental values* or prior climate engagement is crucial for when and how people make sense of climate issues in the news. In closing, we discuss the findings in light of theories of the post-political, and ask whether the sense-making found in our study can help improve efficacious climate communication, or rather demonstrates a fundamental crisis of democracy, where ecology is "the new opium for the masses" (Badiou in Swynedouw 2010, 219), and politics is mere "simulation" (Blühdorn, 2007). As such, the paper addresses relations between mundane and everyday audience practices, and societal and global macro processes.

ARS13 Making sense of mediated citizenship

PP 0995 Navigating morality in mediated relationships: an exploration of viewers' expectations and character behavior in mediated settings

Michelle Möri¹, Fahr Andreas¹

¹ Universität Freiburg / Université de Fribourg, Département für Kommunikationswissenschaft und Medienforschung, Fribourg, Switzerland

Questions of morality are prevalent in media productions. The relationship between character morality and viewers' affinity has been analyzed in the realm of affective disposition research (Zillmann and Cantor, 1977). Fewer studies focused on the connection between characters' morality and viewers' more long-term oriented parasocial relationships. This study expands the literature by respecting viewers' *moral expectations*.

Viewers' *moral expectations* are crucial for viewers' evaluations of (im)moral behaviors. In interpersonal communication, expectancy violation theory explains how people respond to unexpected behaviors (Burgooon and Jones, 1976). Existing studies applying expectancy violation theory to the mediated setting show that viewers also hold moral expectations toward media characters. When characters violated the viewers' expectations, these *expectation violations* were shown to influence viewers' parasocial relationships with these characters differently.

depending on the type of media character (hero vs. villain) and the viewers' expectations (e.g., moral expectations vs. social) (Bonus et al., 2021; Cohen, 2010; Matthews and Bonus, 2021).

RQ1: How do moral, ambiguous, and immoral behaviors of a media character influence viewers' parasocial relationships, and what role do viewers' moral expectations play in this relationship?

Method

An experimental study was conducted with viewers of *The Umbrella Academy*. The popular TV show stars morally diverse media characters (Nielsen Panel, 2022). Participants indicated their moral expectations (Bonus et al., 2021) toward Klaus, one of the protagonists. They read a fictional story about Klaus acting a) morally, b) immorally, or c) morally ambiguously in all five moral domains. Afterward, they rated their perception of Klaus' behavior regarding the five moral domains (Matthews and Bonus, 2021) and their parasocial relationships (Tukachinsky, 2011).

Results

A regression model was calculated for each of the five moral domains with the experimental condition as independent, parasocial relationships as dependent, and viewers' moral expectations as moderator variables (Table 1). For viewers with high moral expectations of care, fairness, and loyalty, the morality of a character's behavior increased viewers' parasocial relationships, which aligns with expectancy violation theory. When the expectation of moral behavior was confirmed, this positively affected the relationship between viewer and character. Regardless of viewers' moral expectations in relation to authority and purity, moral behavior increased viewers' parasocial relationships. This result suggests that violations of viewers' expectations of authority and purity do not negatively affect their relationships with the character, which contradicts expectancy violation theory (Burgoon, 2015).

Discussion

Overall, the results underline the importance of differentiating between the five moral domains also in the mediated setting, as differences emerge between care, fairness, and loyalty, and authority and purity. The assumptions of expectancy violation theory, grounded in interpersonal research, need to be retested for the relationship between viewers and media characters to confirm their validity in the mediated setting. In this study, with a character from the popular TV show *The Umbrella Academy*, only one specific character and viewers' relationship with him were tested. To expand the results, future studies need to include diverse media characters (e.g., very moral to very immoral characters), and different study settings (e.g., lab studies).

ARS13 Making sense of mediated citizenship

PP 0996 Social media and mass protests: Analyzing Twitter use during uprisings in Lebanon

Muhammad Sultan Malik¹, Annika Sehl¹, Sonja Kretzschmar², Christoph Neuberger³

¹ Catholic University of Eichstaett-Ingolstadt, Journalism, Eichstaett, Germany

² University of the Bundeswehr Munich, Management, Neubiberg, Germany

³ Free University of Berlin, Institute for Media and Communication Studies, Berlin, Germany

This study focuses on Twitter (currently branded as 'X') use in Lebanon for communicating about and organizing protests following increased political and economic instability in the country in recent years. The following question is posed:

RQ: How was Twitter used for protests in Lebanon around the Beirut blast?

The use of online platforms with regards to protests around the world has been analyzed through scholarly lens (Howard et al., 2011; Wang & Caskey, 2016) – their influence upon offline or real-world events, however, is debatable. Though experiencing varying degrees of social unrest in the past, protests across Lebanon picked pace in October 2019 as the government introduced new taxation measures. The demonstrations intensified further due to measures to counter COVID-19 and the explosion at the port of Beirut on August 04, 2020, badly damaging the capital city's infrastructure and resulting in over 200 casualties (Al Jazeera, 2023). To express their frustration over the country's state-of-affairs and the ruling elite's incompetencies, the Lebanese public took to the streets and used social media to communicate and organize (Cherici, 2020).

We used Twitter Academic Research API to gather tweets published six months before and after the explosion in Beirut. A total of 6.1 million tweets were gathered which were then analyzed through Guided Latent Dirichlet Allocation (LDA) topic modeling technique. Related seed words were provided to the algorithm to detect relevant themes or terms appearing in the corpus (Venugopalan & Gupta, 2022). The findings were contextualized by matching the results obtained with information provided about Lebanon for the study period on the Global Database of Events, Languages, and Tone (GDELT). Furthermore, to understand the tone of the tweets, a sentiment analysis of the Twitter data was also performed.

The findings indicate the dominance of overall negative sentiment in the Twitter data, including use of revolutionary hashtags around key national events. Terms such as 'revolution', 'martyr', 'force', 'security', 'lebanonprotests' etc., were extracted from the corpus through the Guided LDA. Examples of hashtags present in the tweets include: لبنان_ينهبُ

#(Lebanon rises), #لا_ثقة (No trust), and #لبنان_يثور (Lebanon revolts). Worsening economy resulted in further volatile online discourse, followed by calls for action against those behind the Beirut blast – the hashtags #كلن_يعني_كلن (All means all), #السبت_بكل_الساحات (Saturday in all squares), and #علقوا_المشائق_بالساحات (Hang the gallows in the squares) highlight the Lebanese public's anger and distrust over the ruling elite. The use of certain hashtags also served as a call to action to mobilize the public.

This research adds to the understanding of social media use for protests with a focus on a non-Western country that is engulfed by crises of various nature. Insights gained by the investigation of discourse of Lebanese users on Twitter can be supplemented by analyzing other popular online platforms, e.g., Facebook, Instagram, or TikTok. Moreover, the results can facilitate understanding social media use in the Middle East for expressing dissent and can be expanded to include other countries in the region confronting similar challenges.

ARS13 Making sense of mediated citizenship

PP 0997 What does the 'public' value? Exploring the societal value of social media for young audiences

Anna-Theresa Mayer¹

¹ Weizenbaum Institute for the Networked Society, Digital News Dynamics, Berlin, Germany

Social media is becoming increasingly relevant for news consumption and information seeking, especially among younger audiences (Newman et al., 2023). On social media, however, users not only have access to traditional legacy media, but also a broad range of other media and emergent communicating actors, such as social media influencers or content creators that – as current studies show – also provide content that fulfill the audience's informational needs (cf. Banjac & Hanusch, 2022; Tamboer et al., 2022; Wunderlich et al., 2022). This fundamental shift of the public sphere onto digital platforms has disrupted the traditional role of journalism and caused the emergence of novel news- and information-seeking practices. Research on younger audiences, for example, shows that their informational and news-related practices are less driven by a civic duty of staying informed, but rather related to everyday situations (Autenrieth et al., 2021), and increasingly encompass journalistic and non-journalistic sources (e.g., Wunderlich & Hölig, 2022). While research has advocated for a more audience-centric and holistic approach to explore the value of journalism in the contemporary, predominantly digital media landscape (cf. Broersma, 2019; Costera Meijer, 2013, 2022), our understanding as to the fundamental – both individual and societal – value of social media and content on social media for young audiences remains underdeveloped. Intertwining this scholarship with the more general concept of "public value" (Moore, 1995) and its adaptations to social media (see van Dijck, 2020; van Dijck et al., 2018) that address the fulfilment of public value on commercially-oriented platforms as well as the audience as an essential stakeholder both in its consumer- and citizen-based role in assessing the value of media products, this study takes a holistic, bottom-up approach and explores young audiences' perceptions of communicative actors and content that provide societally valuable/ public value-oriented services on social media.

This study conducted eight focus groups with young German social media users, stratified by age and formal education (N = 48). Utilizing an online platform, data was collected in two steps: Firstly, participants completed tasks regarding their perceived value of social media and social media news seeking and consumption practices on the platform. Based on the answers, we summarized the results and incorporated them into the respective focus group that followed afterwards. This step established a common ground of different individual values that social media provides for the participants and allowed during the focus groups for a more in-depth and concentrated discussion about which of these values can also be further perceived as a societal value/ public value of social media and which communicative actors and content participants perceive as fulfilling specific values. Currently, the focus group transcripts are undergoing qualitative content analysis (Mayring, 2014). The expected findings from the combination of the tasks and focus group discussions will provide a more nuanced understanding of young social media audiences' perceptions of communicative actors and content that provide societally valuable/ public value-oriented services on social media.

PP 1095 Between graphical 'excellence', literacy, and polysemy: A bi-national study of political visualization reception

Eedan Amit-Danhi¹, Christian Pentzold², Thomas Rakebrand²

¹ University of Groningen, Centre for Journalism and Media Studies, Groningen, Netherlands

² University of Leipzig, Department for Communication and Media Studies at the ., Leipzig, Germany

Visualizations, the output of visual encoding of information, are a ubiquitous digital political genre. Their design practices are deeply rooted in a cognitively-oriented model of information transfer wherein "graphical excellence" (Tufte, 2001) should result in a 'correct' reading (Kamat et al., 2014). However, visualizations' effectiveness is a fickle, culturally-constructed concept, as a semantically-fixed graph is an unattainable ideal (Kennedy et al., 2018; van Eijck et al., 2011). Studying visualizations as mere communicative vessels neglects audience-side considerations and decoding processes that resist determination (Hall, 1980). Furthermore, visualizations' best-practices may be

opposed to politicians' use of "strategic ambiguity" (Eisenberg, 1984) to increase appeal. Thus, in this paper, we explore the relationship between graphical excellence, audience's graphical literacy performances, and the ensuing polysemy in personal and group readings of digital political visualizations. We ask: *how do audiences decode political messages embedded in visualizations shared online*.

We convened 8 focus group sessions of 8–10 participants each (67 in total), in two age groups (20–35; 40–55), varied in educational, political, and socio-economic backgrounds, in Germany and Israel. We designed a protocol that combines individual reflections and group discussions, in which participants first utilized an individual decoding-sheet to record their reading, followed by a group discussion. We introduced four types of stimuli: a COVID-19 "flatten the curve" visualization (identical across all groups); an informationally- and graphically-complex visualization; an ostensibly persuasive, low-information visualization; a side-by-side comparison of two conflicting visualizations, based on the same data and visualization mode. This protocol was implemented in two contexts, a health crisis (COVID-19), and a locally polarizing topic (migration or judicial reform).

Following thematic coding of group discourse and individual decoding-sheets, we note that all visualizations, regardless of graphical excellence or topic, resulted in highly polysemic readings. Participants found the task of verbalizing their reading of graphs to be a challenging endeavor. They attributed this difficulty to pre-existing *graphical avoidance* tendencies or expressed varying degrees of willingness to commit to a singular reading. We find that participants approach visualizations with interpretive freedom: they may refuse to engage altogether or choose to evaluate their rhetorical and analytical components. Furthermore, participants often re-shifted their individual readings during group discussions, in which domain-literacy performances were used to assert dominance and indicate identity-alignment. We find that participants perceive graphical literacy as the ability to read *beyond the intended meaning* and to discern political strategies among the inevitable polysemy of visualizations. Graphical literacy, then, is not merely a set of skills and intellectual abilities, but is also imbricated with worldviews, normative assumptions, and is affected by group dynamics. It is from this amalgam that audiences come to engage with visualizations, as their 'reading' is equally an expression of political identity and prowess, as it is of their intellect. It is thus imperative to view political visualizations' role in the digital informational landscape with both strategic ambiguity and audience's interpretive freedom in mind, by making 'graphical excellence' a dual pursuit, in which both audiences and visualizers take on responsibility in the creation and interpretation of digital political visualizations.

PP 1096 What will we be streaming tonight? And why? An analysis of motivations for VOD consumption in Belgium

Isabelle Puskas¹, Noémie Forest¹, Wendy Van den Broeck¹, Tim Raats¹

¹ Vrije Universiteit Brussel, imec-SMIT-VUB, Brussels, Belgium

Keywords: *Audience consumption and motivation patterns; Streaming services; Small media markets; Flemish media user; Diary studies; Audience interviews; Recommender systems and discoverability; Video-on-Demand*

Digitization and the rapid growth of different video-on-demand (VOD) streaming services have changed our habits of consuming content (Kenney & Zysman, 2016). Research has increasingly informed scholars on the adoption and uses of different kinds of on-demand and non-linear viewing. Research has convincingly showed the affordances of VOD and non-linear consumption over different media uses (Evens et al. 2023; Rigby, Brumby, Cox, et al., 2018; Rigby, Brumby, Gould, et al., 2018; Spilker et al., 2020). Little is known however about the motivations for choosing (i) specific (streaming) services, (ii) and particular types of content or titles in VOD catalogues. Additionally, research is limited on the extent to which motivations from users differ across multiple streaming services they consume. This is of particular importance for small legacy players, who are increasingly engaged in the deployment of their own subscription and advertisement-based VOD models, but lack the scale to compete with functionalities, content and curation strategies of global streamers (Raats & Evens, 2021; d'Arma et al. 2021).

This study specifically aims to investigate different motivations of viewers in choosing particular services and content. The research question is formulated as follows: "Within the daily viewing routines of Flemish viewers, what are the different motivations in choosing particular services, devices and content?" with the following sub questions: (i) what key differences can be identified between motivations for choosing (specific) Flemish players over global streamers and vice versa; (ii) and how different affordances related to device, content and context affect the decision-making process of Flemish viewers. The paper proposes an analytical framework that sets out from a threefold categorization of affordances: technological affordances (e.g. functionalities, recommender systems and personalization), context affordances (e.g. rituals and routines) and content affordances (e.g. genre, quality, localness, authenticity). This framework allows us to better grasp the interplay between findings from positioning, content and service branding with findings in consumption studies.

This paper presents the findings from a large-scale multifaceted audience study with VOD consumers in Flanders (Belgium).

The study employed a mixed method approach consisting of an exploratory survey (N = 83), a diary study (N = 65) and semi-structured face-to-face interviews (N = 60).

The findings highlighted in the paper, include, amongst others, the continued need of respondents for a sense of community and structure. An aspiration to stay up to date with specific TV shows and series reflects a need for a shared experience and a desire to engage in conversations. The need for more structure and shared experiences in entertainment consumption increases as audiences face difficulties of navigating through vast content libraries. This is demonstrated through the appreciation of audiences for notifications of new releases and the appreciation for a live button on VOD services of broadcasters.

PP 1097 Everybody's watching their own stream – Using trained introspection and self-observation to explore strategies of media use

Felix Frey¹, Celine Dorrani¹, Benjamin Krämer², Laura Aleman², Max Lechner²

¹ Leipzig University, Communication and Media Studies, Leipzig, Germany

² LMU München, Media and Communication, Munich, Germany

Questions about "how much", "why" and "to what effect" audiences use "which" particular media have often been the focus of our research. Less attention has been paid to "how" – in which different ways – individuals approach, navigate, relate to, and interpret media in particular situations, and even less to how these elements are combined into comprehensive modes or strategies of media use. However, it can be assumed that such qualitatively different approaches to media use can shape the reception experience as well as its effects. The theoretical framework of strategies of media use (Krämer, 2013) understands media use as strategic practice linked to social position (following Bourdieu, 1972) and conceptualizes strategies of media use as combinations of elements on ten dimensions: Stakes, returns, costs, gratifications, spatial and social arrangements of media use, navigation and processing styles as well as the media repertoire of users can be empirically investigated with standard observational or self-report methods. However, these methods reach their limits when they are applied to how users position themselves towards media content during reception, i.e., to the attentional focus, modality judgment, and (phenomenological) attitude adopted towards the medium. In order to grasp these subtle but consequential states of mind and to qualitatively describe the broadest possible spectrum of different media usage strategies in as much detail as possible we applied recently revitalized systematic, trained introspection methods (cf. e.g. Burkart, 2018) in a media diary study. To this end, 20 participants (13 female, 1 diverse, 19–45 years) were prepared for differentiated introspective self-observation through reading, discussion and exercises. Each participant recorded around 9 media reception episodes over the course of three weeks. Episodes were selected partly via random reminders transmitted by smartphone, partly via researcher instructions (e.g., to use content incongruent to one's own opinion), or based on the participants' own assessment as a noteworthy situation. A total of 156 reception episodes covering a wide range of devices and genres (e.g., video and music streaming, social media, podcasts, gaming), spatial (car, public places, private environments) and social (alone, couples, groups, strangers) contexts of media use were recorded. The protocols were analyzed and interpreted using a combined deductive and inductive coding strategy (Kuckartz & Rädiker, 2023) in MAXQDA, aiming at identifying, differentiating and conceptually defining a broad spectrum of strategy elements as well as identifying combinations of these elements (i.e., strategies of media use). Regarding the inner attitudes towards media content, our results show, for example, that perceptions of the ontological status of portrayed objects and events go far beyond the dichotomy of "reality" and "fiction": The participants differentiated various ways in which reality and fiction were mixed (from fictional portrayals with references to "real" persons and events to slightly exaggerated portrayals of reality) or nested (e.g., when a podcast discussed a real fiction book), but also various degrees of uncertainty and fluctuations in their realism judgments. Also, a multi-faceted picture of cognitive, emotional, and moral stances towards media content as well as various patterns of attention allocation emerged.

ARS14 Audivisualities and audiences

PP 1098 Transmedial imaginaries at the Museum

Susana Tosca¹, Nanna Holdgaard², Petersen Martin²

¹ University of Southern Denmark, Department of Design- Media and Educational Science, Odense, Denmark

² National Museum, Modern History and World Cultures, Copenhagen, Denmark

Cultural heritage is a significant and enduring source of inspiration in the contemporary mediascape, as evidenced by tv-series like *Vikings* or *Kingdom*, games like *Assassin's Creed*, comics like *Vinland Saga*, anime like *Blue Eye Samurai* or novels such as the *Kane Chronicles*. These works get repurposed in a global transmedial ecology, where content is remixed and circulated in social media, acquiring new meanings and becoming part of the modern vernacular of popular culture. Viking hairstyles and Japanese tattoos trend on Instagram, and ancient hieroglyphs become a template for viral meme production.

The heterogeneous imaginaries of popular culture shape the knowledge and expectations that audiences bring with them when visiting ethnographic and historical museums, defying historical facts and scientific evidence (Wintle 2017) and producing alternative epistemologies (Lewandosky et al. 2017). At the same time, curators are also media recipients, so contemporary exhibition design is often inspired by the themes and aesthetics of popular culture. This is not without controversy, as the outrage around Jim Lyngvild's *Vikings* exhibition perfectly illustrates (Sindbæk 2018).

Although the field of museum audience studies has paid attention to visitors' personal contexts in relation to motivation, learning and experience-preferences (i.e., Falk and Dierking 1992), it has not considered popular media culture specifically. There have been a few studies about the ways in which popular culture produces wrong beliefs, or "naive conceptions" in science museums (Macdonald 1992; Borun 1993) and also about how popular culture influences national identity building (Watson 2020).

This presentation will explore the reciprocal relationship between popular media products and cultural heritage illustrated by two specific cases of exhibition-making and reception at the National Museum of Copenhagen: the new "Vølv" viking exhibition and a renovation of the communication around the existing East Asian Collection. In our involvement with these two projects, we have proposed to work with the concept of shared *imaginaries*, or ideas and ethos that affect individual cognition (Gaonkar 2002: 4). Imaginaries have a framing power that defines the range of what makes sense in relation to a specific theme (Vogler 2002: 625). Popular culture imaginaries are alive and constantly in-the-making, fuelled by the powerful images offered by media (De Groot 2016). To investigate the emergence and composition of these imaginaries, we draw on the concept of transmediality (Tosca & Klastrop 2019), which integrates the experiential, aesthetic and media-affordance perspectives to investigate complex reception across platforms, and how it affects epistemic emotion (Morton 2010).

PP 1099 A laboratory experiment examining audience responses to touristic virtual reality videos

Johanna Klausning¹, Regina Darenko¹, Max Knobloch¹, Jens Nötzold¹, Nadège Seibring¹, Jana Windoffer¹, Felix Reer¹

¹ University of Münster, Department of Communication, Münster, Germany

Virtual Reality (VR) technology is more and more used in touristic contexts: According to recent representative data from Germany, "going on virtual vacation" is among the topmost popular forms of VR use (Bitkom, 2022). There are even channels on platforms like YouTube that have specialized in VR tourism, like VR Gorilla or Virtual Travel. They feature short 360° videos that can be viewed with a VR headset and show popular touristic locations, like Machu Picchu, or take the recipients on a virtual city tour.

Despite the growing popularity of VR tourism, empirical research on why such content is attractive and how it is experienced is still scarce. The current laboratory study aimed to fill this research gap. Following a 2x2 between-subjects design, we examined how content type (hedonic vs. eudaimonic) and the form of presentation (non-VR vs. VR) influence audience responses in terms of experiencing presence, enjoyment, appreciation, travel intentions, and video sharing intentions.

Content type was manipulated by showing the participants either a video of a more eudaimonic or a more hedonic focused touristic experience. This distinction is based on recent research (e.g., Lee & Jeong, 2021), describing hedonic tourist experiences as more focused on relaxation (e.g., beach holiday) and eudaimonic tourist experiences as more focused on gaining new insights (e.g., city tour). The videos we used as the stimuli were adopted from VR Gorilla and were selected based on a pre-test (N = 53). The form of presentation was manipulated by either using the original 360° videos viewed with a VR headset, or by viewing content-identical 2D videos on a flatscreen.

For the main study, 72 participants (45 females, 26 males, 1 unknown gender) were invited to the lab and were assigned to one of the four experimental conditions. After watching the stimulus, participants filled in a questionnaire measuring the different variables using established scales. Two-way analyses of variance (ANOVAs) were conducted to examine how audience responses differed between the experimental groups and whether there were significant interaction effects between content type and form of presentation. We found that viewing the VR versions led to stronger feelings of presence and enjoyment than viewing the classical videos. Further, the results indicated an increase in sharing and travel intentions in the VR condition. Interestingly, the type of content (hedonic or eudaimonic) had only minimal influence on enjoyment, appreciation, or travel and sharing intentions, which diverges from previous research (Oliver & Raney, 2011). There were no significant interaction effects.

Taken together, our results underline the usefulness of applying VR technology in tourism contexts. The VR versions of the stimuli were more effective in inducing positive feelings and also led to stronger behavior intentions than the 2D-videos and these effects were independent from the type of content. Our findings have several implications for media producers, advertisers, and researchers in media psychology and communication and may serve as a basis for future research on VR tourism, examining the complexities of VR technologies and content types in shaping user experiences and travel intentions in more depth.

PP 0069 Cultural culinary crossroads: The impact of digital influencers on teenagers' food choices across cultures

[Shanshan Shi](#)¹

¹ University of Calgary, Department of Communication- Media and Film, Calgary, Canada

This study examines the impact of digital influencers on the dietary choices of teenagers in an era where digital platforms cut across national and cultural barriers, with a particular emphasis on the attractiveness of food across cultural divides. The research explores how influencers on digital platforms affect teenagers' appetites for different cultural foods, particularly TikTok and Douyin. With more explosion in global food culture, this study is crucial to understanding the shifting dynamics of teenage food preferences.

The theoretical framework of the research is based on social learning theory, which states that observational learning, imitation, and modeling significantly influence behavior. This theoretical perspective contributes to an understanding of how adolescents imitate the eating habits and choices displayed by digital influencers, potentially diversifying their culinary preferences.

The research employs a mixed methodology. A content analysis is performed on 200 selected videos from five well-known TikTok and Douyin influencers. The investigation attempts to identify the trends and strategies influencers use to promote a diverse food culture, along with how they resonate with teen audiences. Furthermore, the study aims to incorporate a survey component targeting adolescents. The primary objective of this survey is to gain direct insights into how exposure to digital influencers impacts their interest in and consumption of multicultural foods. By bridging the gap between online influence and real-life food choices, this survey aims to determine how much digital content influences dietary decisions.

This research will enhance the awareness of the complex interactions that exist between young people's food choices, cultural exposure, and digital media. By focusing on TikTok and Douyin, the study sheds light on the globalization of food preferences and the critical role of digital influencers in this sector. The findings are expected to contribute to dialogue about the role of digital media in defining young people's cultural and dietary boundaries, emphasizing the importance of ethical considerations and culturally sensitive approaches in digital food communication.

PP 0070 Sing-alongs, dance battles, and self-harm: Exploring the spectrum of social media challenges on TikTok through manual content analysis

[Lara Kobilke](#)¹, [Antonia Markiewitz](#)¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

A vast array of Social Media Challenges (SMCs) significantly influences the behavior of young users (Khasawneh et al., 2021). SMCs range from positive community-building exercises (e.g., crowdfunding or collecting trash) to neutral activities like singing or dancing, and extend to negative, potentially dangerous dares. This spectrum of outcomes has garnered the interest of media outlets and researchers (Khasawneh et al., 2021; Park et al., 2023), but current research predominantly focuses on the adverse aspects of SMCs, highlighting evidence that videos of dangerous SMCs are not only numerous but also reach a broad audience (BLINDED). This emphasis on negative aspects limits understanding of the potential benefits of SMCs, such as fostering social connectedness and belonging among youth (Astori et al., 2023; Ortega-Baron et al., 2022). To bridge this gap, our study explores the full spectrum of SMCs on TikTok, currently the most influential social media platform among young individuals (Stahl & Literat, 2023).

Method

Using a keyword-based approach, we conducted a manual content analysis of N = 2,533 TikTok challenge videos in German and English. These videos, collected through scraping in October and November 2023, encompass a wide range of challenges characterized by unique identifiers such as challenge names, hashtags, and visual or auditory elements that promote recognition of the challenge. A team of 26 trained coders analyzed these videos after several rounds of pretesting to enhance intercoder reliability, focusing on their content characteristics and the nature of the challenges they portrayed.

Results

Our analysis reveals that a significant majority of challenge videos on TikTok depict neutral challenges, primarily centered around harmless activities like singing and dancing. Positive challenges, contributing to community building and personal development, constitute about 5% of all videos. Notably, around one-third of all challenge videos on TikTok are categorized as negative, potentially dangerous challenges. The most common content in this category involves depictions of pain occurring during challenge execution. Despite the presence of these negative challenges, videos focusing on neutral or positive challenges achieve notably higher reach and engagement rates. TikTok's content regulation strategies are evident, with the platform actively blocking very dangerous challenges

(approximately 29% of potentially harmful challenge videos being removed during the study period) and associated search terms, making it (almost) impossible to circumvent these with modified search terms. However, when regulation is not as stringent, challenges like the Hot Chip Challenge can quickly gain popularity and reach.

Conclusion and Discussion

Our study contributes to the understanding of SMCs on TikTok, emphasizing the importance of recognizing the positive and neutral aspects of these challenges alongside the negative ones. Our findings suggest that while potentially harmful challenges exist, they attract less attention; the platform is predominantly used for harmless entertainment and positive community engagement. TikTok's role in moderating content is crucial, but our results also indicate the necessity for continuous monitoring and adaptive strategies to ensure a safe online environment for young users.

CYM01 Social media and youth I

PP 0071 In their own words: How adolescents differ in their social media use and how it affects them

[Amber Van Der Wal](#)¹, Patti Valkenburg¹, Irene van Driel¹

¹ University of Amsterdam – Amsterdam School of Communication Research, Communication Science, Amsterdam, Netherlands

Introduction

Despite extensive research, findings on the relationship between adolescents' social media use (SMU) and well-being are mixed, indicating the existence of both positive and negative associations with well-being. This underscores the need for more nuanced, idiographic approaches that acknowledge individual differences in the relationship between SMU and well-being. The two streams of existing idiographic studies, however, have limitations. The first stream of experience sampling studies often rely on narrow quantitative measures, focusing on time spent on social media and single well-being indicators. The second stream, which consists of a handful of qualitative studies, has primarily focused on the diversity of adolescents' experiences, neglecting how this heterogeneity may also be reflected in other parts of the media effects process as conceptualized in the differential susceptibility to media effects model.

Therefore, the first goal of this study is to qualitatively examine homogeneity (communalities) and heterogeneity (differences) in adolescents' motives and moods leading to SMU, the nature of this use, their affective responses, and perceived longer-term effects. Second, we investigate the existence of "within-person duality", where an individual experiences both positive and negative influences of SMU, both in immediate affective responses and longer-term consequences.

Method

Eight focus groups were held in Spring 2022. In total, 55 adolescents (52.7% girls) between 14 and 17 years old from diverse backgrounds participated (5 to 8 adolescents per group). Each focus group lasted 90 minutes and the conversations were videotaped and transcribed. Participants received monetary compensation.

Results

Transcriptions were analyzed using deductive thematic analysis. The analysis revealed large homogeneity in adolescents' motives for SMU and in the social media that are most used (i.e., Snapchat, Instagram, and TikTok). But we found considerable heterogeneity in the moods that predict SMU, social media screentime, the platforms that are used beyond the three commonly used platforms, the affective responses to SMU, and the longer-term effects adolescents experienced due to their SMU. Additionally, our findings revealed within-person duality in affective responses and long-term effects of SMU. This duality, where the same individual is affected in both positive and negative ways by SMU, manifested concurrently, alternatingly, and sequentially, and in cognitive and affective dimensions of well-being.

Implications

Our findings have important implications. The large heterogeneity found in adolescents' SMU illustrates the need for future research to shift to an activity-based, cross-platform approach in studying adolescents' SMU and well-being. Furthermore, in doing so, future research should focus on measuring adolescents' subjective experiences associated with their social media activities, as this study showed that different adolescents have different or even opposite affective responses to the same social media activities. Finally, our findings regarding within-person duality – encompassing cognitive and affective dimensions and varying over time and situations – deepen our understanding of how social media can differentially impact adolescents' well-being. Future research needs to recognize and further explore how homogeneity, heterogeneity, and duality individually and collectively influence the relationship between adolescents' SMU and well-being.

CYM01 Social media and youth I

PP 0072 The signs of times: playing life on TikTok?

[Teresa Castro](#)¹

¹ Universidade Lusófona, CICANT COFAC – 501679529, Lisboa, Portugal

This paper departs from longitudinal research with N = 18 families (2017–2022), with diverse ways of living and different demographics, touched by the effects of the life course (internal and external factors (Zaman et al., 2016) and globalization (Castro & Ponte, 2021)). The families are based in Portugal (n = 16) and England (n = 2) and as expected they were not immune to the signs of these uncertain, and deeply mediatized (Hepp & Hasebrink, 2018) times, which prompted an unprecedented digital immersion of children's everyday lives with consequences on family dynamics and processes of digital mediation. A total of N = 33 children were considered (boys (n = 19); girls (n = 14)). In line with the theme of the conference, I depart from the questions – How do socially disordered events incite on one hand the parental mediation relief and on the other hand children's migration to TikTok? How TikTok's affordances are integrating into children's offline practices of play? An ethnographic research was conducted with the families in their households. Families' consent was requested and negotiated before each visit. The families' recruitment began with personal contacts and evolved into a snowball process. The main data collection procedures included observation, informed conversational interviews or situational conversations through which the researcher and participants' interactions evolve into natural and spontaneous conversations (Punch, 1998; Denzin, 1989). The conversations were audiotaped and parts of it were filmed, and pictures were taken. Ethical guidelines required anonymization of transcribed data, and pictures were taken respecting the image and privacy of the children. The analysis of the data was supported by Marsh et al. (2016) interdisciplinary framework (psychology, Sociology and education) of play with the added value of paying attention to digital technologies in the field of education. They found three characteristics of converged play: 'multi-modal', 'global-local', and 'traditional-digital' and adapted Hughes' (2002) taxonomy to children's play with digital technologies. They proposed 16 types of play for the digital age.

In the scope of this study, children themselves were the ones who brought TikTok from the online sphere (public) to the family sphere (private) – as digital brokers in control of this social media affordances (despite their age under 13), negotiating actively their digital autonomy and rights and how this circumstance raised in parents' the reflexive revision of digital mediation of their young ones.

This paper analyses the characteristics of converged play in the findings. In the families, 8 types of play were identified: symbolic, socio-dramatic, creative, communication, locomotor, fantasy, object and role play. Some topics will organize this paper around children in the short-video culture, namely, i) the display of "doing family" (Morgan, 2015) through carefully choreographed moments, ii) experimentation of different roles; iii) self-display; iv) the embodiment of TikTok body language in offline settings.

CYM01 Social media and youth I

PP 0073 What defines immoral behaviours on social media according to young people: A mixed methods approach

[Kristina Rakinić](#)¹

¹ Faculty of Social Sciences, Centre for Methodology and Informatics, Ljubljana, Slovenia

Social media plays an important role and context for today's youth. However, little attention has been paid to the question of what is perceived as immoral in social media, especially by young people. Most research attention has been focused on specific immoral acts, e.g. cyberbullying or fake news. We argue that morality and immoral behaviour on social media is a broader, overarching concept that is worth exploring, especially as social media is an important developmental context for adolescents today. Our research was based on two studies that utilised a mixed methods approach and, more specifically, we used a sequential exploratory design. The first exploratory, qualitative study aimed to gain insights into young people's perceptions of what they consider to be immoral behaviour on social media and to develop a questionnaire based on this. The second, quantitative study aimed to test the psychometric properties of the new questionnaire on a convenience sample of adolescents and to gain insights into the prevalence of immoral behaviour on social media. The first study included 89 participants, all first-year students. An open-ended questionnaire was used and participants were asked to write down all immoral behaviours on social media. Their responses were analysed using thematic analysis. To categorise immoral behaviour, we rely on Moral foundation theory. A descriptive theory of human morality organises morality along five moral foundations: care/harm, fairness/cheating, loyalty/betrayal, authority/subversion, and sanctity/degradation. We identify immoral actions in direct as well as indirect interaction with others on social media, each with four more specific immoral behaviours, such as misrepresentation or sharing others' content without their permission. Based on the results, we designed two versions of questionnaires: one focusing on individuals' own moral behaviours and the other on their perceptions of immoral behaviours by others on social media. 341 adolescents participated in

the second study. We tested the psychometric properties of the developed questionnaires (reliability, construct and convergent validity). In general, the mean scores for observing others' immoral actions were higher than for their own immoral actions, with hateful and insulting comments being perceived most frequently. Our research broadens the scope of our understanding of morality in social media among young people. In conclusion, these findings not only contribute to the existing body of research but also highlight the need for nuanced considerations in the ongoing discourse on moral behaviour in digital spaces.

CYM02 Literacies & skills

PP 0172 Digital literacy: An analysis of teachers' perspectives in Portugal based on the ySKILLS conceptual framework

[Lidia Marôpo](#)¹, [Susana Batista](#)², [Ana Kubrusly](#)³

¹ Polytechnic University of Setúbal and CICS.NOVA, Escola Superior de Educação/Departamento de Ciências da Comunicação e da Linguagem, Setúbal, Portugal

² CICS.NOVA- NOVA University of Lisbon, Department of Sociology, Lisbon, Portugal

³ CICS.NOVA- NOVA University of Lisbon and Polytechnic University of Setúbal, Department of Communication Sciences, Lisbon, Portugal

There is a consensus that digital literacy and its various elements are essential components of training in the 21st century (Liu et al., 2020). Furthermore, there is a substantial investment in children and young people's access to information and communication technology in Europe (Livingstone, Mascheroni & Stoilova, 2021). Nevertheless, despite the growing academic and sociopolitical debate about the central role of education in preparing youth to act ethically, safely, and productively in digital environments, school curricula are still largely criticized for their narrow perspective, mainly based on technical skills (Falloon, 2020). A list of technical proficiencies and simplistic rules for safely engaging online dominates teaching, but to be "digitally literate" nowadays requires dealing with new challenges such as managing personal data and online presence safely, using ethics and judgment oriented to social justice, and building knowledge and collaborating in virtual contexts (Buchholz et al., 2020; Falloon, 2020). Considering this increasingly complex digital environment, the EU Horizon 2020 ySKILLS Project draws on a recent literature review and empirical research to propose a holistic perspective of digital literacy, consisting of both skills and knowledge, based on four dimensions: (1) technical and operational; (2) information navigation and processing; (3) communication and interaction; and (4) content creation and production (Helsper et al., 2020; Leslie et al., 2020). Each dimension reflects functional (to understand and use technical functionalities) and critical (understanding how and why devices and content are produced in specific ways) aspects. All four are considered fundamental to full participation in digital societies.

To better know how ICT teachers face the challenge of promoting these multidimensional skills and knowledge, we conducted semi-directive interviews (Ghiglione and Matalon, 1997) with twenty teachers (ISCED 1–2) covering different regions of Portugal and diversity of gender, age, and professional experience. The goal is to understand teachers' perspectives on children's digital literacy. To this end, we defined three research questions: 1. What are digital skills for teachers, and which ySKILLS dimensions do they consider essential for children? 2. How do teachers evaluate the school's role and challenges in developing students' digital literacy? 3. Which digital skills do students master best and worst from teachers' perspective?

The findings of this study suggest that teachers have limited conceptions of digital literacy, as they define and value them mainly in terms of the functional aspects of two dimensions of the ySKILLS conceptual framework: technical and operational and information navigation and processing. Students are seen as skilled only in their entertainment and socialization interests. Moreover, their digital safety and training for future professional performance are central topics of concern. Nonetheless, teachers are very critical of their work conditions, for instance, the short class time, extensive curriculum, obsolete computers, and poor internet connection. Some stress that they need to be heard about public policies on digital education, particularly when it comes to public investment in notebooks for students (with flaws in the logistics for their maintenance) to the detriment of school computers.

CYM02 Literacies & skills

PP 0173 Theorising the role of digital literacy in children's wellbeing

[Giovanna Mascheroni](#)¹, [Sonia Livingstone](#)², [David Smahel](#)³, [Ellen Helsper](#)²

¹ Università Cattolica del Sacro Cuore, Facoltà di Scienze Politiche e Sociali, Milan, Italy

² London School of Economics and Political Science, Department of Media and Communications, London, United Kingdom

³ Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Digital literacy is widely seen as key to children's and young people's fruitful participation in digital societies. However, the definition and measurement of digital literacy has remained contested. Moreover, the role of digital literacy in promoting young people's wellbeing and social inclusion has been under-investigated and under-theorised. Therefore, we propose a conceptualisation of digital literacy as multidimensional, consisting of four dimensions (technical and operational, information navigation and processing, communication and interaction, and content creation and production) each with skills and knowledge components. This conceptualisation was supported by empirical work:

a three-wave longitudinal survey among 12-to-17-year-olds in six European countries and performance tests, three qualitative in-depth investigations and a systematic evidence review. Based on the empirical findings validating the conceptualisation of digital literacy, we developed a new theoretical model with digital literacy at the centre, mediating between antecedents and consequences. The model includes, and distinguishes between, individual and social factors as antecedents of digital literacy, digital engagement variables, and wellbeing outcomes.

Various theories have informed the model. First, the model builds on digital inequalities research, which looks at the links between digital and socioeconomic and sociocultural inequalities (Helsper, 2021). In our model, we have adapted the classification of the four domains of digital literacy from this research (Van Deursen, Helsper & Eynon, 2016) and refined the existing conceptualisations in this field by emphasising the need to distinguish functional skills and critical knowledge. The development of the model was also influenced by the DSMM model (Valkenburg & Peter, 2013), which identified three types of types of susceptibility to media effects: dispositional, developmental, and social. Additionally, our model was inspired by the iMEW model (Smahel et al, 2020) which differentiated various types of wellbeing as the outcome and proposed possible long-term and short-term effects. However, in contrast to the DSMM and iMEW models, our model focuses on understanding the role of digital skills in the relation to media effects. Finally, the model rests upon the EU Kids Online's (Livingstone, Mascheroni & Staksrud, 2018) holistic approach that integrates digital skills and literacy within the wider analysis of online opportunities and risks. However, while in the EU Kids Online model digital skills are seen as entwined with digital practices, our model distinguishes knowledge from practice, recognising that use may not always imply knowledge, and nor does knowledge determine use.

We illustrate the value of the new model through analyses of the longitudinal survey, against the backdrop of existing theories. The findings show that digital literacy can contribute to beneficial youth outcomes, including the key dimensions of wellbeing. Hence, policymakers, educators and even industry should act to enhance children's and young people's digital skills and knowledge and smooth the pathway from digital literacy to wellbeing. Recognising the complex relationships between the four dimensions of digital literacy and the different dimensions of wellbeing paves the way for future research and new questions, such as those around the relationship between digital literacy and children's rights.

PP 0174 Social media literacy interventions among adolescents in schools: A cluster randomized controlled trial testing the Vibe Check program

Lara Schreurs^{1,2,3}, Laura Vandenbosch¹

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

² Research Foundation – Flanders, FWO-Vlaanderen, Brussels, Belgium

³ U Hasselt, School of Social Sciences, Hasselt, Belgium

Due to the ubiquitous presence of social media in adolescents' daily lives, SML is needed to empower them in their social media interactions. In this respect, interventions have been set up that teach adolescents SML skills. Yet, these interventions all focused on transmitting cognitive SML (e.g., critical thinking about idealized and curated depictions of appearance and lifestyle). Recent research showed though that affective SML (e.g., being able to adaptively regulate negative emotions that result from exposure to idealized content) has more potential to mitigate the disruptive effects of social media on adolescents' lives. Therefore, this study designed a SML-intervention, called the Vibe Check, that focuses on affective SML in addition to cognitive SML and tested its effectiveness in increasing SML (cognitive and affective), offline well-being (body-esteem, FOMO, social well-being) and online well-being (digital flourishing).

The Vibe Check intervention theoretically draws on social-emotional development programs to help adolescents recognize and express the emotions they experience when interacting with social media, and it teaches them strategies to adaptively deal with these emotions. A cluster-randomized controlled trial was conducted. Schools were assigned to the intervention or the control condition. 636 adolescents ($M_{age} = 13.78$, $SD = .66$; 49.6% girls) completed assessments at baseline, one week post baseline which was immediately following-up the intervention and three weeks post baseline.

In R ("lme4" package), a first series of linear mixed-effects regressions compared baseline with immediate post-intervention between intervention and control group. Condition (0 = control, 1 = intervention,) time (0 = baseline, 1 = immediate post-intervention) and their interaction were independent variables. Demographics were included as covariates. Potential clustering effects within adolescents and schools were accounted for. REML was used. The second series of linear mixed-effects regression models only differed from the first in that it compared baseline with two-week post-intervention between intervention and control group.

In the first series, there were three significant interaction effects of condition with time, for social well-being, digital flourishing-control and cognitive SML. Their coefficients were unexpectedly negative, meaning that the intervention group decreased in social well-being, had less control over their digital media use and less cognitive SML from

baseline to the immediate follow-up, compared to the control group. In the second series, these interactions were not significant and a positive significant interaction effect of condition with time was found for digital flourishing-connection. This means that the intervention group improved in flourishing in their connections online from baseline to two-week follow-up compared to the control group.

The negative effects immediately following the intervention imply that the intervention may have installed in adolescents a highly reflective mindset about themselves and their social media interactions. Special attention to participants' overall well-being may thus be needed in SML interventions. A positive effect is found two weeks later, hinting at the potential of Vibe Check to increase digital flourishing over time. Yet, multiple sessions may be needed to really get the messages across. These results highlight the need to test the effectiveness of SML programs for adolescents, both at the short term and at a longer term.

PP 0175 Digital Skills Formation in Peer Networks: Exploring advice giving and taking in Classrooms

Petro Tolochko¹, [Jana Bernhard](#)¹, Azade Kakavand¹, Aytalina Kulichkina¹, Hajo Boomgaarden¹

¹ University of Vienna, Computational Communication Science Lab, Vienna, Austria

Developing digital skills is crucial for young people in contemporary societies, impacting well-being, educational achievement, and employment outcomes. Socioeconomic background and access to technology shape adolescents' digital skills, with recent research emphasizing the role of peer learning (Boomgaarden et al., 2023). This study delves into advice-seeking, advice-giving, and friendship networks within school classrooms and their interplay with students' digital skills. Adopting a socio-centric network approach, we explore these dynamics across classes, schools, and countries, recognizing the growing significance of digital proficiency.

Students' daily interactions with peers strongly shape their experiences, cognitions, emotions, and behaviors (Bronfenbrenner & Morris, 2006), making them an important, yet thus far understudied component for analyzing the development of digital skills. Classroom networks have primarily been researched in their relationship to academic or psychological well-being (Wang et al., 2020). We rely on the conceptualization and measurement of digital skills recently proposed by Helsper et al. (2021): technical and operational skills, information navigation and processing skills, communication/interaction skills, and content creation skills.

Using a novel dataset of social networks within classrooms, we surveyed students in 212 classes across 18 schools in Germany, Italy, and Portugal, to identify their three closest friends and to indicate the frequency with which they give or receive advice on digital skills. Exponential Random Graph Models were employed to analyze advice-giving, advice-seeking, and friendship networks, providing a robust statistical framework for understanding complex network structures.

In the context of advice-giving, our study proposes hypotheses on the influence of self-reported and perceived digital skills. Perceived skills are expected to be a stronger predictor than self-reported skills, with considerations for gender and age differences in self-assessment. Conversely, regarding advice-seeking networks, the study anticipates that self-reported digital skills have a more pronounced influence on digital skills. Additionally, the research posits that gender plays a more significant role in predicting friendship connections than either self-reported or perceived digital skills, emphasizing a homophily effect.

By examining the intricate interplay between students' digital skills and social networks in diverse classroom settings, this research aims to shed light on the nuanced dynamics shaping digital skills in academic environments in an increasingly digitalized world. Results may contribute to better awareness of educational institutions of alternative routes to digital skills training.

PP 0176 Digital flourishing in adolescence: A one-year trajectory study

Jasmina Rosić¹, Lara Schreurs¹, Sophie H. Janicke-Bowles², Laura Vandenbosch¹

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

² Chapman University, School of Communication Research, Orange, USA

The ubiquitous presence of digital media has disrupted adolescents' daily lives. In this regard, research on how adolescents participate in today's digitalized society has often applied a destructive perspective and looked at the risks of adolescents' digital communication, while adolescents can also flourish online (Raney et al., 2021). Digital flourishing refers to the positive perceptions of an individual's experiences and behaviors in digital communication in five dimensions. Connectedness covers digital communication experiences of connection and support by one's online community. Positive social comparison occurs when feelings of inspiration are triggered after an adaptive social comparison occurs online. Authentic self-presentation relates to experiences in which the user presents oneself authentically online. Civil participation includes a user's considerate and reflected digital communication. Self-control refers to one's ability to control when to start and stop interacting online. The concept of digital flourishing is rooted in self-determination theory and has been associated with relatedness, competence, and autonomy need satisfaction among adults (Janicke-Bowles et al., 2023).

We lack knowledge of how digital flourishing occurs among adolescents and whether it changes over time. Such changes are plausible as adolescence is a developmental period with several changes (Eccles et al., 1993). Accordingly, we aimed to understand how the digital flourishing dimensions evolve in adolescence and whether there are potentially distinct trajectories over one year. Such knowledge can help us understand how digital flourishing evolves in a period in which digital communication is an ubiquitous part of daily life.

The literature (e.g., Scheerder et al., 2017) suggests that adolescents' developmental changes and digital inequalities determinants (i.e., parental education, ethnicity, parental mediation style, and parental digital skills) may play a role in digital flourishing fluctuations. Therefore, these factors were modelled to predict adolescents' belongingness to different trajectories of digital flourishing.

A three-wave panel study among 1,081 Slovenian adolescents (Mage = 15.34 years, 53.8% boys, 80.7% ethnic majority) was conducted in 2021–2022. Latent Class Growth Analysis identified two classes. Adolescents in class 1 (50.6%) reported high levels of digital flourishing, which remained stable over time. Adolescents in class 2 (49.4%) reported lower levels of digital flourishing with decreased self-control over time. Logistic regressions demonstrated that autonomy-supportive restrictive, autonomy-supportive active, and controlling active parental mediation styles, together with higher parental digital skills, predicted adolescents' belongingness to the (more digitally flourishing) first class. Age, parental education, ethnicity, parental controlling restrictive mediation style, and parental inconsistent restrictive mediation style did not predict belongingness.

This study found that some adolescents flourish digitally and keep flourishing over time, while others seem to flourish less digitally, and their self-control over digital communication decreases over time. While age and parental socio-demographics seem negligible in adolescents' perceived digital communication skills and related positive outcomes, parents can stimulate adolescents' digital flourishing by using autonomy-supportive and active mediation practices in guiding adolescents' digital communication and by modeling their digital skills. Interventions that aim to help all adolescents navigate the digital realm healthily and beneficially may focus on enabling such parental-child interactions.

CYM03 Social media and youth II

PP 0266 Navigating Friendships: Children's use of TikTok as a playground for social capital in the Digital Era

Denise Menzonides¹, Anna Van Cauwenberge², Joëlle Swart¹, Marcel Broersma¹

¹ University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

² Ipsos, European Public Affairs, Leuven, Belgium

In this paper, we ask how 8- to 12-year-old children navigate social relations and build social capital through the platform TikTok. Although children's media use and digital skills have been a popular area of research the past decades, how children in middle childhood use social media (Rozgonjuk et al., 2021), and how these practices may translate into social capital has been relatively under-researched (Leonard, 2005). This is striking, especially as children in this age group form an important audience for popular social media platforms (De Ley et al., 2021) and increasingly use social media to interact with peers (Nesi et al., 2018). Furthermore, successfully developing interpersonal relations at this age is important for their overall well-being and social capital (Ladd & Sechler, 2012; Rubin et al., 2011).

To understand how children navigate social relations using social media and how these interactions lead to social capital, we employ longitudinal participant observations and conversations with children aged 8–12 (n = 86) at

afterschool-care. In addition, we conducted semi-structured interviews with parents ($n = 16$) to understand how they support these processes by mediating social media use and social interactions with peers. We focus on children's peer interactions when using the platform TikTok. This short-video platform, whose creative affordances invite children to connect with each other online and engage in creative practices in on- and offline social contexts, is currently one of the most popular apps for children of this age. By considering TikTok as a context to understand how children navigate social relations, this paper answers calls for research into how children navigate social relationships through specific platforms in on- and offline social contexts (Dredge & Schreurs, 2020).

We show that children leverage their use of TikTok as 'techniques of inclusion' through which they try to establish and maintain friendships. In addition, we find that these practices often consist of offline playful interactions. Examples include referencing popular memes, showing off their knowledge of the platform, and engaging in creative trends. While these practices allow children to bond with their peers over shared activities, upholding these friendships is inherently precarious. This fragility arises from the ongoing necessity for constant effort, to not only foster connection but also to navigate the dynamic digital landscape, keep up with quickly evolving trends, and manage the expectations of their peers. To manage these expectations, children selectively share content they produce. While child-produced videos are mainly intended for close friends, children employ other social practices (e.g., watching together, creative play) to connect with peers they have no strong relationship with yet. Failing to manage keeping produced videos private from peers they are not close with leads to scrutinizing comments and feelings of shame. We argue that the precarious nature of children's efforts to employ techniques of inclusion makes it difficult to build bonding social capital using TikTok. Our nuanced exploration of these challenges underscores the need to support children in building digital literacies including social-emotional perspectives of digital media use to enhance children's well-being in a digital age.

CYM03 Social media and youth II

PP 0267 Distress at school between digital fears and coping strategies

Maria Gabriella Pediconi¹, Michela Brunori¹, [Eric Olijnyk](#)¹, Savino Romani¹

¹ University of Urbino, Department of Economics Society Politics, Urbino, Italy

Today's adolescents are facing many challenges in the digital society: on the one hand, they are exposed to a massive amount of information and stimuli from social media that influence the school, affective and social areas; on the other hand, many opportunities are available to them, such as access to online know-how and resources, who can support them in growing and developing their skills. The present study explores the relationship between school distress, digital habits, FoMO, and coping strategies in Italian adolescents after the COVID-19 pandemic. The participants were 85 high school students aged between 16 and 18 years who answered an ad hoc questionnaire on behavioural and affective habits related to digital practice, the Discomfort and Early School Leaving Evaluation Test (TVD), the Fear of Missing Out Scale (FoMO), and the Coping Inventory for Stressful Situations (CISS). The results show a significant interdependence between distress at school, digital habits, and adolescents' coping strategies. Emotion-oriented coping appears positively correlated to school distress factors and Fear of Missing Out, weakening the ego in managing school challenges. Avoidant coping in terms of distraction allows one to maintain a better feeling towards the school institution. The more time youth spend online, the less they use task-centred coping strategies, diminishing the efforts in processing the problem and finding new solutions. Adolescents presenting school distress and relying on emotion-oriented coping strategies use social media as a tool to mitigate negative feelings (e.g. boredom, discomfort, sadness, loneliness) or to avoid confrontation and suspend the processing of problematic situations that directly involve them. Findings highlight the need to develop tailored interventions to reduce and prevent school discomfort and amplify healthy coping abilities, taking into account the affective dimension and the digital practices connected to it.

Keywords: *Adolescents coping strategies, distress at school, early school leaving, FoMO, social feelings.*

PP 0268 Authentic or filtered? Unraveling the impact of augmented reality filters on adolescents' self-image

[Sonia Malos](#)¹, Julia Szambolics¹, Delia Cristina Balaban¹

¹ Babeş-Bolyai University – College of Political – Administrative and Communication Sciences, Department of Communication – PR and Advertising, Cluj-Napoca, Romania

Social media platforms are relevant for adolescents' media diets when searching for entertainment and interaction with peers. Augmented reality (AR) filters are a popular tool for teenagers that enable users to apply visual effects to create and share visual content. AR filters and lenses are digitally based, responsive interactions that are applied to the user's face or surroundings to change or extend what is being seen in the actual environment. The frequent use of these lenses makes them a powerful communication and engagement tool.

While some studies prove a connection between adolescents' social media usage and psychological problems, or negative outcomes, other studies point out positive well-being outcomes in the form of the possibility to express emotions and get social support. Previous research focuses on the use of AR filters in general for marketing and advertising purposes and on the motivations for AR filter usage by adults via social media.

Based on the social comparison theory, the current study investigates adolescents' AR filter usage on Instagram and TikTok in relation to subjective well-being. Thus, it was explored how utilizing filters affected the well-being variables (satisfaction with life, self-esteem, and self-acceptance), which were mediated by social comparison. The method consists of an online survey that we applied to Romanian adolescents ($N = 282$; 65.1% female and 34.9% male respondents) from both urban (53.2%) and rural (46.8%) areas, aged between 14 and 18 years ($M_{age} = 16.52$, $SD = 0.99$) who frequently use social media.

Our findings show that adolescents are more likely to use AR filters for entertainment, fun, and creativity. By applying these filters, whimsical or humorous content that is appealing to both the creator and the viewer may be produced. Moreover, AR filters foster creativity by giving them a means of expressing their individuality and enabling them to experiment with different looks and styles. The use of filters has a significant impact on well-being variables: self-acceptance is positively impacted by AR filters, while life satisfaction and self-esteem are negatively impacted by these filters. The main mediator, upward social comparison, emphasizes the possible negative effects of filter use on people's well-being and mental health. The implication is that whereas AR filters can improve people's perceptions of their appearance, they could also make them feel inferior or less valuable in comparison to those who appear more successful or attractive.

CYM03 Social media and youth II

PP 0269 Social media use in adolescent clinical and non-clinical populations: A registered report

[Luisa Fassi](#)¹, [Amanda Ferguson](#)¹, [Andrew Przybylski](#)², [Tamsin Ford](#)³, [Amy Orben](#)¹

¹ University of Cambridge, MRC Cognition and Brain Sciences Unit, Cambridge, United Kingdom

² University of Oxford, Oxford Internet Institute, Oxford, United Kingdom

³ University of Cambridge, Department of Psychiatry, Cambridge, United Kingdom

There is much concern that adolescent mental health declines and concurrent increases in social media use are linked. To address this, previous research has mostly analysed school- or community-based adolescent samples (for comprehensive reviews, see Odgers & Jensen, 2020; Valkenburg et al., 2022). However, this approach has systematically overlooked individuals diagnosed with mental health conditions, constituting less than 10% of effect sizes in the literature (Fassi et al., 2023). Notably, these populations are particularly at risk and may exhibit distinct patterns of social media use. In this Registered Report, we address this oversight by analysing the Mental Health of Children and Young People survey (approx. $N = 4057$, 11–19 years old). In this survey, professional clinical rates collected standardised multi-informant diagnostic mental health assessments for both internalising (e.g., anxiety, depressive, obsessive-compulsive and eating disorders) and externalising (e.g., hyperactivity and conduct disorders) diagnoses in a nationally representative UK sample. To gain a comprehensive understanding of how social media use differs across clinical and non-clinical adolescent populations, we examine both quantitative and qualitative dimensions of social media use. Specifically, we investigate time spent on social media as well as dimensions of social media engagement that could incur mental health risks (i.e., online social comparison, monitoring and impact of online feedback, lack of control over time spent online) or benefits (i.e., online friendship, as well as opportunities for honest self-disclosure and authentic self-presentation). We apply regression models and equivalence testing to assess our hypotheses of differences in social media use in adolescents with vs without a mental health condition (Question 1), with an internalising or externalising condition vs without a condition (Question 2), and with an internalising vs externalising condition (Question 3). Altogether, this Registered Report aims to comprehensively map and compare the relationship between different dimensions of social media use and mental health in both clinical and non-clinical

adolescent populations. In doing so, it lays the foundation for future mechanistic and translational research studying which specific aspects of social media use relate to mental health in different adolescent groups. These insights will be crucial to inform clinical practice, policy, as well as the design of targeted interventions to improve children and adolescents' mental health. We note that the Registered Report has received in-principle acceptance at Stage 1, the Stage 2 results and discussion will therefore be included in the conference presentation.

CYM03 Social media and youth II

PP 0270 Exploring health-related issues on social media among Italian teens'

Lorenza Parisi¹, Arianna Bussoletti², Francesco Vigneri², Francesca Comunello², [Francesco Gesualdo](#)³

¹ Link Campus University, Research Department, Rome, Italy

² Sapienza University – Rome, CORIS Department, Rome, Italy

³ Bambino Gesù Children's Hospital – IRCCS, Multifactorial and Complex Diseases Research Area, Rome, Italy

While social media are often deemed responsible for spreading health-related dis- and misinformation, they are also important arenas for users to access health information and share thoughts and concerns. This is especially true when it comes to young people and teenagers, whose social media usage rates are much higher than those of the general population (Istat, 2023). We thus focus on teenagers' appropriation of social media platforms for health-related issues and turn our attention to the Italian context, where the impact of social media on health communication is still understudied and there is an overall lack of research focusing on teenagers' understanding of health issues. Our paper presents preliminary results of a two-year interdisciplinary research project aiming to explore knowledge needs, social media use, and social representations of health and vaccine-related issues among Italian teenagers.

Our research methods combine traditional in-depth interviews with an adapted version of the 'cognitive walk-through' strategy (Comunello, Mulargia, Parisi, 2016). Such a strategy contributes to a better understanding of what participants consider an "appropriate way" of communicating health on social media, allowing to grasp the negotiations and sense-giving processes performed by teenagers with regard to health-related social media content. So far, we have carried out 25 interviews with 25 teens, aged 15 to 17, living in Rome (Italy) and are analyzing them through thematic analysis (Braun & Clarke, 2022). Additional interviews are ongoing.

Preliminary results reveal that Italian teens predominantly use Instagram and Tiktok, with a preference for the latter when it comes to searching for new content rather than engaging with friends' accounts. The main health-related issues they mention and interact with are: dietary health/dietary disorders; physical activity and sport; mental health and psychological well-being. These topics are often associated and evoked in connection with each other (e.g. proper nutrition to improve physical/sports performance, eating disorders related to psychological disorders, etc.). Interestingly, the teens show an awareness of the platforms' algorithmic personalization. For example, some interviewees said that they have been targeted on social media with ads covering sensitive topics such as diet apps to lose weight after interacting with similar topics. Some girls even used these apps for some weeks before stopping because of the apps' rigid norms to pursue weight loss, which caused the teens to lose self confidence.

Our preliminary findings contribute to a better understanding of Italian teens' knowledge needs and priorities in relation to health-related issues and related criteria they use to assess the credibility of different sources of information. They also shed light on how affordances and constraints of social media platforms, related business models, and algorithmic logics, contribute to framing health related conversation about sensitive topics (e.g. dietary issues and mental health) among teens.

CYM04 Media, mediation and families II

PP 0331 Voices of resignation. Explaining differences in families' smart speaker usage and privacy cynicism

[Rebecca Wald](#)¹, Jessica Piotrowski¹, Theo Araujo¹, Johanna M.F. van Oosten¹

¹ Amsterdam School of Communication Research ASCoR, Communication Science, Amsterdam, Netherlands

Siri, Alexa, and Google Assistant are making rapid in-roads into the life of many families, especially so in the form of smart speakers. In response to this trend, research has started to explore specific dispositional characteristics (i.e., trust, literacy) and contextual characteristics (i.e., what is reported in news media) as predictors for device ownership and use-motivations following ecological systems, media selection, and technology acceptance theory. Additionally, first studies have also begun to analyze concrete smart speaker use patterns of families based on donated log-data. Yet, no data donation study of this kind exists on a European and non-English speaking sample, like families in the Netherlands, nor do we know what role previously identified predictors play for their long-term usage of smart speakers.

What is furthermore interesting is that people's use-behavior does not always resemble their attitude towards smart speakers, as people have often been found to worry about their privacy and yet continue using smart speakers at home without taking further actions to protect it. This is a sign of digital resignation; it occurs when privacy is seen as increasingly challenging to protect, up to the point where one resigns to this reality to avoid missing out on the technology's advantages. Digital resignation can be inherently problematic, as it impedes users' personal autonomy, makes them vulnerable to exploitation in digital spaces, and increases likelihood for institutional distrust. A possible way to empirically capture this resigning privacy attitude is through 'privacy cynicism': a cognitive coping mechanism with which users justify their continued technology usage all while having privacy concerns. In the context of smart speakers in families, knowing how cynical parents are can help us estimating the extent to which digital resignation may be at play. As this can have consequences for children's media upbringing, it is a crucial next step in research that supports the protection of children's right for privacy as young digital citizens. Thus far though, we lack quantitative evidence, especially with regards to who is more likely to show digital resignation.

Against this background, our study establishes the extent to which Dutch parents currently show signs of privacy cynicism and whether there are links to families' smart speaker use-practices, as well as to their dispositional and contextual characteristics. We ask: *To what extent do dispositional and contextual characteristics of families explain differences in how they use (behavior) and feel about using smart speaker (attitude) particularly when it comes to privacy, and to what extent is there a link between their use-behavior and privacy attitude?*

We employ a multi-method design by combining families' donations of longitudinal smart speaker data with cross-sectional self-reports of $N = 400$ Dutch parents with at least one child between 3–8 years. As such, insights of our study will meaningfully advance our scientific understanding of digital resignation in the context of smart speaker usage in families, and through that signal to actors in industry and policy where families might need additional support to help them gain back user agency.

CYM04 Media, mediation and families II

PP 0332 Parent-adolescent communication in a digital world: A 100-day diary study

[Loes Janssen](#)¹, Ine Beyens¹, Nadia Bij de Vaate¹, Amber van der Wal¹, Patti Valkenburg¹, Loes Keijsers²

¹ University of Amsterdam, Amsterdam School of Communication Research ASCoR, Amsterdam, Netherlands

² Erasmus University Rotterdam, Department of Psychology – Education – and Child Studies, Rotterdam, Netherlands

Digital technology enables parents and adolescents to communicate anywhere and anytime. Knowledge of parent-adolescent online communication, however, is mainly based on cross-sectional studies focusing on how often parent-adolescent communication occurs. Some qualitative studies indicated that online parent-adolescent communication mostly concerned managerial content (i.e., asking or answering questions) or emotional content. While this previous work has provided us with an overall insight into how the average adolescent recalls their online communication with parents, it did not yet provide knowledge on everyday experiences of this communication and how adolescents may differ in patterns of online communication with parents. Therefore, the current 100-day study aims to obtain ecologically valid insights into the frequency, duration, and topics of parent-adolescent online communication (i.e., chatting via WhatsApp, Snapchat, or Instagram).

In order to provide a more nuanced understanding of how much variation in parent-adolescent online communication exists between adolescents, we use both frequency and duration to identify distinct patterns of parent-adolescent online communication. This enables us to investigate whether certain adolescent characteristics relate to such different patterns. Guided by the Differential Susceptibility to Media Effects Model we will investigate the predictive role of two dispositional factors (i.e., gender and autonomy), one developmental factor (i.e., age), and one social-context factor (i.e., family living situation) of the distinct patterns of parent-adolescent online communication to facilitate the interpretation of these patterns.

A 100-day daily diary study among 479 adolescents ($M_{\text{age}} = 15.98$, $SD = 1.15$; 54.9% girls) was conducted from January to May 2023. At the end of each day, we asked adolescents, to indicate whether they had chatted with their parents that day (i.e., frequency – answered yes/no), how long they had chatted that day (i.e., duration – in minutes) and about what topics they had chatted (i.e., topics – a-priori categories were shown with an ‘other’ option). Across the 100 days, 82.8% of the sent daily diary questionnaires were completed (39,598 of 47,847).

Almost all adolescents (96.9%) communicated online with parents throughout the study period. On average, adolescents communicated online with their parents on 36% of days. The average person-mean duration of parent-adolescent online communication was 19.42 minutes ($SD = 29.32$). Adolescents communicated most with their parents online about the time they got somewhere, school, and whereabouts. Additional categories were found by coding adolescents’ text answers such as monitoring and supporting parents. Latent profile analysis indicated a five-profile solution, the profiles were: infrequent short communication (55.4%), frequent short communication (33.4%), infrequent medium-long communication (8.4%), infrequent long communication (2.2%), infrequent very long communication (0.6%). Age and gender predicted profile membership, in that younger adolescents and boys communicated longer with parents online than older adolescents and girls.

Thus, almost all adolescents communicated online with their parents, albeit mostly short. Most parent-adolescent online communication concerned monitoring or managerial aspects. An unexpected phenomenon was found after categorizing adolescents’ text answers on the ‘other’ option: Adolescents monitoring their parents in addition to the other way around.

CYM04 Media, mediation and families II

PP 0333 The establishment of children’s privacy rules towards sharenting practice: Achieving relational agency and interpersonal privacy in China

Yuhui Wang¹

¹ Nanjing Normal University, Journalism and Communication, Nanjing, China

Sharenting has become a prevalent digital practice among Chinese parents, generating topics about children that often amass billions of views across various social media platforms. Both parents and children are incentivized by the benefits offered by these platforms to create more sharented content. While sharenting may expose or infringe upon children’s privacy (Plunkett 2019), which is a significant concern in childhood studies interwoven with issues of agency, various studies have explored negotiated privacy management strategies between parents and adolescents under Communication Privacy Management (CPM) Theory (De Wolf 2020). However, there is a gap in the research regarding how children’s privacy rules towards sharenting practices by their parents are formed and what social contexts can promote or hinder this formation, particularly in non-Western cultural contexts. Based on a relational understanding of agency and privacy (Esser, Baader et al. 2016), this paper addresses the issue of children’s interpersonal privacy in Chinese culture, where generational hierarchy and collective order traditionally prevail, creating a distinct situation for privacy rules to form, differing from Western culture, especially within family communication.

Based on observations and semi-structured interviews with 30 preadolescents (10–14 years) and their parents from different socio-economic classes in southeast China, the paper investigates these areas by drawing on actor-network approaches. It focuses on how human and non-human actors can impact the agency of preadolescent children to understand, negotiate, intervene, or even change parental sharenting practices across various social media platforms through the lens of CPM theory. Actors of relational, socio-economic, technological and cultural dimensions are specifically explored to capture heterogeneous networks where children receive agentic position. As preadolescents become conscious of their online self-image and question authority figures such as their parents, this period becomes crucial for observing the process of forming children’s privacy rules and relational agency in their everyday practices. Continuous contacts were maintained with children to gain a nuanced understanding.

Initial results culturally demonstrate that the establishment of privacy boundary rules concerning sharenting among Chinese preadolescents can be limited by the combination of filial duty and family loyalty. Though some children are dissatisfied with sharenting, they perceive their privacy not as something already own to them, akin to their belongings kept by parents temporarily. Further, the paper examines the interplay results of different actors and identifies the key (combined) actor(s) impacting the formation of children’s privacy rules. Several contributions are expected: (1) the expansion of empirical research using relational approaches in childhood studies, eliminating the dichotomy of structure and agency; (2) the enrichment of CPM theory studies to include the formation process of privacy rules in specific sharenting practice, and (3) the consideration of Chinese culture, where Confucianism has a unique influence on privacy issues, exhibiting distinct characteristics in the outcome of children’s privacy control. Insights to foster the development of healthy privacy rules for children is also offered.

CYM04 Media, mediation and families II

PP 0334 The reciprocal relationship between parental e-health literacy mediation and adolescents' e-health literacy: A three-wave longitudinal study

Natalie Tercova¹, Michal Muzik¹, Lenka Dedkova¹, David Smahel¹

¹ Masaryk University- Faculty of Social Studies, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

The online environment offers a wealth of information, including content related to health, attracting adolescents as frequent users. This information becomes instrumental in shaping their health-related decisions. Beyond useful and accurate health information, however, adolescents may encounter false or even endangering information that may lead to disorderly consequences. To effectively navigate and evaluate such information, it is thus crucial to cultivate e-health literacy. However, our comprehension of the extent of e-health literacy among adolescents is lacking, with even less understanding of the contributions parents make to its development. Research indicates that parental involvement and guidance significantly shape children's media use and health-related behaviors (e.g., Donaldson et al., 2013; Gulec & Smahel, 2022). Nevertheless, there is a shortage of longitudinal studies verifying the actual impact of parental mediation, i.e., the parent-child interactions about media use and consumption, in this regard. Simultaneously, it is recognized that parent's literacy and education, particularly in the field of health, impact their ability to convey precise information (Porter et al., 2012); however, it remains unclear whether this principle extends to e-health literacy mediation. Moreover, the e-health literacy of adolescents may conversely impact parental e-health mediation. For instance, seeing the adolescent struggling with understanding or searching for quality health information online might prompt parents to increase their mediation. Addressing these knowledge gaps can significantly enhance our scientific comprehension of relationships between parental e-health mediation and the e-health literacy of adolescents.

The study newly explores the reciprocal relationship between parental e-health literacy mediation and adolescents' e-health literacy while considering the moderating role of parental education level. Using a longitudinal design, the study collected data from 2500 adolescent-parent dyads (adolescents' age in T1: 11-16, $M = 13.4$; $SD = 1.7$, 50% females) over three waves, employing a random intercept cross-lagged panel model (RI-CLPM). We assumed that the impact of e-health literacy mediation will be positively moderated by the educational level of a parent, meaning that higher-educated parents are expected to have greater influence.

Our study found no support for the hypothesized causal links between parental e-health literacy mediation and adolescents' e-health literacy. However, the age of the adolescent did emerge as a significant factor, positively affecting both e-health literacy and e-health literacy mediation. Additionally, a positive correlation between random intercepts was observed, indicating that adolescents with higher e-health literacy tended to experience higher parental e-health mediation. Notably, the study did not reveal any evidence supporting the notion that parents with a higher education level exerted a more substantial influence through e-health literacy mediation on their children compared to those with a lower education level.

The findings underscore the importance of adapting e-health literacy mediation strategies based on the child's age. This carries societal implications, impacting not only parents but also teachers and other stakeholders actively engaged in promoting the development of e-health literacy among young people. The study invites further exploration, specifically to investigate other factors that may influence adolescents' e-health literacy.

CYM04 Media, mediation and families II

PP 0335 The good child. Exploring children's perspectives on parental connectivity, the parental gaze, and contemporary childhood

Ralf De Wolf¹, Dereymaeker Julie¹, Mazzocchi Giulia¹, De Leyn Tom²

¹ Ghent University, Communication Sciences- imec-mict-ugent, Ghent, Belgium

² Hasselt University, School of Social Sciences, Hasselt, Belgium

New media and data-driven technology allow end-users to watch and even monitor one another, including the surveying of (potential) romantic partners, strangers, friends, and children and teens. In intimate surveillance (Leaver, 2017), transcending parenting (Lim, 2020) and caring surveillance (Sukk & Siibak, 2021), monitoring children and teens could be equated with care and good parenthood – a supposedly "good parent" is then someone who closely watches, monitors and controls the practices of their children. Investigating intimate surveillance, scholars found how these practices come in varying degrees. Parents can read private emails of their children (Kennedy-Lightsey & Frisby, 2016), check up on them via the Internet or Internet based applications (Livingstone & Helsper, 2008; Vongkulluksn, 2016), look into their social media profiles or text messages, and install monitoring or tracking software (Modecki, 2022; Sukk & Siibak, 2021).

Although scholars have pled in favor of child-centric perspectives (Lupton and Williamson, 2017; De Wolf & Vanden Abeele, 2020; Sukk & Siibak, 2021; Özkul, 2022), it is noticeable that much emphasis is placed on good parenthood.

parental monitoring, and/or the characteristics of new technology that allow for intimate surveillance. In this contribution we argue for a child-centric perspective on intimate surveillance and put forward the following research questions:

RQ1. How do children feel about anyplace anytime parental connectivity?

RQ2. How and to what extent do children internalize the parental gaze?

RQ3. What is considered good childhood in terms of privacy and autonomy?

To answer these research questions we carried out an in-depth interview study with children ($N = 32$) between the age of 9 to 12 in [omitted for peer review]. The interviews lasted approximately 40–45 minutes and were carried out in school premises (e.g., during recess or lunch break). During the interview study we made use of eliciting techniques and thinking aloud protocols (Jørgensen, 2016). To illustrate, at the start of the interview, participants were prompted to sketch a timeline portraying a typical day, highlighting specific activities and locations. This exercise served to fuel discussions on parental engagement, connectivity, and monitoring.

In line with the findings of Sukk & Siibak (2021, 2022) and Özkul (2022) our participants expressed a need for a negotiation on how location tracking was used by their parents, found it rather normal that parents watch them in the public domain (not in their homes), and were encouraged to embrace anyplace anytime parental connectivity because it brought comfort and a sense of control to their parents, and not necessarily the children themselves. Moreover, the participants displayed anticipation regarding their forthcoming high school activities, perceiving it as an arena offering increased autonomy and privacy. They contemplated how the practice of intimate surveillance might assist in this transition, viewing it not as a symbol of distrust but as an extra resource, be it through smartphones, tracking applications, or other means.*

*Note: we are currently ending the data collection phase and in the process of analyzing the data. The above findings should therefore be treated as preliminary.

CYM05 Children, youth and AI

PP 0447 Opening children's experience with generative AI. An exploratory study of Romanian secondary school children's engagement with and understanding of generative AI

Anca Velicu¹

¹ Institute of Sociology, Sociology of Communication and Public Space, Bucharest, Romania

Children's wide and eager embrace of generative artificial intelligence (GAI) is one of the phenomena that has lately raised the most concerns in society, especially among educators who worry about presumably unethical use of it for school related tasks (Cao & Dede, 2023). Others worry that the "affective aesthetic style embedded in its whole conversational approach" decreases users' critical alertness needed to discern the truth of information provided this way and makes its use especially dangerous in educational context (Balmer, 2023). At the opposite end, some scholars are enthusiastic about the opportunities that GAI brings for children in an educational context, and talk about "(c)hildren as creators, thinkers and citizens in an AI-driven future"; this bright future does not occur spontaneously, but it is the result of a guided educational process, that aimed for a certain level of critical and creative AI competences among children (Ali et al., 2021).

What links together these concerns is the adult-centered perspective on how children would or should use GAI, with little interest in how, why and with what results children actually use GAI in various contexts. To fulfill this gap, I took a child-centered approach and explored, using a qualitative methodology, Romanian secondary school children's engagement with GAI tools for information seeking, self expression and communication. For this, I interviewed 15 secondary school children (11–14), varied in terms of gender, socioeconomic status, and online user profile; the interviews are thematically analyzed.

My objectives are to map the tools they prefer, to understand their practices as situated in a social context and to unveil their critical understanding of GAI and how they conceive their place in this "AI-driven future". While my conceptualization of children and their interaction with GAI is partially indebted to EU Kids Online theoretical model (Livingstone et al., 2015), I will discuss the results using the three-layer framework proposed by Davis (2023) reflecting on the fact that only starting from the feature layer of GAI and passing by its practice layer one can understand children's culture that emerge around GAI, with all its future implications (for ethics, politics, or even epistemology).

CYM05 Children, youth and AI

PP 0448 Data literacy in Brussels: Learning about chatGPT in a DataBuzz workshop

[Lotte Vermeire](#)¹, [Wendy Van den Broeck](#)¹, [Leo Van Audenhove](#)¹

¹ imec-SMIT- Vrije Universiteit Brussel, Communication Sciences, Brussels, Belgium

This study explores a workshop on ChatGPT within the DataBuzz project. The DataBuzz is a high-tech, mobile educational lab in a bus, promoting data literacy by visiting Dutch-speaking schools in Brussels. Through inclusive, interactive workshops, the DataBuzz raises awareness about the values, risks, and limitations of data and provides young people with a space to engage with real-world questions. The overarching goal of the project is to equip students with the necessary competences to be active and critical citizens in an increasingly datafied society. The project is further driven by the goal of ensuring equal educational opportunities, emphasising digital inclusion, and offering a professionalised learning environment with adaptive guidance.

The workshop is mapped on the Data Literacy Competence Model (DLCM), a high-level analytical framework, developed by the Knowledge Centre for Digital and Media Literacy Flanders-Belgium. This model defines two major competence clusters: *using data* and *understanding data*, each existing of four competences aimed at fostering a common understanding of data literacy, such as analysing data or reflecting on data. The ChatGPT workshop emphasises not only the practical aspects of using data but also the importance of critically understanding and navigating the broader societal implications of AI-tools.

Using a three-fold qualitative case study analysis, we delve deeper into how the workshop contributes to fostering data literacy among students (ages 10–14) in Brussels. Firstly, we do an in-depth interview with the educational representative of the DataBuzz, who also develops the workshops, and with the teachers who booked the workshop. Secondly, we observe at least 20 sessions, with every session having about eight participants. Thirdly, we organise focus groups with participants that followed the workshop.

While the study is currently in its developmental phase, the results will be available for presentation at the conference. This study explores how the workshop contributes to fostering data literate students that go beyond passive data consumption. Given the datafication of society, data literacy has become increasingly important. In social and educational sciences, the prevailing focus in the literature is on data usage skills rather than on fostering a deeper understanding of data. However, there is a noticeable trend towards critical data literacy, emphasising understanding data and critical thinking. Through mapping the workshop on the DLCM, we aim to comprehend how the workshop strives to promote critical thinking and data awareness. Our interviews with teachers and young people aim to gauge their grasp on data literacy and the competences they identify. The findings will further contribute to the ongoing discourse on the integration of AI and data in educational settings and offering guidance for educators, and policymakers seeking to instill data literacy in students.

CYM05 Children, youth and AI

PP 0449 Dealing with AI-generated media: Young people's media and information literacy regarding deepfake

[Yucong Lao](#)¹

¹ University of Oulu, Information Studies, Oulu, Finland

The advanced generative AI technology has led to a tremendous increase in the volume of media content, such as deepfake content, which has become more accessible to young people. In accordance with Vaccari & Chadwick (2020, p. 2), the so-called term "deepfake" is broadly used to describe hyper realistic media, driven by machine learning algorithms, where someone's facial expressions were pasted onto another person's face. Concerns towards how deepfakes might impact youths are rising. As young people are an extremely vulnerable group exposed to the undistinguishable information in these synthetic media (Vosloo, 2023), it is vital to comprehend the situation of encountering deepfakes in young people's everyday lives and the ways they process these media.

This study contributes to the knowledge area related to youths' media and information literacy practices in terms of deepfakes in everyday life. It aims to explore young people's practices of encountering deepfakes in their daily lives. The study particularly focuses on young people's knowledge and experiences with deepfakes, which reveals their competencies in dealing with AI-generated media in a daily setting.

The following research questions are addressed in this study:

RQ1: How do young participants understand deepfakes?

RQ2: In what ways do young participants deal with deepfakes?

In-depth interviews were applied in this study. Twenty-one 9th grade pupils, aged 14 to 15 years, were recruited from school B in Finland and involved in the interview sessions. After data collection, the empirical data of interviews were transcribed and coded through using the qualitative analysis software NVivo.

Based on analysis, two key findings were unfolded: (1) Young participants had shallow knowledge of deepfakes. Most of them could simply describe the features of deepfakes and point out the role AI played in these artifacts. (2) Regarding young people's experiences, all the participants encountered deepfakes by coming across them on social media platforms, such as YouTube and TikTok. However, most of the youths tried to avoid watching these videos since they considered these media as negative.

The findings reveal that young individuals possess fundamental media and information literacy, as well as AI literacy, when faced with deepfakes. Nonetheless, due to a restricted comprehension of AI-generated media among the youth, this study emphasizes the need for heightened awareness. This awareness, in turn, advocates for potential remedies through Media and Information Literacy education or policy initiatives, specifically designed to address the challenging implications posed by deepfakes.

CYM05 Children, youth and AI

PP 0450 Associations between emerging adults' (motivations for) AI use and AI-related attitudes

Michaela Forrai¹, Desirée Schmuck¹

¹ University of Vienna, Department of Communication, Vienna, Austria

Artificial intelligence (AI) tools have entered crucial areas of young people's lives such as education (Baidoo-Anu & Owusu Ansah, 2023), social relationships (Brandtzaeg et al., 2022), and well-being (Inkster et al., 2018). However, research on emerging adults' motivations for using AI and their attitudes toward AI is still lacking, although constant rapid advancements in the field make understanding how young people use and perceive AI all the more important. Based on *Uses and Gratifications Theory* (Katz et al., 1974) and Venkatesh's (2022) *Unified Theory of Acceptance and Use of Technology's* application to AI, we explore how individuals' use of different kinds of AI tools is driven by specific motivations, and, in turn, uniquely associated with their attitudes toward AI.

Method and Key Findings

After obtaining IRB approval, we conducted a cross-sectional survey among a quota-based sample of $N = 569$ emerging adults (49.6% female, 16–25 years) in Austria using existing scales where available (McDonald's $\omega \geq .77$). Our structural equation model revealed a good model fit (CFI = 0.98, TLI = .96, RMSEA = .03).

Using chatbots was associated with creativity motives ($b = .17$, $SE = .05$, $b = .15$, $p = .001$), image enhancement among peers ($b = .11$, $SE = .06$, $b = .11$, $p = .044$), rapid information presentation ($b = .15$, $SE = .05$, $b = .13$, $p = .005$), and obtaining information on intimate topics (e.g., sexual orientation, romantic relationships; $b = .15$, $SE = .05$, $b = .14$, $p = .004$). Making use of virtual assistants (e.g., Amazon's Alexa) was linked to entertainment reasons ($b = .14$, $SE = .06$, $b = .11$, $p = .016$), image enhancement ($b = .23$, $SE = .07$, $b = .18$, $p = .001$), and keeping up with new technology ($b = .19$, $SE = .05$, $b = .15$, $p = .001$). Finally, using AI-based apps for mental/physical health was related to always having someone to talk to ($b = .12$, $SE = .05$, $b = .11$, $p = .011$), image enhancement ($b = .20$, $SE = .06$, $b = .17$, $p < .000$), receiving emotional support ($b = .13$, $SE = .06$, $b = .12$, $p = .015$), getting suggestions for interpersonal relationships ($b = .13$, $SE = .06$, $b = .12$, $p = .013$) and informing oneself about intimate issues ($b = .10$, $SE = .05$, $b = .09$, $p = .046$). Regarding AI attitudes, participants who used chatbots ($b = .07$, $SE = .03$, $b = .10$, $p = .027$), virtual assistants ($b = .05$, $SE = .03$, $b = .10$, $p = .031$), or AI tools that support learning ($b = .09$, $SE = .03$, $b = .15$, $p = .003$) were more excited about integrating AI in their daily lives. However, attitudes related to societal or privacy concerns were unrelated to participants' AI use.

Implications

Our findings revealed that young people employ different kinds of AI tools to deal with key issues of emerging adulthood (i.e., intimacy-related topics, social relationships, or needing emotional support). Importantly, existing research has pointed out issues of using AI to tackle such well-being-related issues due to safety reasons (Kurian, 2023). Our findings underline this need, as young people who use specific AI tools more intensely were more excited to integrate AI in their lives. Simultaneously, AI technology use was not associated with concerns about societal consequences or the safety of participants' data, suggesting that putting potential negative consequences of AI use more into focus might be important.

CYM05 Children, youth and AI

PP 0451 Like any other tool and completely different – University students' use of generative AI as media practices

Ingrid Forsler¹

¹ Södertörn University, School of Culture and Education, Huddinge, Sweden

The widespread accessibility of AI tools has significantly impacted both the public and the academic discourse surrounding their integration into higher education, raising crucial questions about ethical considerations, academic integrity, and the evolving nature of teaching and learning. While the public debate has focused mainly on the written essay and the extent to which it can continue to be used as a form of examination, research on learning in higher education have also emphasized the student perspective and the potential benefits of generative AI tools in learning processes more generally (e.g. Chan & Hu 2023) as well as for specific disciplines such as media and journalism education (Pavlik 2023). Most of this research concerns the practical implementation of AI in teaching and learning rather than its position in a broader social context. Hence, this study wants to contribute to the area with perspectives from media studies that will help to unpack the complex interplay between technology, media representations, societal perceptions, and educational practices.

More concretely, we investigate how students at a middle-sized university in Sweden use and understand generative AI in relation to their views on higher education and Bildung. The empirical data for the study is collected through 1) a survey sent out to all students at the university about the extent to which they have used generative AI in their studies, for what purposes and their objectives for entering higher education, and 2) follow-up focus group interviews where they are given the opportunity to reflect upon the opportunities and challenges of this technology, both in their current educational process and in their future professional and civic life. By analyzing this material from a media practice perspective (e.g. Couldry 2004), the study provides detailed insights into how students use chatbots for various tasks such as translation, summaries, and spell checking, rather than as a 'tool for cheating' as it is often pictured in the public debate. These insights are further related to the students' views on higher education and to shared social imaginaries about the transformative potential of artificial intelligence, revealing an ambiguous relation to generative AI in education and knowledge production among the students.

CYM06 Children & youth participation

PP 0561 Participation of children and youth in digital landscapes: A qualitative study from Portugal

Mariana Menezes¹, Sara Pereira¹, Daniel Brandão¹

¹ University of Minho, Communication and Society Research Center, Braga, Portugal

In-depth and multi-dimensional studies focused on children, youth and the media has shown that the current on-line landscape poses specific challenges: privacy, identification and verification of false news and misinformation, exposure to cyberbullying and discrimination, among others. Early development of critical analysis skills are essential so that younger generations can have the necessary tools to navigate more safely and with agency through a virtual landscape that poses a multiplicity of risks of false, inaccurate, or misleading information circulating widely and at massive speed. By shifting the lens and focusing on the potential offered by the information environments and communication cultures available we can formulate new pedagogies for the digital age (Notley and Dezuanni, 2019). These new pedagogies can benefit from emphasizing inclusiveness and incorporating the voices of children and youth. Rethinking pedagogies can be expanded and combined to other instances of the lives of the younger generation.

The study being carried out in the research project "bYou – Study of the Experiences and Expressions of Children and Young People about the Media" in Portugal will serve as a basis for the presentation of this paper that will focus on how children think about opportunities to participate and express themselves on issues that concern them, and how they evaluate if their ideas are actually being heard. The analysis will present data obtained from 59 focus groups held with 390 children and young people aged between 11–18 yo, attending 6th, 9th and 12th grades.

As other recent studies (Tandoc Jr. et al. 2020 and Ponte, 2019) that addresses perceptions, constraints and interests related to participation, our study highlighted that children and youth feel discouraged to manifest himself/herself feeling unmotivated, intimidated and believing that their opinion will not promote change. Responses revealed that they feel demotivated since their ideas and opinions are rarely taken into consideration. To further our understanding

on the matter the paper intends to relate theoretical approaches on participation and interests with the perception expressed by children and young people about their own interests, concerns and opportunities for self-expression. Among the key questions we aim to analyse: What is perceived as having a voice and to participate offline and online? What are the constraints? How and why it is important to express one's idea?

These concepts are interlinked and involves the appreciation of multiple expressions of children and youth that can be the basis and inspiration for creative and inclusive solutions for participation in general, and equally in the digital landscape.

The bYou research project [PTDC/COM-OUT/3004/2020], that supports this paper, is being carried out at the University of Minho, Portugal, and it is funded by the Portuguese Foundation for Science and Technology.

CYM06 Children & youth participation

PP 0562 Expressions of Portuguese children and young people about the media and other issues: Analysing participation in the "Express Yourself!" campaign

Daniel Brandão¹, Sara Pereira¹, Joana Fillol¹

¹ University of Minho, Communication and Society Research Centre, Braga, Portugal

"Shout out, speak out, do something, express yourself!" is a campaign launched in 2022 within the scope of the research project "bYou – Study of the experiences and expressions of children and young people about the media", funded by the Portuguese Foundation for Science and Technology (PTDC/COM-OUT/ 3004/2020). One of the main objectives of this project is to develop a participatory media tool to promote the expression and participation of children and young people until 19 years old. The participatory platform muralbyou.pt was therefore created, providing quizzes to test levels of media literacy and thematic cards to collect opinions on certain worldwide topics and others from the youngster's own worlds. But the main goal of this platform was to aggregate, organise and present the expressions collected between November 2022 and September 2024. In this paper we will analyse these expressions sent by children and young people themselves or by adults such as teachers or other responsible. This will be a qualitative content analysis based on thematic categories, with the aim of characterising the expressions in terms of formats, themes and content. Variables such as age, gender and geographical area will also be considered.

An initial analysis of the expressions submitted so far seems to confirm that drawing is the easiest mode of expression for the younger children, while text seems to be something that requires greater effort. Video, photography and sound, on the other hand, seem to be the least chosen formats, probably because they demand specific skills and access to recording devices and editing tools. It is also possible to observe a strong tendency to choose present-day themes such as the environment and issues of violence and peace, among other current world issues. This seems to be in line with the perception that children and young people are aware of and want to express themselves about the world around them, and only need the means and opportunities to do so.

The bYou project seems already to prove the importance of creating opportunities for children and young people to express themselves and participate in digital media. The opportunity for participation can also translate into an opportunity for collaborative learning. Involvement in moments of sharing and debate on social and political issues can encourage civic and democratic participation, contributing to more informed citizens who will be actively involved in the future of society. In fact, in an increasingly digital world, it's important to provide opportunities for participation from an early age, in order to prepare new generations to face the challenges, risks and opportunities of that world.

Recognising that proper monitoring and guidance in the process of learning to participate in digital media is fundamental to ensure children's safety online, promote responsible and ethical participation and help them to discern trustworthy content, several authors defend participation as a right. In fact, this right to participate is recognised in the Convention on the Rights of the Child, appearing at the same level as the rights to protection and provision.

CYM06 Children & youth participation

PP 0563 "We often say we lost our childhood, but activism gave us a lot more than it took away" – The lived experience of young climate activists in the digital world

Annamária Neag¹, Victoria Nainová²

¹ University of Groningen, Research Centre for Media and Journalism Studies, Groningen, Netherlands

² Charles University, Department of Media Studies, Prague, Czech Republic

The latest Atlas of European Values (2022) shows disquieting results concerning willingness or actual engagement in various forms of activism in the Central and Eastern European (CEE) region. On a scale from 0 to 4, in most of these countries, enthusiasm for activism is positioned between 0.5 and 1.4 – the lowest on the continent. Moreover, a recent study analysing the online public representations of politically active youth in Czechia and

Hungary showed that adults use a multitude of strategies to exclude young activists from the online public sphere (Vochocová et al., 2023).

Given these circumstances, we set out to understand the practices of everyday activism and how the use of social media is shaping the lives of young activists under 18 in this region. For this, we positioned in the centre of our analysis two Fridays for Future activists: Laura (FFF Hungary) and Engelbert (FFF Czechia). The analysis builds upon data collected through a larger year-long ethnographic study that included in-depth and focus group interviews, and participant observations of climate strikes, workshops and meetings. These were complemented by a digital ethnography phase, during which we observed our participants' social media activities on Instagram.

For analysing the data we relied on Interpretative Phenomenological Analysis (IPA) which allowed us to study how participants make sense of their (digital) activism (Smith and Osborn, 2003). By opting for this methodology, we gained a comprehensive insight into how young individuals perceive their daily activism, both in online and offline contexts. Our double hermeneutic analysis led to the development of the following themes: 1) activism as community; 2) activism and digital media; and 3) activism as everyday life. Our first theme included accounts of how participants make sense of and articulate the importance of the relationships and community formed through their (digital) activism. The second theme highlighted the complex relationship between digital media, technology and activism, such as the necessity of digital literacy skills or what it means to be an influencer. The participants confessed about their mixed and often contradictory feelings regarding the role of these technologies in their everyday activism, such as a feeling of empowerment, but also burnout and disillusionment. Finally, the third theme revealed a rich diversity of experiences, from the daily internal workings of the FFF to others' reactions to their activism. Most importantly, it provided an insight into our participants' relation to other social justice topics, both on social media and in everyday life.

Our analysis shows that while FFF had a crucial role in the development of a political and social-justice consciousness, for these young people fighting for different causes has become an essential part of their offline and online lives. We argue that despite recent social and political disruptions in the CEE region, these young activists challenge societal injustices through everyday (digital) actions not by concentrating on the single issue of climate change, but by adopting an intersectional and holistic approach that focuses on issues ranging from sexism to LGBTQ rights, and anti-war stands.

PP 0564 Student Carnivale: Political humour and satire in Australia's School Strike for Climate Movement

Judith Bessant¹, Michelle Catanzaro², Rob Watts³

¹ RMIT University, School of Global Urban and Social Studies, Melbourne, Australia

² Western Sydney University, Design- Visual Communication, Paramatta, Australia

³ Royal Melbourne Institute of Technology University, School of Global Urban and Social Studies, Melbourne, Australia

The engagement by large numbers of children and young people in climate politics is a striking feature of the contemporary political landscape. However, movements like the SchoolStrike4Climate face numerous obstacles. Those obstacles include the adultist prejudice that as 'defective adults' children and young people cannot, or should not take part in politics.

There is also a history of hostility by mainstream media to dissent, while even liberal-democratic governments are averse to large scale protest. In this paper we explore the creation and communication of satire and humor by school students as a political strategy adopted by the Australian School Strike 4 Climate movement. We ask:

- what do young people themselves say they are doing
- how do they articulate and communicate their politics, and
- why do they create and deploy humour and satire.

Amongst other things, this paper challenges conventional accounts of politics and dissent promoted by positivist social scientists which rely on assumptions that politics entails rational action, political efficacy and resource mobilization. This paper reports on findings from research carried out in Melbourne and Sydney and a number of regional centres since 2018. We draw on insights from the 'affective turn' in the social sciences which has seen increasing and welcome attention given to emotions in general and moral emotions in particular. The paper focuses on how humor and satire is created and used by students in contemporary climate change action. We have used a mixture of surveys, interviews and visual images carried out over a sequence of protest events. We show how humor and satire work in the visual images and placards, puppetry, costumes, theatrical pranks, and tactical 'clowning around' as well as in podcasts, on-line messaging, memes and satire. The paper argues that the use of satire and humor evokes the *carnavalesque* (Bakhtin 1984), which inverts normal hierarchies, provides comic relief from the frightening reality of climate change while offering glimpses of alternative social imaginaries.

CYM06 Children & youth participation

PP 0565 Youth and populism on social media – Epistemic crisis or polarization?

[Johannes Gemkow](#)¹, [Sonja Ganguin](#)¹

¹ University Leipzig, Leipzig Research Centre Global Dynamics ReCentGlobe, Leipzig, Germany

This article discusses the results of interviews with young people about their perceptions of populism on social media. The background of this study is the research conducted at the Research Institute Social Cohesion (RISC) in Germany by the applicants.

Various aspects, such as media use, political opinion formation, socio-psychological factors, but also extremist recruitment attempts, point to the particular relevance of youth in the context of populism on social media.

Theoretically, this article is based on the phenomena of 'epistemic crisis', 'populism' and 'polarization'. The term 'epistemic crisis' refers to the change in knowledge due to digitalization. To this end, the terms populism, fake news, conspiracy narratives and alternative facts are differentiated from one another and the special role of social media in their development as a socio-technological information ecology is focused on. With polarization, a distinction must be made between different concepts of polarization. In the context of social media, ideological and affective polarization are of particular interest. Ideological polarization refers to the drifting apart of attitudes along certain factual issues (e.g. migration, climate change), while affective polarization refers to the increasing mutual rejection of certain groups. With regard to populism, Cas Mudde's definition has been widely used. Mudde defines populism as an "ideology that considers society to be ultimately separated into two homogeneous and antagonistic groups, 'the pure people' versus 'the corrupt elite', and which argues that politics should be an expression of the *volonté générale* (general will) of the people" (2004, 543). Part of the adaptability of populism is that it is often defined as a "thin ideology", meaning that a further, often political ideology is required for populism to unfold.

The qualitative interviews with young people and their analysis provide an in-depth but only partial insight into how young people deal with populism and its polarization. The interviews were analyzed using theoretical coding according to Corbin and Strauss (2015). With this method, the material is broken down much more openly in order to emphasize general patterns and connections.

The analysis reveals four fundamental findings. Firstly, young people – regardless of educational endeavors – have differentiated knowledge about populism. Secondly, the young people do not show any confirmation of the so-called filter bubble in their routinised media behavior. Thirdly, the reason for the consensus-orientation of young people could lie in the thesis of social homophily, since the social network of young people is (also) fed online by people with whom there is a value consensus ('value homophily'). Fourthly, the results provide evidence of affective polarization. This refers to the rejection of political dissenters. Knowledge of populism and social homophily show that it seems important to young people not only to identify with the values in favor of something, but above all to know who they are not close to. Implications, such as a democratic and technological shift in the discourse of media literacy, will be discussed.

CYM07 Digital health, digital well-being and young people

PP 0667 Idyllic or Rollercoaster? – Digital media user profiles based on the digital wellbeing and online vulnerability of 12–14 years old children

[Borbála Timár](#)¹

¹ Moholy-Nagy University of Art and Design Budapest, Doctoral School, Budapest- II, Hungary

A comprehensive understanding of participation in the digital environment, online presence and identification of types of online risks is needed to protect children online (Livingstone, 2016). Identification of online risks (Aven and Renn, 2009; Livingstone and Stoilova, 2021) is merely the first step towards making individual online vulnerabilities identifiable and intervening. Online vulnerability can be defined as the perception of adverse effects on an individual's physical, psychological state as a result of online activities (Davidson and Martellozzo, 2013, Buglass 2017). However, exposure to online vulnerability does not automatically imply psychological vulnerability (Smith and Livingstone, 2017).

Risk exposure of young people in the online media environment is influenced by many factors. Assessing the subjective sense of digital wellbeing can contribute to understanding user's motivations and frustrations. The Basic Psychological Need mini-theory of Self-Determination Theory plays an important role in research on the uses and effects of interactive media (e.g. Rigby and Ryan 2018). Stimuli of digital media can lead to both satisfaction and frustration of basic psychological needs (Schneider et al. 2022). The goal of this study was to examine possible relations between the factors of need satisfaction and frustration and online risk; also, to validate the Digital Wellbeing Scale.

In this research, the Basic Psychological Need Satisfaction and Frustration Scale (BPNDFS) (Vansteenkiste, Ryan, and Soenens 2020), was translated and adapted to the digital environment, among other scales.

Using data from a cross-sectional survey of 300 Hungarian pupils (age 12–14), the theoretical model demonstrated adequate reliability and validity. Regarding the six different factors (autonomy satisfaction and frustration, competence satisfaction and frustration, relatedness satisfaction and frustration) five clusters were set up for digital wellbeing: "Idyllic", "Average", "Not interested", "Rollercoaster" and "Ambivalent". The results also show that the degree of satisfaction is mainly shaped by the feeling of competence, but frustration caused by the poor quality of connectedness. Connections can be explored between satisfaction/frustration and online risk exposures, such as overuse, online social anxiety, and body image concern. Also, some relevant differences between boys and girls appeared. This results highlight the importance of regarding individual factors of being online.

PP 0668 Don't let the bed bugs bite you – Effects of young children's media use on sleep quality

Jennifer Huebner¹, Moritz Jahns¹, Pia Küllstaedt¹, Carolin Noack¹, Luise Zwirlein¹, [Sven Joeckel](#)¹

¹ University of Erfurt, Media and Communication, Erfurt, Germany

Media Educators across the world recommend as little digital media use for children under the age of three as possible. This recommendation stands in stark contrast to the experience of parents with young children and their livelihoods. Two- and three-year-old children do indeed use digital moving image content, primarily through the smartphone as ubiquitously available media. We wonder what effects smartphone use for moving images in early childhood may have and particularly we focus on effects on young children's sleep quality.

Research in developmental psychology has extensively studied the importance of sleep for child development. However, there is limited research on the impact of digital media on sleep quality in young children. This study focuses on the effect of moving image media on sleep quality in children aged 18 to 36 months. This age group is chosen due to their growing engagement with media and established bedtime routines. Our study is based on an adjusted version of Cain and Gradisar's (2010) model of media use and sleep. In brief, this model argues that sleep quality decreases through extended media use during the day and at night due to various processes such as heightened mental, physiological, or emotional arousal, effects of (blue) light on biorhythms or media use compensating sleep time. Extended media use is a consequence of social factors with limited media regulation of media use time among them. Based on this model, we propose the following working hypothesis:

H1: The longer the duration digital moving image media use before falling asleep, the lower the quality of sleep.

H2: The more frequently smartphones for media use are used before falling asleep the lower the quality of sleep.

H3: The greater the child's say in the decision about the duration of use, the lower the quality of sleep.

We tested our hypotheses in an online survey among $N = 480$ adults (95.8 % female; $M_{\text{age}} = 32.1$; $SD = 4.40$) who feel responsible for raising a child aged 18 to 36 months (Child Age $M = 27.1$ months, $SD = 6.14$) recruited through parenting forums, Instagram, nurseries and midwifery practices. Sleep quality was recorded using the short version of the Children's Sleep Habits Questionnaire (CSHQ). Media/ Smartphone use as well as child's co-determination in media use was measured through parental reports.

Our findings show that around 60% of children in our sample used digital moving image media (video clips, serie, movies). Based on linear regression models we could confirm H1 through H3. For the presentation, we will calculate more comprehensive multivariate analyses. Here, we will investigate interaction as well as moderation effects for our socio-demographic variables (age of the child/person responsible, education, gender). The current status of the analysis shows that the observed effects are consistent with the theoretical expectations but are weak to medium. Findings enhance our understanding of the effects of digital moving image media on young children's sleep quality and open the ground for an investigation of effects of digital media use on young children.

PP 0669 Moving beyond screen time: Digital activities, affective and cognitive reactions and adolescent mental health

Borgaize Jake¹, Kasia Kostyrka-Allchorne², [Sonia Livingstone](#)³, Aja Murray⁴, Edmund Sonuga-Barke¹, Mariya Stoilova³

¹ Kings College London, Department of Child & Adolescent Psychiatry, London, United Kingdom

² Queen Mary University of London, Department of Psychology, London, United Kingdom

³ LSE, Media and Communications, London, United Kingdom

⁴ University of Edinburgh, Department of Psychology, Edinburgh, United Kingdom

Screen time is often blamed for the risk of mental health problems in youth, exacerbated by the pandemic. But while some studies report statistically significant associations between screen time and poor mental health, the results are mixed, and effect sizes are typically small. Importantly, the nature of adolescents' digital activities is obscured by the unitary construct of 'screen time', which lacks granularity about which aspects of digital engagement are harmful and which may support wellbeing digital activities. In this paper, we introduce a new self-report measure, the Digital

Activities and Feelings Inventory (DAFI) to address these limitations. The DAFI was co-designed with adolescents. It measures, first, the digital activities that adolescents engaged in over the past two weeks, and second, their cognitive and affective reactions to their digital activity.

To pilot test the DAFI, 192 UK adolescents aged 16–20 years completed the questionnaires online (mean = 18.2 years; SD = 1.2); 69% were female (31% male), 38% were from ethnic minorities, and 17% had received free school meals. Screen time was measured as hours online on an average weekday. Key outcome measures included the functional impact of digital activity on adolescents' daily lives (e.g., less sleep, conflict in relationships, difficulties at school), symptoms of depression and anxiety, and psychological wellbeing. To assess the reliability of outcome measures, adolescents were asked to nominate a proxy rater who knew them well (e.g., a friend, parent, etc.). Factor analysis found that the digital activity items resolved to four distinct though correlated factors: content risks (e.g., watched dark/negative content; saw gory/violent content), conduct risks (e.g., was treated in a hurtful/nasty way; chatted with a stranger), entertainment (e.g., played a game with others; did a hobby online) and social media activity (e.g., checked what others were doing; liked/shared others' content). The cognitive and affective items resolved to two factors – positive reactions (e.g., included; confident) and negative reactions (e.g., upset; ugly).

While screen time was weakly correlated with negative cognitive and affective reactions, depression, and functional impact, multiple regression analyses found screen time was not associated with depression and anxiety. However, content and conduct risks were associated with depression and anxiety. When negative cognitive and affective reactions were added to the model only the associations with conduct risks (and negative reactions) remained significant. In short, granular analysis of different types of digital activities and the cognitive and affective reactions they evoke provided a more powerful insight into mental health and wellbeing than screen time. Further, although positive digital activities (e.g., entertainment) and positive affective and cognitive reactions were more frequent than risky activities and negative reactions, their link to mental health and wellbeing was weaker. We conclude that negative cognitive and affective reactions drive the associations with depression and anxiety more so than digital risky activities. This suggests that the effects of digital activity are mediated by the reactions they evoke in individuals. The implications of research on digital engagement beyond screen time are discussed in relation to mental health research, policy and practice.

CYM07 Digital health, digital well-being and young people

PP 0670 The reciprocal associations between adolescents' mHealth app use, body dissatisfaction, and physical self-worth: A three-wave longitudinal study

Hayriye Gulec¹, Michal Muzik¹, David Smahel¹, Lenka Dedkova¹

¹ Masaryk University, Interdisciplinary Research Team on Internet and Society IRTIS, Brno, Czech Republic

A growing emphasis on personal responsibility in managing one's health and modifiable lifestyle behaviors has garnered much attention in shaping the health discourse in today's societies (Lupton, 2013). Mobile health (mHealth) apps facilitate the self-tracking of personal health data and are commonly utilized by adolescents to monitor and modify lifestyle behaviors related to physical activity, diet, and weight management (Rideout et al., 2021). Previous research primarily focused on the role of mHealth apps in adolescents' health-related outcomes (e.g. Emberson et al., 2021). However, quantification of the body through sports activities engaged, weight gain/loss and calories consumed/burned may impact adolescents' body image perceptions by influencing both positive and negative attitudes toward their bodies. Likewise, adolescents might engage in mHealth apps as a result of how they feel and think about their bodies. Yet, little is known about the association between mHealth app use and attitudes toward one's body. This prospective study contributed by examining the longitudinal bi-directional associations between adolescents' mHealth app use, body dissatisfaction, and physical self-worth.

A nationally representative sample of adolescents (N = 2,500; 50% girls; Mage = 13.43; SD = 1.69) participated in the study and provided data in three waves with six month intervals between 2021 and 2022. We focused on mHealth app usage related to calorie intake and expenditure, weight, and sports activity. We applied the RI-CLPM as an analytical approach to disentangle the within-person and between-person variance to determine the directionality of the associations and used a multigroup model to compare genders. This study provided the first comprehensive information for the longitudinal reciprocal associations between adolescents' attitudes toward their bodies and their mHealth app use in a nationally representative sample of adolescents using a within-person approach.

The results revealed a positive within-person effect of mHealth app use on girls' physical self-worth: increased mHealth app use led to higher physical self-worth six months later. However, this effect was not maintained at 12 months. There was no significant increase in physical self-worth at 12 months for the adolescent girls who used mHealth apps more frequently at six months. We found no significant within-person effect of mHealth app usage on body dissatisfaction. We also did not observe a significant effect from body dissatisfaction upon mHealth app use when we examined the reverse relationship. These findings suggest that mHealth apps are unlikely to harm adolescents' attitudes toward their body appearance and physical self-worth. Furthermore, the use of these apps may even contribute to enhancing physical self-worth among adolescent girls.

CYM07 Digital health, digital well-being and young people

PP 0671 Social media and well-being in adolescents: A cross-sectional and longitudinal study

[Isabel Rodríguez-De-Dios¹](#)

¹ University of Salamanca, Sociology and Communication, Salamanca, Spain

Adolescents are among the most prolific users of social media. This has raised concerns about the negative effects that social media use (SMU) could have on their well-being. However, contrary to the popular assumption, this use could be beneficial, or at least not detrimental, for part of them. The relationship between SMU and well-being in adolescents has been widely researched, but most of the evidence is cross-sectional and it is not clear whether adolescents' well-being precede or follow from SMU. On the other hand, the underlying mechanisms by which social media influence well-being are still being investigated. Following previous studies, we expect that SMU could have a negative impact on well-being through online victimization and a positive impact through online social support.

Therefore, the current study aims to analyze the cross-sectional and longitudinal relationship between SMU and well-being using data from a two-wave panel study with a four-month interval. To do so, it considers two mechanisms by which social media could confer a negative (or positive) impact (i.e., online victimization and online social support) and the role of personality traits. A total of 800 adolescents (51.37% boys; $M = 15.97$; $SD = 1.41$) participated in the study at baseline. Among them, a total of 708 adolescents (51.70% boys; $M = 16.13$; $SD = 1.46$) completed the questionnaire in Wave 2. Results showed that there is an indirect relation between SMU and well-being through online social support and online victimization. This relationship is moderated by personality variables (i.e., extraversion). Moreover, passive SMU was also found to be related to lower well-being, even though the association was weak. Hence, the study only found significant cross-sectional relationships which show that SMU is indirectly associated with well-being through online social support and online victimization. Accordingly, online experiences would be more relevant for well-being than the type of use. However, and although the cross-sectional analyses found a significant relationship, the longitudinal analysis did not reveal any statistically significant associations over time. Consequently, and contrary to popular assumptions, this study does not support the idea that SMU has a negative impact on adolescents' well-being.

CYM08 (Digital) media, (in)visibilities and minorities

PP 0771 Protective and risk factors for disordered gaming in adolescents aged 15 to 18 years

[Marijana Markovikj¹](#), Eleonora Serafimovska¹, Ivan Blazevski¹, Tea Koneska Vasilevska¹

¹ University of Ss Cyril and Methodius, Institute for sociological Political and Juridical Research, Skopje, North Macedonia

Internet gaming become attractive to young people worldwide. Although benefits of gaming can be observed (improvement of learning abilities, stress relief etc.) research and practice point to harmful, addictive effects. WHO included 'Gaming Disorder' (GD) in ICD-11 and American Psychiatric Association included 'Internet Gaming Disorder' (IGD) in DSM-5. This disorder is not related with problematic internet use, online gambling, or social media usage. It is behavioral disorder, characterized with urge to play longer to get satisfaction, reflecting on negative daily routines. In the survey from which this paper arose, the IGD and GD were explored and named by superior category as disordered gaming (DG).

Survey in Macedonia was a part of international project coordinated by Palacký University. The main goal was to explain the risk, protective factors and impact that DG can have on adolescents' mental health. Of particular interest was: to understand the extent to which maternal control, support, and monitoring has influence on the DG; whether DG is associated with higher levels of internalizing (self-harm) and externalizing (deviance) problems; the role of perceived peer support and the effect of resilience on disordered gaming.

A carefully selected instruments with solid psychometric properties were administered. The following instruments were used (correspondingly for each instrument the Cronbach Alpha coefficient obtained for the Macedonian population is provided): Internet Gaming Disorder Scale (IGDS9-SF) (0.86), Gaming Disorder Test (GDT) (0.77), Adolescent Family Process Measure (SF) (maternal support = 0.81 and maternal monitoring = 0.74), Maternal psychological control (CRPBI) (0.77), Child and Adolescent classmates support-CASS (0.94) Child and Youth

Resilience Measure (CYRM-R) (0.85 for both subscales). Normative Deviance Scale, Short Form (NDS-SF10) (0.66). Physically self-harming (only one question).

The survey was conducted during 2022 in the high schools in Macedonia on Qualtrics platform. Respondents (544) aged from 15 to 18 years, 271 were male (49.8%) and 273 female (50.2%). As they are minor respondents, consent letter was signed by them and their parents. This survey was approved by the Ministry of Education and Science.

Research findings showed a high correlation ($r = .78$ $p < 0.01$) between the two scales (IGD) and (GD), justifying the use of the subordinated term disordered gaming (DG).

Resilience (personal and caregiver) have positive effects on DG prevention, as the resilience is more dominant the internet gaming (IGD) is reducing (for personal resilience $r = -.35$ $p < 0.01$ and for caregiver $r = -.31$ $p < 0.01$) as well as gaming disorder (GD) (personal resilience $r = -.31$ $p < 0.01$ and caregiver $r = -.26$ $p < 0.01$). Peer support is another protective factor. When peer support is positive there is a decline of problematic gaming ($r = -.21$ for IGD and $r = -.25$ for GD and for both $p < 0.01$). And concerning adolescent's family process, with particular point on mother it can be said that maternal monitoring can be a protective factor against problematic gaming. Self-harm is positively correlated with DG ($r = .15$, $p < 0.01$ for IGD and $r = .13$, for GD). The same direction was identified with deviant behavior (with IGD, $r = .28$ and with GD, $r = .29$ and for both $p < 0.01$).

Key words: Internet Gaming Disorder, Gaming Disorder, risk factors, protective factors, adolescents

CYM08 (Digital) media, (in)visibilities and minorities

PP 0772 Adolescent cyberaggression: Unveiling the influence of anonymity and appetitive cybermotives on peers and celebrities

Shanu Shukla¹, Hana Machackova¹

¹ Interdisciplinary Research Team on Internet and Society, Faculty of Social Studies- Masaryk University, Brno, Czech Republic

Introduction

The primary objective of this preregistered study was to investigate the impact of anonymity and appetitive cybermotives on cyberaggression directed at peers and celebrities. The study further explores how cybermotives may serve as potential moderators, influencing the relationship between anonymity and aggressive behaviors.

Methods

Data from 500 Czech adolescents (Girls: 52.3%, $M_{age} = 15.42$, $SD_{age} = 1.70$) were collected online using a between-subject experimental design. The data collection took place through an agency in 2022. Participants, divided into anonymous and non-anonymous groups (Manipulated via instructions and group assignments), were involved in virtual tasks to gauge cyberaggression by endorsing (in the form of liking and sharing posts publicly) aggressive comments directed at peers and celebrities. Appetitive cybermotives were measured through Cyber-Aggression Typology Questionnaire (CATQ) (Runions et al., 2017). Besides, normative beliefs for cyberaggression, impulsivity social media activity, age, and gender were controlled. The study session lasted approximately 20 minutes.

Results

Results revealed a greater tendency for cyberaggression towards celebrities compared to peers in both the anonymous ($t(df) = -1.90$ (245), $p = 0.03^*$, Cohen's $d = 1.94$) and non-anonymous groups ($t(df) = -1.90$ (243), $p = 0.03^*$, Cohen's $d = 2.15$). Using Process Macro Model 2 (in SPSS 29), it was determined that neither anonymity nor appetitive cybermotives significantly influenced cyberaggression towards either group.

Discussion

The research underscores the importance of understanding the fundamental factors contributing to cyberaggression. Although anonymity and appetitive cybermotives may bear some relevance, their impact on cyberaggression towards peers or celebrities is limited among adolescents. Findings also suggest that individuals with celebrity status may experience increased levels of cyberaggression. In summary, this study offers valuable insights into the determinants of cyberaggression, emphasizing the necessity for additional research to devise effective strategies for preventing and addressing such behavior in online environments.

Keywords: anonymity, appetitive cybermotives, cyberaggression, experiment

PP 0773 Exploring the unseen: A qualitative study to unravel the social dynamics underlying adolescents' use of closed SNS stories and the sharing of alcohol-related content therein

Robyn Vanherle¹

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

With the rise of social networking sites (SNSs), adolescents' developmental tasks, such as forming an identity, fitting in with peer groups, and gaining autonomy from parents, have also shifted to online environments because adolescents can share posts expressing their identity and chat with important peer groups. Moreover, with the development of private SNS features, such as closed SNS stories on Instagram and Snapchat, these developmental tasks may have been further facilitated because adolescents can share ephemeral and often spontaneous content with a few close friends while keeping others (e.g., parents) at a distance.

However, at the same time, the private character of these features also seems to stimulate the sharing of more deviant content because research shows that adolescents frequently use closed stories to share transgressive alcohol-related content. This, in turn, is worrisome because proximal others, who are predominantly present in closed stories, are more influential in guiding individuals' behaviors, including drinking behaviors (see theories of social impact). The intermingling of private SNS environments and proximal peers, thus, appears concerning.

Still, little is known about the use of closed stories among adolescents because these are fairly invisible to researchers, thus often resulting in them making speculative observations. These observations may, however, misalign with adolescents' experiences since they are part of specific mobile youth cultures that may lead to different perceptions.

This study, therefore, contributes to the literature by conducting focus group interviews among adolescents who are part of the same closed story to 1) grasp which (underlying) social dynamics are present in closed stories (e.g., unwritten rules, expectations regarding peer interactions), and 2) unravel how more deviant behaviors are shared and perceived within these closed stories by taking alcohol-related posts as a case study.

Method

6 focus groups were conducted, resulting in a sample of 32 adolescents between the ages of 15 and 18 (Mage = 16.09, SDage = .86, 71.9% female). The focus groups were transcribed non-verbatim and the coding process followed a thematic analysis.

Results

Two important reflections can be made. First, adolescents used closed stories to share spontaneous content as well as more transgressive alcohol-related content with specific lists of best friends. These lists included peers with shared characteristics (e.g., interests, humor, and trust) and excluded peers diverging from these characteristics, hence aligning with social identity processes. Moreover, these lists enhanced adolescents' feelings of belonging to peer groups when being included but also feelings of exclusion when being excluded or temporarily swiped out. Second, based on shared characteristics, adolescents had different perceptions about the appropriateness of alcohol-related content in closed stories because people within the same group, or in this case story, were evaluated more positively, thereby pointing toward in-vs outgroup tendencies.

Conclusion

This study sheds more light on how adolescents navigate their peer relationships within private SNS environments, i.e. closed stories, that are under the radar of adult supervision. These insights were revealed by relying on youth's perspectives, thus showcasing the need to actively involve youth in research to gain a profound understanding of how they adapt and experience digital innovations.

PP 0774 Exploring active bystander behaviors in the context of non-consensual forwarding of sexting messages among youth: Applying the theory of planned behavior

Chelly Maes¹, Joris Van Ouytsel², Laura Vandenbosch¹

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

² Arizona State University, Hugh Downs School Of Human Communication, Arizona, USA

Sexting, or the "online sending of sexually explicit texts, images and video's" (Mori et al., 2020) is increasingly common among adolescents and young adults. Although sexting usually occurs in the private context of a trusting relationship between two individuals, this sense of privacy can be violated when sexts are shared beyond the intended recipients. About 8.4% of adolescents (Madigan et al., 2018) and 7.6% of young adults (Mori et al., 2020) have experienced sexts of themselves being forwarded without their consent. Non-consensual forwarding of sexts (NCFs) is a form of sexual harassment and can be highly detrimental for the sender's social and emotional health (Wachs et al., 2021).

Prevention strategies aiming to reduce NCFS in youth typically apply a victim-focused approach and have been criticized for encouraging a victim blaming discourse (Naezer & van Oosterhout, 2021). An alternative approach could focus on third parties. When a third party receives a forwarded sext, they can support the victim and engage in active bystander behavior (Salmivalli et al., 1996). The latter active behavior is an important protection factor for victims experiencing sexual harassment and cyberbullying (e.g., Domínguez-Hernández et al., 2018) and seems pivotal to reduce NCFS and its harmful consequences. Yet, knowledge is missing regarding underlying mechanisms predicting youth's intentions to engage in active bystander behavior in the context of NCFS.

Accordingly, using cross-sectional data from 1337 Flemish adolescents and young adults (78.4% female; $M_{age} = 21.64$ years, $SD = 3.57$ years), this study investigates the potential determinants of youth's intentions to engage in active bystander behavior in the context of NCFS as proposed by the Theory of Planned Behavior (Ajzen, 2011). More specifically, we measured youth's attitudes towards active bystander behavior in this context, injunctive and descriptive norms, and perceived behavioral control. Structural equation modeling showed that attitude, $p < .001$, injunctive, $p < .05$, and descriptive norms, $p < .001$, and perceived behavioral control, $p < .001$, were significantly related to intention to engage in active bystander behavior in the context of NCFS. In turn, intention related to self-reported engagement in active bystander behavior, $p < .001$.

These findings provide ground for the development of evidence-based sexting education resources that not only educate youth about the risks of sexting but also encourage active bystander behaviors. Within the context of NCFS, educational resources could focus on teaching adolescents how to recognize NCFS as an abusive behavior, and not as a joke or gossip, and offer guidelines on how to confront the perpetrators of NCFS effectively to maximize third parties' perceived control in these situations (e.g., by discussing the role of consent, discussing the responsibility of the perpetrator, and offering effective ways to tell them to stop). Further, prevention programs and educational curricula can benefit from adopting a norm-based approach and, thus, reframing youth's attitudes and norms surrounding active bystander behaviors in the context of NCFS. For instance, practitioners could highlight the benefits tied to intervening (e.g., reducing negative impacts on the victim), and communicate about peers' positive norms towards active bystander behaviors.

CYM08 (Digital) media, (in)visibilities and minorities

PP 0775 I don't hide it on TikTok: Performances, self-representation, and dilemmas of early adolescent pregnancy

Antonio García-Jiménez¹, Rebeca Suárez-Álvarez¹

¹ Rey Juan Carlos University, Dept. Journalism and Corporate Communication, Fuenlabrada, Spain

Although teenage pregnancy is socially more accepted in the West, pregnant minors feel stigmatised and risk social isolation (SmithBattle, 2020). However, some girls have chosen not to hide their pregnancy, therefore transcending conventional interpersonal communication boundaries (Cino and Formenti, 2021). They show realities that do not appear in legacy media and generate high level of interest from the audience with more than 229M views on TikTok. This study is framed within the research on the dynamics of presentation of minors on TikTok (De Leyn et al., 2022) and on the Social Role Theory of Sex Differences (Eagly and Wood, 2016).

Through content analysis methodology, this research aims to contribute to current academic findings about Generation Alpha behaviour and gender inequalities. 240 videos of western minors aged between 12 and 14 years old with early pregnancies and who self-identify their age have been selected. The selection of videos was made using 6 hashtags in English and Spanish, between October and December 2023, considering those which would pop up on the "top" section. In addition to the analysis of the self-representational agency of these mothers, the research is complemented with the study of 2.000 comments from the conversation threads that the minors receive on their profiles, taking into consideration the terms, the topics, and the degree of polarisation that they generate in the audience.

The first results point to the worrying typification of minors in their pregnancies and the disconnection of fathers (men) in these practices of sharing performances. They proudly show their bellies without revealing, except on rare occasions, how it affects them in their daily lives, the vulnerabilities to which they are exposed, and the risks involving teenage pregnancy. The dilemma of presenting their pregnancies on social media is reinforced by the audience's collective praxis. As a result of the ambivalent nature of the comments, they receive support from other mothers, whilst also facing offensive and degrading messages. They lash out at their sexuality and question harshly their behaviour. This research aims to harmonise the study of these social practices of teenage mothers-to-be and the conversational output constructed in TikTok to explore the situations they face. From a communicational perspective, we delve into the culture of social media on the assessment of female bodies and question the prevalence of gender stereotyping that reproduces dominant ideologies.

PP 0810 Barometer of habits of use and consumption in tablets and smart-phones among children and adolescents from 7 to 15 years old in Spain, two wave data 2022 and 2023

Félix Ortega¹, María Marcos-Ramos¹, Teresa Martín-García¹, Patricia Sánchez-Holgado¹

¹ University of Salamanca, Department of Sociology and Communication, Salamanca, Spain

1. Introduction

There is a need to build methods and techniques for measuring, monitoring and evaluating the habits of use and consumption of children and youngsters in smart screens. There is a demand from the different suppliers of products and services, private or public institutions, to know, measure and evaluate usage and consumption habits with traditional indicators and new ones. We present results from a National Study survey Barometer of Habit of Use and Consumption in Tablets and Smart-phones in Spain, a two wave study with 2455 respondents. In our presentation-paper the research questions that will be answered and presented correspond to three age groups, 7 to 9 years, 10 to 12 years, and 13 to 15 years.

Q1 (Research question 1): What are the habits of use and consumption of children between 7 and 15 years old on tablets and smartphones? Media Consumption, Educational Consumption, Videogames Consumption, Consumption in Social Networks, Advertising Consumption, Consumption of other contents.

Q2: What are the levels of anxiety and stress perceived by the different age groups when they are using and not using their smartphone and/or table? – a anxiety scale is used and a cybervictimization scale.

Q3: What are the differences of gender and age in the patterns of use and consumption, children vs girls, ages and Autonomous Communities-CCAA, are there significant differences and correlations?

Q4: What are the interactions of socialization and communication carried out by children and youngsters with their peers and elders on their mobile devices?

Q5: What are the Opportunities, Threats, Strengths and Weaknesses that children and youngsters identify in their activity on smartphones and tablets when they entertain, study, communicate and socialize with their digital environment and their interaction with the physical environment?

Q6: What are the wishes and demands that children and youngsters have in the variables of entertainment, leisure, education, socialization that they would like to have available in their devices?

2. Background and innovation

This is a longitudinal research carried out in Spain for the three indicated age groups with funding from the Chair RTVE University of Salamanca in Children Youth and Media, with a representative sample in all the Autonomous Communities and in the defined research variables, with a verifiable scientific methodology, contributing to the construction of new, accessible and open data research, there will be a white paper and free access to the data matrix.

Research initiatives such as the EU & Global Kids Online project, the research of Common Sense Media-Research and the initiatives developed around ECREA, European Communication Research and Education Association, in its section of "Children, Youth and Media" shows the need and innovation at the EU to address complementary studies to these and explore new scenarios.

3. Methodology

Typology: Web Survey, will be carried out through the Qualtrics Platform with access to an online panel that will be rewarded for their participation, ethical supervision by the University Ethical Commission was implemented. We present the results of Barometer waves 2022 and 2023, with a total of 2455 valid respondents among both rounds.

CYM09 Social media and youth III

PP 0811 Daily excessive internet use symptoms in adolescents: Ecological momentary assessment study of symptoms' daily variability and their predictors

Martin Tancoš¹, Jana Blahošová¹, David Šmahel¹

¹ Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Although the internet is a source of opportunities and challenges for adolescents, it can bring numerous risks, such as excessive internet use (EIU), often perceived as risky and disordered behaviour that can shape an individual's daily life. Previous research on adolescents' EIU mainly concentrated on the between-person perspective (comparing those who are more excessive users with those who are less), emphasising the perception of EIU as a stable trait.

Questioning this assumption, recent longitudinal studies examined EIU at the within-person level (comparing individuals with themselves in different time points), however, over months or years. Few studies suggested that the levels of EIU symptoms could vary on a daily basis, proposing that the EIU symptoms could be more context-dependent and transient. The current study examined whether daily variability in EIU symptoms could be observed.

However, factors that might influence the daily variability of the EIU symptoms were neglected by previous research. Based on the literature, we explored the effect of smartphone social media use, entertainment app use, or use of other electronic devices. In accordance with mood management theory and the compensatory internet use model, we also examined the influence of daily negative affectivity and daily stressors.

Participants ($N = 114$, $M_{age} = 14.99$, 54% of boys) were involved in the ecological momentary assessment. They installed a research app onto their mobile devices through which questionnaires were sent to them four times a day and which objectively measured time spent in different applications during the 14-day period. Data from 1,926 questionnaires aggregated into 570 daily observations entered the analysis.

We found that a substantial proportion of EIU variability was due to day-to-day changes within the individuals ($ICC = .54$). The multilevel zero-inflated Poisson regression model indicated that social media app use, daily negative affectivity and other media use predicted the EIU symptoms positively at the within-person level, whereas daily stressors did not. Entertainment app use predicted the EIU symptoms at both levels, however, while the relationship at the within-person level was negative, the direction of the between-person relationship was positive. Daily negative affectivity was also positively related to self-reported EIU symptoms at the between-person level. Nevertheless, no significant relationship at the between-person level was found for social media app use, other media use, daily stressors, gender, or age.

Our study newly showed that EIU symptoms can fluctuate from day to day, which challenges the prevailing perception of EIU as a stable trait in adolescent research and highlights the need to consider the within-person variability. We also contributed to the field by differentiating within-person and between-person levels when examining the influence of various factors on EIU symptoms. Moreover, we discovered that adolescents' use of specific smartphone apps, daily negative affectivity or usage of other devices may influence the daily level of the EIU symptoms. These findings also have important societal relevance. Understanding day-to-day fluctuations in these factors and their effect on the EIU symptoms may help us to formulate more precise recommendations for stakeholders, parents, or teachers.

CYM09 Social media and youth III

PP 0812 Idols within reach: Measuring the perceived attainability of media role models among youth

Darian Harff¹, Heleen Dekoninck¹, Desiree Schmuck^{1,2}

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

² University of Vienna, Department of Communication, Vienna, Austria

Social comparison with media role models can have positive consequences for youth when idols are 'attainable' (Ivaldi & O'Neill, 2010; Politte-Corn & Fardouly, 2021), referring to exemplars who represent ostensibly realistic comparison targets for people (Lockwood & Kunda, 1997). Nowadays, young people are increasingly exposed to counter-stereotypical and seemingly attainable success stories via social media (Webb et al., 2019), where many also follow social media influencers (SMIs), who may be seen as more 'within reach' than traditional celebrities due to their origin of fame (Khamis et al., 2017; Jin et al., 2019). Despite the relevance of the concept, particularly in today's digital environment, research lacks a comprehensive and validated scale to reliably assess perceptions of role model attainability.

Method

We addressed this lacuna by developing a novel scale to capture the perceived attainability of media role models, which was tested and validated among three independent youth samples ($N_{total} = 1043$, ages 16–25). Following an extensive literature review to construct items, nine experts reviewed a translated version of the scale. We revised the

items before testing the scale using EFA (Study 1), validating it using CFA and correlated it with related constructs to establish construct validity (Study 2). Finally, we validated two short-form versions of the measure (Study 3). For further information see OSF (https://osf.io/7g693/?view_only=c5e57eb36bec43dfb3b87714bc4d5922).

Results

In Study 1, the EFA suggested that the measure was five-dimensional (i.e., attainability of skills, fame, values, person in general, and appearance), explaining 62% of the variance in the items. Following CFAs and tests for measurement invariance, we arrived at 23 items in Study 2 showing good model fit ($\chi^2/df = 1.61$, CFI = .967, TLI = .963, RMSEA = .050 [.040, .059]). The scale was strongly correlated with—but also sufficiently distinct from—perceived similarity, $r(240) = .53$, $p < .001$, and attitude homophily, $r(240) = .57$, $p < .001$. Moreover, we found that young men ($M = 4.07$, $SD = 1.26$) perceived their role models as more attainable than young women ($M = 3.68$, $SD = 1.35$; $t(218.90) = 2.30$, $p = .022$), and that SMIs ($M = 4.14$, $SD = 1.36$) were perceived as more attainable than traditional celebrities ($M = 3.69$, $SD = 1.29$; $t(149.43) = -2.51$, $p = .013$). In Study 3, both short-form versions of the scale showed good model fit (10-item: $\chi^2/df = 1.64$, CFI = .984, TLI = .976, RMSEA = .056 [.025, .083]; 5-item: $\chi^2/df = 1.97$, CFI = .978, TLI = .956, RMSEA = .069 [.000, .132]) and internal consistency (10-item: $\alpha = .86$; 5-item: $\alpha = .72$).

Conclusion

To capture perceived role model attainability, we developed and validated a five-dimensional scale, as well as two short-form versions of the scale. Across three independent youth samples, our measure showed good psychometric properties and was related to relevant constructs like perceived similarity. As such, we close an important research gap with this work, which has persisted since the emergence of first studies on role model attainability (e.g., Lockwood & Kunda, 1997).

CYM09 Social media and youth III

PP 0813 Individual factors of expected and unexpected sexting and the subsequent feelings: A nationally representative study in adolescents

Michaela Lebedikova¹, Rubén Oliveira-Araujo², David Smahel¹, Kaveri Subrahmanyam³

¹ Masaryk University, IRTIS – Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

² University of the Basque Country, Audio Visual Communications and Advertising Department, Bilbao, Spain

³ University of North Florida, Department of Psychology, Jacksonville, USA

Sexting, the practice of sending, receiving, or forwarding sexual content about oneself or others, is prevalent among adolescents, raising many parents' concerns who see it as disruptive and risky behavior that may be against what is considered "orderly." Its consensual and non-consensual forms may elicit pleasant and upsetting feelings; however, we lack an understanding of how adolescents feel after different sexting types and the psychosocial factors that may drive those feelings. Driven by the Integrative Model of ICT Effects on Adolescents' Well-being (iMEW) framework, the present study explores (1) the associations between depression, loneliness, self-esteem, happiness, sensation seeking, age, and gender, with the three types of sexting behavior (expected and unexpected receiving and sending of sexts); and (2) the role of individual factors in feeling happy and upset after different types of sexting, in a nationally representative sample of 2,500 Czech adolescents (11–16 years old, $N = 2,500$, 50% girls). Among Czech adolescents, 15.4% had an experience with receiving expected sexts, 18.4% with receiving unexpected sexts, and 10.9% with sending sexts in the preceding six months. Binomial logistic regression revealed a similar pattern of associations across the three sexting behaviors. When receiving sexual messages, adolescents felt more upset than happy. Among girls, 44.1% who received expected sexts felt upset at least monthly, compared to 23.3% of boys. After receiving unexpected messages, 53.2% of girls felt upset at least monthly, while only 35.5% of boys did. In both cases, boys felt significantly happier than girls, and girls felt significantly more upset than boys. Interestingly, regardless of consent, receiving sexts is upsetting for adolescents. After sending sexts, adolescents felt more happy than upset, and we found no gender differences. While we found a similar pattern of associations with all three types of sexting behavior, there was no pattern of associations regarding feelings after sexting. This is an important theoretical contribution, as we tested the assumption of the iMEW, which, in line with the Differential Susceptibility Media Effects Model (DSMM), posits that individual susceptibility variables predict not only ICT activities/media use but also the outcomes of ICT activities. Our results clearly show that this is not the case with sexting. Moreover, different sexting behaviors – and their outcomes – are often researched under one umbrella of "sexting," but our results clearly show that the three studied forms of sexting are distinct behaviors, including their outcomes, and should be studied as such. Our results are important for educators, parents, and policymakers: Girls are especially vulnerable to experiencing negative feelings compared to boys, regardless of the consent when receiving sexts. Importantly for healthcare workers, we found that depressed individuals are more likely to receive sexts, regardless of consent. Still, their mental health problems are not related to feeling upset after any type of sexting. Sex education should focus on the different situations under which adolescents might receive sexts and focus on consent navigation and coping strategies to help alleviate negative feelings.

CYM09 Social media and youth III

PP 0814 Personal and social norms of adolescents' visual self-presentation on Instagram and Snapchat

Jessica Kuehn¹, Claudia Riesmeyer¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

Instagram and Snapchat are changing adolescents' identity development by offering numerous opportunities for visual self-presentation, i.e., presenting oneself to others through verbal, non-verbal, or visual means to convey a specific image of oneself (Grieve, 2017; Riesmeyer et al., 2021). Thereby, norms serve as rules for action (Yau & Reich, 2019). Personal norms reflect individual values and beliefs, while social norms represent socially negotiated, perceived, and context-dependent rules of action (Interis, 2011; Rimal & Lapinski, 2015). Proximal (e.g., peers, family) and distal (e.g., social media influencers) reference groups set social norms through their actions (descriptive) or formulate them as demands (injunctive). Personal and social norms are closely linked and shape visual self-presentation. Although there are research findings on adolescents' visual self-presentation, only a few examine the relationship between personal and social norms and compare distal and proximal reference groups. Therefore, we ask which *personal* (FF1) and *social norms of proximal and distal reference groups* (FF2) adolescents perceive for their visual self-presentation and how these norms are related (FF3).

We conducted in-depth interviews with 55 adolescents (12–16 years, 25 female, 30 male, medium to highly educated) from July 2022 to July 2023. The interviews were transcribed verbatim, anonymized, pseudonymized, and analyzed with MAXQDA using categories. We received a positive ethics vote from "####".

The results show that Instagram depicts special moments, while Snapchat is increasingly used for spontaneous depictions of everyday life. Adolescents' visual self-presentation is strongly based on their personal norms (FF1): The profile design and the feature choice (story/feed, single/round snap) are determined by personal norms of gaining a certain reach and protecting privacy. These personal norms often result from the social norms of others (FF2). Since *peers* also use Instagram and Snapchat and are therefore present (descriptive), they are the most crucial reference group with whom shared norms are also formulated as (mutual) calls to action (injunctive, e.g., veto rights and liking shared posts). Snapchat streaks are conspicuous as an expression of the relationship's strength, which entails adolescents' compulsion to present themselves, as the streaks are only maintained with daily contact. Depending on their media literacy, *parents* serve as (non-)role models for visual self-presentation (descriptive). They set injunctive norms, which are subject to sanctions (e.g., positive = like; negative = offline sanctions). *Teachers* rarely set descriptive (often no contact via social media) or injunctive norms (curriculum, engagement). *Social media influencers* are perceived as norm setters for descriptive and injunctive norms (e.g., purchase recommendations, body image). Social norms are first compared with personal norms before they are recognized as rules for action and incorporated (or not) into one's norm repertoire (FF3). The findings show the interaction between personal and social norms: While social norms can influence personal norms by serving as models of acceptable behavior, personal norms can, in turn, affect the perception and acceptance of social norms. We show the complex interrelationships of norm negotiation for visual self-presentation on social media, which, as a new branch for adolescents' identity development, enables numerous options for identity experimenting.

CYM10 Media, mediation and families I

PP 0877 (Dis)connected families: A dyadic perspective on the role of mobile technology devices within family interactions

Nele Janssens¹, Kathleen Beullens¹

¹ KU Leuven, The Leuven School for Mass Communication Research, Leuven, Belgium

The characteristics of mobile technology devices have drastically transformed family life by allowing new ways of integrating technology in familial interactions. Mobile technology can disrupt social interactions (i.e., technoference) and lead to conflict, yet, these devices have also the capacity to foster connection when used in a family-oriented way. The role of mobile technology within family life depends on how family members make use of these devices, which can differ between parents and children following the uses and gratifications theory [1].

The current study aims to examine the evolving role of mobile technology in parent-child interactions, either as an interfering (technoference) or connecting (family-oriented use) factor. More specifically, using dyadic data, we will explore (1) differences in perspectives of technoference and family-oriented mobile technology use between parents and children, and examine (2) how these types of mobile technology use contribute to the quality of the parent-child relationship and (3) individual well-being.

Method

Parents and their children (8–14 years old) filled in a survey, resulting in a sample of 390 dyads ($M_{\text{age parent}} = 43.14$; $M_{\text{age preadolescent}} = 11.54$). We assessed the level of technoference, family-oriented mobile technology use including a differentiation between usage when physically together versus apart, parent-child conflict and closeness, and

parents' and children's individual well-being. After testing for measurement equivalence, a separate parent and child model were analyzed through structural equation modelling in R.

Results

Our findings reveal discrepancies in child technoference perceptions, more specifically, the level of child technoference is significantly lower when self-reported compared to the parent-reports ($t(768) = 11.99, p < .001$).

We also found varying relations between the different types of mobile technology use and the relationships and well-being between parents and children. In the child model, both parent ($b = .20, SE = .04, p < .001$) and child technoference ($b = .18, SE = .04, p < .001$) was negatively associated with the parent-child relationship but not the child's well-being. Family-oriented mobile technology use when being physically together was beneficial for the trust and spending fun time together in the parent-child relationship ($b = .12, SE = .04, p = .009; b = .13, SE = .05, p = .009$), and indirectly for the child's well-being ($b = .03, SE = .02, p = .03; b = .02, SE = .01, p = .03$). The parent model, on the contrary, only showed a negative relation between the child technoference and the parent-child relationship ($b = .29, SE = .06, p < .001$) and indirectly on parent's well-being ($b = -.06, SE = .02, p = .06$).

Discussion

Thus, mobile technology use can be both detrimental and beneficial, however, the effects can differ depending on the family member. This could explain current literature's mixed findings and highlights the need to focus on specific technology usages and to take multiple perspectives into account.

CYM10 Media, mediation and families I

PP 0878 Enhancing media awareness among parents within a Dutch rural child-rearing community by engaging professionals in maternity-care, daycare, and youth health care: Results of a participatory action research

Peter Nikken¹, Emma Middag¹, Svenja Buttner¹

¹ Windesheim university of applied science, Research center Children & Media, Zwolle, Netherlands

Introduction

Young children increasingly use digital screens[i], whereas parents increasingly rely on screens as a babysitter[ii]. These trends present challenges for professionals supporting young children and their families, especially those with lower socioeconomic status[iii]. This study focuses on how professionals can enhance the media awareness of these usually hard-to-reach parents with young children.

Method

We organized a chain-wide participatory project in a small rural village in the North East-region of The Netherlands. Five professionals working in maternity care, daycare, and youth health care together with a dozen parents of children aged -9 months to 4 years from a lower socioeconomic part of the community and three communication researchers explored challenges like managing young children's screentime and choosing suitable content and created opportunities to solve them.

The Design Thinking research methodology was applied, constituting a 'bottom-up' approach to narrow perspectives of different groups by making decisions that are informed and driven collectively by those who are affected by those decisions[iv]. The methodology of Design Thinking consists of the following 5 phases: empathize, define, ideate, prototype, and test.

Accordingly, focus group meetings were organized within the regular care system (e.g., coffee-mornings for parents, team-meetings for professionals) to gather experiences and needs of parents and professionals within the community. Their input was visualized by a digital designer into accessible talking boards with little text which lead to new in-depth focus group sessions to co-design methods to create tools to increase media awareness.

Results

Parents' needs mostly focused on practical support. Parents questioned how much screentime is allowed for their child(ren), how to set boundaries, how to be engaged in children's media use, and how to find age-appropriate content. The professionals acknowledged the importance of informing parents about media awareness, but lacked the time and knowledge to make this part of their daily practice.

Eventually, in the ideate en prototype phase, three 'tools' for increasing media awareness were co-designed by all participants: four awareness posters, six coasters with parental awareness recommendations and three information videos. The videos showed a conversations at the centers between a maternity nurse and a mother about the importance of eye-contact during feeding, between a youth care professional and a mother about screentime,

and between a toddler and a childcare worker about a request to use media. In 2024 the effectiveness will be tested and results presented at ECREA 2024.

PP 0879 Guardians of digital privacy: Unravelling children's perceptions beyond parental control

Katharine Sarikakis¹, Lisa Winter¹, [Angeliki Chatziefrimidou](#)¹

¹ University of Vienna, Department of Communication, Vienna, Austria

When aiming to counteract privacy risks for children when on online and social media platforms, the solutions to which policy and scholarship gravitate concern largely the educational system and literacy as well as the role of parents as educators and supervisors. Although the place of media platforms themselves is an area that has attracted a lot of attention, as has media literacy, the role of parents when not related to literacy matters remains under/researched. Even more under researched is what children think themselves about the role of parents in navigating issues of privacy when online. This paper explores children's perceptions of privacy and the role of parents in developing those understandings and in negotiating privacy. Children's perceptions to the role of parents must be understood against the backdrop of an increasingly digitised world, where personal boundaries are continually evolving, and the resources utilised by global platforms in shaping the conditions under which children's media use is technologically directed. By examining children's perspectives on privacy through focus group interviews, this research aims to contribute into the evolving landscape of privacy in the digital age and the intricate web of relationships that shape children's perceptions. The paper presents the limits and possibilities of education and media literacy and their practices within European and Austrian contexts. Parental involvement is discussed in relevance to mediation strategies and the important consequences of parents' own media literacy levels for their children's online privacy protection. The paper finds that the views of children about the role of their parents are complex and vary, but also there are commonalities such as: parents' expertise and relevance; issues of belonging to the social milieu of platforms; inconsistency and differing approaches of parents across families, hence children of the same age. Through this work, we draw upon elements of relevant policies that can improve and support the protection of children's online privacy and interrogate the extent to which the existing status quo reflects children's perceptions in fostering and enhancing parental media literacy in a common effort to proactively creating an environment, where online privacy is protected.

PP 0880 Balancing boundaries: Mapping parents' perceived concerns and opportunities of LGBTQ storylines in children's television

[Thalia Van Wichelen](#)¹, Alexander Dhoest¹, Sander De Ridder¹

¹ University of Antwerp, Communication Studies, Antwerp, Belgium

In the evolving landscape of international media, the inclusion of LGBTQ narratives in children's television has reshaped the portrayal of different identities in media for young audiences. While these media representations

indicate growing attention to diversity on screen, they exist within global controversies regarding children and sexuality (e.g., the Don't Say Gay bill in the USA). Building upon the framework of 'bounded acceptance' (Huijnk et al., 2022), this study further explores the dynamic where support for LGBTQ individuals coexists with growing biases and reservation, particularly when the discussion involves children. Taking Flanders as a case study, a total of 53 Flemish parents with at least one child between 4 – 12 participated in qualitative interviews to examine their perceptions of LGBTQ characters in current media for children.

The empirical data first and foremost illustrates a complex relation between children, sexuality, and media representation. While many parents initially advocated for LGBTQ inclusion based on norms of equality, this initial positivity was often tempered by more conventional arguments that focus on safeguarding children. This interplay between support for inclusive media and subsequent reservation about its impact on young audiences, illustrates that acceptance remains rather bounded. It could moreover be described as a 'why not' vs. 'yes, but' dynamic, where perceived opportunities are acknowledged, whilst distinct boundaries are also established.

In terms of this initial positive reception, our findings reveal four opportunities associated with LGBTQ characters: (1) information, (2) socialization, (3) promoting prosocial behavior, (4) and facilitating identification. Parents recognize the educational potential of these narratives in inciting awareness of diversity and normalizing differences, especially given the dominance of heteronormative narratives on screen, and often limited encounters with the sexual and gender diversity in children's personal environments. Furthermore, it could prompt conversations between children and parents, and provide support for those in need of it.

Conversely, the interviews also indicated two clusters of concerns associated with LGBTQ characters. These concerns stem from (1) characteristics of the audience (children's age and gender) and (2) characteristics of the represented storylines (the quantity, quality, and depiction of physical affection). Parents expressed reservations about the age at which these characters are introduced to children, emphasizing the perceived cognitive maturity needed to fully understand what these representations are about. While references to non-heterosexuality generally seem to be more accepted, transgender or non-binary characters are met with more reservation. Furthermore, parents especially raised concerns about the current quantity of LGBTQ characters in contemporary media, fearing that it might shift the focus away from authentic representation to a mere act of 'political correctness', which was moreover described as 'confusing' to young children.

Hence, even within a country recognized for its legal protection of sexual and gender minorities, our findings uncover an atmosphere in Flanders where initial support for diversity yields to reservations regarding inclusive media, especially when children are involved. Accordingly, this research sheds light on the complex negotiation where endorsement of equality is met with certain boundaries, prompting critical reflection on societal norms and evolving children's media landscapes.

PP 0881 Do restrictions work? Examination of the impact of parental restrictions on adolescents' online flirting with new people in 4-wave panel

[Lenka Dedkova](#)¹, [Vojtěch Mýlek](#)¹, [Michaela Geržičáková](#)¹

¹ Faculty of Social Studies- Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Parental restrictions are widely used to regulate children's usage of digital technologies (Beyens et al., 2022). However, previous findings about their effects on children's behavior are inconsistent—some studies show that increased restrictions are connected to lower online risks (e.g., Cabello-Hutt et al., 2018), whereas others report the opposite (e.g., Shin & Ismail, 2014). One reason could be the effects' bi-directional nature: restrictions can affect children's behavior, but their behavior can also determine whether parents set restrictions (Kuldas et al., 2021). Most of the existing parental mediation research was cross-sectional and not well suited to disentangle these effects.

In our study, we utilize longitudinal design, allowing examination of the effects over time. We are interested in adolescents' online flirting with people from the internet. This activity includes exchanging flirty or sexually loaded messages with people whom the adolescent met online. Online flirting is closely related to sexting, but it is not limited to exchanging sexually explicit messages (Dodaj & Sesar, 2020; Whitty, 2004). As a risky activity (Jiswal, 2021), sexting and interactions with unknown people online in general are often restricted by parents (Corcoran et al., 2022; Dedkova et al., 2022). Yet, so far, we lack a longitudinal examination of the restrictions' effects on this behavior.

Thus, in our study, we examine whether parental restrictions affect adolescents' engagement in active (sending) and passive (receiving) online flirting with unknown people. Because parental mediation tends to be less effective among older adolescents (Padilla-Walker et al., 2012) and because parental fears over contact risks online are gendered (Steinfeld, 2022), we further examine adolescents' age and gender as moderators. We utilized data from a 4-wave survey of 2,933 adolescents (age $M = 13.44$, $SD = 1.74$ in T1; 50% female). Quota sampling was used in T1 to gain a sample representative of the Czech population in basic socio-demographics. We analyzed the data using

a random intercept cross-lagged panel model, which separates between-person association and within-person effects (Hamaker & Kuiper, 2015).

Results show that higher restrictions were connected to lower active as well as passive online flirting on a between-person level. However, they were not connected on a within-person level, i.e., the person-specific changes in parental restrictions did not lead to changes in online flirting six months later (or vice-versa). While gender made no difference, the effects differed between younger (11–13) and older (14–16) adolescents. Among older ones, restrictions had no effect. Among younger adolescents, restrictions led to less active flirting, and further, engagement in active flirting resulted in decreased parental restrictions six months later.

Our results thus show that restrictions seem to have the desired impact among younger adolescents, but they cease to be effective among older ones. Further, the effect holds only for active flirting, i.e., the situation where adolescents themselves decide to send flirtatious messages. This is likely because passive flirting (receiving messages) may not be under adolescents' direct control, making it also less prone to be affected by any parental rules.

CYM11 Social media and youth IV

PP 0912 The role of visual informality in shaping news perception among young audiences

Jan Novotny¹

¹ Charles University- Faculty of Social Sciences, Institute of Communication Studies and Journalism, Praha, Czech Republic

This project explores the impact of informal visual communication on the reception of news content. More and more news media, especially those targeting the younger generation, are moving away from established forms and using expressive visual and linguistic devices that are more typical of informal communication. Knowing that Generation Z and other groups of young audiences most frequently get their news from social media, journalists simulate the organic materiality of news by presenting headlines resembling instant messaging apps or interfaces of social media platforms. Additional visual elements, such as emojis or irregular typefaces, can be perceived not only as a way of making the content more visually interesting and original but also as a way to close the perceived communication distance between the author and the recipient. Previous studies have shown a positive relation between the level of graphic design of news websites and their traffic, as well as the importance of interactive elements in contemporary news content. The effect of language or visual informality is, however, studied very rarely.

The method of this study is an experimental study of effects. The study presented young students with fictional news articles that vary in the use of informal visual elements. Participants were randomly assigned to different experimental conditions, and their evaluation of presented news items was measured using quantitative metrics. The study focused on perceived trustworthiness and authenticity. Furthermore, it examined whether the audience judges visually informal news as more prone to bias. Finally, the study tests how informal means of expression affect information retention in the young demographic.

Preliminary findings show that visual informality can be an effective tool to increase the relatability of news content, making it more accessible and relatable to a younger audience. In some cases, however, the informality trivialised serious news and decreased the perceived importance of said articles. Furthermore, the results suggest a noteworthy tendency among participants to associate visually informal news with a higher susceptibility to bias. These findings align with the broader discourse on the evolving landscape of news communication, raising questions about the delicate balance between new media forms, such as infotainment, and perceived credibility.

Recognising that trust and authenticity remain fundamental pillars in an increasingly visual news landscape, especially for the younger demographic, this study underscores the critical need to comprehend the impact of visual forms. This understanding not only brings the results of the evaluation processes but also holds the potential to guide effective strategies against misinterpretation and the potential abuse of deceptive practices within news media.

PP 0913 Tweens' perceptions of the opportunities and risks of their online world

H. Ying Chuck¹, Chiara de Jong¹, Serena Daalmans², Esther Rozendaal¹

¹ Erasmus University Rotterdam, Erasmus School of Social and Behavioural Sciences, Rotterdam, Netherlands

² Radboud University, Communication & Media – Behavioral Science Institute, Nijmegen, Netherlands

Tweens (i.e., 8 – 12 years old) are growing up in an interactive digital media society and are avid users of digital media. For tweens to thrive in an interactive digital media society, it is important for them to develop digital resilience. Digital resilience refers to a dynamic process in which digital media users adaptively use preventive and reactive strategies to mitigate digital media risks and benefit from digital media opportunities. To better understand tweens' digital resilience, it is vital to first explore tweens' online activities and their perceptions of its opportunities and risks. Although previous research provides some insight into this, there are two reasons why it is crucial to further expand and extend this research. First, previous research has predominantly used quantitative methods (e.g., surveys), while the use of qualitative methods can provide more in-depth insights in tweens' online world from

their perspective. Second, with the rapid development of digital media, tweens' engagement with digital media is constantly changing, as are the online risks and opportunities they face. Together, this calls for new qualitative research to gain a more timely and in-depth perspective of tweens' online world. Therefore, the current study aims to examine tweens' online activities and tweens' perceptions of the opportunities and risks of their online behaviors using a qualitative approach.

Tweens engaged in a participatory research project consisting of interactive activities (i.e., "mind mapping my online world" and "visualizing and evaluating the (dis)advantages of my online world") which enabled them to explore their online world as co-researchers. Discussions that took place within the research project were audio recorded and supplemented with tweens' creations (e.g., mind maps). Based on both the verbatim transcripts and tweens' written and visual creations, an inductive thematic analysis was conducted to explore how tweens articulate their perceptions of opportunities and risks of their online behaviors.

Results revealed that tweens engage in content consumption (e.g., watching videos, seeking information), participation (e.g., sharing videos, direct messaging), and production (e.g., creating and uploading videos) activities. In line with Uses and Gratifications Theory, results showed that tweens actively select and engage in these online activities to fulfil various motivations: it provides them opportunities to fulfill their cognitive (e.g., gaining information), affective (e.g., entertainment, emotion regulation), social integrative (e.g., maintaining and building relationships) and relaxation or escapism needs (e.g., passing time). Additionally, in line with Livingstone and Stoilova's 4Cs classification of online risk, tweens reported that their digital media use also comes with risks regarding content (e.g., encountering scary or sexual content), contact (e.g., receiving annoying or bothersome messages), conduct (e.g., cyberbullying), and contract (e.g., hacking).

In the presentation, we will delve deeper into the findings of this research and further reveal how teenagers articulate their perceptions of the opportunities and risks of their online activities. We will also discuss how these insights contribute to a better understanding of tweens' digital resilience and their empowerment as media users.

CYM11 Social media and youth IV

PP 0914 Is digital native journalism winning the hearts of young people? A Portuguese case study

Vasco Avides Moreira¹, Patrícia Caneira¹

¹ Instituto de Comunicação da Nova ICNOVA, Media Studies and Journalism, Lisboa, Portugal

Constructing and controlling a narrative is part of young people's need to create meaningful frameworks for interaction today. Thus, young people want stories that can inspire them about the possibility of change (Galan, 2019). Legacy news is increasingly distant from young people (Madden et al., 2017), in contrast to a new paradigm, in which digital natives are involved, with a significant emotional dimension. Emotion drives not only more intimate relationships with technology, but also fuels engagement with news by inspiring connection (Beckett & Deuze, 2016), what Clark and Marchi (2021) refer to as connective journalism, in which young people share what seems relevant to them. These feelings are then deepened as they are shared through communication with others. In this sense, digital media, and social networks in particular, are environments where young people can express their identities, bond with their peers and learn about participatory culture (Boyd, 2014; Jenkins et al., 2016).

Current studies carried out with young people show that teenagers and young adults are receiving news not only from online organizations, but also from personalities, influencers and celebrities on social networks (Common Sense Media, 2020; Digital News Report, 2023) with a preference for the latter (Munslow, 2023), and a growing disinterest in the media. In Portugal, the 18–24 age group (the lowest age group studied by the report) had the lowest interest in news in 2023, with only 34.4% of them interested (Digital News Report, 2023).

The Wall Street Journal's senior platform editor, Julia Munslow, says that in 2024 the news that will appeal to young people will have to be "more personalized, shorter, more accessible and visually appealing" and that "young people are looking for information from people they feel like a family member or a close friend" (Munslow, 2023). In general, studies on audiences and emotions show that people are more likely to become emotionally involved, retain information and take action when they relate to the news (Wahl-Jorgensen, 2020).

This paper aims to identify which editorial approach is more effective and generates greater empathy and interest in news among young audiences. Three research questions are addressed: 1) Which are the main feelings shared by youngsters to describe the narrative of different news reports?; 2) What characteristics are highlighted by young audiences in the reports presented that arouse news interest?; 3) Which are the main differences in terms of position among media outlets towards mental health? To answer these questions, 15 in-depth interviews were conducted with young people aged between 16 and 18, who were presented with two different articles on mental health from two Portuguese media outlets: one of them is a digital native, Fumaça, while the other one is a legacy media, Público. Preliminary results show that young people are more empathetic and consequently more interested in the editorial approach used by digital native Fumaça.

CYM11 Social media and youth IV

PP 0915 What's in your newsfeed? Analyzing the political information landscape of Austrian adolescents through experience sampling

[Susanne Reitmair-Juárez](#)¹

¹ University of Innsbruck, Institute of Political Science, Innsbruck, Austria

Research indicates that adolescents predominantly, and often exclusively, seek information online through social media, whereas older adults also rely on traditional news media outlets (Gadringer et al., 2021; Newman et al., 2022). In the current era of high-choice media and algorithmic curation, the individualization of news consumption practices has reached unprecedented levels, prompting scholars to question the existence of an overarching public sphere with a common set of politically salient questions and events—considered essential for participatory democracy (Praprotnik et al., 2019). Thus, this study poses the questions, (1) what types of news contents adolescents (aged 13–20) encounter in their daily media use? (2) To what extent do these consumed news contents overlap with traditional news media coverage? (3) What types of news contents are lacking in adolescents' news consumption?

Literature on the effects of social media news use on democracy, particularly on participation and potential filter bubble and fragmentation effects is expanding rapidly, yielding ambivalent empirical findings. Recent studies suggest emerging disparities in citizens' perception of news content based on their varied political information repertoires, whether more online or offline (Cardenal, Galais, and Majó-Vázquez, 2019). However, this line of inquiry has neglected adolescents, who exhibit distinct media diets compared to older cohorts and are in a formative stage of their political development. This highlights the relevance of the current research.

Empirically, this study addresses the understudied group of adolescents, aiming to provide insights into their practices of acquiring political information as a foundation for political participation, particularly within algorithmically curated media environments. The unique context of Austria, with its lower active voting age, adds further significance to the research, as it remains relatively unexplored. Insights into interests and needs of young citizens, their interpretations of political issues, and effective means of reaching them as an audience are valuable for political actors, media professionals, and educators alike.

In addressing these questions, a Mobile Experience Sampling Method (MESM) was employed, involving 184 adolescents surveyed randomly three times a day via WhatsApp during one week in June 2023. Participants reported if they had encountered any news content in the recent hour, specified the topic, and information source. Simultaneously, a media dataset documenting news media coverage of that period was constructed using the three largest outlets in print, TV, radio, and social media.

Preliminary results of the comparative analysis reveal a surprisingly limited set of topics consumed and sources used by adolescents. The dominance of local news, with direct geographical and personal connections (albeit less political relevance), contrasts with their interest in "big politics," such as international crises or scandals. The potential implications of this presumed political information base for adolescents' informed political participation are discussed.

CYM11 Social media and youth IV

PP 0916 'I heard about it in the podcast ...': Young Danes' (re)discovery of podcasts for coherent information

[Gitte Stald](#)¹

¹ IT University, Digital Design, Copenhagen, Denmark

This paper's objective is to investigate the potential qualities of young Danes' extensive uses of podcasts as supplements to other information sources, that is, a combination of strategic and erratic information facilitated through mobile technologies. The study behind this presentation investigates the research question of how young Danes integrate podcasts into their critical information and -debate repertoire and what the specific affordances of podcasts offer. A wider perspective regards the impact of transforming information patterns on young citizens' democratic citizenship and participation (Coleman & Blumler, 2009; Ohme et al., 2022; Stald, 2023).

The paper draws on three publicly available surveys on media use in Denmark (DR, 2023; Schrøder et al., 2021; The Ministry for Culture, 2022). The survey findings are contextualized by results from a case-study with 15–24-year-old Danes, conducted in 2021 in the project *Youth, Trust, Information, and Democracy* and on data from a pilot study conducted in 2023, on 15–24-year-olds' use and reflections of podcasts.

It is not a new phenomenon that young people get information in different formats in a hybrid media environment (Mascheroni & Murri, 2017; Stald, 2023; Wunderlich et al., 2022). It is, however, vital to understand the impact of the transformations of access platforms and the qualitative diversity of the content sources. A new direction in the information repertoire is the increasing use of podcasts among young Danes. Schrøder et al. (2021) found that 56%

of the 18–24-year-olds listened to a podcast during the past month. One of the informants from the 2021 study says: 'I listen to podcasts a lot. And social media, but I get more on international politics from them. ... And I catch up on stuff from my parents'. (4. Male, 16).

A need for meaningful activities triggered the re-discovery of podcasts during the Corona lockdown when many young people took up individual activities such as long walks or runs. Podcasts are listened to on-demand (Ohme et al., 2022), alone, and in a kind of dual mobility modus, on the smartphone, on the go, or in the immersed tranquility of a private setting (Lundström & Lundström, 2021). The podcast, however, also serves as a bridge that enables users to cross boundaries of knowledge and context (Swiatek, 2018).

While TikTok and similar services motivate fast, erratic surface orientation and flux between bits of content, professional podcasts invite immersion and in-depth consideration (Chan-Olmsted & Wang, 2022). Many podcasts, although varying in professional quality, offer coherent narratives and longer formats of in-depth topics that include research, agonistic positions, new insights, and pointers for debate. The topic and approach in podcasts are often popular and personal. However, some provide critical journalistic perspectives that potentially inspire reflexivity and discussion: 'Right now, I follow the news on the kids in those refugee camps because it came up in several media. Me and my parents talked about it, but I also heard about it in the podcast and my friends talk about it' (4. Male, 16).

CYM12 Media uses and effects on children and Youth

PP 0976 Longitudinal effect of early digital experiences on standardized learning outcomes during school career

Marco Gui¹, Chiara Respi¹, Giovanni Abbiati²

¹ University of Milano-Bicocca, Sociology and Social Research, Milano, Italy

² University of Brescia, Sociology, Brescia, Italy

There is a heated debate both among scholars and in the media about early access to digital media by children and adolescents: parents and educators seem disoriented and ask if anticipating access to the Internet is a good or a bad thing (Livingstone&Blum-Ross 2020). In the meantime, early access to the Internet is more and more common: for example, the moment of arrival of smartphones is constantly anticipated among early adolescents, and the covid-19 pandemic has further accelerated this trend (Mascheroni & Siibak 2021).

Simultaneously, evidence is emerging that digital media practices during childhood and early adolescence constitute a new dimension of social inequality. Smartphones, video gaming consoles and other forms of autonomous access to the Internet seem to be anticipated – somehow paradoxically – especially among deprived families in terms of socio-economic background (Gui et al. 2020). Research is also highlighting that problematic digital media use is more likely to manifest in families where socio-economic conditions are more deprived (Gerosa et al. 2021). However, the empirical results obtained on the relationship between early digital media use wellbeing in the long-run are scarce (see Gerosa et al. 2024). In particular, the negative impact of early digital use on learning outcomes that have been highlighted are often reproached for not being solid from a methodological point of view, as they are based on correlational or short-term longitudinal data (Amez&Baert 2020). Also, there is a very urgent need to gather robust empirical evidence about why and how online problems can be largely predicted by young people's vulnerabilities offline (Odgers & Jensen 2022), that is how early access to permanent connection interacts with social inequality in the lives of youths.

To fill these gaps, we aim to provide the most rigorous estimation so far of the impact of an early autonomous access to smartphones, videogames and social media on the learning outcomes of high school students, and its interaction with gender, migratory background and parental education. This becomes possible as – for the first time since INVALSI (the Italian National Institute for the Assessment of the School and Training system) started to collect data on students' outcomes – it is possible to follow the entire school careers of current 10th and 11th graders. Exploiting this possibility, we merge an ad-hoc retrospective survey data about screen use during childhood and early adolescence with students' longitudinal learning outcomes at grades 2nd, 5th, 8th and 10th. A dataset with 5600 high school students in northern Italy, representative by school type, is analyzed to answer the questions above by means of longitudinal analysis. Preliminary results confirm that early digital use is more likely in socio-economically deprived families and that age of smartphone ownership has a negative impact on learning outcomes in low and high school for those with pre-existing habits of intensive media use during childhood. The paper discusses the implications of these findings for communication and education theory, in particular for what concerns digital inequality in technologically mature contexts.

CYM12 Media uses and effects on children and Youth

PP 0977 Social media, social norms, and health behaviour: How social media exposure affects adolescents' alcohol use and physical activity

Lukas Tribelhorn¹, Thomas Friemel¹

¹ University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Introduction

With regard to health behaviour, adolescents constitute an exceptionally vulnerable demographic. The years of life between the ages 10 and 19 are an important phase for the development of (un)healthy habits such as regular consumption of alcohol (Frey & Friemel, 2021) or regular physical activity (Dumith et al., 2011). The formation of health habits during adolescence is influenced by a broad variety of factors (Wills, 2001), including the use of social media (Purba et al., 2021; Purba et al., 2023). Hereby, multiple pathways as well as various moderating and mediating variables are discussed (e.g., adolescents' personal identity (Geusens & Beullens, 2021) or social capital (Pouwels et al., 2021)). An increasing body of literature points to the decisive influence of social media use on perceived social norms (Davis et al., 2019; Vanherle et al., 2022). Beside a direct effect, this includes an indirect effect, as suggested by the influence of presumed media influence hypothesis (Gunther, 1998; Gunther et al., 2006). In the context of alcohol consumption and physical activity, past research supports the proposed direct effect of social media on norms (Boers et al., 2020) and the pathway via the influence of presumed media influence (Ho et al., 2016; Ho et al., 2014). However, social media use has often been measured only coarsely and both adolescents' media use and platform characteristics have drastically changed in recent years. We thus want to investigate the effect of exposure to today's social media content related to alcohol use and physical activity on *perceived social norms* towards these health behaviours (RQ1) and the extent to which this effect is mediated by the perception of a media influence on others (RQ2).

Method

To answer these questions, a three-wave longitudinal study is currently being conducted with students between the ages of 14 and 18 attending public schools in [COUNTRY]. To maximise representativeness, a random sample of schools was drawn from the national statistics of educational institutions and invited to participate. In total, 12 schools covering secondary, upper secondary, and vocational education have agreed to assist in the data collection. The participating schools were then visited by the research team at the start of the school year for the first wave of data collection, which was completed in October 2023 with 1'669 participants. The second wave of data collection is currently ongoing, and the third wave is planned shortly before summer break (June 2024).

The survey questionnaire is administered online and consists of sociodemographic questions, self-reported alcohol use and physical activity, self-reported social media use with frequency-intensity measures for the most common platforms, self-reported exposure to content referencing alcohol or physical activity, questions on perceived norms and presumed media influence and questions on attitudes towards alcohol use and physical activity. Individual responses are linked using a self-generated identification code (see Audette et al., 2020).

Once data collection is complete, latent growth curve analysis and advanced structural equation modelling will be employed to test the preregistered hypotheses. Additionally, insightful exploratory and descriptive results will be reported.

CYM12 Media uses and effects on children and Youth

PP 0978 Longitudinal associations between screen time, bedtime and daytime sleepiness among adolescents: A three-wave panel study

Michal Tkaczyk¹, Albert J. Ksinan², David Smahel¹

¹ Masaryk University, Interdisciplinary Research Team on Internet and Society IRTIS, Brno, Czech Republic

² Masaryk University, Research Centre for Toxic Compounds in the Environment RECETOX, Brno, Czech Republic

Digital media use has been found to be a salient factor for worsened sleep outcomes and consequent impairment in daily functioning among adolescents. Prior evidence is largely cross-sectional. Despite the growing number of longitudinal research, it mainly focused on the effects of digital media use on sleep-related outcomes. Only a few studies considered the opposite direction of the association, yielding mixed findings (e.g., Mazzer et al., 2018). Tri-variate analyses that also consider some subsequent sleep-related outcomes, such as daytime sleepiness, are even rarer (for meta-analysis, see Sagano et al., 2023). Moreover, many such studies relied on the cross-lagged panel model (CLPM), the statistic modelling strategy that conflates between- and within-person variance in observed variables and thus may lead to erroneous conclusions regarding causally dominant variables in the underlying causal pattern (Hamaker et al., 2015). Therefore, there is a lack of studies evaluating bi-directional longitudinal associations among digital media use, sleep, and sleep-related outcomes with a particular focus on distinguishing stable traits from individual change over time.

The current study is the first study to examine reciprocal associations between screen time, bedtime, and daytime sleepiness – the understudied (Sagano et al., 2023), yet potentially important mediator of various adverse effects of sleep impairment such as worsened performance in school (Dewald et al., 2012) or sedentary behaviour (Kim et al., 2020). The second aim is to examine the moderating effect of reducing screen time before bedtime – a common sleep-friendly recommendation (Hale et al., 2018). To achieve these aims, the current study utilizes the multiple group RI-CLPM and analyses data from a three-wave, one-year-long panel study based on the representative sample of Czech adolescents aged 11–16 ($N = 2,500$, $M_{\text{age}} = 13.43$, 50% girls at T1).

The preliminary analyses showed stable, trait-like differences between adolescents in all observed variables. Concerning the within-person effects, later bedtime at T2 was associated with higher screentime at T3. Carry-over autoregressive effects were found for all three variables but only between T2 and T3. Concerning the between-person effects, adolescents who typically spent more time with screens during the day went to bed later and reported higher daytime sleepiness. In addition, adolescents who typically went to bed later reported higher daytime sleepiness. The multiple group analysis did not find a moderating effect of reducing screen time before bedtime.

The current study's findings contribute to existing knowledge, showing that stable between-person differences in screen time, not within-person processes, explain the associations between digital media use, sleep, and associated sleep outcomes. These findings also have important societal implications: Because the analysis did not find statistically significant group differences between adolescents who reduce screen time before bedtime and those who do not, reducing the typical daily patterns in screen time seems to be a more effective sleep-friendly recommendation for adolescents.

CYM12 Media uses and effects on children and Youth

PP 0979 Adolescents' digital nightlife: The comparative effects of day- and nighttime smartphone use on sleep quality

Teun Siebers¹, Ine Beyens¹, Susanne Baumgartner¹, Patti Valkenburg¹

¹ University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

Sleep is essential for a healthy lifestyle. Although the basis for healthy sleep patterns is formed during adolescence, proper sleep is not self-evident for many adolescents. Research has suggested that smartphone use, especially at night, is an important factor that may impair adolescents' sleep quality. However, prior studies have provided limited insights into the daily causal relationship between smartphone use and sleep quality, and whether this effect depends on the time of day that the smartphone is used. Besides, there is a lack of objective measures of smartphone use as most existing studies have relied on self-report measures.

The current preregistered study differentiates between daytime, pre-bedtime, and post-bedtime usage in investigating the day-to-day effects of adolescents' smartphone use on their sleep quality. In line with the displacement, bright light, and cognitive arousal theory, we hypothesized that adolescents experience lower sleep quality during nights when they spent more time on their smartphone in the hour before bedtime (H1) and after bedtime (H2). In addition, we asked whether adolescents sleep worse during nights when they spent more time on their smartphone during the preceding day (RQ1), and whether smartphone use during these three timeslots may differentially impact their sleep quality (RQ2).

In total, we collected data from 155 adolescents across 21 days using smartphone tracking (758,558 app activities) in combination with experience sampling (1,950 sleep quality assessments). The continuously tracked smartphone app activities were divided into three timeframes (i.e., daytime, pre-bedtime, and post-bedtime smartphone use), based on participants' wake-up times and bedtimes. On average, participants spent 6 hr 25 min on their smartphone per day ($SD = 3$ hr 35 min), of which roughly 85% occurred during the daytime, 6% during the hour before bedtime, and about 10% after bedtime.

Our DSEM analyses revealed no significant within-person effects of daytime (RQ1) or pre-bedtime smartphone use on sleep quality (H1), and a medium but insignificant within-person effect of post-bedtime smartphone use on sleep quality (H2). These effects did not differ substantially from each other (RQ2). In addition, exploratory analyses showed that participants slept worse on nights when they had spent more time on social media apps in the hour before bedtime and, predominantly, when they spent more time playing games after bedtime. We found no evidence that watching videos on the smartphone during daytime, before bedtime, or after bedtime affected adolescents' sleep quality.

Taken together, the current longitudinal study found that adolescents' daytime use may, as suggested by previous studies, indeed not be harmful to their sleep quality. The impact of nighttime smartphone use, however, varies depending on the type of apps that are used: While using video player apps does not affect sleep quality, using social media apps in the hour before bedtime and predominantly gaming apps after bedtime can lead to diminished sleep quality. This leverages support for the cognitive arousal hypothesis. Therefore, this study sheds new light on the widely explored effects of smartphone use on sleep quality by showing that the effect is both time- and app-specific.

CYM12 Media uses and effects on children and Youth

PP 0980 The perfect li(f)e: A longitudinal study on positive social media content and European adolescents' perfectionism

Gaëlle Vanhoffelen¹, Anaëlle Gonzalez¹, Lara Schreurs¹, Caroline Giraudeau², Laura Vandenbosch¹

¹ KU Leuven, School for Mass Communication, Leuven, Belgium

² University of Tours, Psychologie des âges de la vie et Adaptation, Tours, France

Over the last 30 years, youth perfectionism levels have increased up to 36%. Although empirical evidence on the causes of the latter finding is lacking, social media are often pointed out as contributors of this rise. Given the dominance of picture-perfect content on these platforms, adolescents might start to endorse this seemingly perfectness of others as a personal goal to strive for and accordingly develop perfectionistic traits on the long term. Following the disposition-content congruency hypothesis, perfectionistic adolescents might, reversely, especially seek out "perfect" content when using social media. By examining how exposure to positive social media content might increase adolescents' perfectionistic traits and vice versa, the current study thus aims to unravel whether the societal concerns regarding the disruptive role of ubiquitous social media use in the development of perfectionism can be supported or are rather a form of moral panic. Moreover, the potential mediating role of upward social comparison and the potential moderating role of adolescents' sociocultural context will be examined. This way, the study will investigate whether the hypothesized social media effects are rooted in a specific culture or not.

Method

To capture such personality development over time, a three-wave panel study was conducted. This design allows to distinguish between- from within-person variability in particular. The study was simultaneously conducted in three European countries which differ in their individualism levels (i.e., France, Belgium and Slovenia, ordered from more individualistic to less individualistic).

Results

The analytical sample consisted of 1743 adolescents with a mean age of 15.16 (SD = 1.77) and 58.2% were girls. Differing patterns were found on the between-person and the within-person level. On the between-person level, exposure to positive social media content was significantly and positively related to self- and socially oriented perfectionism. Social comparison appeared to be significantly and positively related to both exposure to positive social media content and socially oriented perfectionism, but not to self-oriented perfectionism.

On the within-person level, reciprocal significant and positive relationships were found between perfectionism (self- and socially oriented) and online social comparison. However, this relationship only held in one out of two time intervals, indicating a lack of consistency. Regarding the intercultural differences at the within-person level, an increase in exposure to positive social media content led to an increase in perfectionism among Slovenian adolescents in one time interval and this differed significantly from Belgian adolescents for whom this association did not occur. Also, a reverse association occurred in one time interval in that an increase in perfectionism led to a decrease, and not an increase in exposure to positive social media content among Slovenian adolescents. This was less strong for French adolescents but did not occur not among Belgian adolescents.

Conclusion

Altogether, our results show that exposure to positive social media content and perfectionism are significantly and positively related. Yet, at the within-person level, a more complex pattern emerges with different results for each country. These findings highlight, amongst others, the importance of investigating differential cultural practices in social media use and how it influences personality development.

CYM13 Adolescents and risky online behaviour

PP 1072 Breaking barriers in the study of the relationship between sexualities, adolescence, and media: Reflections on fieldwork, limitations, and contributions of an ethnographic research in Barcelona

Maria-Jose Masanet¹, Eduard Ballesté Isern², José-Miguel Tomasena¹

¹ Universitat de Barcelona, Department of Library and Information Sciences and Audiovisual Communication, Barcelona, Spain

² Universitat Oberta de Catalunya, Department of Arts and Humanities, Barcelona, Spain

This article focuses on the methodological design of the project 'TRANSGELIT' on young people learning about gender and sexualities through media with the aim of creating educational resources. Initially, the project proposed a Participatory Action Research (Chevalier and Buckles, 2013) focused on Participatory Design and with an Ethnographic Approach. Participatory Action Research is a methodological strategy that serves for social action and transformation through research (Alvarado, 2008; Ander-Egg, 2003) and the team considered it was particularly suitable as the project aims not only to understand a social reality but also to create educational resources.

During the fieldwork, the team found that applying the principles of Participatory Action Research and a traditional Ethnographic Approach with adolescents discussing sexualities in educational settings was not effective. In

practice, the team encountered various barriers, and the application of these methods revealed shortcomings. First, difficulties were identified in entering and doing ethnographic research in an institutionalized space such as the school with the aim of exploring informal activities and practices (media and sexualities). In the second place, the dichotomy between action and research also proved complex, sparking a debate about the type of participatory action to be undertaken throughout the project. The dilemma was related to the team's intervention in the field within the framework of a research endeavor aimed at generating scientific production. All these debates and reflections led the team to refine the project's methodological approach.

Finally, the team proposed to focus on the ethnographic approach following the precepts of short-term ethnography (Pink & Morgan, 2013). It was especially appropriate for creating contexts in which researchers could go deeper into the study interests in a short period of time through the implementation of more interventional, participative and creative tools. The research ended up following 5 steps: a) Consent management; b) Participative and reflection workshops about gender and sexualities and about media uses, practices and perceptions; c) Co-viewing workshops to debate and reflect about specific media representations of gender and sexualities; d) Creative workshops for creating audiovisual content in which young people could explore specific topics about sexualities and gender that interested them; e) In-depth interviews to go deeper into the adolescents' discourses and understandings about the research topics.

This presentation aims to provide a methodological reflection on the research fieldwork process, highlighting the limitations and challenges encountered during the project and the ways in which they were addressed. It seeks to be useful for future research with adolescents and media aiming to undertake ethnographic approaches. The text is structured around limitations encountered and proposals to face them: 1) Reflection on how to investigate informal practices such as media use and adolescent sexualities in formal settings like school, with a special emphasis on entering the field, the researchers' position, and the reinvention of the occupied space; 2) The tension between research and action and the dilemmas this presents; 3) Proposal of research tools created throughout the research, such as the development of audiovisual materials (podcasts) and the co-watching practices.

PP 1073 Children with disabilities on social media – Parent influencers between peer support and commercial opportunities

[Stine Liv Johansen¹](#)

¹ University of Aarhus, School of Communication and Culture – Centre for Children's Literature and Media, Aarhus C, Denmark

Children are – for numerous reasons – good content on social media. Just as cute kittens and lovely food videos, social media platforms like Instagram and TikTok are packed with videos of children in funny positions, children saying funny stuff, and children generally behaving in appealing and childlike manners. The concept of sharenting has therefore become not only a matter of parents sharing photos and videos with friends and relatives; for some, sharing their everyday experiences as parents have become a professional practice, for some even a living. These parents have been described as *mommy bloggers* or *mommy influencers* (although we also find examples of fathers posting online about their children and family life). One particular sub-genre of child-related content on social media includes children with different kinds of diagnosis or disabilities. In this paper I want to discuss how parents of children with disabilities are using social media, with which intentions and outcome.

The paper is based on an ongoing interview study with Danish parents, who are explicit about their child(ren) and the challenges, they are experiencing, on their social media platforms. Some of them have given their profile a name related to their child like "Mum of XXX" where X refers to the child's name or diagnosis. They have different strategies when it comes to what and how they share, and they also differ when it comes to numbers of followers and whether they have sponsored and commercial content on their profile. Generally, the children of the parents which are participating in the study, are in the age group of 2–10 years and their diagnosis span a range of rare genetic syndromes, over cerebral palsy to down's syndrome, meaning that they are experiencing different physical as well as mental challenges.

The interviews will address how they decide on which content to post, how they relate to and describe their child's diagnosis, disability, and treatment, and how they experience their online presence. Further, the interviews will address how social media may enable parents in vulnerable situations to build relations and network with other parents as well as with fans and followers and how social media can be used to raise awareness about the life circumstances of children living under special conditions. Also, the interviews will focus on the balance between common, everyday experiences and specific circumstances and experiences as well as ethical issues related to the exposure of their child(ren) on social media.

PP 1074 An intersectional perspective for studying digital inequalities. An ethnographic study focusing on socio-digitally disadvantaged young people in Germany

Cigdem Bozdog¹

¹ University of Groningen, Centre for Media and Journalism Research, Groningen, Netherlands

Ongoing research into digital inclusion and inequalities underscores the reproduction of existing social inequalities within digital spaces (Helsper & Livingstone, 2007; van Deursen and van Dijk, 2015), resulting in socio-digital inequalities (Helsper, 2021). Contrary to common assumptions, young individuals residing in larger Western cities aren't necessarily less affected by these socio-digital inequalities, which encompass issues of access, digital literacy, and varying outcomes in digital interactions (Helsper, 2021).

Focusing on young people attending a secondary school situated in a culturally diverse and socioeconomically disadvantaged neighborhood in Bremen, Germany, this paper provides an in-depth understanding of their daily digital media experiences. The field research took place between January 2020 and April 2021 and discussions in this paper are based on participatory observations in the school context, focus group discussions with 47 students and 10 teacher interviews. The paper adopts a qualitative and intersectional approach to studying digital inequalities that the young participants are facing. Such an approach allows us to go beyond the class bias within the inequalities research and also the ethnicity bias in migration studies (Bilecen, 2021). It also enables a situational analysis of "inequalities [that] are constituted by particular situations and contexts" (Bilecen, 2021, p. 473).

Looking at the intersecting influences of gender, socio-economic background, and migration background, this study maps 5 patterns of socio-digital disadvantage that were identified in the analysis. These digital disadvantage patterns that limit the digital inclusion of the young research participants include 1) limited material access; 2) digital irritation (based on the concept of Ytre-Arne & Moe, 2021); 3) lack of support structures; 4) missing and/or unrecognized socio-digital skills; 5) experiences of discrimination online and offline. The paper will not only discuss these patterns concerning how they structurally limit the participants' engagement with digital environments but also their tactics for navigating digital environments despite these limitations. By developing the concept of patterns of socio-digital disadvantage, the paper aims to provide a contextualized understanding of how young people with different backgrounds experience limitations in their everyday engagements with digital media without making linear arguments about the effects of singular demographic factors. Furthermore, the proposed concept enables us to study the intersecting influences of different socio-cultural factors on media practices.

PP 1075 Assessing media influence and attitudes towards LGBTIQ+ rights among Barcelona teenagers: An ethnographic study

Anna Iñigo¹, Vitor Blanco-Fernández², Maria González Aran³

¹ Universitat de Barcelona, Department of Library and Information Sciences and Audiovisual Communication, Barcelona, Spain

² Universitat Pompeu Fabra, Communication, Barcelona, Spain

³ Centre Jove d'Atenció a les Sexualitats Sexual Health and Education Centre for Young People- CJAS, Communitary Area, Barcelona, Spain

The influence of media on perceptions of LGBTIQ+ rights and individuals is pivotal (Žerebecki et al., 2021), especially among younger, teenage citizens (e. g., Kosenko et al., 2018). In the Spanish context, prior research has investigated this phenomenon through two, main approaches: media analysis of LGBTIQ+ portrayals through quantitative and qualitative methods (e. g., González-de-Garay et al., 2022), and analysis of public perceptions of LGBTI+ issues through ethnographic approaches, interviews or surveys (e. g., Miravet et al., 2018).

However, there remains a gap in literature exploring the intersection of these approaches—that is, examining media engagement alongside attitudes towards LGBTIQ+ rights. This paper aims to fill this gap by assessing teenagers' perceptions of LGBTIQ+ rights, considering their usage of media and its influence, and within the Spanish context. This general objective is divided into three research questions: RQ1) What are the attitudes of Barcelona's teenagers towards LGBTIQ+ rights and LGBTIQ+ people?; RQ2) What role does the media play in shaping or altering these attitudes?; and 3) How do factors like gender, age, sexuality, and socio-economic background impact both attitudes and media influence?

To address these research questions, an ethnographic study was conducted as part of the 'Transmedia Gender & LGBTI+ Literacy' national R&D project. Following methods aligned with short-term ethnography (Pink & Morgan, 2013) from feminist perspectives, the study spanned from March 2022 to May 2023 across four educational institutions in the Barcelona metropolitan area. It involved 155 participants aged 14 to 23, encompassing diverse gender identities, economic backgrounds, races, ethnicities, and religious affiliations. Data collection methods included field journals, participant-generated written activities, podcast scripts and transcripts, and in-depth, semi-structured interviews (47 interviews). Data analysis employed ATLAS.ti software, following a mixed approach combining deductive and inductive logics.

While our findings are preliminary, they reveal key insights. These include discernible patterns of polarization in the acceptance of LGBTIQ+ rights, the persistence or reinforcement of traditional stereotypes (e. g., perceiving being LGBTIQ+ as a "trend"), the emergence of transphobic discourses, various forms of explicit or implicit allyship, and a perceived lack of sexual and gender education within institutional curricula. These preliminary results offer valuable insights for scholars, practitioners, and educators. They indicate potential areas for intervention in both academic research and teaching practices within educational institutions.

CYM13 Adolescents and risky online behaviour

PP 1076 Children's futures amidst algorithms in the public domain: Parents' discourses about invisible and super-visible children

Ranjana Das¹

¹ University of Surrey, Department of Sociology, Guildford, United Kingdom

Algorithms and data-driven technologies are increasingly being utilized in the public sphere, despite variations in public trust. Research on the impacts of automated decision-making emphasizes the need for an approach that prioritizes people (Lomborg et al. 2023). As more and more families and households become intertwined with data (Edwards & Ugwuodike, 2023), this study, based on interviews with 30 parents in England, highlights

parents' concerns regarding the possibility of some children becoming invisible while others are overly visible due to data-driven decisions, especially within the public sector.

Understanding how parents make sense of algorithms in children's lives can be enriched by examining their discussions on datafication and data-driven childhoods (Mascheroni, 2020). Mascheroni et al. (2023) highlight the intertwining of caring dataveillance (Lupton, 2020), sharenting (Blum-Ross & Livingstone, 2017), and the broader parent-child relationship. There is also useful precedent in media and communications of listening to parents' future discourses. Alper (2019) draws our attention to *future talk*, as do Livingstone & Blum-Ross (2020) on parenting for digital *futures*. In this paper, I suggest that we approach parents' discourses about inevitably algorithmic futures they see for their children, aren't future discourses, but rather reflect where parents are, here and now, in relation to real, present-day concerns. Pentzold et al (2020) speak of this as the future collapsing into an extended present. Matthews & Barnes (2016) remind us that questions of the past are also questions of the future, and Livingstone & Blum-Ross demonstrate how parents' own pasts shape their parenting presents and their future imaginaries (2020). I draw upon think-aloud interviews, combined with fictional scenarios and vignettes, with 30 parents across rural and urban England to present my analysis. My findings demonstrate that parents' 'future talk' about algorithms (Alper, 2019) extend beyond initial discussions of inevitability (Markham, 2021). Instead, they articulate unmistakable expectations for institutions to take action, now. I begin by noting parents' individualised understandings of the risks of datafication and the increasing presence of algorithms in the public domains their children will grow up to live their lives in. In response to these worries, I note their overarching call for an "additional comments box" – a metaphor for human intervention, and what they perceive to be the complexity, warmth (Gillespie, 2014) and nuance of human presence, intervention and even error – in place of, or to balance the automated and algorithmically shaped futures they imagine. I note particularly that parents' discourses and feelings about algorithms (see here Ruckenstein, 2023) in the future are not future feelings but feelings in the here and the now and these feelings shape parents' attempts to learn about technology, to speak about technology to shape and mentor (Livingstone & Blum-Ross, 2020) their children's interfaces with algorithms and technology more broadly. Indeed, in these agentic practices, we begin to spot glimpses of the collective amidst the individual, in parents' beliefs about algorithmic futures.

PP 0079 Hijacking information flows through initiating topic drifts: Analyzing temporal patterns of how counterpublic actors shift discourses about climate protests by inserting disinformation narratives

Jana Johanna Klapproth¹, Said Unger¹, Svenja Boberg¹, Thorsten Quandt¹

¹ University of Muenster, Department of Communication, Muenster, Germany

Climate change is currently one of the most significant existential challenges for our planet. Mitigating the destructive consequences of climate change by developing appropriate solutions requires global cooperation and climate activists are raising their voices worldwide to reinforce the demand for climate action. Meanwhile, the accompanying public discourse is highly emotionalized and politically polarized. This paves the way for counterpublic actors (Holt et al., 2019) to hijack the debate about climate protests by inserting disinformation narratives and conspiracy theories. While previous research has mainly focused on the hijacking of hashtags as piggybacking within existing discourse structures in a form of agenda surfing (Bradshaw, 2022), this study investigates how counterpublic actors try to influence the development of the debate about climate protests by initiating topic drifts.

To identify temporal patterns of topic drifts as a strategy to hijack information flows, we analyzed the discussion of climate protests within over 200 German counterpublic Telegram channels (N = 14K). Furthermore, we compared the identified topic structures with those in news coverage about climate protests (N = 32K) to gain further insights regarding the orientation or differentiation from journalistic coverage. To identify topic drifts within the topic structure over time, we applied structural topic modeling. Additionally, we conducted a named entity recognition followed by a co-occurrence analysis to inspect how (political) actors are instrumentalized within inserted disinformation narratives to drift a topic.

The results show that the discussion of climate protests within the Telegram counterpublic is dominated by topic drifts linked to disinformation narratives and conspiracy theories. The analysis of the debate over time shows that initially topic structures were adopted from news coverage especially along important (political) events, but then drifted through the framing of climate change as an example of government failure towards the denial of Covid, disinformation about the invasion of Ukraine and the Great Reset conspiracy theory. Paradoxically, the denial of climate change is accompanied by solidarity with climate activists whose actions are seen as criticism of political elites and oppositional stance against the government. The debate of climate protests is thus drifted to the topics of unmasking democracy as a dictatorship and the looming end of freedom of speech. Furthermore, the co-occurrence analysis shows that topic drifts are not driven suddenly but steadily, especially through a change in contextualization and the establishing of coherent disinformation narratives. Especially conservative and more right leaning news media outlets function as a bridge in the legitimization of the arguments and connect alternative arguments to the mainstream. Therefore, the results of our study show that initiating topic drifts can strategically influence the development of existing topic structures within the debate about climate protests and threat to distort and undermine the discourse by interspersing disinformation narratives.

CDE01 Disinformation in contemporary politics

PP 0080 Features of disinformation: An interview study on disinformation perceptions with political, governmental, journalistic and economic decision-makers in Germany

Jana Johanna Klapproth¹, Said Unger¹, Svenja Boberg¹, Thorsten Quandt¹

¹ University of Muenster, Department of Communication, Muenster, Germany

Disinformation challenges existing political and media systems by sowing doubt and attacking trust as an essential pillar of democratic discourse, which can lead to extremism and individual radicalization processes. With the aim of influencing public opinion and achieving (geo)political goals, especially the strategic use of disinformation campaigns is thus a significant threat to democratic societies (Bennett & Livingston, 2018). Due to the rapid spread of disinformation within online environments, societal decision-makers are currently working intensively on suitable solution strategies to protect societies from harmful effects. To efficiently curb disinformation, a comprehensive understanding of the various features of disinformation is necessary. In addition to a shared definition, these particularly relate to disinformation topics, actors, motives, and targets. Furthermore, the identification of disinformation publica as well as the typical characteristics of the temporal process of disinformation campaigns is important for developing adequate intervention strategies (Quandt, 2018). While there is a broad scientific consensus on disinformation

features due to a growing academic debate on the research topic in recent years, it is currently unclear how societal decision-makers that are responsible for the planning and implementation of counter strategies, perceive the different features of disinformation. To answer this question, we conducted a series of guided face-to-face interviews (N = 59) with German political, governmental, journalistic and economic decision-makers between September and December 2022. The interviews followed a semi-structured guide evaluated in a pretest.

Preliminary results show that respondents across all four sectors reported a generally high level of experience in being confronted with disinformation. The definition of disinformation also largely corresponds to the current scientific consensus: only interviewees from the business sector lack an overall societal view of disinformation. While there is broad agreement on specifying frequent disinformation topics, actors, narratives and motives, the approach of identifying disinformation differs widely. While extensive fact-checking is often part of the daily routine of politicians and journalists, an intuitive approach to handle disinformation based more on a gut feeling than on established routines can be seen in the administrative and business sectors. Overall, our study shows that decision-makers in politics, journalism, administration and the economy all have extensive experience with disinformation within their individual work structures. Nevertheless, there are clear differences in the way they deal with disinformation, which is primarily linked to the requirements within their professional field. Especially exposed persons have developed a competence based on their own experience by becoming a target of disinformation themselves.

CDE01 Disinformation in contemporary politics

PP 0081 The model of Russian disinformation after the large-scale invasion of Ukraine: The case of 'Ukraine sells Western arms' narrative

Roman Osadchuk¹

¹ National University of Kyiv-Mohyla Academy, Chair of International Relations, Kyiv, Ukraine

The topic of Russian propaganda and disinformation dissemination (Paul & Matthews, 2016; Allcott & Gentzkow, 2017) aimed at foreign audiences worldwide is well-researched with the identification of its pillars (GEC, 2020) and established infrastructure of RT and Sputnik (Kling et al., 2022; Deverell et al., 2020). However, Russia's large-scale invasion of Ukraine led to the widespread blocking of Russian media in multiple countries, undermining the regular communication patterns and schemes, and creating new objectives, like limiting foreign assistance to Ukraine. This situation forced Russia to change tactics and find alternative or more potent ways to reach foreign audiences outside their immediate reach, which are being studied concurrently with the ongoing war. The purpose of this study was to examine the patterns and present a model of Russian propaganda and disinformation dissemination abroad based on the multiple campaigns that focused on undermining the image of Ukraine, namely around the narrative that 'Ukraine sells Western-aided munition.' Based on the theories of framing (Chong & Druckman, 2007), agenda-setting (McCombs et al., 2014), using content analysis (Wilson & Starbird, 2020), the author analyzed four complex Russian disinformation campaigns related to the new disinformation topic of 'western weaponry trade.' The results determine a hypothetical recurring model of Russian disinformation dissemination and narrative injection, which serves as a blueprint for similar operations and will be demonstrated in detail during the research results presentation. Identified campaigns suggest a schematic approach Russian actors use to affect foreign public opinion and discourse, which might have dire consequences for the course of support. The study's results will be useful in the disinformation and propaganda studies of Russian campaigns. They will also be of interest to researchers of international relations and communication, as well as practitioners from counter-disinformation fields and governments.

PP 0082 Media literacy and the age barrier: A peer-to-peer training project in the fight against disinformation

Christopher Tulloch¹, Aleix Marti²

¹ Pompeu Fabra University, Communication, Barcelona, Spain

² Universitat Pompeu Fabra, Communication, Barcelona, Spain

Media literacy and the age barrier: a peer-to-peer training project in the fight against disinformation

Senior citizens are particularly vulnerable when it comes to disinformation strategies through digital networks whether we refer to financial fraud malpractice such as phishing or more sophisticated "fake news" techniques such as when misleading and often fraudulent stories are presented under the guise of serious news content. Increasing media literacy among the elderly both enables them to dispose of tools to combat disinformation and increases the quality of their participation in democratic decision-making processes (Brashier & Schacter, 2020; Guess et al., 2019; Valera-Ordaz, 2022).

Within this ever-expanding field (Sadaba et. al. 2023; Moore et. al. 2022) this paper proposes – and offers the first results of – a hands-on model applied to "third age" media literacy by offering a peer-to-peer training model according to which a 65+ cohort is targeted by the researchers for training in digital media literacy in order for themselves to take their acquired knowledge out into the field.

The training programme is to be carried out by the authors of this paper – both professors in Journalism at the Department of Communication Studies at the UPF in Barcelona – in conjunction with Barcelona's leading professional fact-checking platform known as Verificat. The pioneer counter-desinformation cohort has been drawn together from the community of students enrolled on the Senior Programme at the UPF. As well as the initial training course, a ten-episode series of 2-minute videocapsules is under preparation as is the construction of a whatsapp-based application to test whether progress has been made. All trial runs are to be carried out in the spring and initial results will be presented at ECREA 2024.

As for the structure of the paper itself, it will begin by examining the challenges of media literacy initiatives among senior citizens as well as offering a comparative analysis of similar projects at international level. The technical and methodological details of this project would then be presented before offering the reader the first results from the "train the trainers" initiative and contemplating the implications for such knowledge transference in order to combat disinformation in this often-overlooked sector of society.

PP 0083 Political and economic determinants of disinformation in the COVID-19 pandemic situation. A comparative study of cases from Poland and Serbia

Sebastian Sosnowski¹

¹ Institute of Philosophy and Sociology Polish Academy of Science. - Warsaw, Poland

The process of communication disorder was omnipresent in almost all countries over the world during the COVID-19 pandemic. This presentation focuses on two specific cases of communication disorder in the media systems of Poland and Serbia. Both countries are a good example of the process of "media capture" (e.g. Dragomir, 2019) by the political authorities, especially since the second decade of the 21st century. The main research question is: What determinants of the current media systems do media workers indicate as contributing to the issue of disinformation? In the analysis, I used 20 interviews with media professionals from the EnTrust project on media and disinformation from Poland and Serbia (10 interviews per country). The interviewees come from diverse occupational backgrounds in the media sector and are divided into 5 subgroups: public broadcasting, professional journalism, local and national government or EU projects, nonprofit and independent journalism projects, and civil society or non-government organisations. Additionally, I use the data from reports on media pluralism and media systems collected by international organisations (e.g. Reporters without Borders, Centre for Media Plurality and Freedom) to compare the overall conditions for journalism in both countries. To analyse the data, I apply the critical theory of communication (CTC; e.g. Fuchs & Mosco, 2016), especially the concept of informational capitalism (Fuchs, 2011). By doing so, I intend to explain not only the political, but also economic characteristics of both media systems contributing to communication disorder laying on the intersection of politics and capitalism: financial models of media functioning, commodification of information and attention, and eventually – deteriorating work conditions of journalists. The main contributions of this presentation is the approach to the subject of communication disorder from the critical perspective and its focus on the structural problems of the media systems rather than on the technical determinism present in the research on social media's role in disinformation.

CDE02 Telegramming politics

PP 0099 Conspiracy narratives and content moderation: Insights from Telegram channels during COVID-19

Corinna Peil¹, Ricarda Drueeke¹, Charlotte Spencer-Smith¹, Thomas Steinmaurer¹

¹ University of Salzburg, Department of Communication Studies, Salzburg, Austria

The Covid-19 pandemic has provided fertile ground for the spread of disinformation and conspiracy theories. In response, social media platforms have implemented stringent content moderation measures, including the deletion of problematic content and 'deplatforming' of offending accounts, compelling conspiracy theorists to migrate towards the messaging app Telegram (Rogers 2020). While previous studies explore how non-conspiracy users perceive content moderation (e.g., Myers West 2018), there is a lack of research on how conspiracy theorists interpret content moderation and how it fits into broader censorship narratives. Our study addresses this gap by investigating how conspiracy communities on Telegram discuss content moderation practices across platforms. We aim to uncover prevalent beliefs, proposed resistance strategies, and how these views intersect with overarching conspiratorial frameworks.

Our research methodology involves an in-depth examination and content analysis of Telegram messages utilizing a dataset comprising 87 channels in the German and Austrian corona skeptical "Querdenken" community over three time periods in 2021, 2022 and 2023. We analyzed references to content moderation to identify key themes and narratives. Using the three most mentioned platforms regarding content moderation – Telegram, Facebook and YouTube – we then developed comparative case studies on the discussion of these platforms. Overall, the case studies show how the content moderation measures identified by users are woven into conspiracy narratives and which actors are seen as central. At the same time, they reveal which platforms are considered alternative and free from censorship.

On each platform, there is a distinct discourse about how content moderation in the context of the Covid-19 pandemic is perceived. Conspiracy theorists often portray Telegram as a refuge for unfiltered communication, citing its encrypted nature and limited content moderation. Nevertheless, they consider Telegram to be under threat from

both government regulators and app store operators. Strategies to circumvent potential bans, such as VPN usage, are frequently discussed. Similarly, Facebook is criticized for alleged censorship disguised as fact-checking, especially in relation to Covid-19 vaccine-related content. Conspiracy theorists point to selective censorship practices and suggest that corporate influence, particularly from pharmaceutical companies, may play a role in content moderation decisions. On YouTube, criticism of the removal of content and accounts is directed at various tech companies that are perceived as representing the so-called elites. The regulatory interventions that prevent people from learning the "whole truth" are highlighted.

Our findings provide valuable insights into the emergence and spread of conspiracy theories in digital ecosystems, shedding light on the development of censorship narratives and circumvention strategies. This helps to illuminate how conspiracy theorists make sense of disruption and unpredictability in their social media communications and bring the new order of platform power into their understanding of the old order of conspiracy.

CDE02 Telegramming politics

PP 0100 The communicative construction of ingroups and outgroups in Telegram counterpublics: The interplay of self-identification and othering between channels and users

Florian Buhl¹, Katarina Bader¹, Kathrin Müller¹, Lars Rinsdorf²

¹ Hochschule der Medien, Faculty of Electronic Media, Stuttgart, Germany

² TH Köln, Faculty of Information Science and Communication Studies, Köln, Germany

Since the COVID-19 pandemic Telegram has developed into a popular platform for exchange and mobilization of networked counterpublics. Mapping Telegram content, communication scholars have shown anti-state, anti-democratic and extremist stances of some of the channels and groups involved (Jost and Dogruel, 2023; Rothut, Schulze, Hohner, and Rieger, 2023; Zehring and Domahidi, 2023). However, little is yet known about Telegram users: their biographical backgrounds and their motivations to turn to the platform (Dogruel, Kruschinski, Jost, and Jürgens, 2023). Here we contribute to fill this gap by researching the communicative construction of ingroups and outgroups on Telegram in the interplay between channels and users. On the one hand, we ask how Telegram channels communicate self-identification and othering; on the other hand, how Telegram users perceive their ingroup and outgroups, and how their biographies factor into these perceptions.

First, we conducted a quantitative manual content analysis of 2.669 Telegram posts from 40 German-language Telegram channels with high audience reach (collected April to June 2023). Among topics and stylistic features, we studied ideological orientations as well as speech acts of self-identification and othering (Holsti = 0.85 – 0.99, Brennan & Prediger's κ = 0.70 – 0.99). Second, we conducted semi-structured interviews with fourteen German Telegram users (November and December 2023) from three Telegram-based counterpublics: (1) people gathering in pro-Russian groups, (2) supporters of esotericism and alternative healing methods, and (3) pressure groups of parents originally formed to oppose anti-covid measures in schools and kindergartens. We asked them about their identity, ingroups, and outgroups.

In our content analysis, we found that the COVID-19 pandemic and its social aftermath is still the one most shared topic among high-reach German Telegram channels. At the same time, most channels focus their attention on specific current topics such as Russia's war in Ukraine. This pattern resonates with our interview findings about users' Telegram adoption stories: The public discourse on the pandemic and vaccinations prompted many to join. This includes users who today turn to Telegram for mostly other topics.

We found only few channels to focus on one specific ideological background such as QAnon. Most channels serve a wide range of ideological orientations. All channels express a populist stance against elites.

The interviewees have in common that they distrust mainstream legacy media. They claim to have a high level of understanding, strong research skills, and news savviness. Self-attribution as "knowers" is also one of the most common identity markers we found in our content analysis, alongside self-references to the "real people" suffering from those in power. Many interviewees reported biographical transitions, often linked to the collapse of the Soviet Union and the German Democratic Republic. The experience of the upheaval of a societal system and its fundamental values seems to contribute to their susceptibility to conspiracy theories.

Linking a content analysis with interviews, this paper contributes to a better understanding of how identification and othering are co-created between Telegram messengers and users and hence the formation of networked counterpublics. Additionally, especially new insights from the interviews provide directions for future research.

CDE02 Telegramming politics

PP 0101 Clandestine, contested, crucial: The significance of Telegram as a site of discursive power struggles within contemporary media systems

Christian Schwieter¹

¹ Stockholm University, Department of Media Studies, Stockholm, Sweden

The messenger-turned social media platform Telegram has become one of the most prominent online platforms for the far right over the past years. In Germany in particular, the platform is popular among extremist actors due to its lax content moderation. Researchers have shown how Telegram facilitates the development of far-right "alternative" information and mobilisation networks, integrating previously related but disparate political movements – ranging from Russian disinformation channels, radicalised anti-lockdown groups to antisemitic conspiracy theorists (Schulze et al. 2022). In response, the German government has put pressure on Telegram to enforce existing hate speech regulation – albeit with limited success. Telegram is now key platform for far-right community-building and a central hub for its propaganda activities or, as argued in this paper, a key site for far-right "discursive power" (Jungherr et al., 2019).

While research on far-right activity on Telegram is growing, there is little discussion about the significance of Telegram as a contested political communication tool itself. The goal of this paper is therefore to understand how Telegram is framed by political actors in three different German-language media environments, namely German newspapers of record, far-right alternative media, and far-right Telegram channels. To this end, the study deploys a computational frame detection approach, combining the word embedding technique word2vec with more traditional dictionary-based approaches (Yu & Fliethmann, 2022) to identify commonalities and differences in how Telegram is characterised as a political communication tool across different German-language media environments.

Initial findings indicate that attempts to regulate Telegram, by first the German government and later the EU, are used by far-right actors to present themselves as victims of what they see as a repressive regime censoring political dissenters. Alternative media also portrays the anti-democratic mobilisation efforts by the far right on Telegram as in line with the anti-government protests of pro-democracy activists in Iran and Belarus, among whom the use of Telegram is also widespread. On the other hand, Telegram has become crucial for newspapers of record covering the Ukraine war, as the platform is used by Russian and Ukraine authorities for informational as well as propaganda purposes. As such, Telegram is a highly contested platform that is not just of significance to far-right political actors to enact "discursive power", but also exemplifies the complex relationship between emerging European digital regulation and global political communication practices.

CDE02 Telegramming politics

PP 0102 Posting, sharing, channeling – Telegram media practices of the Identitarian Movement in Austria, Germany and Switzerland

Giuliana Sorce¹

¹ Eberhard Karls Universität Tübingen, Institute of Media Studies, Tübingen, Germany

Far-right movements, populist collectives, and right-wing actors have long harnessed the mobilizing power of social media. In the case of the Capitol Hill riots in January of 2021, social media were key in organizing the massive protest. Similar scenes were previously seen in Germany, when a mob of far-right protesters sought to storm the Reichstag in August of 2020. Both cases demonstrate that extremists have become savvy in digital mobilization, using both commercial and fringe platforms to create ad hoc protests and spread far right ideology. The Identitarian Movement (Identitäre Bewegung) is a pan-European far-right collective that has been able to garner sizable support, in particular with younger voters. The IM originated as a Facebook group in October 2012 and was later deplatformed in May 2018 as the page was found to aggregate extremist messages and facilitate organized hate speech (Guenther et al., 2020).

The messaging application Telegram has since been used as a central communication platform for the IM in German-speaking countries (Schulze et al., 2022). Telegram's open-source architecture contradicts regulation and moderation and open spaces for extremist content and user radicalization (Urman, Ho & Katz, 2022). Instead of focusing on the content of posts such as frames or visuals, this paper investigates the professionalization of Telegram app use with a focus on how movement information is clustered and disseminated for users to increase app efficiency and usability for channel and group members. Theoretically, this study brings together organizational communication literature with social movement approaches in digital contexts.

To assess the IM's networking structures, organizational professionalization, and information circulation on Telegram, this study relies on a mixed-method approach using both textual and structural data. In assembling the data set, the IM Telegram channels for Germany (@IdentitaereDeutschland) and Austria (@IdentitaereOesterreich) were used as seed accounts for subsequent snowball sampling to identify the relevant public movement accounts across the German-speaking contexts. After filtering, $N = 12$ channels were included in the final dataset. Using the Telegram API and the Telethon Python package, all messages were scraped from the public channels in the sample, totaling $N = 13,819$ posts. Word frequency data mining was used as a first step to extract relevant posts, which were then imported into the qualitative data analysis software MAXQDA. Two rounds of inductive coding enabled a first systemization of posting types and functions to address how movement actors employ the platform Telegram on an organizational level. This includes paying particular attention to networking structures, organizational professionalization, and information circulation in the larger far-right network.

The study finds three main themes: First, the functions of the post (branding, mobilization, "information" circulation, community-building); second, sharing practices (alternative news, key accounts); and channel roles (gatekeeper, representative liaison, broker, coordinator). In building this typology, this study moves us to understand how far-right movement actors employ Telegram on an organizational level, providing a template that can be used by further studies in the area to examine the uses of messaging applications in political organizing.

CDE02 Telegramming politics

PP 0103 Accessing online communication (dis)order: The COVID-19 protest Telegram dataset 2020–2022

Heidi Schulze¹, Kilian Bühling², Maximilian Zehring³

¹ LMU Munich, Department of Media and Communication, Munich, Germany

² Freie Universität Berlin – Weizenbaum Institute for the Networked Society, Institute for Media and Communication Studies, Berlin, Germany

³ Ilmenau University of Technology, Computational Communication Science, Ilmenau, Germany

The hybrid messenger platform Telegram has a large global user base and is used for both private and public communication. The hybrid platform architecture, which combines features and affordances of instant messengers with those of social networking sites, enables various, multimodal communication modes (one-to-one, one-to-many, many-to-many; text, image, audio, video) and affords a high degree of anonymity rendering Telegram, a popular platform for extremist actors. In Germany, Telegram came to the general public's attention in the summer of 2020 at the latest, when news media reported that protesters primarily used COVID-19 measures to organize and exchange information via this platform without having to fear restrictions or account deletions by large platforms.

During the pandemic, but also during subsequent societal crises, such as the Russian invasion of Ukraine or the energy price crisis, Telegram became an important platform for the dissemination of conspiracy theories, far-right narratives, and other forms of disinformation. While research into the mobilization and networking of protest actors on the platform is therefore moving closer to the focus of communication science interest, there are few comprehensive, comparative data on protest mobilizations on Telegram due to its novelty and dynamic ephemerality. However, such comparative data can be used to categorize future developments of narratives and actors and explore their continuities.

For this reason, we created a dataset that maps the German-language anti-COVID-19 measures protest mobilization from 2020 to 2022. It includes the public messages from 390 channels and discussion groups associated – by name – with the Querdenken movement, as well as 611 channels and groups affiliated with the COVID-19 protest movement in terms of content and organization, and individual organizers of the movement ($N > 5.5$ Mio. posts). In contrast to the few other available data sets of public Telegram communication, the channels and groups of the Querdenken Telegram dataset 2020–2022 are classified and processed manually so that this specific movement and its network can be mapped longitudinally. The data collection took place at different points in time during the observation period, which is why the loss of data due to deletions by the actors is low, increasing the historical value of the published data.

In addition to the extensive indexing and processing of the initially unorganized digital behavioral data, which were also documented in detail in a codebook and will therefore also be relevant for future Telegram research, the authors created additional variables (e.g., network data, geolocation) that can be used for further research purposes. To address data protection and ethical concerns, the authors consulted with data protection officers in advance

and received a positive evaluation from an ethics review board. The dataset will be published in consultation with a professional academic data archive (GESIS) to select an appropriate license and data access.

The aim of the presentation is to present the dataset but also to advertise and critically reflect on the hurdles of social media data publication, which is so far rarely done in communication science.

CDE03 Media discourses and radicalization

PP 0187 Mapping far right discourse and anti-systemic contestation in digital alternative news environments (2019–2022): Combining computational text analysis and network analytics

[Frederik Henriksen](#)¹, Jakob Bæk Kristensen¹, Eva Mayerhöffer¹

¹ Roskilde University, Department of Communication and Arts, Roskilde, Denmark

Communication scholars observe how far right rhetoric's and discourse move from the fringes of political systems and public debates to the center (Brown et al., 2021; Katsambekis, 2023). These moves are entrenched in mainstreaming processes where discourses become normalized, which gradually shifts what is acceptable in public discourse and policy-making. The result is a change in what is deemed 'normal' or 'legitimate' as a 'new normal' threatening to distort digital information ecosystems and ultimately democratic societies.

Besides far right discourse, digital anti-systemic contestation has become a 'new normal' on digital platforms driven by conspiracy theory networks during COVID-19 and anti-democratic movements (e.g., Freedom Convoy or the Querdenken movement). These movements rely on alternative news media to legitimize their world views and demands. By combining a (quasi-)journalistic self-understanding with explicit anti-mainstream agendas, these media curate far right and anti-systemic information ecosystems by challenging mainstream media and political systems.

Although scholars disagree to which extent the far right is successful in using alternative news media and social media to transform the public discourse, empirical research suggests that far right discourses is mainstreamed through these media and platforms (Crawford et al., 2021; Zhang & Davis, 2022). What is less clear is how these mainstreaming processes emerge and materialize in contemporary digital information environments.

The aim of this paper is to provide a comprehensive empirical study to ground scholarly debates on mainstreaming of far right discourse and anti-systemic contestation in digital information environments. With alternative news environments as our empirical context, we investigate mainstreaming processes in Austria, Denmark, German and Sweden from 2019–2022. This study uses data collected from nine different social media platforms (X, Twitter, Telegram, TikTok, YouTube, VKontakte, Instagram, 4chan, and Gab) and more than 150,000,000 social media posts containing links to alternative news media sources and related content.

We construct a hyperlinking network that we are able to divide into left-wing, right-wing or anti-systemic communities using manual coding and a propagation algorithm. To specifically detect far right discourses and anti-systemic contestation, we use computational text analysis based on large language models to classify posts of social media profiles (~32,000 posts annotated) belonging to right-wing communities. These posts are classified into seven far right discourse dimensions (xenophobia, islamophobia, Anti-semitism, anti-progressive, authoritarian, white supremacist, and far right conspiracy theories) and three forms of anti-systemic contestation (anti-institutionalism, anti-globalism, and anti-mainstream news). Based on this classification, we use study how these dimensions evolve over time. This gives an impression of how COVID-19 transformed far right discourse:

RQ1 How does far right discourse and anti-systemic contestation evolve over time?

As our data provides a large network consisting of heterogenous types of actors (media, politicians, activists, public groups etc.), we are able to measure the distribution of far right discourse, but also the relations between far right actors and more mainstream actors:

RQ2 How widespread is far right discourse and anti-systemic contestation across the three countries?

RQ3 Which prominent communities drive the mainstreaming processes?

RQ4 How are network ties formed between far right, anti-systemic and mainstream political communities?

CDE03 Media discourses and radicalization

PP 0188 Alternative news use in a high-trust media context: Evidence on the association between alternative news use and topic – and outlet-specific trust in mainstream news in Denmark

[Miriam Brems](#)¹

¹ Aarhus University, Department of Media and Journalism Studies, Aarhus N, Denmark

Alternative media have emerged online across European countries and positioned themselves as correctives of mainstream media (MSM) whose credibility they often blatantly attack (e.g. Figenschou & Ihlebæk 2019). While recent studies have shown that alternative news use is related to lower trust in MSM in general (e.g. Andersen et al. 2021), this study breaks new empirical ground by investigating the association between alternative news use and

trust in MSM coverage of news in general as well as trust in coverage of specific news topics (climate, immigration/integration, economy) and specific outlets. To the author's knowledge, this is the first study to investigate the relationship between alternative news use and MSM trust at this granular level. The study is set in Denmark, which is a particularly interesting case because the generally high levels of MSM trust and strong public service tradition (Schrøder et al. 2023) should make the mainstream media system robust to attacks on its credibility.

The study makes four novel contributions to the existing literature:

- 1) Findings show that alternative news use is associated with lower levels of trust in mainstream coverage of news in general and the three specific news topics. Alternative media users' lower trust is thus not confined to specific value-based topics as qualitative studies have indicated (e.g. Thorbjørnsrud & Figenschou 2020).
- 2) Unlike most previous studies, it distinguishes between use of left-wing and right-wing alternative media and finds that both are related to lower levels of mainstream media trust.
- 3) Yet, the associations are modest, and results show that Danish users of alternative media have relatively high levels of trust in mainstream news in international comparison.
- 4) Results suggest this is related to the strong Danish public service tradition as the users, surprisingly, have highest trust in public service media and lowest in tabloids.

Based on the findings, the study argues that the democratic implications of the spread and use of alternative media is context dependent. On the one hand, this means that there is reason to temper concerns over the spread and use of alternative media in high-trust contexts like the Danish. On the other hand, the association with lower trust in mainstream news can be expected to be stronger in dissimilar contexts characterized by lower mainstream media trust.

The study builds on original survey data from a nationally representative sample of the adult Danish population ($n = 2455$). Trust was measured at the brand and topical level (Strömbäck et al. 2020) and data analyzed using OLS regression.

CDE03 Media discourses and radicalization

PP 0189 Geopolitical mythmaking: A narrative study of far-right media discourse on the Russian invasion of Ukraine

Bianca Welker¹

¹ University of Helsinki, Faculty of Social Sciences, Espoo, Finland

The beginning of Russia's invasion of Ukraine was characterised by an information environment rife with conflicting narratives, disinformation and information uncertainty. As the crisis unfolded, German far-right media were quick to promote narratives closely aligning with Russian state media, yet further entwined their endorsements with narratives of Western decline and global corruption. This paper is an in-depth narrative analysis of far-right online media's coverage surrounding the Russian invasion of Ukraine in early 2022. The paper examines how far-right media utilise political myths to construct narratives which promote a deterministic view of history, often at odds with constructive democratic processes.

By analysing the structural elements, actor representations and temporal sequences of these narratives, the paper illustrates the capacity of storytelling to legitimise and constrain discourses. To do so, I began with a comprehensive web scraping of 1513 articles using BeautifulSoup to first understand all existing narratives on the invasion across six German far-right media outlets: Achse des Guten, Apolut, Compact, Junge Freiheit, PINews, and RT.de. Then, the set was narrowed down to 56 articles, on which I performed several rounds of an in-depth actor-centred narrative analysis, aided by concepts from discourse theory. This combined approach not only underlines the importance of narratives as crucial vessels for perceived social structures but also elucidates how political myths function within these narratives to legitimise far-right ideologies.

The study finds that media on the Far Right predominately linked the Russian invasion to geopolitical narratives and more broadly, the political myth of a 'Decline of the West' and the potential onset of a new political order. The crisis is portrayed as symptomatic of Western moral and geopolitical erosion, which challenges the liberal

hegemonic order. The article discusses how this narrative was constructed through selective re-contextualisations of history, dramatized actor portrayals, and connotations of heroic story tropes. The recurrent narrative arc of cyclical societal crises is a common theme in far-right discourse, finding a new expression in the invasion coverage. It follows a similar narrative trajectory as seen in their earlier coverage of significant immigration events, financial crises and the global pandemic. The study illustrates that mythmaking—or mythopoesis—remains a central narrative mechanism in far-right meaning-making, playing an important role in linking various geopolitical events and crises to far-right ideologies.

This study concludes by urging a deeper engagement with the narrative constructions of far-right media, which go beyond the misinformation perspective and instead problematises their effectiveness in crafting compelling grand narratives which normalise far-right ideologies under the guise of populist discontent.

CDE03 Media discourses and radicalization

PP 0190 Media use, cultural orientations and support for right-wing populist political parties: Comparing nine European countries

Marc Verboord¹, Riie Heikkilä², Susanne Janssen¹, Semi Purhonen²

¹ Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

² Tampere University, Sociology, Tampere, Finland

In the past decades, right-wing populist political parties have become increasingly prominent in European politics. These parties often have political agendas which promote xenophobia, intolerance toward minority groups, anti-elitism, and even anti-democratic sentiments. The role of the media in explaining populist voting tendencies has been studied both from a message perspective (e.g. Hameleers et al., 2018) as well as from a media repertoire perspective (e.g. Doroshenko, 2018; Štětka et al., 2021). This paper follows the latter approach, and studies how media use and cultural orientations predict right-wing populist voting from a cross-national perspective.

By examining the populist party support in nine European countries we increase our insight in how contextual elements shape the impact of media. We advance on existing studies through a more fine-grained analysis of digital media by distinguishing between online news websites, social media and video platforms. Furthermore, taking a cue from political science work on cultural grievances (e.g. Castelli Gattinara et al., 2022), we compare various dimensions of culture that potentially predict right-wing populist voting (e.g. EU skepticism, conservative cultural values, dissatisfaction on societal changes, domestic cultural orientation). We employ survey data collected in 2021 as part of a large European research project in Croatia, Denmark, Finland, France, the Netherlands, Serbia, Spain, Switzerland, and the United Kingdom. These European countries differ, among other things, in terms of their media systems and dominant socio-cultural value orientations, yet in all countries populist parties are active. The survey asked for which political party the respondent would support, if there would be a General Election tomorrow, from a list of all parties represented in the national parliament of their country and recently established parties. All political parties were recoded into the European political parties and groups they are part of.

We conducted a multilevel analysis with right-wing populist party support as dependent variable. The (preliminary) results show differences between using public television broadcasters and press (less populist voting) and commercial television and online video platforms (more populist voting). We find also clear effects of cultural variables, both cultural values and cultural consumption. Here, we see strong predictive effects of EU skepticism, cultural conservative values and domestic cultural consumption. Being negative about societal changes also increases the chance of supporting populist parties. However, there are also cross-national differences in how right-wing populist voting can be explained by these factors. This implies that taking into specific country contexts remains important to understand right-wing populist tendencies.

CDE03 Media discourses and radicalization

PP 0191 Digital crossfire: Political polarization and harassment of journalists on social media during the Spanish General Elections

Simón Peña-Fernández¹, Urko Peña-Alonso¹, Ainara Larrondo-Ureta¹, Morales i Gras Jordi¹

¹ University of the Basque Country, Journalism, Leioa, Spain

In the rapidly evolving landscape of journalism, social media has become an indispensable tool for journalists, facilitating news tracking or communication with information sources (Weaver & Willnat, 2016; Neuberger et al., 2019). While this expansion fosters closer audience relationships and personal branding opportunities, it also intensifies workloads, hastens content creation, and amplifies journalists' exposure, blurring the boundary between professional and personal spheres.

The prevalence of online harassment poses significant challenges, manifesting in increased stress, psychological issues, and potential premature career termination. The impacts extend beyond individual well-being, influencing the quality and nature of stories shared on social media, thereby affecting public discourse. The consequences of

such harassment are profound, threatening not only the freedom of expression for journalists but also the foundation of democratic societies.

Social media amplifies the voices of aggressors, fostering a breeding ground for hate speech, misogyny, and sexism. Female journalists, in particular, face gender-specific online harassment, perpetuating societal inequalities (Possetti et al. 2020).

In this context, this study investigates the prevalence of online harassment and hate speech directed at journalists and media outlets in the context of the highly impactful Spanish general elections on June 23rd, 2023.

This research scrutinized 200 highly active and influential profiles in X/Twitter, split evenly between media outlets and individual journalists. Utilizing X/Twitter's Academic API, responses to posts in the days surrounding the elections (n = 60,684) were collected and subjected to machine learning analysis.

The results showed that 2.42% (n = 1,478) of these responses contained identifiable harassment or hate content. The attacks targeted a variety of entities, closely tied to political contexts. When considering responses exclusively or partially targeting journalists or media outlets, the majority of messages (46.69% and n = 494) exhibited a clear political bias, in line with the electoral period's nature. Descriptions such as 'fascist,' 'nazi,' 'communist,' or 'terrorist' dominated, reflecting a highly polarized and dualistic atmosphere. In contrast, content constituting hate speech—attacks based on specific group membership or identity attribution—had a considerably lower presence: discrimination or racial hatred elements were identified in 7.18% of analyzed messages (n = 76), while 5.77% (n = 61) included sexist or misogynistic epithets. Regarding account types, journalist accounts received twice as much harassment and hate as institutional accounts of the media outlets they represented. In addition to its evident political dimension, the data also suggests a gender dimension in harassment and hate speech against women journalists, especially from right-leaning positions.

The findings highlight that online hate speech and harassment against journalists, at least in its less extreme forms, are systemic on social media, particularly in highly polarized contexts such as electoral processes. The prevalence of political hatred against journalists indicates a notable "shoot the messenger" effect, and journalists become targets of attacks from both ends of the political spectrum.

The results also emphasize the personal dimension of online harassment, as individual journalist accounts receive more insults and hate than institutional media accounts. This raises questions about journalists' heightened exposure on social media and the inadequacy of codes of conduct regarding their use by media organizations (Holton et al. 2023).

CDE04 Automation and surveillance in governance

PP 0203 From decisions to data: Datafication and automation in the Swedish Public Employment Service

[Amela Muratpahic¹](#)

¹ Södertörn University, Culture and Education, Huddinge, Sweden

Recently, there has been a surge of popular and scholarly interest in artificial intelligence, most notably with the introduction of 'Chat GPT' in late 2022. Yet, a perhaps more overlooked aspect is the increased development of automated systems in public organisations, e.g. the use of automated decision-making (ADM) when distributing welfare benefits or matching systems connecting jobseekers with job providers. In Sweden, governmental organisations are currently exploring how to intensify digitalisation and automation, often citing its promise for increased (cost)-efficiency (Agency for Digital Government, Digg, 2023).

Datafication and automation in the public services can be seen as a way to increase social order, for example by classifying citizens into neat data packets and increasing efficiency, but also with the underlying belief in the inherent objectivity of data and numbers ('dataism') (Van Dijck, 2014). However, previous research has found that datafication and ADM in the public services can exacerbate inequalities (Eubanks, 2018; Kaun & Dencik, 2020). It is therefore crucial to ask what happens to different social actors in light of increased datafication and automation in the public services.

This doctoral project started in the autumn of 2023 and aims to investigate how social actors with different roles and resources understand, negotiate and interact with digital and automated systems in the public services. The focus will be on the Swedish Public Employment Service (PES), since it is an organisation that has undergone larger structural changes, increased privatisation and cutbacks in recent years. Hence, the project will also examine potential tensions between increased faith and development of digital and automated systems—and political developments, such as activation policies promoting self-sufficiency and use of digital tools in gaining employment (Bengtsson, Jacobsson & Wallinder, 2024).

Furthermore, an overarching theme is centred on *inequalities* and relations between social actors. I conceptualise the different levels of actors as the *macro* level, consisting of decision-makers, the *meso* level, made up of developers and employees at the PES, since both are to execute decisions from the macro level. Lastly, the *micro* level consists

of jobseekers, being exposed to the rolled out systems. Since the focus is on inequalities and relations, the theoretical framework will mainly consist of Pierre Bourdieu's field theory. Although Bourdieu himself never investigated digital media, his framework has been used in research on digital inequalities and, more recently, AI (Ignatow & Robinson, 2017; Airoidi, 2022). Going in line with Bourdieu, the methodological aim is to first conduct a survey among the conceptual levels, in order to map their position in the field(s). Subsequently, qualitative interviews with actors and observations at the Swedish PES will examine perceptions and experiences of the technological systems.

Finally, the presentation of this project will be focused on research design, i.e. how Bourdieu can be applied to research on datafication and automation at the Swedish PES. It will also include a critical discussion on underlying assumptions of the possibilities of data to creating social order, as well as its connections to democratic ideals.

CDE04 Automation and surveillance in governance

PP 0204 Marginalizing machines: Sociotechnical imaginaries in Dutch E-governance policy

[Maud Rebergen](#)¹, Rik Smit¹, Marcel Broersma¹

¹ University of Groningen, Research Centre for Media and Journalism Studies, Groningen, Netherlands

This paper analyses how sociotechnical imaginaries have influenced the development of DigiD, the Dutch digital identity management system, over the past twenty years. Technologies are not neutral or innocent, but driven by 'sociotechnical imaginaries' (Jasanoff and Kim, 2009), shared ideas about the way in which our social order should exist, that have material consequences for those who use them. We argue that information and communication technologies, such as DigiD, enhance the socio-economic position of those who are privileged enough to leverage them, while others are increasingly marginalized. This paper coins and explores the concept of 'marginalizing machines' to understand the role of ICTs and their implications for digital inclusion and citizenship.

Governments across the globe are increasingly leveraging information and communication technologies to enhance the efficiency and cost-effectiveness of the state. The Netherlands has been at the forefront of this global development (United Nations, 2022). Two key focus areas in Dutch e-governance include the development of online public services and identity verification (Digitale Overheid, 2020). Numerous digital platforms have emerged in the past two decades that citizens can employ to access a wide range of public services, including tax filings, social benefits applications, and business registrations. As the state is becoming digital-by-default, citizens are increasingly dependent on their own (digital) capabilities to access public services. Although the population of the Netherlands generally enjoys high digital literacy and internet penetration (CBS, 2020), a large subset of the population faces challenges in accessing and using online government services. Approximately 4.5 (out of 17.5) million Dutch individuals struggle to find information on the digital government and cannot use online public services effectively (Hoevenagel & Joossen, 2022). The use of DigiD, the Dutch digital identity management system, causes problems in particular, leading to become socially excluded and deprived of social benefits (De Vries, 2023).

Based on a historical-diachronic critical discourse analysis (Carvalho, 2008; Wodak & Meyer, 2001) of 363 policy documents published by the Dutch central government on DigiD from 2004 to 2023, this paper traces how changing 'sociotechnical imaginaries' (Jasanoff and Kim, 2009) have shaped e-governance policy in the Netherlands over time. Our results indicate that DigiD was initially adopted in Dutch governance in an effort to increase efficiency and reduce the administrative burden for vulnerable citizens, such as people with chronic illnesses and disabilities, and people who receive social benefits. As a result of the DigiNotar hack of 2011 (Kirk, 2011), the security and reliability of the platform became important issues. This resulted in a range of security measures that decreased the platforms accessibility. From 2018, the year when the Dutch childcare benefit scandal came to light (Trouw, 2018), there was an increased consideration for enhancing the accessibility of online government services. Despite these efforts, many people remain excluded from using these services today, restricting their citizenship. The results of this study contribute to a better understanding of the causes and consequences of e-governance policy for citizenship and inclusion in the digital age.

CDE04 Automation and surveillance in governance

PP 0205 Between two worlds: Practices and pitfalls of immigrant public connection

[Özlem Demirkol Tønnesen](#)¹

¹ University of Bergen, Department of Information Science and Media Studies, Bergen, Norway

This paper explores the social, habitual, and emergent aspects of how first-generation Turkish immigrants maintain and sustain a level of public connection in Norway. I argue that citizenship that is caught between a setting where the mass media is controlled, political fanaticism is encouraged, and electoral fraud is normalized (Irak, 2016) and one with free media, coalition governments and free elections introduces uncertainties to the repertoires of engaging with public issues (Moe, 2020). This necessitates exploring how these immigrants navigate civic life in new and different political settings, gauge what should be considered as important public issues and how this affects their willingness or efforts to partake in democratic processes.

In immigration studies limited attention has been paid to the political integration of immigrants (Dollmann, 2021). Studies on immigrant transnationalism, for instance, often focus on how immigrants keep up with news and perform their citizenship duties in their home countries (Boccagni, Lafleur, and Levitt, 2016) rather than how they engage with and navigate politics in their host countries beyond immigration issues. Whereas in media studies focus has been on digital diasporas that enable connections between immigrants and foster activism (Andersson, 2019) as well as the diasporic/ethnic media that champion immigrant voices and offer an accessible platform for public connection (Nguyen et al., 2023). This paper contributes to these fields both by delineating how immigrants build and maintain an orientation towards issues of public concern in their host countries as well as methodologically by combining insights from the mediated experiences and local diasporic connections of immigrants. This methodological approach is necessary as social and traditional media use and diasporic connections constitute the key venues of public connection for transnational citizens that are positioned in between two geographically and culturally distant settings.

This study will combine an autoethnography of my experiences as a Turkish immigrant in Norway, participant observation during local community events organized by Norwegian-Turkish Culture Association in Bergen and in-depth interviews with 15 Turkish immigrants who are members of this association. Autoethnography is used to foster openness and rapport with participants as mutual experiences become more readily identifiable (Berger, 2001), which will then be analyzed in combination with observation notes from social events. These observations will inform whether and how diasporic community settings can facilitate a space for discussion of public issues. Finally, through the interviews I aim to gain insights into the tactics and practices citizens employ to navigate news and information on public issues via social and mass media and the obstacles they face in terms of access, motivation, and relevance.

CDE05 Communal welfare: Reimagining automated welfare provision

PN 041 Communal Infrastructures of Welfare: public value, data extractivism and data justice

[Doris Allhutter](#)¹, Astrid Mager¹, Rafaela Cavalcanti de Alcântara¹

¹ Austrian Academy of Sciences, Austrian Academy of Sciences, Vienna, Austria

Across Europe, the public sector is expanding its efforts to introduce data-driven decision-support and intelligent systems in the administration of welfare and city-based initiatives aiming to raise citizens' wellbeing. Our notion of 'infrastructures of welfare' suggests that the implementation of data-driven, automated systems is closely entangled with a transformation of the relationship between citizens and the state and of welfare more widely. The datafication of community resources that shall make human settlements more inclusive, safe, resilient and sustainable (UN 2017, par. 9) has far reaching implications as regards equality, governance, and democracy. Numerous scholars have raised concerns that datafication as a social and political process has mainly catered to commercial and governance interests (Kitchin et al. 2017). With Couldry and Mejias (2018, p. 338) the purpose and extent of datafication of urban life can be seen as a mechanism that "produces the social for capital, that is, a form of the 'social' that is ready for appropriation and exploitation for value as data". Data extractivism is "the ubiquity of mechanisms that turn citizens into datafied subjects" (Segura & Waisbord 2019, p. 413). Dencik (2022, p. 161) emphasizes that the "ideology of dataism and the political economy of technology posit values and operational logics that are markedly different from how the welfare state has previously been understood". When elaborating on possible alternatives to the current widespread notion of smart cities, the idea of commons and common data infrastructures emphasizes alternative data ownership regimes, open source, open standards, development of cooperative models of service provision, and digital sovereignty (Bria & Morozov, 2018; De Lange, 2019). Furthermore, the notion of data justice details that "[n]avigating the tension between having/using and not having/using certain types of data is crucial for more equitable, just, non-discriminatory futures" (Draude et al. 2022, p. 188). Conceptualizing the communal data infrastructures that are being built for welfare and wellbeing as digital public goods, we connect the concepts of public value and welfare for the flourishing of community/ies. Thus, we explore the entanglement of datafication with the sociomaterialities of public and urban life and citizens' exercise of different rights. References Couldry, N., Mejias, U. A. (2018). CDE05 Communal welfare: Reimagining automated welfare provision

PN 042 How to make smart place? Competitive space use, administrative overload, and holistic aspirations

Emma Hughes¹, Christian Pentzold¹

¹ Leipzig University, Department for Communication and Media Studies, Leipzig, Germany

In our talk, we follow a public-private venture that seeks to develop a prominent square in the city centre of a major German city from of transit, traffic, and trouble into a social hub and space of civic encounters. This vision is driving the Smart Space Initiative and its three-year plan of holistic rejuvenation and smart urban management. Together with the population, the aim is to diversify the square's utility, foster civic-minded initiatives and their need for public space, promote public mobility, and help negotiating and solving these potentially conflicting and swiftly changing demands administratively. Unsurprisingly, there is a strong enthusiasm for technological solutions that are deemed to aim these ambitious goals and at the same time some concerns regarding the administration's readiness. The case study we present investigates how administration, business and science work together during the project's planning stage. A central part of the concept is to involve citizens and stakeholders in the process, and to enable and ensure their participation once the project will have been completed in 2025 with a – hopefully – running processes of managing the place the smart way (Halpern & Mitchell, 2023). That requires a digital tool involving automated steps of sorting requests and collecting necessary data so to bring together the various offers and interests. For example, spaces are envisioned to be booked by local associations, businesses or citizens via the tool so that the square follows their needs. In particular, we will discuss how software developers who are currently working on the tool are dealing with ensuing questions such as 'Who can use the space and for what purposes?', 'How should the tool decide whether a local association or a large corporation should be able to go through with their booking request in the event of simultaneous bookings?' By studying the planning and implementation of the tool and the overarching process, we are able to shed light on the ways, the requirements and demands on the space are being determined in order to design a suitable concept for flexible use and management (Zuzul, 2019). This means to align multiple and potentially competitive claims with administrative instances and their limited capacity. As the project is intended to serve as a model for other locations, the lessons we derive on mitigating this tension through the curtailing of options, the hierarchization of demands, and the tech-based formalization of procedures may apply to other communal welfare infrastructures as well. References Halpern O., & Mitchell, R. (2023). The Smartness Mandate. MIT Press. Zuzul, T. W. (2019). "Matter Battles": Cognitive Representations, Boundary Objects, and the Failure of Collaboration in Two Smart Cities. *Academy of Management Journal*, 62(3), 739–764. <https://doi.org/10.5465/amj.2016.0625>.

CDE05 Communal welfare: Reimagining automated welfare provision

PN 043 Sensing the city: Smart traffic AI as communal welfare infrastructures

Anne Kaun¹, Maris Männiste²

¹ Södertörn University, Södertörn University, Stockholm, Sweden

² Södertörn University, Culture and Education, Stockholm, Sweden

In recent years, the implementation of smart city applications in the form of AI-based systems has become ubiquitous, almost mundane. While not taking the coherence and "uncontroversial thingness of AI" for granted (Suchman, 2023), we propose to think of these systems as communal welfare infrastructures and accordingly position them in the broader field of welfare technologies. Doing so has both practical (who pays for and owns these infrastructures) and political (who and how are citizens implicated differently in these infrastructures) implications. Drawing on two case studies of smart traffic AI in Estonia and in Sweden we develop what it would mean to think of the technical implementations as fundamental infrastructures for communal welfare. The first case constitutes a smart pedestrian crossing application that has been implemented by several Estonian local governments to make pedestrian crossings safer not just for the humans but also in the future for the automated robot couriers. Several local governments have already implemented "SafeLight" system which is based on the thermal cameras equipped with special sensor-based systems, which based on the fixed temperature can detect living organisms near the pedestrian crossing. Pedestrian crossings will have specific LED lights and in the implementation the characteristics of the particular pedestrian crossing will be taken into account. In pedestrian crossings where this system is implemented, the driver will see LED lights turned on when the pedestrian is already on the crossroad or near the crossroad, which will give the driver enough time to stop or slow down. The second case is an AI based camera system detecting bicycle crossings on a local bridge in a Swedish municipality. The data on how many cyclists are crossing the bridge are accessible in real time both through an external app and the municipal AI chatbot. The aim with the sensing system is to produce real time data for better traffic planning and coordination of bridge openings. At the same, time it serves as test site for camera-based technologies that are GDPR conform and do not register personal data. Both cases are examples of current in-use AI traffic systems, however, they are justified and implemented differently depending on the specific contexts. The presentation will disentangle these contextual aspects to draw

conclusions about the character of communal welfare infrastructures and their geographical, political, and social boundedness. References Suchman, L. (2023). The uncontroversial 'thingness' of AI. *Big Data & Society*, 10(2), 20539517231206794.

CDE05 Communal welfare: Reimagining automated welfare provision

PN 044 Smart Waste Management Technology : A Medium of Communication and a Tool for Simulating Change

Celina Strzelecka¹

¹ Polish Academy of Sciences, Polish Academy of Sciences, Warsaw, Poland

In this paper, I propose a critical analysis of the role of technology in waste management within smart cities, with a specific focus on the Digital Urban Waste Tracking System (DUWTS). This system represents a novel form of digital communal welfare infrastructure, challenging traditional concepts within the smart city paradigm (Frang et al., 2023). In doing so, I utilize the perspective of Critical Theory of Technology (Feenberg, 1991) to illustrate how DUWTS, influenced by social and political forces, evolves from a neutral technological tool to an active agent in shaping societal narratives. My argument in this paper is that DUWTS, beyond being a mere technological innovation, serves as a significant communicative medium. It not only promotes a marketing narrative aligned with the recycling goals of the European Union but also reflects the technocentric belief in technology's effectiveness, which is often disconnected from its real-world efficiency. This analysis brings to light the impacts of smart city initiatives, particularly those fostered by alliances between governments and tech companies, and how they may perpetuate digital age injustices (Rosol & Blue, 2022). Furthermore, the paper examines the influence of global hegemonic neoliberalism on the concept of smart cities (Zapata & Fernando, 2021), urging a deeper contemplation of technology's role in contemporary urban development. In conclusion, the article critiques how DUWTS often serves more as a tool for simulating change than driving actual progress, thereby fostering an illusion of innovation while sidelining comprehensive solutions. It highlights the "information technology paradox" (Zimmerli, 1986), where an overabundance of information paradoxically leads to reduced control, a situation exacerbated by the unintended social consequences of DUWTS. The technology's influence in shifting recycling and waste management responsibilities from collective to individual levels is also scrutinized, indicating a rise in individual responsibility (Beck & Beck-Gernsheim, 2001). Ultimately, DUWTS can be viewed as a "phantom" of technological advancement, giving a misleading sense of progress and efficiency in the smart city landscape.

PP 0276 Online monitoring activism: Civic surveillance practices as a reaction to the rise of the far-right in the COVID-19 pandemic

Julia Lück-Benz¹, Primig Florian¹

¹ Institute for Media and Communication Studies, Freie Universität Berlin, Berlin, Germany

During the COVID-19 pandemic, anti-government protests have resurged in Germany, most visible in movements contesting anti-pandemic measures and the institutional orders responsible for them (states, media, science). Simultaneously, the Telegram COVID-protest sphere has been under continuous surveillance by digital counter-activists sharing screenshots from protestors' Telegram channels and other platforms on X. It is this monitorial practice of counter-protest empowered by digital infrastructure, expected in monitorial democracy and normalized by surveillance culture, that we focus on. Such practices could previously be observed, for instance, in organized counter-speech activism targeting incivility and hate or far-right extremism, but also from misogynist and counter-feminist activists. Still, it remains unclear what precisely monitoring activism entails besides the observable act of publishing content previously published elsewhere by the surveilled.

We conducted eight semi-structured in-depth interviews (average 74 min., Sept. 2023) with German monitoring activists who posted about far-right Corona-protest online activities on X. We were mainly driven by the research interest to understand who these online monitoring activists (OMA) are, why they are doing what they are doing and how they are doing it.

The interview data revealed a distinctive form of activist engagement characterized by high individualization, with activists demonstrating no direct affiliations with structured groups or organized movements. However, they all follow

the same core practice workflow of continued systematic collection, processing, and publishing of information on adversary observable others online (to inform a broader public about their actions and harm them specifically).

We identify four core themes of engaging in online monitoring activism:

In the activists' **ethical normative orientation**, the tensions of OMA grounded in surveillance culture and the normative strong demand of monitory democratic citizenship become most prevalent: The activists do collect data in abundance, and it is mainly at the publishing stage that they make (self-protective) decisions to withhold data from the public – yet some share it with law enforcement. The activists navigate these tensions by justifying surveillance with normative democratic necessity, stemming directly from the activists' **discontent** with the democratic normative orders' performance of scrutinizing far-right mobilization during the pandemic. In their practice, the activists show a considerable degree of **professionalization** observable in the stylistic coherence of their output and visible in their highly specialized and localized expertise. Finally, **knowledge-sharing practices**, always central to activists, also emerge as a critical compound of their relationship with other OM activists here. While they do not usually gather for coordinated efforts as other activists have previously done, they share information where needed within a loose network of like-minded without the formation of a collective activist identity.

In conclusion, our study conceptualized online monitoring activism as a specific form of individual digital activism. It is not directly affiliated with organized protest movements or social movements, yet supports their existence by furnishing essential information with a dual purpose of contributing to awareness-raising and consciousness-building efforts and informing organized activists' actions. This form of activism seeks to disrupt or hinder opposing social movements by strategically leveraging the influence of visibility and institutionalized power within a complex framework.

PP 0277 Fighting Hate Speech and Promoting Democracy Online: Actor constellation and communicative practices of Austria's No Hate Speech Committee

Sascha Trültzsch-Wijnen¹, Philip Sinner², [Christine Trültzsch-Wijnen](#)³

¹ University of Salzburg, Dept. of Communication, Salzburg, Austria

² University of Bremen, ZeMKI – Centre for Media – Communication and Information Research, Bremen, Germany

³ Media&Education, Salzburg University of Education Stefan Zweig & Charles University – Prague, Salzburg, Austria

The Council of Europe (CoE2022) launched 2013 a campaign "to combat hate speech by mobilising young people to speak up for human rights and democracy online". This No Hate Speech Movement (NHSM) is currently organized in 43 national committees. They bring together partners, coordinate campaigns, support young people in their school/work life including severe situations. This paper focusses the Austrian Committee (2022) launched in 2016 as agency to "raise awareness of hate online, counteract it and encourage and support campaigns against hate speech". In mediatized societies fighting hate speech is a major challenge (Rideout et al.2021; Williams2019; Hepp2020), especially since hate speech is also spread automatically through social media via algorithms, linking of accounts etc. (Bilewicz&Soral2022). The relevance is reflected in research: For 2014–2021, the CO:RE evidence base (Aroldi et al.2022) lists 301 publications and 118 studies on *hate speech*, *cyberhate* and *bullying* for Europe. One focus is media usage of hate speech recipients, their respective coping strategies, but also on bullies (Schmid et al.2022; Šori&Vehovar2022; Wachs et al.2022). Also affected companies such as Facebook, Twitter/X (Bilewicz&Soral2022) and regulations (Bromell2022; Kaye2022; ViejoOtero2022) have been researched. In contrast, organized actors working against hate speech and structural aspects (Dixon2022; López&López2022; Krause et al.2021; Pálmadóttir&Kalenikova2018) have only been researched to a limited extent.

Against the backdrop of mediatization research, we study whether the institutional collaboration and professionalization has triggered a new wave of mediatization (Hepp et al.2015) among non-profit organizations aiming to encourage citizens and question the logics of algorithms. The online approach of NHSM in general and the intensive usage of digital media for diverse purposes among the Austrian committee and its members can be considered an indicator for processes of "deep mediatization" (Hepp2020) in civic and social engagement. This relates to research indicating that social domains, so-called "communicative figurations" (Hasebrink&Hepp2017, 363), do not rely on one tool to disseminate information or to communicate but rather apply a whole *media-ensemble* with various tools serving different purposes.

Our empirical work started with a quantitative structure-analysis as web screening (Plum, 2010), to capture the entire overarching *media ensemble* of all actors, including 44 semi-automated tools and all image, text, and video-based actions and campaigns of the committee and its members. To complement this, we conducted qualitative content-analysis (Welker et al.2015) of material chosen from members' media repertoires. We selected "information-rich cases" (Patton2002, 230) to deepen the research and to reveal the complex interrelation between structural conditions and actors' objectives.

With a view to diverse communication tools, methods, campaigns, and multimedia content it becomes clear why activism, citizenship, and civil engagement turn into mediated activism in times of "deep mediatization" (above)

and digital forms of activism, algorithmic, and data activism are becoming essential to combat hate speech and enable counter speech.

PP 0278 Watching over the watchers? Ethical dilemmas in qualitative studies of sousveillance on YouTube

Paul Reilly¹

¹ University of Glasgow, School of Social and Political Sciences, Glasgow, United Kingdom

Watching over the watchers? Ethical dilemmas in qualitative studies of sousveillance on YouTube

The socio-technical affordances of online platforms like YouTube enable citizens to distribute sousveillance (or inverse surveillance) footage focusing attention on police brutality to a potential global audience. This undoubtedly creates new opportunities for qualitative researchers exploring the role of social media in contemporary protest and social movements, but it also presents a series of ethical dilemmas to be addressed. Most notably, scholars must consider the feasibility and desirability of seeking informed consent from those uploading and commenting on these videos. This necessitates some engagement with the merits and demerits of the so-called 'fair game' defence, namely that publicly available social media data can be used without ethical considerations due to the fact that users should be aware of such data collection courtesy of the terms of service of each platform. In this paper, I will explore these issues through case studies such as the 2010 'anti-Tesco' riot in Bristol and the 2012-13 union flag protests in Northern Ireland (Reilly, 2021; Reilly and Trevisan, 2016). These are incidents in which those posting online commentary were often subject to abuse and harassment; naming and shaming these commenters could not be justified on the grounds they were 'fair game'. Drawing on a feminist ethics of care (Luka and Milette, 2018), the latest iteration of the AoIR guidelines for ethical research (franzke et al. 2020), and privacy theories such as contextual integrity (Nissenbaum, 2019), I propose a new framework for qualitative online sousveillance research that balances the rights of unaware participants against those of researchers accessing these online spaces. I argue that paraphrasing YouTube comments rather than repeating them verbatim is congruent with the 'do no harm' principle of qualitative research. Sousveillance researchers should focus on what is said online rather than who says it.

PP 0279 Privacy expectations and norms: Perceptions of the Digital Activists in Turkey's Xsphere (Twittersphere)

Yusuf Yüksekdağ¹, Sarper Durmus¹

¹ Istanbul Bilgi University, Department of Media, Istanbul, Turkey

Over the last decade, researchers have conducted empirical investigations to discuss how different groups of digital users perceive privacy, its value, and how they address contextual concerns surrounding it (Paine et al., 2007; Zhang et al., 2020).

Nevertheless, amidst these discussions, a recurring gap would persist. While the notion of privacy has been extensively framed and discussed, how evolving regulations and rapid platformization are interacted with by specific user groups, especially digital activists, warrants more discussion. For these activists, the stakes are higher; their informational privacy and security are perpetually under threat, underscoring the urgency of such inquiry (Sanfilippo & Strandburg, 2019). Furthermore, gaining a more contextual understanding of privacy perceptions and interactions with such technologies in non-Western contexts is essential, where perceptions of privacy and interactions with technology may differ.

This study seeks to examine (a) how perceptions and values regarding privacy are formed in conjunction with the daily interactions of digital activists in X (Twitter), (b) interspatial concerns of the activists attributed to their safety and other concerns in between the digital and physical worlds, and (c) how digital spaces themselves are perceived given their prospects and benefits for digital activism. By conducting semi-structured interviews in Turkey with eight

digital activists with different agendas, this study aims to provide a framework for future ethnographic research that goes beyond perceptions and problematizes the nature of interaction.

In this paper, we first delve into revisiting the concept of privacy, its different conceptions and values while emphasizing the significance of individual perceptions and the existing studies surveying them. Secondly, we take on the digital activist-privacy nexus while contextualizing such concerns in Turkey. Later, we set out our methodology and analysis, respectively emphasizing the contextual privacy norms and factors shaping identity-forming, activist pursuits and the informational flow of digital activists. Our normative discussion on privacy sets our framework to analyze the digital activists' perceptions towards privacy, its significance and function. Our analysis reveals an interplay between theoretical privacy constructs and digital activists' lived experiences. While the narratives align with established theories – such as control and restricted space and Floridi's (2005) ontological perspectives – they also present a nuanced understanding deeply embedded in the activists' roles and the socio-political landscape of Turkey.

Keywords: communication, digital activists, ethics, perception, privacy, Turkey, Twitter, X

PP 0280 Identifying misinformation at scale – Studying the correlation between Facebook user reports and professional fact-checker ratings

Anton Elias Holt¹

¹ Aarhus University, Department of Media and Journalism Studies, Aarhus N, Denmark

How can misinformation reliably be identified at scale? This question becomes increasingly important as advances in AI capabilities have made it easier than ever to produce large amounts of misinformation (Yang & Menczer, 2023). As part of their efforts to stop the spread of false information on Facebook, Meta employs professional third-party fact-checkers to identify misleading content and even though this has proved a valuable approach it is not fast enough to keep up with the pace of social media platforms, especially with the acceleration in content creation. As an alternative approach, a growing literature has proposed to place much greater emphasis on user reports, as laypeople have been shown to reliably identify misinformation, even when presented with limited information in the form of a headline and lead paragraph (e.g., Allen et al., 2021; Martel et al., 2023). These studies have been conducted in laboratories or online settings on a smaller scale but claim to have found a scalable method of identifying misinformation, commonly referred to as the wisdom of crowds approach. To test the approach at scale, this study will utilize the unique Meta-created URL Shares dataset (Messing et al., 2020) and conduct a logistic regression of user reports (numerical) with professional fact-checkers' ratings (categorical). The dataset contains information from Facebook for 46 countries about every URL that was shared more than 100 times publicly, with logs of the number of interactions (clicks, likes, shares, etc.) for every month from January 2017 until November 2022 at the URL level. Furthermore, the dataset has information on the number of users who have reported each URL as *fake news*, *hate speech*, or *spam*, and which URLs were rated by fact-checkers along with their verdicts. Thus, the study will test the wisdom of crowds approach on real-world data, using professional fact-checkers' verdicts to provide evidence at a hitherto unseen scale. Additionally, the study employs NLP methods to investigate content differences between the URLs rated as false by fact-checkers and the URLs reported by users to identify types of unwanted content that are currently not being investigated by fact-checkers.

CDE07 Climate activism and protest

PP 0295 Between civil disobedience and democracy threat: Media portrayals of disruptive climate protest

Lea Von Den Driesch¹

¹ University of Muenster, Department of Communication, Muenster, Germany

We currently witness an increasing amount of more extreme protest methods around the world. Some of them, however, claim to be civil disobedience: Morally motivated law-breaking acts that aim for political change and align with the criteria of civility (Berglund, 2023)[1]. Moreover, civil disobedience is understood as a stabilizing force for democracies as it aims for the just distribution of rights (Rawls, 1971)[2] or, following a radical democratic perspective, represents direct democratic participation (Celikates, 2016)[3]. Therefore, theorists argue that the label of civil disobedience provides inherent legitimacy (Delmas, 2021)[4]. However, perceptions of legitimacy depend on (re-)presentations (McLeod, 1995)[5], and research has shown that news coverage tends to delegitimize protests, especially those with more extreme protest methods (Boyle et al., 2012)[6]. This pattern, the so-called protest paradigm, thus leads to a theoretical discrepancy: While theorists argue that civil disobedience provides protests with legitimacy, its law-breaking nature should, according to the protest paradigm, trigger a rather delegitimizing portrayal. Therefore, I aim to uncover the interplay of claims of civil disobedience and the protest paradigm by analyzing protest coverage of the German environmental group Last Generation, which claims the label of civil disobedience and is currently highly discussed. Specifically, I asked (RQ1) how the news coverage of their protest actions (de-)legitimizes their protests and (RQ2) to what extent the coverage depicts a picture of the protests that aligns with the concept of civil disobedience. To address these research questions, I conducted a qualitative content analysis of online articles from two German news media, the *Süddeutsche Zeitung* and *Frankfurter Allgemeine Zeitung*, representing the German legacy media, politically opposite in slant on the left to right scale. I collected all articles related to seven attention-grabbing protest methods within seven days of their initial occurrence, resulting in a sample size of $n = 100$. For the codebook, I employed deductive categories derived from the characteristics of the protest paradigm and civil disobedience. The results show that the news coverage of the protests still delegitimizes the protests by applying various aspects of the protest paradigm, especially represented by a high disproportion of quotes. Throughout the sample, the normative evaluation of the protests is mostly left to politicians, the protests' target, while the protesters are barely quoted. As a consequence of the politicians' critical quotes, the protests are widely characterized as inefficient, inappropriate, radical, and undemocratic. The focus on the politicians' evaluations also influences the depiction of the protests as civil disobedience. The alignment of the protests with civil disobedience is barely discussed, and quotes claiming the protest to be undemocratic, unconstitutional, or violent depict a picture contrary to civil disobedience. Therefore, I conclude, that aligning and claiming the label of civil disobedience does not provide legitimacy to the protests as it does not overthrow the protest paradigm. Instead, the protest paradigm mostly prevents the label of civil disobedience and its democratic notion from occurring.

CDE07 Climate activism and protest

PP 0296 Climate protest – what is it good for (absolutely nothing)? Media influence on climate protest perception: A content analysis of news coverage and related reader comments

Claudia Thoms¹, Tobias Schrimpf¹, Andreas Reich¹

¹ University of Hohenheim, Institute of Communication Science, Stuttgart, Germany

Protest movements, like other non-media actors, rely on media attention to disseminate their messages to the public, achieve their goals and contribute to democratic opinion-forming (Strömbäck & Esser, 2017). Dramatic protest action can capture media attention. However, it also risks diverting focus from the actual cause, potentially leading to the delegitimization and demonization of the movement (McLeod, 2007). Therefore, a key challenge for protest movements consists of finding protest forms that meet journalistic criteria of newsworthiness without detracting from their core message (Goldenbaum & Thompson, 2020). This is crucial, as the public's perception and

evaluation of protest movements, their activities and messages, depend decisively on the media coverage they receive, ultimately influencing the movements' social impact. To analyze the implications of these dynamics, we will focus on climate protests as a case study.

In recent years, two influential players have shaped Germany's climate protest scene: 'Fridays for Future' (FFF) and 'Letzte Generation' (Last Generation, LG). Their differing protest strategies have led to comparisons, revealing notable distinctions. Despite having limited political impact beyond parties aligned with their views, FFF has gained widespread societal acceptance (Berker & Pollex, 2023; Rucht, 2023). LG, embracing civil disobedience and confrontation, faces social resistance, particularly in contrast to the peaceful and cheerful protests and school strikes of FFF (Rucht, 2023). Media reports frequently allege that the protest strategy of LG shifts the focus away from climate issues, causing defiance rather than solidarity towards the movement and discouraging public support for the climate cause (Kumkar, 2022; Rucht, 2023).

Considering that LG's dramatic protest actions, compared to FFF, align more with media preferences and likely result in a focus on these actions rather than other aspects, the following questions arise: How does the media craft narratives about the movements? And, more crucially, how do these narratives impact public discussions about the movements, their goals, actions, and the broader climate topic?

To explore these questions, we conduct a quantitative content analysis. We analyze 102 randomly selected news articles published online on three major German news sites between 2019 and 2023 along with 2040 corresponding reader comments. We maintain an equal sample for FFF and LG, coding relevant factors at both the article and comment level.

Preliminary multilevel logistic regressions show that articles about FFF are more likely than articles about LG to prompt discussions about the climate topic among commentators. However, the focus of the article is just as crucial. When the coverage centres solely on protest actions, commentators are less likely to discuss climate change compared to instances where the movement's goals or climate change in general are mentioned as well. If protest actions are not covered at all, the likelihood of a discussion about climate change is highest. This suggests that coverage focused on protest actions diverts attention away from the issue. The study thus indicates that different protest strategies and the associated forms of protest can indeed lead to different discourses due to variations in their media coverage.

CDE07 Climate activism and protest

PP 0297 A media ecology of ecological media? Conceptualizing environment-oriented communication in climate change activism

*Arianna Bussoletti*¹, *Emiliano Trerè*², *Francesca Comunello*³, *Francesca Belotti*⁴

¹ University of Roma La Sapienza, Communication and Social Research, Roma, Italy

² Cardiff University, School of Journalism – Media and Culture JOMEC, Cardiff, United Kingdom

³ Sapienza University of Rome, Communication and Social Research, Rome, Italy

⁴ University of L'Aquila, Scienze Umane, L'Aquila, Italy

Mainstream social media (i.e. Instagram, Facebook...) play a pivotal role in climate activism, serving as key platforms for sharing information, organizing protests, and mobilizing support. However, it is crucial to acknowledge that these platforms are not neutral; they carry environmental implications and governance challenges often overlooked in discussions about digital communication's relationship with environmental sustainability (Hogan & Vonderau, 2019; Lucivero, 2020).

Mainstream social media platforms also face scrutiny for their political economy, ethical governance, privacy policies, and data control (Kuntsman & Rattle, 2019). These concerns pose a stark contrast to the values of grassroots social movements and climate activists who utilize these platforms. While literature extensively covers activists' use of mainstream social media, less explored are their strategies regarding platform-sustainability (see Rone, 2022). This gap is particularly significant in climate activism, given that critics often target activists' use of social media.

Our research, centered on Fridays for Future (FFF) Rome, delves into how the activists navigate and negotiate their approach to social media and digital platforms for activism. We explore the criteria guiding the selection of various social media platforms when the imperative to combat climate change clashes with the need to reach a wider audience.

We adopt a media ecological perspective both in our methods and analysis (Trerè, 2019). We operated a six-month participant observation of the group and digital ethnography of its Instagram page, followed up by 20 semi-structured interviews with FFF-Rome activists. These methods allowed us to account for online and offline activist practices across multiple media platforms, linking the communicative complexity of social media usage with the environmental impact of digital communication technologies. Through thematic analysis, our investigation reveals two fundamental conflicts in FFF-Rome's climate activism on social media: the tension between addressing the climate crisis via digital tools, which contribute to environmental harm, and advocating for systemic change rooted in anti-capitalism and anti-corporatism while utilizing platforms aligned with these models.

We argue that FFF-Rome's media ecology, encompassing both backstage and frontstage (Trerè, 2019), and mainstream and alternative social media (Gehl, 2015), manages these tensions by embracing an ecological understanding of digital technology's environmental footprint. FFF-Rome activists strategically transition between platforms, weighing the advantages and contradictions of utilizing different social media in their advocacy efforts.

CDE07 Climate activism and protest

PP 0298 Against the mainstream but for what? – An automated content analysis of worldviews in alternative online communities towards climate change

Said Unger¹, Svenja Boberg¹, Johanna Klapproth¹, Thorsten Quandt¹

¹ Westfälische-Wilhelms-Universität Münster, Department of Communication, Münster, Germany

Climate change is an existential challenge for society. Even though its existence and the threat it poses have been the academic consensus for quite a while, public debates remain polarized and emotionalized (Cook, 2019). Positions range from outright denial of climate change over denying that it is caused by humans, up to discussions of the strength of impacts.

Media play a crucial role for such debates and therefore for the formation of worldviews and lifestyles. With changes in the media landscape, not the least by the internet and social media platforms (Neuberger et al., 2023), we also see the emergence of alternative media that see themselves as a corrective to a perceived mainstream (Holt et al. 2019).

While studies on alternative media and their positions on climate changes are abundant, it is not yet clear what lifestyles they and their audiences position as alternatives to mainstream ideas. To understand how societal negotiation processes on climate change mitigation strategies come to pass, we believe it necessary to understand how alternative publics that believe themselves to be unrecognized by public debates address such issues. We are interested in how worldviews and lifestyles towards climate change are formulated in alternative publics.

To answer this question, we collected 65 Telegram chats from various political and ideological directions like right-wing populists, conspiracy groups, the originally anti-covid measure Querdenken movement as well as religion or spirituality focussed groups. This messaging service is especially popular among alternative communities. We trained a BERTopic model on the ~120,000 messages that contain mentions of climate change to perform an automatic content analysis and applied close reading to explore lifestyle concepts communicated in the chats.

Preliminary results show two main argumentation structures: The first line of arguments rejects any restrictions by mainstream mitigation arguments, characterizing the whole debate as a lie or conspiracy by the mainstream. The other approach problematizes the turning away from a lifestyle that is seen as traditional or even primordial and that should be oriented towards nature and the family. This often includes the forsaking of modernity and democratic values.

It is apparent that rejecting official narratives is at the core of these groups, the suggested alternative lifestyles and worldviews differ however and could be an important building block to better understand alternative online publics and address climate change denialism.

CDE07 Climate activism and protest

PP 0299 The construction of 'the local' and 'local voices' in locally-led climate adaptation in Kenya

[Margit Van Wessel](#)¹

¹ Wageningen University & Research, Strategic Communication Chair Group, Wageningen, Netherlands

This paper explores the roles of civil society organizations (CSOs) in Kenya that are involved in articulating locally-owned climate action, through an internationally funded programme involving activism and collaboration with government. It zooms in on the ways in which Kenyan civil society organizations contribute to certain voices obtaining the status of 'the local', defining locally-led adaptation as ultimately legitimate solutions to climate change. The rationale for this study is that the meaning of local ownership and local voices in the context of climate deserve close attention, to develop our understandings of what 'local solutions' are in practice, through what dynamics they come about, and with what implications for the democratic quality of 'the local' and 'local voices' thus constructed. While efforts centre on local populations, CSOs involved need to engage with multiple legitimacy audiences, and work within specific political and policy contexts. At the same time, addressing climate issues, and identifying climate solutions that can address the needs of people effectively is a tremendous challenge, addressed while having to navigate the above conditions. The study is interpretive, identifying patterns across a range of Kenya-based CSOs that work on various subthemes and from varied approaches, capacities, understandings, and regional focus. The study is based on semi-structured interviews, participant observation and document analysis. Key findings of the study are that 'the local' and 'locally led solutions' are commonly approached in terms of facilitation and inclusion of understandings of climate problems and solutions as understood and identified by local communities that organizations work with, in ongoing climate policy processes. This implies placing responsibility for climate solutions with local communities, banking on local knowledge. CSOs also face important resource and expertise limits, and often avoid challenging questions addressing climate beyond the local, or difficult and politically sensitive aspects. The study thus points to the delimitations and implications of the way 'the local' and 'local voices' come about, and considers how CSOs and communities can be better supported in articulating and advancing local climate solutions.

CDE08 Voters and politicians in global elections

PP 0391 New divide – Changes in social media polarization during Finnish elections

[Esko Nieminen](#)¹, [Pekka Isotalus](#)¹

¹ Tampere University, Communication Sciences, Tampere, Finland

Modern democracy is often shaded by negativity and division instead of deliberative meetings of different ideas. Social media has been a factor in this polarization, and studies have revealed that affective polarization in social media is on the rise in societies not often characterized by division. Functioning democratic systems are built on discussions, and online polarization presents itself as a threat to having such discussions. This study examines the changes in affective social media polarization during Finnish parliamentary elections of 2019 and 2023. Finland hasn't typically had a very polarized democratic system, but the absence of studies about affective polarization in the Finnish context make this study an important look into social media politics.

The study analyzes data from both Facebook and Twitter, both of which are still widely used in Finnish politics. The data includes posts and tweets by party leaders that represent the elected parliamentary groups of the 2019–2023 term and the comments and replies from other users from up to a month before election day. The party leaders' posts and tweets along with the comments and replies from other users were analyzed for their polarizing content. The method used in the analysis phase consists of identifying the sentiments toward politicians and political groups.

Results indicate that affective polarization has gained traction between elections as a phenomenon in Finnish political social media. Politicians campaign with more vitriol towards other parties and their leaders, whereas comments and replies have seen an uptick in hostility towards opposing parties. This is especially seen on Twitter, which became a largely polarizing platform when compared to Facebook. "Ideological bubbling" does not seem to be a prevalent phenomenon during campaigning times: party leaders' posts contain commentary from all around the political spectrum. Further studies should focus on different platforms and the effects polarization has on politicians' social media use and on online democracy.

CDE08 Voters and politicians in global elections

PP 0392 Translating transparency – A study on project leaders responsible for counting and controlling votes in Swedish election administration

Ida Nilsing¹

¹ Mid Sweden University, Department of Communication- Quality Management and Information Systems, Sundsvall, Sweden

This study explores how transparency is understood and practiced in election administration and engages with the issue of declining trust in democratic institutions in established democracies. Using translation theory and following project leaders in the Swedish elections of 2022 over a period of six months, the study informs the research on how trust and transparency is managed during different conditions in a public election context.

Recently there has been a growing awareness that trust in well-established democracies, as Sweden, can diminish – including trust in public elections. This decline is not necessarily related to how elections actually function but to how they are perceived to function, which spills over on the democratic system as a whole. Consequently, this puts civil servants and their efforts to maintain trust through managing perceptions, on stage.

Transparency is understood as an idea underpinning organizational communication activities, which can generate trust (Fredriksson & Edwards, 2019). The project leaders are understood as “translators” (Røvik, 2023) of this idea since they are key players in the process of counting and controlling the votes, which requires insight and openness as well as communication with the media and the public.

To capture the process, serial interviews have been applied. In total 30 interviews with five project leaders representing different regional agencies have been conducted during six months: before, during and after the elections of 2022. The data was analyzed through qualitative content analysis.

The preliminary results show that when the project leaders interact with the media and other stakeholder groups, they translate transparency differently, adapting either a modifying mode or a radical mode (Røvik, 2023). In relation to the media or management, the modifying mode can be understood as a careful act of balance between what to share and not, and when and how to do it. “Back stage” information is shared more freely, to “be on the same page” and appear as a “united front”. The results also indicate that the “united-front-ideal” is difficult to uphold when media pressure augments. At the same time, some results point towards a more radical translation of transparency illustrated by the argument that it is more important to “tell it like it is”, than to coordinate messages in detail.

The study contributes to translation theory, shedding light on how the same actors understand and practice transparency during different conditions. It also contributes with knowledge on how transparency is managed and negotiated by practitioners, adding to previous research by Fredriksson and Edwards (2019) and Ihlen et al. (2022), among others.

CDE08 Voters and politicians in global elections

PP 0393 Unveiling disinformation: Mapping attacks on Brazil's Electoral System and the response of the Superior Electoral Court (2018–2023)

Augusto Santos¹, Cazzamatta Regina¹, Grazielle Albuquerque²

¹ University of Erfurt, Department of Media and Communication, Erfurt, Germany

² Federal University of Ceará, Department of Media and Communication, Ceará, Brazil

Reasoning and study contextualization: Disinformation challenges democracies as it can undermine the legitimacy of electoral processes, creating confusion about voting procedures and inciting violence. Despite the global significance of researching disinformation, studies have predominantly focused on the Global North, especially the US and Europe, resulting in gaps in our understanding of this phenomenon (Bennett & Livingston, 2018; Wasserman & Madrid-Morales, 2021). Within this framework, this study investigates disinformation targeting the Brazilian electoral system from 2018–2023, spanning national, regional, and local elections. Against the backdrop of the intense proliferation of political disinformation in Brazil, partially driven by far-right populism actors, the Superior Electoral Court (TSE), the highest authority in Brazilian electoral justice, has partnered with fact-checking organizations to

expose falsehoods aimed at undermining the democratic electoral system. In 2018, TSE established the 'Fato ou Boato' (Fact or Rumor) website to debunk electoral disinformation. To our knowledge, this case represents a pioneering collaboration between an electoral superior court and fact-checking entities with the objective of countering disinformation directed at the electoral system.

Research questions and hypotheses: The study aims to address three primary research questions:

RQ1: What are the primary sources, geographical scope, and narratives of disinformation, and deception strategies targeting Brazilian electoral processes?

RQ2: What key commonalities and differences exist across elections?

RQ3: What strategies does the Brazilian Supreme Electoral Court employ to combat disinformation?

As this research is currently in the coding phase, scheduled for completion on January 31st, the following hypotheses remain to be verified: (a) the thematic narratives of electoral disinformation have evolved over time, with a notable rise in falsehoods surrounding the electronic voting system coinciding with the rhetoric of far-right populists in Brazil, and (b) selected justice officials, particularly Supreme Court Ministers, gradually became the primary targets of electoral disinformation.

Methods: To address RQ1 and RQ2, this study analyzes TSE's 'Fato ou Boato' platform by conducting a quantitative content analysis of 420 verification articles published between 2018 and 2023. Specifically, we examine the origins of disinformation claims, geographical reach, thematic narratives, and deceptive strategies employed. A comprehensive codebook containing category descriptions and Krippendorff's coefficient reliability for each category is available. Furthermore, to address RQ3, we combine quantitative data with semi-structured interviews of TSE public officers involved in the anti-disinformation program alongside qualitative analysis of official reports and promotional materials from electoral justice. This mixed-methods approach provides a comprehensive understanding of electoral disinformation in Brazil and the counteracting strategies developed.

Contribution to the field: This research aims to contribute to the disinformation literature, particularly within its context-bound components (Hameleers, 2023). This study also seeks to contribute to fact-checking studies as it dives into a pioneering collaboration between Brazilian electoral justice and fact-checkers. Furthermore, it addresses the scarcity of research surrounding the diverse forms of false information circulating in both the Global South and North (Schiffirin & Cunliffe-Jones, 2021), particularly those undermining the legitimacy of electoral systems. Lastly, our analysis offers a valuable longitudinal perspective, spanning three major Brazilian elections conducted amid the rise of far-right forces.

CDE08 Voters and politicians in global elections

PP 0394 The antecedents and electoral consequences of voters' preference for authentic politicians

Simon Luebke¹, Dennis Steffan²

¹ LMU Munich, Department of Media and Communication, Munich, Germany

² Free University Berlin, Institute for Media and Communication Studies, Berlin, Germany

In light of the personalization of politics and the growing distrust towards political elites, the perception of politicians' authenticity is discussed as a decisive factor in voters' evaluations of candidates and in their voting decisions. Previous research underscores the significance of political authenticity in elections, revealing positive correlations between political authenticity and voting decisions (Kenny et al., 2021). When citizens perceive individual politicians as (more) authentic, it increases their likelihood of supporting them and their parties. Yet, one aspect that has received little attention in this relationship is the individual preferences for authenticity among citizens. The assumption that political authenticity is universally important for citizens is common but has rarely been tested empirically. This contrasts with the observation that citizens value different qualities in politicians (Laustsen & Bor, 2017).

Against this background, our study investigates the role of perceived authenticity in citizens' voting decisions and makes a threefold contribution. Firstly, we test the effect of perceived authenticity on voting intentions. We understand perceived political authenticity as a constituent of the candidate image and a subjective perception of the extent to which individual politicians appear true to themselves (Luebke & Engelmann, 2023). Secondly, we examine how the individual preference for authenticity influences the relationship between perceived authenticity and voting intention. The preference for authenticity describes the importance citizens attribute to authenticity perceptions in their candidate evaluations and voting behavior. Finally, we analyze factors contributing to variations in this preference for authenticity, such as citizens' media exposure.

To address these aspects, we conducted an online survey with a quota sample in Germany ($N = 1,485$). Participants were asked to evaluate the authenticity of two politicians using the three-dimensional P-PA Scale (Luebke & Engelmann, 2023). Their preference for authenticity was measured with a sum index of three items, with each item capturing the importance of one authenticity dimension (i.e., consistency, ordinariness, immediacy). Our findings reveal that perceived political authenticity influences citizens' voting intention even when we control for other image variables. We find the effect of perceived political authenticity on voting intentions for politicians to be moderated

by citizens' preference for authenticity. We further demonstrate that citizens differ in how much they value the authenticity of politicians. Despite a generally high preference in our sample, we observe differences among individuals. These differences are linked to socio-demographic factors (e.g., education) and political attitudes (e.g., political interest), but not to media exposure. The study sheds light on the electoral role and the consequences of political authenticity and identifies the segments of the population that consider authenticity particularly important.

CDE08 Voters and politicians in global elections

PP 0929 Dissipation of “westernormativity” in late post-socialist condition: Unravelling Czech social media discourses on colonialism and racism

Irena Reifová¹, Lýdie Kárníková¹

¹ Charles University, Faculty of Social Sciences, Praha, Czech Republic

With the upsurge of emancipatory discourses forming around the anti-racist movements such as “Black lives matter” or “Decolonize this place” and circulating through the globalized digital communication channels, diverse audiences around the world have been confronted with the task to revisit the history of European colonization with critical eye. In the countries of Central and Eastern Europe, historically rendered subaltern within the world system of global hierarchies (Sušová-Salminen, 2012; Wolff, 1994), these discourses have been stirring a unique array of connotations, primarily within illiberal channels. We introduced the concept of “westernormativity” to address early post-1989 consensus on catching up with the West in the post-socialist region, which now seems to be dissipating. Principal research objective of our study is to elucidate how Czech Facebook users with illiberal views perceive and interpret the domestication of anti-colonialism and anti-racism in the Czech Republic.

Theoretical introduction of this study examines the post-socialist condition through the lenses of post-colonial theory (Hann et al., 2002; Půtová, 2016; Tlostanova, 2015). The illiberal reactions to the influx of Western influences (including emancipatory decolonial and antiracist movements) are often interpreted as a backlash against the early post-1989 hegemony of the West. This phenomenon is decomposed into two distinct levels in our analysis. The decline of liberal values is typically analyzed at the level of political systems, being interpreted either as the product of an unfinished liberalization (Mesežnikov and Gyárfášová, 2018), or, conversely, as a “liberalization overkill” (Holmes and Krastev, 2020). We explore the illiberal disconnection from the West also on the level of post-socialist subjectivities, examining it as a negotiation of the deficient post-socialist self and the phenomena of (self)orientalization (Bakić-Hayden, 1995; Todorova, 1997; Zarycki, 2014).

The qualitative research entails an analysis of extensive narrative interviews with 12 respondent-commenters, who were active in discussions on Facebook pages of Czech press outlets under articles shared on the topics of decolonization and antiracism.

In the analysis, we explore the sentiments of coloniality in its semantic multiplicity and situate them in the complex life stories of the individual respondents with respect to their diverse socioeconomic backgrounds. We focused notably on the interaction between the local and global, i.e. on propositions that classify the topics of decolonization and antiracism as foreign, domestically inauthentic discourses. These are perceived as imported from the West and are often intertwined with expressions of nationalist appeals and interpretations of the Socialist past.

The dismissive reactions to decolonization and antiracist movements reveal striking inconsistencies. For example, the frequent references to the Czech Republic as a contemporary colony “of the West” display a lack of critical reflection on the historical projects of European colonial expansion. Instead, they often reciprocate with orientalizations and degradation, mirroring the experiences they claim to be enduring. These narratives simultaneously express a fear that the Western woke discourses are spreading in the form of a new communication order infringing upon the freedom of speech, a reaction contrasting with the often favourable attitude towards the former Czechoslovak authoritarian regime reported by the respondents.

CDE09 Perspectives on the reception of political information

PP 0409 In polls we trust? Investigating the credibility of political polls in Austrian news media: An online-experiment

Florian Woschnagg¹, Matthias Karmasin²

¹ University of Klagenfurt, Department of Media and Communications, Klagenfurt, Austria

² University of Klagenfurt/Austrian Academy of Sciences, Department of Media and Communications/Institute for Comparative Media and Communication Studies, Klagenfurt/Vienna, Austria

Several corruption scandals have recently shaken Austria's political and media landscape. Opinion polls and media have played central roles in subsequent debates and investigations. This may have also negatively impacted media trust in Austria, as the Digital News Report 2023 indicated.

However, there is a lack of research on the credibility of political opinion polls in news media. This gap is significant because political entities regard opinion polls as highly influential (Oleskog Tryggvason 2019), incorporating them into political decision-making processes. Notably, Oleskog Tryggvason & Strömbäck (2018) reveal that journalists often discuss poll changes inaccurately, attributing significance to shifts that fall within the margin of error – implying that sampling errors cannot be dismissed.

Only a few scholars have delved into examining poll credibility in journalistic articles. Notably, it has been demonstrated that, while source credibility does not significantly impact the perception of political polls in news media, motivated reasoning and personal political attitudes – where individuals tend to believe what aligns with their preferences – largely shape the reception of polls (Kuru et al. 2017; Tsfati 2001). Additionally, Stadtmüller et al. (2022) found that information on sample size, representativity, and margin errors influence trustworthiness.

This study seeks to contribute to the field by concentrating on a Central European perspective, asking the fundamental question: What factors determine the credibility of political opinion polls in Austrian news media outlets? To explore this, we employ a 3x2-between-subject-design online-experiment with a sample size of 1600 participants, representative of the Austrian population. The experimental design underwent a priori power analysis, unveiling a robust 95% power.

The study investigates the impact of a current political opinion poll (Austrian national election) presented by an Austrian media brand on the poll's credibility. After a pre-test, each participant was randomly assigned to one of six groups, employing a between-subject design. Each group member was exposed to one of six stimuli. The stimuli varied the media outlet (public service media/boulevard/no media brand) and the information provided on the respective poll (information given/information not given). Subsequently, the post-test phase commenced. Various variables were examined, including media trust, motivated political reasoning, warmth and competence perceptions of media brands, and belief in conspiracy theories.

The data for this experiment was gathered in December 2023 and is presently under examination. Preliminary evaluations indicate that the publishing medium has no influence on poll credibility. Conversely, political affinity and the availability of information about the survey (such as sample size, etc.) do exert influence. Particularly noteworthy are unexpected findings that respondents show significantly higher credibility in polls without detailed information than in surveys that provided such information. Additional evaluation procedures, including moderation analysis, mean value comparisons, regressions, and structural equation modeling (SEM), are currently underway.

PP 0410 Is it what you know or what you think you know? Understanding the roles of objective and subjective political knowledge in political discussion

Jana Dreston¹, Audrey Halversen², Brian Weeks²

¹ University Duisburg-Essen, Human-Centred Computing and Cognitive Science, Duisburg, Germany

² University of Michigan, Communication and Media, Ann Arbor, USA

Political discussion is essential for a healthy democracy, but what motivates people to engage in it? Traditionally, objective political knowledge—holding factually correct beliefs about political actors, policies, institutions, etc. – has been considered a crucial prerequisite for political action, including political discussion. However, recent research challenges this conventional wisdom, arguing that subjective knowledge – individuals' metacognitive perceptions of their own knowledge – is a more accurate predictor of political engagement. Yet, whether this subjective knowledge facilitates political discussion remains a relatively unexplored question. The purpose of this study is to better understand how objective and subjective political knowledge relate to political discussion. In particular, we investigate the extent to which engaging in various forms of political discussion is driven by what people actually know or what they think they know about politics.

Political discussions can occur with different audiences: while people mostly engage in political discussions with close ties and those who share their political opinions (in-group), they sometimes discuss politics with weak ties and people with whom they disagree (out-group). Based on literature, we expect people's willingness to engage in

these different types of discussion will depend in part on their levels of objective and subjective political knowledge. As people are motivated to maintain a positive self-image during political discussions, those with higher subjective knowledge may have less concern about incurring reputational damage that may occur when talking about politics with weak ties and members of a political outgroup. Consequently, we expect subjective knowledge to be an important predictor of discussions with different audiences, relative to objective knowledge.

Data for this study were collected as part of a two-wave online survey (YouGov), fielded during the 2020 U.S. presidential election. Using a diverse sample of U.S. adults (W1 = 1800; W2 = 1265), we measured participants' objective and subjective knowledge, the frequency with which they discussed politics with members of the political in-group and out-group, as well as strong and weak ties (pre-registration: https://aspredicted.org/Y8V_GW1).

Results from multivariate regressions (with control variables) indicate that subjective knowledge is particularly important for political discussion. People who think they know a lot about politics were more willing to engage in all types of political discussion, including those with political out-group members and weak ties. In contrast, objective knowledge was only associated with political discussions with political in-group members and strong ties; knowing more about politics did not associate with out-group or weak tie discussions. Our findings suggest that both objective and subjective knowledge are important for politically homogenous discussions, while discussions with weak ties and the political outgroup depend more on what people think they know rather than what they actually know. Thus, discussions with the out-group and weak ties, may be motivated by a flawed perception of knowledge that is not supported by actual facts and information (illusion of knowledge). Overall, this study highlights the importance of subjective knowledge in political behaviors and suggests that those who think they know a lot may feel most prepared to engage in political discussions, regardless of their actual knowledge.

CDE09 Perspectives on the reception of political information

PP 0411 Imagining a common good: How news texts, audiences, and journalists construct – and differ about – the democratic value of news

[Imke Henkel](#)¹, Tim Markham¹

¹ Birkbeck- University of London, School of Creative Arts- Culture and Communication, London, United Kingdom

The popular belief that good journalism is indispensable for a healthy democracy, and in turn democracy is needed for good journalism (Carey, 1996), has dominated journalism scholarship throughout the 20th century (Ryfe, 2020). This paper sets out to study the extent to which, in current democracies, journalism fulfils the positive function that has been conventionally ascribed to it. Specifically, we are interested in news' democratic effect beyond the widespread reductionist model that sees news only in terms of its information pay-offs and as an instrument to hold the powerful to account.

Our paper draws, instead, on emerging research into a more complex functionality of news. News has been shown to engage affectively beyond the structured expression of opinion or information (Papacharissi, 2015); to report, perform, and elicit emotions (Wahl-Jorgensen, 2019); to present dramatic action that audiences observe like a play (Carey, 1999); to act as moral educator that cultivates "cosmopolitan sensibilities" (Chouliaraki, 2008, 831); to evoke imagined identities revealing as much about the reporter who "draws" a picture of the object than about the object itself (Chernobrov, 2021); and, more generally, to shape our mediatised political and ethical being (Markham, 2020). Empirical research has, furthermore, questioned an oversimplified link between news consumption and democratic participation (Coudry, Livingstone & Markham, 2010; Ohme et al., 2022).

Building on this research, our paper investigates empirically the democratic effects of news, using Covid as a case study. We designed our study as a pilot, using a mixed-method approach. We combine qualitative analysis of news-texts with audience focus groups and in-depth interviews with journalists in order to triangulate news content, news reception, and news production. Furthermore, we compare news content, reception and production in the UK and Germany to study news' democratic effect in two close but still different democracies (Henkel et al., 2019).

We collected the top four items from the homepages of twelve news websites in the UK and Germany on seven consecutive days each in spring 2020 and late winter 2021 as a proxy for what editors (or content management systems) at this time considered the most important stories (N = 672). We decided on 'elite' websites (such as *BBC News*, *The Times*, *Zeit Online*, and *Tagesschau*) because these are generally perceived as positive models for democratically valuable news (Cushion, 2022; Toff et al., 2021). We recruited four focus groups of people who regularly consume one or several of the 'elite' news sites in our text corpus, two in each country (UK and Germany), using convenience and snowball sampling. Each focus group consisted of five or six members, with a roughly equal gender distribution, an age range between people in their 20ies to 80ies, and from socially diverse backgrounds. We interviewed 16 journalists, eight each working for the UK and German news websites we included in our text corpus.

We find that all three actors (texts, audiences, journalists), emphasizing an ideal purpose of news, imagine its "common good". However, all actors differ on what constitutes this imagined "good", while audiences and journalists voice mistrust in each other.

CDE09 Perspectives on the reception of political information

PP 0412 Disrupting political self-observation: Algorithm-based dissemination, messenger services and the disappearance of public opinion

Isabel Kusche¹, Jakob Wiesinger¹

¹ University of Bamberg, Institute of Sociology, Bamberg, Germany

The relationship between media, communication, and democracy has often been approached based on Habermas' notion of the public sphere and his seminal book on its structural change(s). The function of the public for the formal democratic process, institutionalized in the form of a party system and regular elections, tends to be downplayed in this tradition. However, Habermas himself later acknowledged a centre-periphery differentiation of democratic political systems, where parliament, public administration and the courts routinely prepare, implement and review political decisions. According to this view, the public sphere functions as a bridge between the political centre and civil society as the periphery. From a normative viewpoint, this links the legitimacy of political decisions to their being the result of communication flows from the periphery to the centre. Stripped of its normative claim, this view of democratic politics closely resembles the systems-theoretical understanding of the political system and its relation to a political public, proposed by Luhmann. It is a view that focuses on the function of the public sphere and public opinion for social order in the sense of the formal democratic process and its informal shadow.

In our paper we will use this Luhmann-based theoretical framework and draw on empirical data and case studies from the research literature to pinpoint how certain types of digital media disrupt established democratic processes due to their effects on dissemination and eventually the observation of public opinion. In a first step, we introduce the analytical distinction between three dissemination modes of mediated communication: asymmetrical broadcasting, network-based dissemination and algorithm-based dissemination. While the first two modes of dissemination already existed in the age of mass media, as highlighted by Paul Starr's notion of relational publics, the third mode is genuinely new.

In a second step, we analyse this new mode in greater detail. It challenges both Starr's notion of a relational public and Luhmann's notion of the public as the generalized environment of a social system. Algorithmic dissemination categorizes users as suitable consumers for a particular piece of content without any reference to their personal network connections. The more publicness and accessibility become a matter of algorithmic calculation, the more there is a disconnect between any kind of collective self-recognition that the producer of a piece of content may wish to evoke and the audience that actually sees that content. In systems-theoretical terms, this disconnect translates into problems for the political system with observing public opinion, despite the supposed insights provided by audience metrics.

In a third step, we further stress the challenges for political self-observation by focusing on messenger services a specific type of digital platform that combines the broadcasting and the network-based mode of dissemination. Their combination of communication based on closed groups and enormous potential reach further limits the political system's capacity to observe public opinion by isolating political centre and periphery from each other.

CDE10 Democracy and participation in public communication

PP 0506 Between autonomy and heteronomy: Toward a common conceptual framework for participation research

Moshe Schwartz¹, Hillel Nossek²

¹ Ben Gurion University of the Negev, Communication studies, Beer-Sheva, Israel

² Kinneret Academic College on the Sea of Galilee, Kinneret Research Institute for Society- Security and Peace, Zemach, Israel

The significance of participation has grown recently following political crises and aggravated social tension that are afflicting liberal democracies and against the backdrop of the new media environment. However, the widespread use of the concept in the absence of a basic agreement on its essence threatens to turn participation into an all-encompassing phenomenon up to the point of becoming a fluid signified (Allen et al., 2014). This theoretical paper examines the foundational assumptions behind four key conceptual approaches to participation present in academic literature: the political, the sociological-cultural, the political economy, and the science, technology, and society studies (S.T.S) (Carpentier, 2016; Chilvers & Kearnes, 2020; Fuchs, 2014; Jenkins, 2006; Jenkins & Carpentier, 2019; Literat, 2016). These approaches differentiate themselves in research tradition, in understanding the purpose, meaning, and scope of participation, and consequently in defining participation. Beyond recognizing media and communication as essential participation components, we explore the possibility of establishing a connecting bridge between them. Striving for common foundations is essential for conceptual clarity and developing a shared analytical framework. Our analysis looks first for common characteristics and points of (dis)agreement within these

approaches. Subsequently, we distinguish four conceptual aspects of the controversy: (a) the individual and society, (b) the political and the cultural, (c) ethics, and (d) power. Further systematic analysis reveals a reincarnation of long-standing disciplinary disagreements between media research traditions. By scrutinizing these aspects, we suggest that some of these differences can be theoretically reconciled, and points of disagreement can be demarcated. The paper's concluding section presents an alternative conceptualization based on power and institutionalization as its central foundations. Consequently, we construct a spatial typology of participation situated on axes of autonomy – a society that collectively and actively self-institutes its own social imaginary, and heteronomy – a society that is instituted and "implicitly governed by an elsewhere" (Castoriadis, 1987, p. 167). Such typology can serve as a unifying research framework and enhance participation's democratic essence.

CDE10 Democracy and participation in public communication

PP 0507 Co-creating tomorrow: Participatory democracy and future scenario-building as catalysts for inclusive communication

Hawva Ebrahimi Pour^{1,2}, Carina Veeckman¹, Dorottya Varga¹, Ilse Marien¹

¹ Vrije Universiteit Brussel, Department of Communication Sciences, Brussels, Belgium

² imec, Department of Communication Sciences, Leuven, Belgium

The evolution of democracy and communication demands enhanced and inclusive decision-making procedures that genuinely engage the public. Recognizing diverse perspectives and public dialogue is crucial for elevating communication standards. The European Commission advocates for member states to implement participatory initiatives led by citizens, endorsing individual and collective modes of participation like citizen panels and assemblies, aiming to fortify resilient democracies [1]. In the context of climate resilience, the focus on collective decision-making procedures becomes imperative to address the challenges posed by climate change. This emphasis aligns with the broader goal of fortifying resilient democracies by ensuring that diverse perspectives and public dialogue actively contribute to the development of effective strategies and policies in response to the pressing issue of climate change.

This study aims to co-create and analyze alternative visions of the future of climate resilience in societies with the ultimate goal of informing policy-making and social innovation. A combination of qualitative and quantitative approaches was used. We carried out participatory future scenario-building workshops, as a method from the innovative and transdisciplinary field of future studies. The utilization of future scenario-building, specifically through the future workshop method, enables organizers and facilitators to engage citizens and stakeholders in envisioning diverse futures for climate action, fostering ownership, engagement, and inclusive participation. To conduct workshops, we deliberately chose two Living Labs [2] (30 participants) through purposive sampling to guarantee gender equality and diversity. The future climate-resilient scenarios and their criteria were then generated, assessed and ranked by employing a survey and creating a multi-criteria decision-making (MCDM) tool for prioritization. Through the application of MCDM to rank future scenarios according to the preferences of citizens and other stakeholders, we offer transparent decision support for making an informed choice regarding the preferred scenarios to achieve a climate-resilient society.

The main outcomes of this methodological study are (a) Developing a future scenario-building workshop methodology and supporting the organization of the workshops by providing clear and practical guidelines and

recommendations (b) developing a decision-making tool that supports citizens to create value-based scenarios, identifying key values, and prioritizing different choice alternatives systematically (c) Offering principles, guidance, and creating conducive conditions for policymakers to enhance citizen engagement and empowerment mechanisms during the preparation phase and agenda setting of climate assemblies.

Our work contributes to the existing literature by filling a crucial gap in the methodology of future scenario-building within the context of democracy and communication. While previous studies have explored participatory approaches, our research uniquely focuses on 'citizen-collaborative future scenario-building,' a method that integrates diverse voices in envisioning and planning for the future. Additionally, our research highlights the innovative aspect of building consensus through collective and systematic decision-making, contributing new insights to the field by emphasizing the importance of finding common ground and shared goals in the transformative process of communication and democracy.

Sila Latz¹, Julie Uldam¹

¹ Copenhagen Business School, Department of Management- Society and Communication, Frederiksberg, Denmark

In this article we reflect on knowledge creation with research subjects. We draw on experiences from a study of social movements and multinational companies and their understandings of the role of social media in their relations. The Aristotelian concept of Phronesis has been invoked as an approach to create knowledge with research subjects in the social sciences. Putting the Aristotelian concept of phronesis in dialogue with Foucault, Flyvbjerg's (2001) phronetic approach becomes both an emergent and looping logic of inquiry, method, analysis and result towards democratic maintenance and/or change. This was our starting point in a research project on social media and climate crisis debates. Here, we brought together social movements and multinational companies in what we term multi-stakeholder integrity forums. More specifically, communications and digital media practitioners from NGOs, activist groups and multinational companies, all from groups and organizations based in Europe. The companies are all companies with a trajectory of being criticised for practices detrimental to the climate, representing energy, food, agricultural and construction industries. The social movement actors are from NGOs and activist groups that represent the climate movement, representing both reformist and anti-systemic orientations. We brought them together in multi-stakeholder integrity forums after we had interviewed them individually. Starting from Flyvbjerg's (2001) Aristotelian approach to phronetic social science research, our aim was to go beyond antagonism in unequal power relations. Rather than achieving this, our phronetic approach left most social movement participants feeling alienated. On the basis of this, this article reflects on what is it that Flyvbjerg's (2001) phronetic approach does not capture as well as our own blind spots in applying it. In doing so, we discuss feminist approaches to phronetic research as well as action research, and suggest attention points for research on and with societal actors in unequal power relations.

CDE10 Democracy and participation in public communication

PP 0509 Alternative Media and the fluid Dynamics of Trust and Distrust: Implications for social Cohesion and Democracy

Christian Schwarzenegger¹, Katharina Schöppel²

¹ University of Bremen, ZeMKI Centre for Media – Communication & Information Research, Bremen, Germany

² University of Augsburg, Media – Knowledge and Communication, Augsburg, Germany

Social cohesion and the negotiation of shared social norms are intricately tied to questions of trust and distrust in media. The construction of societal reality as a mediatized process takes on a unique dimension when distrust in mainstream media prompts a departure from the public sphere, impacting social cohesion and democratic participation. (Couldry & Hepp, 2016; Kovach & Rosentiel, 2014; Patterson, 2013; Strömbäck et al, 2020). Our research focuses on system-critical alternative media (AM), which position themselves as counter-solutions beyond the distrusted "system media."

Studies have shown that distrust in media can lead individuals to turn to AM; however, trust and distrust in media are fluid, selective, and pragmatic categories. (Kyriakidou et al., 2022; Schwarzenegger, 2020) Our argument centres on the idea that trust and distrust in media are flexible, adaptive, situative, and interactive, with AM playing a distinctive role. Distrust in mainstream media may lead to the use of AM, but AM can also amplify and reinitiate distrust in the mainstream. This research explores the implications of these mediatized acts of trust and distrust, examining their consequences for democratic society, social cohesion, and social (dis)order.

Our empirical findings, drawn from a qualitative long-term panel study with three survey waves on the use of system-critical AM, shed light on how 33 users articulate trust and distrust toward media. We investigate the (re) configurations in their media repertoires associated with these articulations and explore how these decisions ultimately affect societal participation. Employing a methodological triangulation of media diaries, media repertoire cards, and qualitative online interviews, our study provides diverse insights into the negotiation of trust or distrust toward media as vital instances of (de)constructing our social (dis)order.

The research reveals that distrust in the perceived 'elitist mainstream media system' is multi-faceted, and trust/distrust in this "media system" is characterized by flexibility, adaptability, situational responsiveness, and interactivity. Users combine the use of AM and mainstream media in a continuous and evolving manner, adapting their media repertoire based on alignment with their worldview, responding to socio-political events, and influenced by peer interactions.

Considering this fluidity, AM assumes a crucial intermediary role: combining both distrust in media as a social condition and distrust by media as a social consequence. Distrust in the mainstream, when AM are exclusive sources, can be detrimental to social cohesion, fostering the formation of 'alternative realities.' Conversely, constructive distrust in the mainstream occurs when AM serve their democratizing potential as voices of marginalized communities.

In our presentation, we highlight the unique position of AM as discursive references of trust and distrust in media. We discuss the instability of trust and distrust and reflect on their implications for social cohesion and democracy. Understanding the dynamic interplay between trust, distrust, and alternative media is vital for comprehending the evolving landscape of media influence on societal structures and democratic processes.

CDE10 Democracy and participation in public communication

PP 0510 When new uses of media disrupt old forms of decision-making: Following youth advocacy in institutional politics

Alice Bergholtz¹

¹ Södertörn University, Department for Media and Communication Studies, Stockholm, Sweden

Media scholars have long given extra attention to the media practices of young people for democratic and political participation. Ideas of citizenship are pluralized, with emphasis on the connectedness and fluctuation of participatory action stemming from the mediatization of society (see Bennett & Segerberg, 2013; Collin, 2015; Theocharis & van Deth, 2019). While the common focus tends to be on more or less innovative forms of youth participation outside of formal structures, this risks limiting our understanding of the full scope of how media shape contemporary practices for democratic participation. This study focuses on the young people who do turn to formal institutions to channel their activism, and how they use media to navigate their participation, role and mandate. Since young people are dramatically underrepresented in institutional politics, what happens when they enter these spaces?

This PhD project uses grounded theory to study how young people utilize media to navigate their participation and influence deliberative decision-making processes – and ultimately what they learn through their experiences about democratic participation. Data is gathered focused on the primary deliberation process for youth policy development in the EU, the EU Youth Dialogue, with its current cycle spanning from July 2023 to December 2024. Following youth delegates from 15 countries, this study can present early analysis and categories derived from data gathered during interviews and observations of the still ongoing dialogue process. Young people in these forums show a media-integrated approach to participating in formal settings, where media is given values through a vast variety of practices, as in preparation, information gathering, coordinating positions, advocating causes, and creating alternative paths for influencing the decision-making process. Additionally, discussing media use with this particular group of young people uncovers alternative ideas of what can be constituted as political success in formal participation processes, and adds to a complex web of motives for participating in formal democratic practices. The initial findings of this study show potential in unveiling new perspectives on medias role in young peoples' democratic participation in decision-making processes, and in extension how media potentially reshapes formal participation practices on a wider scale.

PP 0526 Citizen media vs. Traditional media: Strategies and synergies in digital campaigns

Walid Al-Sagoff¹, Kristina Riegert²

¹ Doha Institute For Graduate Studies, Journalism Department, Doha, Qatar

² Södertörn University, Journalism, Huddinge, Sweden

In the midst of the escalating humanitarian crisis in Gaza and the intensive coverage of the Israeli-Hamas conflict, our study observes a growing polarisation in global societies, leading to Islamophobia, antisemitism, and divisive opinions in Western countries about response strategies. Our research focuses on how citizen journalists are leveraging digital campaigns like @Ceasefire_Track and hashtags such as #ceasefireNow to advocate for ceasefire and peace in Gaza, often appearing in opposition to mainstream, corporate media narratives. We aim to explore the role of citizen journalism in conflict zones, particularly examining its potential as a tool for transnational digital advocacy and as a form of resistance against the conventional media discourse, drawing upon theories of media influence and social movement activism (Bruns & Highfield, 2015). Building on recent literature, such as the work of Horoub (2023), our study explores the evolving role of citizen journalism in the Palestinian-Israeli conflict, particularly in how citizen journalism has played a crucial role in revealing aspects of the Palestinian struggle that are often underrepresented or omitted in traditional media.

The study also delves into the strategic and methodological nuances of citizen journalism in conflict resolution, drawing on Wall's (2015) review of research on citizen journalists' strategies, tool-kits, and use of legacy media compared to other social media campaigns in conflict zones. This research analyses how citizen journalists curate mainstream media to support their efforts and what can be learned by studying the shelf-life of their campaigns. By leveraging hashtags like #ceasefireNow, citizen journalists try to actively shape the news agenda and contribute to discourse creation on conflict resolution. This aligns with Wall's insights into the role of citizen journalism in promoting accountability and civic engagement, especially in challenging environments like conflict zones.

Methodologically, the study employs a mixed-methods approach. Quantitatively, it analyses social media metrics such as reach, engagement rates, shares, and likes, to understand the scope and impact of these online campaigns. Qualitatively, it performs a content analysis of posts, hashtags, and user interactions to interpret the narratives and strategies used. This multifaceted approach allows for an in-depth exploration of digital activism dynamics.

Our study highlights social media's distinct role in conflict zones, contrasting with mainstream media narratives and underscoring its value in advocating for peace and social justice. These findings will be useful for media professionals, policymakers, and activists, illustrating the role of digital media campaigns and their connections to traditional media in the promotion of conflict resolution.

PP 0527 Social accountability dynamics in the memetic politics of Instagram

Salla-Maaria Laaksonen¹, Joonas Koivukoski²

¹ University of Helsinki, Center for Consumer Research- Faculty of Social Sciences, Helsinki, Finland

² University of Helsinki, Media and Communication Studies, Helsinki, Finland

Political humor is an umbrella term that refers to humorous communication and texts dealing with political people and issues (e.g. Young 2018). Over the last couple of decades, political humor has taken on new forms on the internet and social media platforms. Through memes, GIFs, and parody accounts, active citizens and other political actors engage in public debate and frame issues, often in ways that support their agenda (e.g., Phillips & Milner, 2018). Alt-right humor, which is often based on irony, outrage, and intertextuality, has been used by the far right (Hakoköngäs et al., 2020), but it is also used by progressive counter-forces (Laaksonen et al., 2021; Hatakka, 2020), including anti-populist and anti-far-right meme-makers active on Instagram and Twitter.

During the past years using humor in political contestation has become more mainstream and simultaneously it has also spread to new platforms. In particular, the previously lifestyle-oriented Instagram has also turned into a political space. Instagram was first adopted by social activists and politicians (Dumitrica & Hockin-Boyers, 2022; Ekman & Widholm, 2017), but later also emerged as a site for subversive political communication and resistance towards

those in power. In this study, we investigate how vernacular online humor is adapted as a tool for progressive and leftist political commentary by politically oriented pseudonymous accounts ($n = 13$) on Finnish Instagram. The studied accounts promote their viewpoints without a disclosed political affiliation or inclination yet clearly target their critique toward specific political actors.

We conceptualize these accounts' communication as a means to hold the political elite accountable. Social accountability means that the powerful are expected to justify and explain their decisions, are answerable for their conduct, and are held responsible for their failures and wrongdoings (Bovens, 2007). Social media technologies enable online citizens to voice their critiques and demands directly at public authorities and political actors (Chadwick, 2013; Ojala et al., 2019), thus fostering new kinds of accountability processes and dynamics. In the current media landscape accountability issues have become increasingly complex and subject to growing contestation (Djerf-Pierre et al., 2013). Accountability claims typically breed more controversies and discussion, sometimes leading to scandals with concrete consequences to the challenged institutions and elites (e.g. investigations, warnings, loss of position).

We used online observations and Instagram's recommendation system to select the accounts, and Crowdtangle to fetch historical post data from the years 2021–2023 ($n = 3,155$). Using multimodal qualitative analysis we explore how leftist counter-publics are formed in the Finnish memetic Instagram around accountability claims targeted towards the government's value statements and policy reforms. The multimodal genres and humor techniques of these accounts combine distinct memetic aesthetics, such as deliberately ugly and clumsy combinations of visuals and text, ironic emancipatory pathos, and self-reflective and critical political economy analysis with platform-specific communication styles. The analysis allows us to further theorize the dynamics of social media platforms and novel civic engagement practices in social accountability mechanisms. Overall, our paper sheds light on how digital media technologies shape the interactions and power relations between citizens and the elites.

CDE11 Pro-social digital campaigns

PP 0528 The visual construction of the Woman, Life, Freedom protests: Instagram ecologies of protest communication

Victoria Balan¹, Delia Dumitrica¹, Alexandra Schwinges²

¹ Erasmus University Rotterdam, Media & Communication, Rotterdam, Netherlands

² University of Amsterdam, Communication Science, Amsterdam, Netherlands

Protest communication is a crucial mechanism for amplifying the cause, mobilizing fellow citizens, and legitimizing both the cause and the protesters as political actors. Political actors and society at large come to know about protests primarily via news coverage. News coverage, however, tends to zoom in on the spectacular aspects of protests, often at the expense of a serious engagement with the protest issue. The tendency to rely upon official source also works against protesters, foregrounding official narratives that de-legitimize protesters as trouble-makers and re-frame the protest issue (Smith et al., 2001). However, with the integration of social media into political life, new participants in the information eco-system (e.g., bloggers) are increasingly engaging with protest coverage, providing alternative (and less antagonistic) representations (Harlow & Johnson, 2011).

In this paper, we ask whether and how social media afford more diverse representations of protest, particularly against the protest paradigm literature. Zooming in on the Iranian "Woman, Life, Freedom" movement, we focus on how news organizations, non-governmental organizations, and activist influencers engage in protest representation and circulation on Instagram. With our focus on Instagram, we foreground the importance of visual representations in contemporary communication and in the social construction of protest as a political form of citizen intervention (Dumitrica & Schwinges, 2022).

We manually collected posts that a) referenced the Iranian protests; b) included at least one visual; c) were posted during the timeframe September 2022 (when the death of Mahsa Amini marks the beginning of this round of protests) and December 2022 (when large protests subside as death sentences for protesters are announced). We performed a qualitative content analysis guided by an inductive/deductive codebook theoretically-informed by the protest paradigm, visual semiotics, and Instagram platform vernaculars. In addition to capturing the visual representation of protesters, our analysis also asked who had produced the photo and which photos were re-used across different accounts. This allowed us to consider the role of Instagram in the production of iconicity.

We found that the visual representation of protesters on Instagram relies upon visual frames that are also present in news journalism (e.g., groups of people with protest signs, catchy slogans, national flags). Most images used by NGOs and activist influencers are taken from news journalism. Images are often re-used by the same account across multiple posts. Their framing, via text on slides and/ or captions, differs with the type of account. In our sample, the powerful female protester is a recurrent visual trope that challenges stereotypical representations of protesters as breaking the law or social order. However, most such visuals clearly displayed a Western gaze, for instance wearing Western clothes and accessories, or removing/ burning their hijab. By contrast, only a handful of visuals depicted female protesters donning the hijab or burqa. This Westernized perspective was also linked to

ambiguous protest locations, as the images in our sample were often taken from protests supporting the Iranian movement around Western Europe and the U.S.

PP 0529 Act like a swarm: Civic cultures of Ukrainian online pirates

[Kateryna Boyko](#)¹

¹ Uppsala University, Informatics and Media, Uppsala, Sweden

Peer-to-peer (P2P) file-sharing (when files can be downloaded from other computers directly through a software called "torrent") has been in focus of many studies, often in the context of copyright and resistance to it. However, there is evidence that P2P file-sharing in certain contexts has much greater importance in encouraging civil activism, community building and identity formation than a narrow focus on copyright violation can show (Haigh 2007; Lindgren & Linde 2012; Mylonas 2012; Ashley 2015). Thus, this presentation highlights civic cultures of P2P file-sharing practices in Ukraine, in particular, how Ukrainian torrent-users relate their pirate practices to civic expression and activism.

The choice of the country is motivated by its specific features: the ubiquity of piracy (e.g. Ukraine has been on the US government copyright infringement watch list since 1998) and P2P file-sharing in particular, prolonged political and civic struggles between the Euro-Atlantic and pro-Russian vectors of development that are reflected in people's media consumption routines; the 2022 Russian full-scale invasion of Ukraine serving as a turning point in nation-building as well as shifting society's attitudes towards the state.

While applying the concept of civic culture (Dahlgren 2000; 2003; 2005) the study explores the multidimensional complex of factors and everyday practices that enables political participation within the online piracy area. It approaches some of these practices as instances of subactivism (Bakardjieva 2009, 2012), "everyday practices of citizenship" (Bakardjieva 2012, p. 85) – individual actions within one's private sphere that may have political or ethical underpinning.

This research has an ethnographic approach and explores the empirical material accumulated from in-depth interviews with the torrent users and online observations of one of the biggest torrent-trackers in Ukraine before and after the full-scale Russian invasion of Ukraine. The tracker offers exclusively Ukrainian language content (original or translated) and is central for the accumulation of content in the Ukrainian language, in particular, pirated movies and TV-series dubbed into Ukrainian by underground studios.

Analysis shows that in the situation when the state fails to conduct effective cultural politics, dispersed amorphous online communities with a contested legal status can take over the initiative. Torrent-users adopt functions of the state in preserving cultural legacy and promoting the Ukrainian language by scanning and giving access to rare books in Ukrainian, establishing a collection of classic movies dubbed into Ukrainian, promoting Ukrainian through releasing trendy TV series dubbed into the national language earlier than the Russian-language releases. These efforts in the form of subactivist practices follow the technical logic of a swarm (when the users' computers join together in order to share content and dissolve when there is no need for it any longer). The members of the community organise quickly around urgent issues but disperse when the problem is solved or becomes irrelevant. On the individual level, these actions seem to be chaotic and unsystematic but, on the level of the collective, they acquire a certain vector.

PP 0530 "And I also remember how people were tracked back then": Experiences and imaginaries of surveillance in a generational and cross-cultural perspective

[Veronika Kalmus](#)¹, [Göran Bolin](#)², [Rita Figueiras](#)³

¹ University of Tartu, Institute of Social Studies, Tartu, Estonia

² Södertörn University, Department of Media & Communication Studies, Stockholm, Sweden

³ Universidade Católica Portuguesa, The Research Centre for Communication and Culture-CECC, Lisbon, Portugal

In datafied society, corporate surveillance by social and other online media for commercial purposes, and state surveillance for the purpose of crime prevention and national security are principally organised through the same technologies, often also involving the same technological platforms. Most previous studies on online surveillance are conducted in long-time liberal democracies with limited experiences of explicit and intrusive state surveillance. Given this background, an intriguing question is whether online media users make any connections between (historical) state surveillance and corporate dataveillance, and the related social orders. More specifically, we set the research question: What role does the historical legacy of totalitarianism or authoritarianism, embodied in generational experiences and values, play in the formation of attitudes and imaginaries regarding contemporary state and corporate surveillance? This paper will analyse results from an original study among two generations (born in 1946–1953, and in 1988–1995) in three European countries with different historical surveillance regimes – Estonia.

Portugal, and Sweden. The study combined a quantitative online survey (N = 3,221) with qualitative focus group and individual interviews (71 participants in total).

Our analysis revealed significant cross-cultural differences in the experiences of surveillance: the older generations in Estonia and Portugal reported more experiences of state surveillance in their social networks, compared to their younger compatriots and both generation groups in Sweden. Younger Swedes, however, reported higher levels of actual and mediated experiences of state surveillance, compared to their older compatriots. Tolerance towards online state surveillance was, in all countries, more characteristic of the older age group, and it was predicted by trustful, obedient, and less individualistic attitudes towards state authorities and other institutions. Tolerance towards corporate dataveillance was, in all countries, more characteristic of the younger age group, and it was predicted (besides tolerance towards online state surveillance) by active and self-confident (online) media use (functional diversity of internet use, trust in the media, and digital skills). Tolerance towards contemporary state or corporate surveillance was not predicted by individual-level experiences of state surveillance in any country.

Qualitative interviews revealed that participants, especially in the older group of Estonians, clearly distinguished between the historical totalitarian/authoritarian and contemporary "democratic" surveillance regimes, imagining the former as restrictive and dangerous, and the latter as loose and even partly beneficial (by increasing individual security and convenience of consumption practices).

Based on these findings, we can posit a theoretical hypothesis of the "surveillance survival paradox": personal experiences of the past (totalitarian/authoritarian) surveillance regime do not lead to a greater fear or criticism of the contemporary regime (when compared to the younger generation with no previous survival regime experiences); rather on the contrary. Perceptions of the past surveillance regime as more direct, dangerous, and terrible overshadow sensitivities towards more abstract and covert risks related to the contemporary datafied world. The findings, furthermore, suggest that global cultural and technological developments, forming generational values, mindsets and practices, and individual-level trade-offs are more powerful factors behind generation-specific attitudes than past experiences of authoritarianism and surveillance regimes.

Keywords: surveillance, dataveillance, authoritarianism, generations, cross-cultural analysis, Estonia, Sweden, Portugal

CDE12 Social movements and digital media

PP 0618 Biased and unrepresentative? A systematic review of Digital Activism Scholarship between 2011 and 2018

Suay Melisa Özkula¹, Paul Reilly²

¹ Center for ICT&-S. Communication Studies, Salzburg, Austria

² University of Glasgow, School of Social and Political Sciences, Glasgow, United Kingdom

Digital activism (DA) scholarship to date has been shaped by what Marres (2017) refers to as 'digital bias', issues of representativeness that emerge from research focussing almost exclusively on data collected from a small number of online spaces and the groups that coalesce within them. This often results in activism within the "Global South" and semi-periphery regions being less visible within this scholarship. While some researchers argue that a 'decolonial turn' in digital media research is occurring (see Couldry, & Mejias, 2021 for example), this trajectory seems less clear within the field of DA where software-based digital methods continue to grow in popularity.

In response to this issue, this paper provides a critical discussion of the application of regional representation in the field. We draw on data gathered from a systematic review of DA journal articles (N = 315) published between 2011 and 2018 (Özkula, Reilly, & Hayes, 2022). The corpus was coded on categories tied to region including case study location, author affiliation, and researched digital/ social media platform. We tested specifically whether empirical digital activism research 1) predominantly focuses on case studies from Global North contexts, 2) is less diverse in terms of geographical focus where it draws exclusively on traditional rather than digital data sources, and 3) is primarily published by lead authors based in Global North institutions.

Results indicate that single-platform studies, mainly focused on well-known sites like Twitter, dominated DA research published during this period. Most of these articles focused on case studies from countries identified as Global North/Global Majority, although a significant proportion explored the activism of social media movements and hashtag networks such as Black Lives Matter that were wider/global in nature. Similar distributions were found in authorship patterns, with the majority of lead authors based in institutions in Global Majority countries, and in particular the Anglosphere. These trends were particularly notable in the case of digital social research relying on software-based approaches. Overall, the study raised questions about whether activists and social movements in the Global South were adequately represented within the field of digital activism research.

CDE12 Social movements and digital media

PP 0619 New platform, new me? Cross-platform variation and convergence of styles and functions of conspiracy-related communication

Kilian Bühling¹, [Xixuan Zhang](#)¹, Annett Heft¹

¹ Freie Universität Berlin, Weizenbaum Institute for the Networked Society, Berlin, Germany

Social media platforms and various digital communication venues are central infrastructures for distributing conspiracy-related content online. The narration of conspiracy theories on and across social media platforms has been highlighted by research studying conspiracy theory spread from an “infodemic” perspective, i.e., the diffusion of novel and emerging conspiracy narrations to places where they were not present before (Heft & Buehling, 2022). While Mahl et al. (2023) theorize in their framework of “platformed conspiracism” that a conspiracy theory’s narration is shaped by the distinct characteristics of the platform it is uttered on, longitudinal analyses of platform-specific conspiracy narrations are scarce. Therefore, this study examines how the user cultures on different platforms shape the communication style of conspiracy-related content over time.

We define conspiracy-related communication as all public communication *on and about* (alleged) conspiracy theories with the function of either further contributing to a conspiracy theory’s narration, engaging in counter-narration and debunking, or observing neutrally. Tailoring the communication style, in which the choice of words plays a crucial role, to the intended message can influence the recipient’s interpretation and signal a group identity without altering a message’s factual content (Blankenship & Craig, 2011; Khalid & Srinivasan, 2020).

Thus, the interplay of platform features and their appropriation within distinct user groups can be expected to shape the style and functions of conspiracy-related communication. Further, the actors involved in digital communication, either as authors or as (perceived) audiences, are expected to impact the conspiracy-related content characteristics. To test our assumptions, we analyze users’ word choice and communication function, focusing on two closely interlinked, salient, and transnationally persistent conspiracy theories: The narratives of the “New World Order” and the “Great Replacement/White Genocide”. We evaluate adaptation to a given communication environment by comparing posts from three platforms which vary considerably in their governance, norms, use cultures, and characteristics of creators and audiences: 4chan, Twitter, and legacy media.

The English-language platform-specific text corpora analyzed span a time frame from 2011 to 2021. Employing computational text analysis, the most distinct and informative lexical items used to talk about the aforementioned conspiracy theories are compared and analyzed regarding their cross-platform and cross-time variation and convergence. Further, the direction of cross-platform diffusion of lexical change is measured using vector autoregressive models. The communicative functions of conspiracy-related content are classified in a manual content analysis.

The results suggest that the user cultures on different platforms heavily shape the language style in which conspiracy-related content is disseminated. Significant differences appear in word choice between all platforms when communicating about the same topic. Further, the results suggest some convergence of communication styles between platforms, especially between 4chan and Twitter and, to a lesser degree, between Twitter and legacy media. These insights are likely to inform the ongoing debate about the effectiveness of online governance in broader sociotechnical systems.

CDE12 Social movements and digital media

PP 0620 “Facebook is a bit like a lost cause”: Social movement actors’ perspectives on social media affordances

[Irene Blum](#)¹

¹ Copenhagen Business School, Department of Management- Society and Communication, Copenhagen, Denmark

Social movement actors working to hold businesses accountable for misconduct face challenges as they operate in the digital media environment characterised by unequal power relations. Previous work has provided insights into media practices and campaigning, but little is known about the underlying understandings social movement actors have of the platforms that enable much if not most of their work. It is also unclear how these understandings shape their activism. Filling this gap, this article takes its starting point in the interplay between technology and practices that make up affordances. It examines how social movement actors understand the affordances offered by the social media platforms they operate on. It also sheds light on differences between anti-systemic and reformist social movement actors’ understandings of these affordances. Thus, it considers opportunities and challenges, and, ultimately, power, as the way social movement actors perceive affordances impacts how they strategically utilise them.

Theoretically, I draw on affordance theory and the notion of media ecologies. I suggest that to apply affordance theory to the study of social movements productively, we must use media ecologies as a starting point to avoid a too narrow lens of platform-specific affordance theory that encourages research on only one platform at the time. This theoretical approach helps highlight the distinctive particularities of the struggles faced by anti-systemic and reformist social movement actors despite them operating within similar political and cultural contexts. Empirically, I draw on interviews with communication experts from anti-systemic and reformist environmental organisations. 22 communication experts have participated in in-depth qualitative interviews from organisations such as: WWF, Greenpeace, Extinction Rebellion, and Danish Society for Nature Conservation.

The article finds differences in understandings of affordances between anti-systemic and reformist social movement actors. While both generally reject Facebook as a productive site for communication, anti-systemic actors tend to favour Twitter and Instagram and their possibilities to reach the wider public while reformist actors prefer taking advantage of the access to companies which LinkedIn offers. In addition to the environmental organisations' selection of these platforms marking a strategic communicative choice, this further signals an understanding and navigation of the wider power relations these commercial platforms are embedded within. Such a consideration of power further hints that while some platforms may die and others become popular, what remains is the profit-driven infrastructure. While different actors have different conditions and goals for successful communication, some actors will still find that some infrastructures limit them while others may not. This understanding raises the question what about media ecologies? It is widely accepted in social movement and media studies literature that no social movement operates on one platform in isolation. In answer, this research critically engages with the particularities of platforms while accounting for ecologies as well, thereby responding to an emerging point of view in this research.

CDE12 Social movements and digital media

PP 0621 Love and hate speech in activism: Interaction with online petitioners

[Monika Pater](#)¹, Kathrin Voss¹

¹ Universität Hamburg, Journalism and Mass Communication, Hamburg, Germany

Petitions are one of the most used tools for political participation in most European countries right after voting (ESS 2023) and they are a common tool of activism. Digitalization has made it easier to sign petitions as well as to start and distribute them. Accordingly, petitions are not only used by social movement organizations but also by individuals and small ad-hoc groups. Therefore, petitions are one of the prime examples for individualized online activism (Margetts et al. 2016). For petitions to reach people, petitioners need to engage in public communication using a variety of channels. They thereby take part in public discourse on many different levels. In some cases, there are many negative reactions, including outright hate speech. But since petitions are by definition an instrument that collects approval, many positive reactions can be found as well, expressions of solidarity, we call love speech. We will investigate the conditions and effects of hate and love speech: What kind of reactions have petitioners experienced, how did they deal with them and what are the consequences for future political involvement?

The proposed paper presents findings from semi-structured interviews with

- three employees of two platforms available in Germany (innn.it, openPetition.de) which focused on the organizational approach towards managing comments, especially in regard to hate speech;
- ten petitioners whose different speaking positions in terms of gender, age and ethnicity might have had contributed to negative comments (eight women, two men, two with migration history). For our explorative approach, we interviewed petitioners suggested by platform employees. In addition to petitioners' ascribed identity, the petitions had to a) be successful regarding number of signatures, b) have received love or hate speech and c) address a diversity of topics, including controversial ones. The majority of the petitioners interviewed received negative comments, two received mainly positive and two received both positive and negative feedback according to platform employees. Recruiting male petitioners whose petitions provoked particularly strong reactions turned out to be difficult although the majority of German petitioners self-describe as male (Voss 2021).

As expected, petitioners get a variety of reactions via many different channels; different social media sites play the most important role for interaction. Communication on the petition platforms is at times filtered by the platform organizations in order to protect petitioners from vile comments. Our research also reveals how petitioners deal with hate speech. The employed strategies range from ignoring to seeking help to pressing charges. Some petitioners expect negative reactions from the beginning, and tailor their communication activities in a way to avoid getting hate speech altogether.

Surprisingly, the nature and extent of hate speech does not appear to have a negative impact on future engagement; on the contrary, the majority of interviewees feel empowered by the experience as petitioning enabled networking with like-minded people and provided unexpected opportunities. Despite at times extensive hate speech, support and solidarity often have a more profound impact and seem to encourage further activism.

PP 0622 Influ-activism and the shaping of civic engagement: Bridging digital activism and influencer culture

Marco Pedroni¹, Maria Francesca Murru², Simone Tosoni³

¹ University of Ferrara, Humanistic Studies, Ferrara, Italy

² University of Bergamo, Literature- Philosophy and Communication, Bergamo, Italy

³ Università Cattolica of Milan, Communication Sciences, Milano, Italy

In the landscape of contemporary communication and democracy, the emergence of 'influ-activism' represents a significant intersection between digital activism and influencer culture. This paper seeks to explore this intersection by examining the evolving roles of influencers in shaping public discourse and civic engagement, particularly in light of the themes of communication and social (dis)order.

In recent years, a shift in the dynamics of digital activism and influencer culture has been observed. Mainstream commercial influencers, previously focused on brand endorsements, have started engaging with socially sensitive issues. Chiara Ferragni's support for the LGBTQIA+ community exemplifies this trend. Simultaneously, a new wave of influencers has emerged, prioritizing contentious public issues as their primary focus, diverging from traditional consumer-centric content. This phenomenon, termed 'influ-activism', blends the realms of digital activism and social media influencing, creating a new paradigm in which public discourse and activism are redefined.

The paper aims to establish a theoretical framework for understanding influ-activism, drawing on key concepts from media and communication studies. Utilizing Fraser's notion of 'counter-publics' and Kavada and Poell's concept of 'contentious publicness', it explores how digital platforms facilitate the rise of influencers as agents of social change. The study examines how these influencers navigate the neoliberal dynamics of social media, balancing personal expression and collective mobilization.

In the context of connective action and personalization of protest, as discussed by Bennett and Segerberg, the paper investigates how influ-activism embodies a new form of political and social engagement. It scrutinizes the ways influencers leverage their platforms to promote diverse causes, from sustainability and social justice to minority representation. The focus is on how their influence extends beyond commercial interests, potentially reshaping public opinion and civic participation.

Additionally, the paper addresses potential critiques of influ-activism, such as the commodification of activism and the challenges of building stable political communities in a digital age dominated by fleeting, networked interactions. It questions whether influ-activism represents a genuine shift towards empowering counter-hegemonic narratives or if it is a manifestation of 'social washing' within the constraints of algorithmic social media environments.

By examining case studies across varied domains like fashion, beauty, healthcare, and sustainability, the paper provides a comprehensive analysis of influ-activism. It aims to contribute to the broader discourse on the role of media and communication in a globalized society, marked by social and political upheavals, and the ongoing reconfiguration of democracy and public engagement in the digital era.

CDE13 News in politics

PP 0637 Unexpected collaborations within local journalism and the return of Place

Malin Picha Edwardsson¹, Maria Zuiderveld¹

¹ Södertörn University, Journalism, Huddinge, Sweden

Local journalism is currently facing significant challenges, which affect democratic processes. New forms of media, fewer users, implementation of savings measures, and new technology are examples of such challenges (Napoli et al. 2017; Nielsen 2015).

In this paper, we explore what happens when local newspapers in Sweden dare to think outside the box and try new and unexpected collaborations to meet their challenges, for example by collaborating with local libraries. Generally speaking, public libraries and local media are quite different, but at the same time, they share similarities when it comes to promoting local democratic processes. So, what happens when they collaborate with a common goal? Can new collaborations help local media counteract the current challenges and how does this relate to the scientific discussion about public space and place, participatory journalism, and civic engagement? These are some of the questions explored in this paper.

Our research draws theoretically on public discourse and the mediated public sphere, and empirically on workshops and semi-structured interviews with readers and Swedish journalists in two separate research projects. The results show an increased awareness about the importance of *place*, as local media companies discover how important *place* is for connecting with their readers. This is in line with previous research that shows that local media traditionally creates a feeling of fellowship and solidarity among different groups in one place (Coleman et al. 2016;

Hess & Waller 2017) and helps bring together a place by sharing references and creating a local identity (Nygren & Tenor 2021).

Furthermore, we draw the conclusion that local media need to take more space in the local community – to dare to step out of the comfort zone and arrange debates, hold politicians accountable and ask and discuss controversial questions. We also conclude that returning to *place* is of utmost importance for successful local journalism. Local media companies experience that ideas are born, and trust created, in the physical meeting between journalists and residents.

Local media companies could therefore investigate the road back to the local place-based public sphere that it once had, and thus gain a clearer place-identity. They could increase the amount of participatory journalism, which explores how media users can become more involved and socially responsible in the public debate. Consequently, Swedish media could continue to explore this particular road to increased relevance in order to enhance civic engagement.

PP 0638 Shaping the Narrative: Analyzing the role of United Arab Emirates english-language newspapers on Instagram during the Israel-Palestine conflict

[Daniela Patornilho¹](#)

¹ NOVA-FCSH, Communication Science, Lisbon, Portugal

In the complex world of international diplomacy, media plays a crucial role in shaping public perceptions and narratives. The United Arab Emirates (UAE), strategically positioned at the crossroads of Western and Eastern geopolitical interests, stands out, particularly as one of the few Arab countries to normalize relations with Israel in 2020 since the conflict's inception in 1948, presenting itself as a distinctive case for study. Against this backdrop, the role of English-language newspapers in the UAE offers a rich context for analysis, with the current study focusing on their Instagram accounts during the critical Israel-Palestine conflict period from October 2023 to January 2024. These newspapers, including The National, Gulf News, Khaleej Times, and The Gulf Today, have unique structures that may influence their editorial perspectives and coverage. The diversity in ownership and editorial direction is critical in understanding how these media outlets frame international issues, particularly on platforms like Instagram, where content is more accessible and widespread.

This research proposes analyzing the Instagram content of these prominent newspapers, a medium that has become increasingly central to disseminating news in the UAE, reflecting the global shift from traditional print to digital platforms. The study explores how these newspapers, each with their editorial perspectives, portray the Israel-Palestine conflict, offering insights into their narrative construction and public engagement strategies.

Key to this analysis is understanding the impact of the UAE's media regulations, especially Law No. 5 of 1980, which governs media content and imposes significant restrictions on the critique of the UAE's diplomatic allies, such as Palestine. This legal framework presents a challenging landscape for these newspapers in their Instagram coverage of the conflict, potentially influencing their portrayal of events and issues.

Employing a mixed-methods approach, this study combines qualitative and quantitative analyses of the UAE English newspapers' Instagram posts. The qualitative component will examine themes, linguistic framing, and narrative styles, focusing on how specific linguistic choices and thematic focuses contribute to the overall narrative around the Israel-Palestine conflict, aiming to uncover underlying biases and assumptions in portraying the conflict.

The quantitative aspect will measure post frequency, audience engagement, and representation of different view-points. This includes analyzing the volume of posts related to the conflict, the types of engagement they receive, and the diversity in perspectives offered. The statistical analysis will also categorize and code the posts to identify coverage patterns, revealing correlations between the conflict's portrayal and each newspaper's ownership and editorial stance.

This research intends to investigate the repercussions of the Israel-Palestine conflict on media coverage in the UAE, emphasizing the challenge newspapers face in maintaining editorial integrity amidst regulatory compliance. A significant observation from an initial analysis indicates that The National, a government-owned newspaper, publishes a higher frequency of conflict-related content on its Instagram in contrast to other local newspapers privately owned. These findings are essential for comprehending the media's intricate role in presenting complex diplomatic issues in a country-specific context like the UAE.

CDE13 News in politics

PP 0639 50 years of Magdalene laundry survivors in Irish news: Voice, recognition and a transformed status

Dawn Wheatley¹, Eirik Vatnoey²

¹ Dublin City University, School of Communications, Dublin, Ireland

² University of Oslo, Department of Linguistics and Scandinavian Studies, Oslo, Norway

More than 10,000 women in Ireland were confined to Magdalene laundries between the 1920s-1990s, forced into unpaid labour and suffering psychological and physical mistreatment. For decades, these women were effectively silenced and shunned, by both society and the news media, reflecting a socially conservative culture in which the Catholic church was highly influential. However, previous work has documented how activists, since the mid-2000s, effectively mobilised and produced a campaign in which recognition of the women's experiences, coupled with exposing the state's compliance, led to an official apology in parliament in 2013. This apology acknowledged the State's role in these institutions, and a redress scheme was established for the women.

The research presented here documents that shift in status from the perspective of news reporting, centring the discussion on ideas around voice and sources, and who is granted "primary definer" status in a news story: ultimately, who is elevated as the expert to provide insight, within whose narrative others must respond. We document a shift towards the news media's use of the women themselves as the dominant narrators of the reality of Magdalene laundries. The study does this by analysing the appearance of Magdalene laundries and survivors in Irish news reporting between the 1970s-2020s, capturing not only a heightened presence in recent years, but a tone and underlying sense of esteem which was wholly absent in earlier decades.

The primarily qualitative work draws mainly on newspaper reports, alongside selected available radio and television clips, to document how the women's status in the news shifted. We identify five intertwining factors which facilitated this shift in status in the news: (i) Strategic communication efforts and media-friendly approaches from activists; (ii) The involvement of state actors and associated journalistic interest in reporting on state failings; (iii) A holistic recognition process as the basis for a social struggle, functioning as a central force behind societies' ethical development; (iv) Shifting audience and societal attitudes which had become more open to troubling narratives; and (v) Key moments – such as the state apology in 2013 – which further legitimised the women as credible, authentic sources, and provided clear newsworthy angles.

Ultimately, we argue that there was a shift in status from being silenced to being centred and elevated by journalists in news coverage, and this was enabled following a process of recognition, all taking place against a backdrop of a country reckoning with its oppressive past.

CDE13 News in politics

PP 0640 Views for all the people: Mapping debate section contributors, topics, and qualifications in Danish letters to the editors

Camilla Dindler¹, Bolette Blagaard¹

¹ Aalborg University, Dept. of Communication and Psychology, Copenhagen SV, Denmark

This paper asks the research question (RQ): who are enabled to express themselves in the news papers' debate sections and how; on what topics do they speak; and with what implications for the democratic and social sustainability of the public sphere?

For some time now, media and journalism scholars have focused on public debate on social media platforms rather than on the letters institution, which encompasses debate sections in newspapers off- and online as well as commentary and letters to the editor. However, as contentiousness and fragmentation online rise and the market forces shift to favour few but powerful corporations governing the public debate, the role of editorial and democratic spaces as frameworks within which identity-based marginalisation and/or empowerment occur among political subjects warrants a revisit.

Diverse, equal, and inclusive representation in letters to the editor is important to secure engagement in the public sphere, whether deliberative and/or agonistic. Previous scholarship shows that while news institutions strive to select "average citizens" to write letters, women and ethnic minorities are sorely underrepresented. Younger writers are missing from the pages too, while knowledge about representation of sexual, religious, and social or neural diversities is non-existent. Not surprisingly, if asked to imagine the average letter writer, editor respondents in the

US context give a rather narrow definition: "an elderly, well-educated white male". The lack of representation of minorities – let alone empowerment – may be due to the temporal gap in scholarship as the most recent study is from 2012. Attention to minorities, critical race studies and postcolonial critiques has grown significantly within journalism since the noughties. However, it is by no means certain that this development is reflected in the editors' selection criteria. This paper thus seeks to bridge the temporal and epistemological gap in the scholarship.

To answer the RQ, we use the case of Danish national newspapers. The sample encompasses all letters to the editor published between 20. and 27. of March 2023 (N = 376). Following, the data is coded according to the categories: headline, media, author type (i.e., expert, politician, academic, student etc.), gender, whether an illustration accompany the letter, profession or title, capacity (i.e., experience, professional, special interest etc.), main argument, and topic of the letter (i.e., politics, science, technology, crime, economy etc.), to show the capacities within which different writers are afforded a voice.

Qualitative and discursive analyses are moreover conducted to supplement the discussion of the implications of the representation for the democratic and social sustainability of the public sphere. Drawing on postcolonial critique and theories of citizen media, we argue that the letters institution is at a crossroad defined through technological, political, and social processes warranting a reconsideration of diversity, equality and inclusion in the institution.

PP 0641 "Don't hate the media, be the media!": An analysis of pseudo-journalistic political communication

Maximilian Grönegräs¹, Benjamin De Cleen¹, Yazan Badran¹

¹ Vrije Universiteit Brussel, Department for Communication Sciences, Brussels, Belgium

This paper analyses six media outlets associated with three populist radical right (PRR) parties, which we understand as cases of *pseudo-journalistic political communication*. By this we mean the way in which especially PRR parties produce political communication in which they write and speak like journalists, use stylistic and design elements we associate with journalism, and address their audiences like journalists do. This phenomenon is embedded within developments that Blumler (2016) describes as the *fourth age of political communication* and Chadwick (2013) as *hybrid media system*, both of which are characterized by the blending of formerly separated political and journalistic forms of communication. The paper thus contributes to a critical understanding of the contemporary media-politics nexus through a focus on the PRR, whose paradoxical relation to mainstream media is characterized by both mutual criticism and interdependence (Haller & Holt, 2019).

The analysis is conducted as a comparative case study including the Belgian *Vlaams Belang* (VB), the German *Alternative für Deutschland* (AfD), and the Austrian *Freiheitliche Partei Österreichs* (FPÖ). Two pseudo-journalistic political communication formats by each of the three parties are analysed: the news show *VBTV* and the news website *V-NIEUWS* by the VB; the talk show *AfD im Gespräch* and the news website *AfD Kompakt* by the AfD; and one-on-one interviews with FPÖ-members, published on the party's YouTube channel *FPÖ TV*, as well as the FPÖ's newspaper *Neue Freie Zeitung*. The content was gathered with *4K Video Downloader*, *YouTube Data Tools*, and *Open Web Scraper*, and qualitatively analysed with *MAXQDA*.

The results primarily provide insights into the content-dimension of pseudo-journalistic political communication. All three parties make use of these formats to utter criticism against the ruling political elite in their respective country. This criticism is focussed on the topics of COVID-19, arguing that European governments introduced disproportionate precautionary measures that put their citizens under the conditions of surveillance states; on migration, claiming that European citizens live under the threat of repopulation and becoming minorities in their own countries; and on the LGBTQ+ community, questioning for instance the fairness of transgender women competing in female sports.

The analysis, does, however, also reveal that pseudo-journalistic political communication commonly has the purpose of making up for a lack of positive mainstream media coverage on the respective PRR party, that it is usually being produced by professionals with previous journalistic experience, that it primarily reproduces the form of informative quality journalism, and that audiences often view it as a respectable alternative to mainstream media. Such insights show that a complete and multidimensional understanding of pseudo-journalistic political communication requires its examination from the perspectives of its purpose, production, content, form, and reception. It is these other four dimensions, next to the content, that future research should be directed towards.

Blumler, J. G. (2016). The Fourth Age of Political Communication: *Politiques de Communication*, 6(1), 19–30. <https://doi.org/10.3917/pdc.006.0019>.

CDE14 Narratives and discourses in digital environments

PP 0712 The 'troll' metaphor and its problems

Johan Farkas¹, Yiping Xia²

¹ University of Copenhagen, Department of Communication, Copenhagen, Denmark

² Texas A&M University, Department of Communication & Journalism, College Station- Texas, USA

The notions of 'trolls' and 'trolling' in digital media have become ubiquitous across online communities, journalism, and scholarship, capturing a range of different phenomena. Depending on the context, the metaphor of the 'troll' might invoke images of bored teenagers engaging in silly pranks, political activists mocking opponents, radicalized groups orchestrating targeted discriminatory harassment, or paid propagandists interfering in foreign elections.

In this paper, we analyze the origins and uses of the troll metaphor and – building on existing research – present a critique of both its vagueness and potential role in downplaying the severity of racism, misogyny, and state-orchestrated propaganda. The metaphors of 'trolls' and 'trolling', we argue, have become oversaturated with meaning due to their invocation of longstanding mythologies about *tricksters* and *monsters*.

Through an engagement with academic literature, we show how the notion of 'trolls' is not only used to describe widely different types of online actions, motives, and implications, but also *contradictory* forms. In one instance, trolls act apolitically on nothing but primordial desires and impulses with no serious harm intended — in the next, they work systematically towards political goals and targeted harassment. In one instance, they act within a loose network of like-minded individuals, and, in the next, they act based on top-down orders.

Based on these findings, we discuss how the 'troll' metaphor has obtained a mythological oversaturation of meaning. Doing so, we put forward two main critiques of the current usage of the term: First, its adds a jovial and apolitical veneer to harmful behaviors, giving them a phantasmatic allure of otherness — something that transcends human motives and accountability — by invoking a sense of mythological agency. This added veneer can then easily be used to excuse or condone racism, misogyny, and harassment (e.g. "Relax, it's just trolling"). Second, the term 'trolls' often conceals the level of organization behind transgressive behaviors, and by extension the similarities between offline and online (both contemporary and historical) forms of harm. The term frames perpetrators as individual rather than collective actors, while also obscuring the historical (and at times geopolitical) roots of online harm, including racism, misogyny, and state-backed propaganda. Taken together, the paper concludes that the term contributes with little clarity in academic research, while adding a problematic sense of more-than-human agency to social transgression online. This calls for critical reflection in the field of media and communication studies going forward.

CDE14 Narratives and discourses in digital environments

PP 0713 Towards an empty signifier? Unraveling the dynamics and manipulations of the 'resistance' narrative across the political spectrum

Hanna Rueß¹, Susanne Kinnebrock¹, Christian Schwarzenegger²

¹ University of Augsburg, Department for Media- Knowledge and Communication, Augsburg, Germany

² University of Bremen, Centre for Media- Communication & Information Research, Bremen, Germany

In the contemporary political and media landscape, the term "resistance" has become a ubiquitous element in discussions surrounding democratic struggles. Rather than fostering deliberation, social cohesion, and consensus, the discourse often revolves around calls for resistance against oppressive regimes, various hegemonies, and adverse socio-political forces. This resistance narrative spans a broad spectrum, encompassing progressive activists like the G7 and WTO protests or climate activism advocating for social justice and political reforms to nationalistic, racist, migrant-hostile groups like PEGIDA in Germany, and even political figures in governing positions like Donald Trump co-opting the resistance label.

The term "resistance" has evolved into an almost empty signifier due to its association with a diverse array of ideas and ideologies. This versatility is exacerbated by its alignment with affective publics and digitally networked communication. In this context, we endeavor to discern common features and characteristics of communication for resistance, exploring the appeal of "resistance" for activist purposes, its evocative power, concealments, and its utility for mobilization and justification of political measures across different contexts.

Our exploration involves examining empirical observations of protest articulation across the political spectrum, identifying similarities and differences in the construction of "resistance." Key aspects include the perceived threats that necessitate acts of resistance, the portrayal of opponents and enemies, the self-concepts of those engaging in resistance, and the traditions they align themselves with. In this context we can identify the prominence of historical cases of resistance in current struggles and how they are weaponized for current political ends. We scrutinize how these criteria are employed in digital communication and offline-protest communication to legitimize (alleged) acts

of resistance. We also relate the self-presentation as resistance to how the respective protests or political acts were represented in media coverage.

This analysis connects contemporary calls for resistance with the historical transformation of the term. Traditionally, especially in the German context, "resistance" was associated with morally justified opposition to the totalitarian NS-regime, emphasizing the right to resist against tyrants, to defend human rights and freedom. However, in current discourse, activist groups and social movements widely use "resistance" (e.g., by invoking the memory of Sophie Scholl, a young resistance fighter against the NS-regime, for anti-vaccination protests) to justify a range of actions, including violent measures. Notably, far-right organizations have redefined the concept, using it to exclude groups, justify violence, and, in some cases, glorify the NS-regime. This shift in the meaning of resistance has become a strategic tool for mobilizing the far right.

The devaluation of "resistance" occurs as its application spans from legitimate struggles against oppression to instances where it is manipulated for exclusionary and even violent agendas. The overuse and misuse of the term diminish its ability to serve as a nuanced and powerful tool for societal critique. Our discussion underscores the importance of discernment in the utilization of the term "resistance" to preserve its meaningfulness and effectiveness in fostering genuine democratic dialogue and social change.

CDE14 Narratives and discourses in digital environments

PP 0714 Affective and contested meanings of hate speech on social media

Reeta Pöyhkäri¹, Kaarina Nikunen¹, Paula Haara¹, Alekski Knuutila², Heidi Kosonen², Tuija Saaremaa²

¹ Tampere University, Faculty of Information Technology and Communication Sciences, Tampere University, Finland

² University of Jyväskylä, Department of Music- Art and Culture Studies, Jyväskylä, Finland

Recent years have witnessed the proliferation of manifestations of hate speech on digital platforms. Hate speech is one of the disruptive and harmful elements of digital communication that has been argued to endanger even democracy itself (Council of Europe 2024). Research has identified different formations, technologies and affordances that support, manage and amplify hate speech in digital contexts (Back 2002; Daniels 2018; Laaksonen et al. 2020; Matamoros-Fernandez 2017), while theoretically oriented research has focused on the definitions and understandings of hate speech (Brown 2017; Pohjonen & Udupa 2017; Udupa et al. 2021). In this latter body of work the concept of hate speech has often become problematised as either a too narrow, regulatory term, or a too all-encompassing universal term.

While scholarship in this field involves a range of conceptual work to develop an understanding of hate speech, in everyday contexts, the term hate speech has become increasingly politicised and emotionally charged. A variety of understandings of hate speech are circulated and contested in the everyday cultures of digital media and shaped by the digitalised media environment. Ongoing debates on social media consist of whether the phenomenon exists at all, whether it is harmful, what constitutes hate speech, and who is empowered to define it.

In this paper, we explore the meanings of hate speech in social media debates in Finland. The data consists of almost 290,000 public social media messages in Finnish from various platforms dating from 2015–2022, containing the word 'vihapuhe' ('hate speech'). The data covers Finnish-language social media and discussion forums and was retrieved through the Legentic data platform. We performed topic modelling on the dataset with Latent Dirichlet Allocation, and analysed and thematically categorised the found topics with qualitative methods. We aimed to examine how hate speech is interpreted, contested and reproduced in this complex discursive landscape.

We identify different political and social articulations of hate speech, and analyse how the term is used as an alleged or potential vehicle of different ideologies. The data manifests how in the analysed context, regardless of the more specific themes of discussion (e.g. immigration, gender, politics, control, freedom of speech, education), a definitional struggle over the meaning of hate speech occupies the heart of the debate. The continuous and affective contestation of hate speech serves to undermine the very existence of hate speech and it often seeks a rhetorical overturn that twists existing societal power positions. More generally, we argue that in these public online discussions, hate speech operates as a sticky sign, a source for the so-called post-truth condition that seeks to challenge traditional or legitimate sources of knowledge (Harsin 2023). This signals a political and cultural shift in public debate, in which casting obscurity on terms such as hate speech can serve personal and political goals. The research illustrates how generation of uncertainty and obscurity over hate speech operates in practice as a mechanism that also targets and undermines the established democratic principles.

CDE14 Narratives and discourses in digital environments

PP 0715 Decoding racism in news media: Exploring coder bias in human and LLM-based classification

[Ahrabhi Kathirgamalingam](#)¹, Jana Bernhard¹, Fabienne Lind¹, Hajo G. Boomgaarden¹

¹ University of Vienna, Department of Communication, Vienna, Austria

Studying racism in mass communication as a problem of social (dis)order is a fundamental research endeavor in addressing discriminatory practices and promoting social equality. Racism is embedded in mass communication in many different ways such as discriminatory language and recurring narratives. To study the prevalence of racism and related concepts in communication, researchers can draw on a variety of theoretical perspectives and methodological frameworks. Accordingly and as a fundamental tool in communication studies, manual quantitative and, increasingly, computational content analysis are used to examine racism. Although methodological debates on content analysis focus on various aspects such as reliability and validity of coding, potential sources of disagreement at the level of individual coders are rarely systematically investigated. However, researchers using content analysis to study racism report the specific challenge of reliable coding and suggest disagreements based on coders' awareness and sensitivity to discrimination, without systematically examining these for news media data.

This three-part study aims to address this gap by examining the impact of coder-level biases on the coding of racism in news media. As chat-based Large Language Models (LLMs) are increasingly being introduced to assist in content analysis tasks that are reportedly fairly competitive with student and crowd coders, we additionally investigate algorithmic biases in the coding of racism in news media texts. As a first step, we conducted a survey study with 100 paid crowd workers and 300 texts from German mainstream (Bild, TAZ, Welt) and far-right news media (Junge Freiheit, PI News, zuerst) as coding tasks. We include a pre- and post-questionnaire, a coder training with a definition and examples of racism, and ask our crowd workers to code 15 texts as racist or not. With this study design, we aim to investigate the influence of socio-demographics, political attitudes, awareness and experience of racism, and prior coding experience on coding decisions and disagreements. In a second step, we use the insights from our human annotations to design prompt experiments to systematically explore and potentially reduce biases in the annotations produced by chat-based LLMs. Third, we test and compare prompts, human annotations, and their respective biases for different LLMs, including GPT 3.5, GPT 4, and LLaMA.

This comprehensive approach is intended not only to improve reliability assessment, but also to foster a deeper understanding of the intricacies of coding processes, ultimately strengthening the research integrity of both manual and computational content analysis in the study of racism in mass communication.

CDE15 Autonomy in the age of big data

PP 0726 Between algorithms and autonomy: Exploring users' preferences of personalised content moderation

[Anna Maria Planitzer](#)¹, Sophie Lecheler¹, Svenja Schäfer¹

¹ University of Vienna, Department of Communication, Vienna, Austria

Harmful content on social media poses potentially devastating consequences for users, democratic discourse, and society at large. To mitigate such effects, platforms employ content moderation strategies, which increasingly rely on algorithmic approaches for timely action (e.g., automated demotion or reduction, wherein platforms adjust algorithms to reduce visibility of content).

Traditionally, many platforms have primarily employed a one-size-fits-all approach to moderation through uniform community guidelines, which is surprising, given that several decades of media effects research has shown differential susceptibility to media and differential motivations for using them. This poses challenges for platforms and regulatory bodies striving to effectively address such differential user needs and safeguard against impacts of harmful content.

Hence, there is a growing need for additional research and knowledge on how uniform approaches may be replaced by more personalised moderation strategies, tailored to each user's specific requirements. Such novel personalised forms of moderation may still rely on (a) general uniform community guidelines, but additionally consider (b) allowing for individual direct configuration of content filters, also known as *explicit personalisation*, and (c) utilise user's prior interactions with content for algorithmic curation, also known as *implicit personalisation* to provide a more context-aware and user-centric moderation experience.

In practice, some platforms have recently started to experiment with tools allowing users to explicitly personalise their moderation measures. And while there are initial indications of positive benefits of such personalizable measures, research also shows that users have concerns about the additional mental load involved in utilising such explicit tools of customization. Conversely, recent developments regarding regulation of algorithmic communication online, in particular the EU's Digital Service Act (DSA), and other research highlights significant privacy challenges associated with implicit personalised moderation interventions, building on traditional recommender system literature.

Therefore, acknowledging the inherent conflicts in differential content moderation strategies, industry leaders, scholars, and activists debate how to balance various trade-offs for a more nuanced moderation experience.

Available user-centric insights from qualitative indications suggest users' support for personalised moderation measures. However, there are significant gaps in our understanding of how users perceive and favour different types of personalised content moderation approaches. Specifically, we do not know how they wish to receive forms of (a) explicit personalisation, and (b) implicit personalisation against (c) one-size-fits-all moderation based uniform community guidelines.

To assess users' intentions to support such personalised content moderation approaches and explore the driving forces behind individual preferences, such as privacy concerns, attitudes towards algorithms and automation (e.g., cues that trigger positive and negative machine heuristics), and socio-demographic factors, this work-in-progress conducts a pre-registered survey with a representative sample of Austrian citizens (N = 1,000).

The findings will contribute to the growing body of literature on different types of personalization of content moderation and shed light on how digital moderation architectures should be constructed to benefit democracies instead of harming them. The findings may therefore not only inform academic discourse across disciplines but also provide practical insights for the ongoing discussions surrounding the implementation of personalised moderation measures for platforms and governing bodies alike.

CDE15 Autonomy in the age of big data

PP 0727 Artificial intelligence as a new tool in the political sphere

[Ilona Dąbrowska](#)¹

¹ Maria Curie-Skłodowska University, Faculty of Political Science and Journalism, Lublin, Poland

The speech will discuss the problem of rapid development and global popularization of artificial intelligence (AI) in the context of its political implications. The article is an attempt to answer the question about the goals and ways of using artificial intelligence both in times of stabilization, during election campaigns, and during political crises, tensions and wars. The speech will also present the problem of using computer generated videos – deepfakes. Based on a review of literature, reports and media reports, examples of the use of deepfakes in the political sphere were identified. This is a technology that allows you to generate videos with any message, using, for example, samples of a person's voice. Thanks to this, it is possible to create films presenting in a very realistic way events or statements that have never happened. During the speech, I will refer to specific examples of the use of the discussed technology both in Europe and around the world.

The basic research goal of the work is to present ways of using artificial intelligence in the political sphere. The indicated goal will be achieved by answering the following research questions: What cases of the use of artificial intelligence in the political sphere have been recorded so far? Also: What was the purpose(s) of using images generated by artificial intelligence (deepfake) in the policy area? The research used the case study method using content analysis, audiovisual analysis of multimedia materials and semiotic analysis. The analyzed research material includes film materials, entries on social networking sites with artificially generated photos and fictitious profiles on social networking sites. In order to answer the research questions, a review of scientific literature and official, analytical and media sources of information was conducted. Analysis of the above area will allow both a better understanding of the scale of the problem and the construction of a plan to prevent and eliminate the negative effects of popularizing AI in the area of politics.

Preliminary key findings allow us to conclude that year by year, there are more and more cases of the use of artificial intelligence in the area of politics and political communication. Increasingly, this technology is a tool for political propaganda, manipulation and disinformation. The victims of deepfake videos are both heads of state and lower-level politicians. Artificial intelligence is also increasingly used during election campaigns, as well as in extreme situations, such as conflicts and wars (an example of fake videos generated by Russia during the attack on Ukraine). The escalation of the phenomenon is facilitated by the continuous development of AI, which in the future may translate into its easier, more accurate, faster, wider and cheaper use. Therefore, people and entities responsible for the development of AI tools that generate authentic-looking images should prepare their tools to appropriately mark the created materials and provide tools that will enable their quick identification in the event of their unethical use.

CDE15 Autonomy in the age of big data

PP 0728 Negotiating alternative AI futures: a critical engagement with European civil society organizations, tech entrepreneurs and journalists

Marie Poux-Berthe¹, Veronica Barassi¹, Philip Di Salvo¹, Rahi Patra¹

¹ University of St. Gallen – MCM Institute, School of Humanities and Social Sciences, St. Gallen, Switzerland

With the popular diffusion of artificial intelligence (AI) systems in our society pushed by the rise of generative AI systems such as ChatGPT and Midjourney, the critical debate around AI has exited expert and technical circles. The existing debate on AI is often hyped and polarized and characterized by either catastrophic or utopian points of view, which are directly overshadowing the discussion of the social disorder emerging from the concrete harms for which AI systems are already responsible (Barassi et al., 2022). Currently, most of the debate around AI is thus driven by the discussion of “existential threats” which are mostly speculative in nature, and not by a coming to terms with already documented and visible issues, such as discrimination, biases, or data (in)justice perpetuated or amplified by prone-to-errors algorithmic systems (Ryan-Mosley, 2023). With the aim of writing an “history of the present” (Aradau and Blanke, 2021) of the social construction of AI in this crucial moment, in this paper, we thus investigated how three crucial social groups are coming to terms with the fallacies of AI systems and how AI “errors” could also serve as starting point for negotiating our possible futures with AI systems (Barassi, forthcoming). Through 105 in-depth interviews with civil society representatives, tech entrepreneurs and journalists based in Europe, this paper aims at 1) mapping the concerns of three of the most engaged groups involved in the debates around AI. Additionally, through the analysis of their views and discussions of the various “errors” of AI, the paper also wants to 2) contribute to the analysis of how the critical responses to AI harms are being currently expressed and negotiated by different critical societal actors. At the same time, the paper also discusses 3) alternative AI futures, where expert views and takes on the technology are addressed towards the building of alternative future scenarios, where both dystopian and techno-fetishist views get challenged in their most evident weaknesses and rhetorical shortcomings. Overall, the paper reacts to hegemonic and normative takes on AI and its futures, looking beyond the utopia/dystopia juxtaposition, which is usually presented as ineluctable by different stakeholders (Bory, 2019). The results presented in this paper emerge from “The Human Error Project”, a multidisciplinary research project launched in 2020 with the goal of studying how different social actors are making sense of AI systems through an analysis of where the debates around the errors of these systems are driving our collective and societal construction of AI. Blending anthropology and media studies approaches and methodology, “The Human Error Project” and this paper position themselves among the growing literature and research field of critical data and AI studies.

CDE15 Autonomy in the age of big data

PP 0729 Research capture: Assessing Big Tech funding of academic research on digital platforms

Pawel Popiel¹, Sydney Forde², Hendrik Theine³

¹ University of Pennsylvania, Annenberg School for Communication, Philadelphia, USA

² Pennsylvania State University, Bellisario College of Communications, State College, USA

³ Vienna University of Economics and Business, Department of Economics, Vienna, Austria

Across the globe, intensifying policy discussions about regulating digital platforms and emerging AI services represent a key battleground over defining the future oversight of digital markets. As dominant tech companies exert immense resources to influence democratic policymaking, independent scholarly research represents an increasingly essential resource and, often, counterbalance in these debates. A growing number of major university research centers and individual scholars scrutinize various dynamics in digital platform markets, often with crucial policy implications.

However, the widespread marketization of academia, driven by neoliberal logics (Fenton et al., 2023; Mintz, 2021), has contributed to the growing reliance on external research funding for knowledge production. Increasingly pervasive academic-industry collaborations facilitate market actors’ ability to influence “the conduct and content of the research through the modification of funding arrangements” (Gläser & Velarde, 2018, p. 2). Many tech-focused research centers and individual researchers – often housed within public universities – rely on funding and data from big tech companies (see Rikap, 2023; Abdalla & Abdalla, 2021). Although efforts to secure independence from private funders exist, so do instances of big tech companies shaping research agendas through leveraging funding and, subsequently, editorial control (Dave & Dastin, 2020). How do we make sense of such collaborations between the tech industry and academia, and their potential impact on democratic policymaking and knowledge production pertaining to communication technologies?

In this study, we assess the scope of tech funding of academic research in the United States, with broader theoretical implications for other countries where such collaborations increasingly take place, fueled in part by the growing displacement of higher education institutions’ public missions by neoliberal logics like in the UK (Fenton et al., 2023). Following recent work in this area (Rikap, 2023; Abdalla & Abdalla, 2021), we focus on two major types of funding,

First, we map tech funding of academic labs and centers, using publicly available data on academic research centers, their organizational missions, funding sources, projects and research output. Second, we use data from Scopus and Web of Science to assess which individual scholars and projects receive tech funding and whether they are affiliated with the funders. Using a mixed-method approach, combining quantitative and qualitative analysis, we survey both data sources to trace tech funding influence on academic knowledge production.

Our preliminary findings reveal the complex, entangled, and often obscured web of big tech-academic relationships, out of which tech influence emerges through setting research agendas in a way that marginalizes structural critiques, reflecting a historic dominance of administrative over critical research in communication studies (Gitlin, 1978). Our study contributes to critically scrutinizing big tech collaborations within academia, with implications for accounts of big tech market power that extend beyond platform power exercised exclusively within platform ecosystems to more pernicious influence over seemingly public, independent knowledge production, and therefore over a process crucial to a democratic politics.

CDE15 Autonomy in the age of big data

PP 0730 Unmasking illiberalism in Romania: Understanding its roots, manifestations, and impact

[Madalina Botan](#)¹, Nicoleta Corbu¹, Denisa Oprea¹, Raluca Buturoiu¹

¹ National University of Political Studies and Public Administration SNSPA, Communication studies, Bucharest, Romania

This study aims to deepen the general understanding of the causes, manifestations, and consequences of illiberalism, shedding light on its implications for democratic governance, societal cohesion, and political discourse in Romania. Our goal is to have a fine-grained approach on specific factors that affect attitudes related to illiberalism, such as political knowledge, news consumption, conspiracy beliefs, vote intentions, church attendance and education. In order to analyse the predictors of people's tendency to hold illiberal attitudes, we conducted a national survey using an online panel (N = 1000), using quotas for gender, age, and education. The survey was conducted by Dynata during 23–29 March 2023.

Our data indicate that lower levels of political knowledge, propensity towards a conspiracy mindset, lower education and church attendance are associated with stronger illiberal attitudes. Additionally, consumption of news from social media is positively correlated with illiberal attitudes, while consumption of mainstream media has no impact. These findings are bound to the Romanian context, in which the role played by the Orthodox church in shaping political attitudes has proved consistent in the last decades, and the conspiracy theories have flourished especially in the context of the COVID-19 pandemic.

Furthermore, we identify a correlation between the strength of individuals' illiberal attitudes and their voting behaviour, as those with stronger illiberal attitudes are more likely to vote for extreme right-wing parties. These findings highlight the complex interplay between various attitudinal and behavioural factors and illiberalism and call for a more in-depth analysis of the broader societal and political contexts in which these dynamics unfold.

We discuss these findings in the context of the forthcoming super election year, when both EU and national elections will be a test for democratic institutions. The widespread political turmoil and the global scale crisis amplified by the wars in Ukraine and Gaza, together with the spectacular raising of extreme right-wing parties throughout Europe, call for a better understanding of illiberalism, which becomes crucial in an electoral context that has the potential to influence the future of European democracies.

CDE16 The push and pull between surveillance and resistance

PP 0821 Mistrusted identities and surveillance of Dalits in India: The case of GPS-enabled tracking of sanitation workers

[Rahi Patra](#)¹

¹ University of St. Gallen, School of Humanities & Social Sciences – MCM Institute, St. Gallen, Switzerland

While the discriminatory or intrusive aspects of algorithmic and data-driven technologies have gained attention in the West, the critical inspection of these technologies remains limited within the Indian context, especially with regards to the issue of caste. Scholars have highlighted how the historical caste-based ideologies and biases have the potential to be further encoded and solidified in the design and logic embedded within algorithmic and data-driven technologies. For instance, Sambasivan et al. (2021) highlighted how often, due to the biased idea of caste and religion, the data fed into the safety apps used for scoring and measuring the safety levels of particular locations might indicate neighborhoods resided by Dalits and Muslims as unsafe. This in turn can lead to greater surveillance of these neighborhoods. While Mishra (2021) explained that the bodies of Dalits are often assumed to have "mistrusted identities" and the deployment of biometric technologies often target these communities to gather information about them. These technological artefacts then, serve as an apparatus for verifying the truth and ensuring trustworthiness of the so-called "suspect identities for the state" (Mishra, 2021, p. 60). While these scholars highlighted the tendency where casteist ideologies and biases can also influence data-driven decision systems and their deployment, there remains a gap in exploring how the use of data-driven technologies, such as

for surveillance purposes can create conditions that potentially confine Dalits to their historically inferior caste-based identities.

Drawing on Michel Foucault's theory of biopower (Foucault, 1995, 2003), I situate this paper at the intersection of Critical Caste Studies (CCS) (Ayyathurai, 2021) and Postcolonial Science and Technology Studies (postcolonial STS) (Anderson, 2002, Ashcroft et al., 2005). In this paper, I will specifically focus on the case of GPS-enabled smartwatches used for tracking sanitation workers – predominantly comprising of Dalits to highlight how contemporary surveillance technologies can reproduce techno-colonial practices resulting in caste-based social marginalization of Dalits. I will present the results of 25 qualitative interviews that I conducted during my 3-month ethnographic fieldwork in India. The participants for the interviews are divided into two groups: 1) NGO officials working on Dalit rights and empowerment in India and, 2) Dalit sanitation workers who have been subjected to GPS-enabled smartwatches used for tracking their movements and productivity within the city of Chandigarh, India.

Based on the analysis of this data, I will highlight how the deployment of surveillance technologies, like GPS-enabled smartwatches to track the movements of sanitation workers exposes Dalits to targeted surveillance and violates their human rights. In doing so, their bodies are not only appropriated and scrutinized for data extraction but are also assumed to have "mistrusted identities" that requires to be kept under check and control.

CDE16 The push and pull between surveillance and resistance

PP 0822 Triggers of a sense of dataveillance: Empirical insights into characteristics, determinants, and affective responses

[Céline Odermatt](#)¹, Noemi Festic¹, Daniela Jaramillo-Dent¹, Kiran Kappeler¹, Michael Latzer¹

¹ University of Zurich, Department of Communication and Media Research IKMZ, Zurich, Switzerland

Digital traces generated by internet users are automatically collected, stored, and analyzed by public and private actors (Büchi et al., 2022). This digital dataveillance can become salient to individuals and elicit a feeling of being watched or listened to (Segijn et al., 2021). Such a sense of dataveillance is subjective and does not require evidence of actual dataveillance. When individuals' sense of dataveillance is heightened, they can respond by self-inhibiting their legitimate communication behavior, known as the chilling effects of dataveillance (Büchi et al., 2022). Such chilling effects are not desirable as they undermine the crucial role of digital communication in contemporary democratic societies: When digital communication is subjected to surveillance, people can be deterred from utilizing digital media for everyday activities, personal growth, societal participation, or political advocacy. From a democratic perspective, limiting individuals' freedom to engage with digital media can have detrimental consequences (Büchi et al., 2022; Penney, 2022).

Considering chilling effects as a potential danger of dataveillance, the question arises about what elicits people's sense of dataveillance. We conceptualize events in everyday life that heighten people's sense of dataveillance, mediated by technology or not, as *triggers of a sense of dataveillance*. These triggers are the starting point of the causal mechanism of chilling effects and thus need to be investigated to understand the formation of a sense of dataveillance and subsequent behavioral modifications (Büchi et al., 2022). Due to the subjective nature of the sense of dataveillance, whether everyday-life events become triggers varies at the individual level.

To deal with possible consequences of a sense of dataveillance, it is important to consider the governance of both dataveillance practices and their unintended and undesired consequences like chilling effects. Therefore, a thorough theoretical and empirical understanding of the formation of a sense of dataveillance and the factors contributing to individual differences in people's perceptions and responses is required. However, comprehensive and systematic user-centered empirical research remains scarce (Zhang et al., 2023). Thus, this study aims to: (1) identify the triggers of a sense of dataveillance and characterize them, (2) determine which everyday-life events become triggers and why, and (3) assess internet users' affective responses to triggers.

To answer these research questions, we conducted a semi-structured qualitative diary study with 17 [country blind-ed] internet users. First, the results include a systematic characterization of online and offline triggers of a sense of dataveillance based on the perceived trigger-initiating actors. Second, our findings show that everyday-life events become triggers when users consume information about dataveillance or when they feel that they are or someone else is subjected to dataveillance. Third, we found differences in the users' affective responses to triggers in terms of perceived proportionate intrusiveness of dataveillance, user agency, and certainty about dataveillance workings. This article provides an innovative user-centered contribution to research on individual differences in experiencing triggers of a sense of dataveillance and hence adds to the empirical understanding of the formation of chilling effects. The findings can inform the governance of dataveillance practices and their consequences.

CDE16 The push and pull between surveillance and resistance

PP 0823 Face recognition and personal autonomy: Practices, attitudes, and perceived risks of surveillance

[Caja Thimm](#)¹

¹ University of Bonn, Media Studies, Bonn, Germany

New technological systems for facial recognition and their increasing use in diverse contexts have opened up new challenges for democracy and personal autonomy in relation to technology and surveillance. Based on biometrics, human body movements, and particularly characteristics of the human face, these automated recognition systems measure, identify and compare human faces in order to determine the identity of a person. Hence, the face is becoming an integral part of a technological interface which enables a variety of surveillance measures. Many of the situations in which face recognition systems are used are touching on personal autonomy issues and are regarded as threatening or unethical (FRA, 2019) in relation to human rights. Particularly border crossings, policing surveillance purposes, or public transportation have come under critical view in some countries (Kosta, 2021). On the other hand, as more and more practical uses based on AI tools have come into play, such as phone unlocking, smart home control systems or fully digitized food stores, more in-depth and more contextualized evaluations are needed.

In order to understand better, how attitudes on face recognition have evolved with more personalized technologies, we carried out two empirical studies.

Study (1): online questionnaire (n = 439).

Study (2): focus groups studies (same/mixed sex groups, n = 12).

In study (1) we not only tested for situated acceptance, personal utilization and prior experiences, but we also directed attention to the fact that the face, as an intimate facet of the body, has evolved into a distinctive interface for technological interaction.

The results underscore individuals' discernment of distinct differentiations between the function and contexts of use. Notably, despite expressing minimal trust in commercial applications, there exists a widespread acceptance of facial recognition systems integrated into technical devices. This acceptance is particularly pronounced when a technology offers tangible practical advantages for end consumers, despite occasional reservations. Conversely, when the usage of data becomes ambiguous or is perceived as leveraged against personal rights, opposition towards the utilization of facial recognition systems arises, as observed in instances such as medical scenarios, public demonstrations, and customer interactions.

The findings also revealed significant distinctions contingent upon digital literacy, gender, and overarching attitudes toward technology. Evidently, participants contextualize their reception of face recognition within a diverse array of categories. To enhance the depth of these results for subsequent applications, we conducted focused group discussions (gender-specific and gender-diverse). Particular emphasis was placed on scrutinizing digital practices and body perceptions concerning technological usage in relation to the perceived sense of personal autonomy.

In light of these findings, we propose a model on "Somatic Interfaces," defining the face as a technical information surface, which serves as an expansive data pool through automated technical systems, which poses risks for citizens' rights.

CDE16 The push and pull between surveillance and resistance

PP 0824 A comparative analysis of fact-checking organizations and their impact on information integrity and democracy

[Tirse Erbaysal Filibeli](#)¹

¹ Bahcesehir University, New Media, Istanbul, Turkey

The years 2023 and 2024, marked by pivotal elections worldwide, underline the critical role of fact-checking organizations in sustaining democracies. This study examines the global landscape of fact-checking organizations, evaluating their prevalence, effectiveness, and policies in the context of the World Press Freedom Index of Reporters without Borders (RSF) and the Economist's World Democracy Index. This study, extending from the earlier research conducted in 2020 (Erbaysal Filibeli), seeks to explore whether a correlation exists between a country's ranking in various indices and the existence of effective fact-checking organizations in those countries.

A significant component of the study is the comparative analysis of the policies and methodologies employed by fact-checking organizations through the analysis of the European Fact-Checking Standards Network's (EFCSN)

and the International Fact-Checking Network's (IFCN) standards. This comparison provides insights into the diverse approaches adopted by these organizations, highlighting the variances in fact-checking practices across different political and cultural contexts. The analysis also considers the challenges faced by these organizations, including political pressure, misinformation campaigns, and resource limitations.

The research employs a mixed-methods approach, combining quantitative data from the World Democracy Index and the World Press Freedom Index with qualitative analyses of fact-checking organizations. The primary focus is on quantifying the number and analyzing the effectiveness of these organizations in different countries by comparing the rankings of those countries. The study's broader objective is to understand the impact of fact-checking organizations on the health of the information sphere in democracies. It explores how these entities contribute or not contribute to countering misinformation, particularly in the high-stakes environment of election years.

This study contributes to the ongoing discourse on the role of fact-checking in democratic societies and non-democratic societies through providing valuable insights for policymakers, media professionals, and civil society. It also lays the groundwork for future research on the evolving landscape of fact-checking in the face of digital media proliferation and the ever-changing tactics of misinformation.

CDE17 Identity in movements, governance, and media

PP 0840 Constructing identity on YouTube: How influencers portray collective identities and audiences engage with them

Ellen Van Houtven¹, Darian Harff¹, Desiree Schmuck^{1,2}

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

² University of Vienna, Department of Communication, Vienna, Austria

Social media influencers (SMIs) nowadays extend beyond entertainment and lifestyle, as they intermittently include (socio-)political issues such as the Israel-Palestine conflict, mental health, or LGBTQIA+ topics (Suuronen et al., 2022). As such, SMIs display collective identities by making shared values, symbols, or beliefs of a group salient (Klandermans, 2014). Such collective identity portrayals (CIPs) enhance the visibility of social groups and may shape intergroup attitudes.

Existing research suggests that SMIs' content features certain marginalized collective identities more frequently and in more diverse ways than traditional media (e.g., King & Fretwell, 2022). Therefore, we study, for the first time systematically, which kinds of CIPs are featured in SMIs' content. Moreover, since CIPs on social media are often unfiltered and can therefore render content more emotional, negative and antisocial (Kaakinen et al., 2018), we investigate SMIs' use of uncivil or emotional language when portraying CIPs. Lastly, drawing from the SIMCA (Van Zomeren et al., 2008) and affective intelligence theory (Marcus et al., 2000), we hypothesize that SMIs' content containing CIPs will incite more user engagement (i.e., comments per views). We also consider whether SMIs' self-identification with the represented collective identities affects these relationships.

Method

To examine the prevalence of CIPs in SMIs' content and their interplay with SMIs' self-identification, context, and user engagement, we conducted a quantitative content analysis of $N = 267$ YouTube videos. This study was informed by a youth survey ($N = 1829$), in which popular German YouTubers were nominated who (at least sporadically) discuss political topics. Inter-coder reliability tests were successful for all presented categories ($K\alpha$ and $K\beta > .70$).

Results

Findings showed that CIPs are strongly present in SMIs' political content (76.8%), with national (27.7%), gender (27.7%) and political (26.6%) CIPs being most prevalent. Over a third of the videos (35.2%) contained multiple types of CIPs, potentially suggesting portrayals of intersecting identities.

Next, multi-level linear and logistic regression revealed that sexual CIPs significantly predicted the presence of incivilities in videos ($b = 0.23$, $SE = 0.08$, $p = .003$), while videos containing gender ($OR = 0.99$, $SE = 0.47$, $p = .037$) and religious ($OR = 1.64$, $SE = 0.80$, $p = .042$) CIPs were more emotional. In general, the presence of any CIP significantly predicted emotionality in SMIs' videos ($OR = 0.91$, $SE = 0.37$, $p = .015$).

Furthermore, we found that for videos containing a CIP user engagement was higher among viewers ($b = 0.25$, $SE = 0.11$, $p = .019$). More detailed analysis revealed that the presence of political ($b = 0.30$, $SE = 0.10$, $p = .004$) and religious ($b = 0.31$, $SE = 0.15$, $p = .041$) CIPs significantly increased comments per views. SMIs' own identity did not affect these relationships.

Overall, CIPs are highly prevalent in SMIs' political content on YouTube and seem to stimulate discussions among viewers. While national, gender, and political identities received more attention in SMIs' content than marginalized

identities. SMIs' use of incivilities and emotionality when portraying these marginalized CIPs points to the risk of polarization.

CDE17 Identity in movements, governance, and media

PP 0841 Exploring patchwork religions – An automated text analysis of new ideological movements

[Anna Davydova](#)¹, Saïd Unger¹, Thorsten Quandt¹

¹ Westfälische-Wilhelms-Universität Münster, Department of Communication, Münster, Germany

By crafting their ideology from various esoteric, spiritual and religious movements and enriching them with conspiratorial and anti-establishment themes, so-called, "patchwork religious groups" (PRG), simultaneously distinguish themselves from established religious groups and also incorporate their ideas. These PRG construct alternative narratives and can thereby challenge mainstream logics (Bromley, 2012). While not all such movements are inherently problematic, some of them are spreading disinformation, conspiracy theories and questioning democratic values. Their ideologies can undermine the consensus on scientific findings, and their supporters do have a tendency to develop extreme positions on vaccination, climate change and political elections.

While New religious movements (NRM) have been studied by different disciplines, mainly religious sociology, psychology and political science, there are few studies addressing patchwork religions, the online networking of these groups as well as the mixture of conspiracy theories, religious beliefs and general societal concerns (Moon, 2023), especially in communication science. However, research on PRG's online communication is highly relevant, as they use social media platforms to disseminate their agenda and recruit new members (i.e. inward and outward communication).

We focus on the German Querdenken (QD) movement, as it is a perfect host for such hybrid ideologies, making use of crises, esoteric and anti-establishment sentiments. While it was originally anti-lockdown, the movement quickly jumped on general anti-government narratives and pro-Russia topics.

As the defining criterion of PRG is their patchwork character, we are most interested in the composition of these groups in terms of the themes discussed among them. Or simply put: how do patchwork religious groups combine themes to create their own ideology?

We base our study on a dataset of QD messages from large city-related groups on Telegram and gather additional chats (groups and channels) mentioned or cited therein. We manually evaluate these chats and retain chats discussing religious, spiritual or esoteric themes and gather their messages since their inception on telegram.

To assess the thematic blend, we run a BERTopic model to classify individual messages and aggregate them on the chat level. We then employ a qualitative approach to analyze the proportions of different themes discovered via BERTopic. Initial results show a variety of topic combinations that indeed include themes with religious, political and more mainstream themes. Some center around a main theme like a conspiracy narrative or specific political decisions and branch out to less referenced topics while others apply broader approaches, seemingly jumping on most current topics. Understanding these patchwork patterns is an important step towards understanding communication strategies of PRG, how they define themselves and how they present themselves to potential followers.

CDE17 Identity in movements, governance, and media

PP 0842 The diversity of alternative media users: Socio-demographics, political attitudes, and social media use

[Christian Strippel](#)¹, Boaning Gong², Annett Heft², Martha Stolze³, Elizaveta Kuznetsova³, Jakob Ohme³, Victoria Vziatysheva⁴, Felix Gaisbauer³

¹ Weizenbaum Institute for the Networked Society, Weizenbaum Digital Science Center, Berlin, Germany

² Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

³ Weizenbaum Institute for the Networked Society, Digital Markets and Public Spheres on Platforms, Berlin, Germany

⁴ University of Bern, Institute of Communication and Media Studies, Bern, Switzerland

As a result of multiple social and political crises in recent years, we are witnessing a growing mistrust of political institutions and media organizations in many European countries (Humprecht, 2023). In this context, a variety of new media, which position themselves as "alternatives" to established news media, have gained greater popularity (Heft et al., 2020). Unfortunately, it is difficult to study the users of these media, as many of them are skeptical of scientific research (Rutjens & Večkalov, 2022), and assume that their usage behavior is not socially accepted

(Ischen et al., 2023). In addition, alternative media users make up only a small part of the population, so that even general surveys do not provide a sufficient data base to gain deeper insights into this group.

We address this research gap with an online survey of more than 2,000 alternative media users recruited through a large German panel provider. We defined "alternative media" as "special news providers that generally differ from the classical or established information media," and considered a wide variety of outlets, including left-wing and far-left, right-wing and far-right, pro-Russian, conspiratorial, and mixed ideological alternative media. Using a combination of population-representative recruitment, targeted screening, and a questionnaire that allows us to compare our sample with the German population, we are able to study the users of these media in detail while placing them in a broader context. Our research questions concern (1) the prevalence of different groups of alternative media users in Germany, (2) their socio-demographic characteristics, (3) their political attitudes, and (4) their political engagement on social media.

Our results show that (1) about 17% of the general population uses alternative media for political information. (2) Although alternative media users are more likely to be male, younger, and better educated, these sources are used across all socio-demographic groups. (3) Alternative media users appear to be slightly more interested in politics than the general population, but while they are interested, they are also more disillusioned with the existing political order and show a lower level of trust in democratic institutions. Of particular note is the level of satisfaction with democracy, which is considerably lower among alternative media users than among the general population. (4) Finally, alternative media users rely heavily on social media platforms to receive news about current events, with Facebook and Instagram being by and large the preferred social media platforms. They are also more active than the general population in sharing and commenting on news on social media platforms.

PP 0843 Unraveling social and communication disorder in Western Democracies through Piketty and Bourdieu

[Wies Van Der Stroom](#)¹, [Alexis von Mirbach](#)¹, [Annabell Burkhardt](#)¹, [Clara Uttenthal](#)¹, [Dafne Pérez](#)¹, [Ida Dreiaeger](#)¹

¹ Ludwig Maximilian Universität, Institute of Communication and Media Research, Munchen, Germany

Exemplified by the rise of populism, Piketty (2020) sheds light on the social disorder in Western democracies due to a transformation of the traditional left-right cleavages within the voting structure and discourse in which political conflict no longer takes place between top and bottom, but between the cultural elite versus the financial elite. Combined with the increasing economic inequality following neoliberal reforms since the 1980s, Piketty observes legitimate feelings of abandonment in populist movements.

We apply Piketty's findings with Bourdieu's concept of homology to the field of journalism to analyze whether this social disorder also exists as a communication disorder. In three steps we analyze four high-quality democracies: the US, Germany, the Netherlands, and Denmark. First, we use reader audience data to prove that the homology voting structure applies to the journalistic field. Secondly, we selected from the field for each country, media with high symbolic capital (and the relationship cultural capital > economic capital) and low symbolic capital (and the relationship economic capital > cultural capital). The high symbolic media were NYT (US), SZ (Germany), NRC (Netherlands), and Politiken (Denmark). The low symbolic media were Fox News (US), Bild (Germany), Telegraaf (Netherlands), and Ekstra Bladet (Denmark). Thirdly, we identified the economic positions through a content analysis by identifying six "neoliberal key dates" from the "Economic Recovery Tax Act" of 1981 to the "Tax Cuts and Jobs Act" of 2017 in the US. In addition, we identified three national key dates for each of the other three countries. Following the ideal of a functional communication order, we hypothesize that low-symbolic media are against tax cuts for the rich and against welfare cuts for the poor, and high-symbolic media will be for tax cuts and welfare cuts. At the same time, we expect that media with a higher ratio of economic to cultural capital will favor free market policies and, conversely, media with higher cultural capital will be more likely to oppose neoliberal reforms.

In the collection, we divided the articles into those reporting directly on the neoliberal key date (direct event) and those mentioning the head of state in another context (other event). Across all media analyzed, we found a significantly higher number of "other event" articles for the 1981, 1986, and 1996 key dates, indicating that the

initial tax and welfare cuts were not relevant to the media agenda and that their subsequent global impact on economic inequality was not anticipated.

For the neoliberal key dates starting in the 2000s, we found a much higher number of direct events in the European media, while the US media still had higher numbers of other events. These results suggest that neoliberal reform received significantly more attention in the European public debate. This difference can be explained by the longer welfare tradition in Europe and the tradition of a democratic-corporatist media system instead of the liberal model in the US. Our more detailed analysis will be presented in Ljubljana.

PP 0927 Media supply side analysis to enhance participatory democracy: The case of Portuguese market

[Tatiana Chervyakova](#)¹, [Nuno Cintra Torres](#)¹, [Manuel José Damásio](#)¹, [Ana Filipa Oliveira](#)²

¹ Lusófona University, CICANT, Lisbon, Portugal

² Lusófona University, CICANT, Porto, Portugal

According to the Portuguese Constitution (Art.2), "deepening participatory democracy" is one of the core goals of the republic. Participatory democracy implies "an open information system to ensure informed decisions" (Held, 2006), thus giving the national media the task of mediating the debate, empowering people to speak out, and being included in the decision-making process. This paper examines Portugal's media market supply side to analyze the diversity of its public service, commercial and non-profit media offering, market transparency, plurality, and standards of journalism content production which affect the capacity of the media system to cater as a forum for public participation. A supply-side analysis that articulates the strengths and weaknesses of the national media market, contributes to further developing recommendations aimed to foster democratic participation through media.

The research was conducted within the framework of the project Mapping Media for Future Democracies (Horizon Europe no. 101094984), the aim of which is to assess how national media in 9 European countries meet democratic criteria and challenges, as well as under which conditions they perform. The results are based on the analysis of secondary data, namely the country's related legislative documents and institutional research (Obercom, Markttest), country-level data from international research projects (Digital News Report, Media Pluralism Monitor), and primary data coming from semi-structured interviews with national experts. This was supplemented in view of triangulation with the creation and analysis of the data set of national media offerings covering audiovisual, press, radio, and digital native media. Overall the sample considered 228 media outlets with news elements.

Results show that Portugal is highly ranked in the World Press Freedom Index (RSF, 2023 – 9/180) and trust in media (Reuters Institute, 2023 – 3/46), but branded a "flawed democracy" (EIU, 2023, p. 52). The peculiarity of the Portuguese media market can be considered a high level of transparency of ownership, a mandatory declaration by each media outlet of its goals and mission in a publicly available Editorial Statute, and the absence of widely spread media associated with political forces due to the existing legislation. The political orientation of most media outlets cannot be unambiguously labeled, which, in addition to the legislation, the expert attributes to the "catch-all" strategy of the small media market representatives aimed at reaching as wide an audience as possible for the outlet to have revenues. However, the legislative infrastructure faces the systematic problem noted by the experts – enforcement of rules, which leads to significant violations affecting the stability and development of the media industry.

By providing an overview of the current media market offering in a Southern European Country, the study aims to highlight already suitable premises for democratic media operation and articulate the shortcomings to contribute to designing pathways to enhance political participation and civic engagement development in the contemporary European media landscape. The presentation will focus on results presentation and discussion along with initial comparative analysis at the European level and discussion of identified key variables and trends.

PP 0928 Performing nationalism and cosmopolitanism: Self-representation of Chinese diaspora on Douyin under the commercial logic

[Xiaoyu Zhang](#)¹

¹ Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

Given the popularity of Douyin (Chinese version of TikTok), a hyper-commercial short-video platform, among Chinese both at home and overseas, this research investigates how the Chinese diasporic communities represent their everyday life in host countries and perform their national identity on Douyin. Through a qualitative content analysis

of the eighty most popular videos and their audience comments on Douyin under the hashtags # a life oversea, #diary of a life oversea, # documenting a life oversea, the research revealed the diasporic vlogger's performance of Chineseness (nationalism) and cosmopolitanism to increase the visibility and monetize from the data traffic, under the commercial logic of Douyin. The discourse of nationalism and Chineseness is very salient in textually, visually, and audially articulating their daily life in host countries, especially concerning the representation of the internationalization of Chinese culture (eg. Chinese food, festival, costume, media products), although it is often expressed in a playful and humorous way. By framing the internationalization and popularization of Chinese culture in the host countries, both vloggers and the audience envisage the cosmopolitan orientation of the Chinese nation. Besides the overwhelmingly nationalistic discourse, cosmopolitan discourse also appears in the vloggers' representation exemplified by their cosmopolitan consumption, their seemingly beyond-nation friendship, and international mobility, which demonstrates their social capital and class-based privileges. However, cosmopolitan discourse is framed through and interplays with the national discourse. The study shows that in Douyin's landscape where nationalism is a predominant discourse, representing diasporic life in a nationalistic way is more visible and favored, which in turn reinforces Chinese digital nationalism. The study also reveals that nationalism can be compatible with cosmopolitanism and the two ideologies can go hand in hand to negotiate one's identity (Kyriakidou, 2009; Beck, 2006). Moreover, both Chineseness (nationalism) and cosmopolitanism can be commodified to increase visibility given that Internet celebrities (Wanghong) can make a huge profit from their data traffic on the hyper-commercial Douyin platform.

PP 0930 Comparative analysis of the Italian media landscape: Evaluating risk and opportunity domains in a European context

Javier J. Amores¹, Martin Oller Alonso², Sergio Splendore³

¹ University of Milan, Social and Political Sciences, Milan, Italy

² University of Salamanca, Sociology and Communication, Salamanca, Spain

³ University of Milan, Social and Political Sciences, Milan, Italy

Studying the media landscape and the conditions influencing deliberative communication within a media system is crucial since it provides insights into how media diversity, freedom, and practices impact public discourse and democracy. Understanding these dynamics is essential for ensuring that the media serves its role as a watchdog and public informant effectively. Such analysis can inform policies and strategies to enhance media quality and integrity, counter misinformation, and support journalistic freedom. It also contributes to the broader understanding of media's role in society, particularly in a rapidly evolving digital and globalized world.

For these reasons, this study – developed within the framework of the EU Horizon 2020 research project MEDIADCOM –, presents a comprehensive analysis of the conditions influencing deliberative communication in Italy's media landscape, using the Fuzzy-set Qualitative Comparative Analysis (fsQCA) not only to analyze the Italian context, but also to compare it with the media landscapes of other European countries. By comparing Italy with other European countries, the study seeks to highlight the distinctive characteristics and challenges of the Italian media environment, offering insights essential for informed media policy-making and the advancement of media studies in the European context. The fsQCA method allows for a nuanced analysis of the interplay of different factors that shape the media practices and policies in Italy, contributing to a comprehensive evaluation of the country's unique media system. It involves identifying specific conditions within the journalism domain and assessing their impact on the outcome of deliberative communication.

Key findings indicate that in Italy there is a legal framework apparently aligned with European standards of freedom of expression, but with some conflicting legislation. The media system is mainly characterized by hybridity and concentration, reflecting the Mediterranean polarized pluralist model. Media-related competencies and literacy show varied levels of development across different areas and population groups. The journalism market, while diverse, faces economic constraints and legal pressures. Considering this, in a comparative level, Italy presents unique characteristics in its media landscape when compared with other surrounding countries, primarily in areas of media market concentration, journalistic professionalism, legal and ethical frameworks, digital transformation, and media literacy. Italy's media market, dominated by a few major companies, particularly in television, limits media diversity and influences journalistic practices. There is also a notable presence of journalists in precarious positions and a lower share of educated journalists, impacting journalistic quality. Legal protections for journalists and whistleblowers are inconsistent, reflecting challenges in enforcing freedom of speech and press. Digital advancements and the evolving role of social media in news dissemination present both challenges and opportunities in maintaining journalistic integrity and combating misinformation. Media literacy initiatives are crucial for equipping the public to critically engage with media content amidst these changing dynamics. These factors collectively shape Italy's media system, distinguished by specific risks and opportunities compared to its European counterparts. The study suggests a need for continued monitoring and policy development to navigate the dynamic interplay of

legal frameworks, media practices, and competencies in fostering a healthy media environment conducive to deliberative communication.

PP 0931 Mitigating social disorder? Exploring the cohesive potential of public service broadcasters

Daniel Stegmann¹, Birgit Stark¹

¹ University of Mainz, Department of Communication, Mainz, Germany

Given the multiple crises in recent years, social cohesion is increasingly invoked in public debate as a means of mitigating social disorder and overcoming existential threats like the Corona pandemic. In this context, media's role is ambivalent as it can contribute to both social cohesion and division (McQuail & Deuze, 2020). This paper focuses on the cohesive potential of news media and specifically highlights the role of Public Service Broadcasters (PSBs) in the case of Germany.

News media ideally foster social cohesion by sustaining the public sphere that enables citizens to participate in society via public discourse, form a common understanding of social reality, and therefore overcome political differences. This should facilitate attachment to society, i.e., a *sense of community* (McMillan & Chavis, 1986) as a core element of social cohesion (Strömbäck, 2015). We argue that PSBs best serve this public forum-function, where media are expected to represent the various voices, positions, and issues in society fairly and adequately (*fair and adequate representation*; Fawzi & Mothes, 2020). Thereby, individuals can see their important issues and perspectives publicly represented and thus perceive themselves as valuable members of society, while a lack of representation would contribute to the perception of being excluded from society. Furthermore, fair and adequate representation is supposed to foster mutual visibility of the various social groups with their issues and positions, which contributes to sense of community by reducing social distance and promoting tolerance toward citizens with different perspectives (Jakubowicz, 2007; Park et al., 2023; Schneiders et al., 2023). In Germany, PSBs are legally required to provide internal pluralism, i.e., to report diverse, address, and represent all groups in a balanced manner. PSBs' legal obligations therefore contain precisely the mechanisms that should ideally promote cohesion and therefore produce public value (Serong, 2011). We thus assume that using PSBs for news is positively associated with various indicators of perceived representation in the news (generalized perceived representation: 4 items, $\alpha = .85$; perceived representation of one's issues and opinions: 2 items, $\alpha = .75$; perceived insights into the issues of opinions of others: 2 items, $\alpha = .79$; H1), which subsequently foster sense of community (5 items, $\alpha = .87$; H2).

To explore these hypotheses, we conducted a representative cross-sectional, mixed mode survey (50% each CATI and CAWI) in Germany in summer 2022 (N = 1008). Multiple regression analyses show that using PSBs for news is positively associated with all three indicators of perceived representation, confirming H1. However, only two of those indicators (generalized perceived representation, perceived representation of one's issues and opinions) are positively linked to sense of community. For both mediators, mediation analyses show a positive indirect from using PSBs for news on sense of community. Finally, using PSBs for news is also directly positively linked to sense of community. Therefore, H2 is partly confirmed. In summary, our analysis indicates a cohesive potential of using PSBs for news, which tentatively suggests that strong PSBs can promote unity in societies and therefore act as a counterbalance to social disorder.

CDE19 (Dis-) ordering datafication and automation: Towards people-centred ADM

PN 137 From citizens to data points: (un-human) experiences of data welfare state from the margins

Karoliina Talvitie-Lamberg¹, Sanna Valtonen², Kaarina Nikunen²

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

² Tampere University, Communication Sciences, Tampere, Finland

This paper is based on an empirical study that investigates experiences of datafication in the everyday life among three social groups that are considered to be vulnerable in terms of their opportunities or life situation: the undocumented migrants, unemployed persons and the older adults. Based on diaries, interviews and case studies with 87 participants the paper introduces the manifold and often ambiguous experiences of datafication among these groups in Finland. Our approach draws on postcolonial feminist thinker, Chandra Mohanty (2003), who argues that envisioning a just and democratic society requires understanding the experience of some of the most marginalized. While automated data driven systems may provide efficiency and ease to many, in our data, experiences of datafication were connected to a sense of invisibility, mistrust and loss of agency in different ways. While some particularly suffered from the increased surveillance and lack of access to social services, others were more concerned about becoming data points and targets of data driven advertising (Jørgensen 2023). The research also shows the contextual nature of datafication: it becomes visible in different life situations from seeking jobs to asylum process, from public transport to banking – and accordingly shapes social relations and social status in various ways. Our participants experiences speak of the complicated connections between visibility and invisibility (Taylor &

Broeders 2015). In other words, participants lacked means to negotiate appropriate levels of data visibility, therefore not being able to control or know how and when their data is used for their harm or benefit. Yet on a general level the participants' showed awareness of data extraction and data leakages that they considered as inevitable part of contemporary digital environment. This awareness increased their sense of mistrust towards the changing technological structures and data driven systems of the welfare state. Overall, the research illustrates the embodied transformation from citizens with rights to data points. The study echoes concerns raised by Dencik and Kaun (2021) on the possible conditionality of social protection with increased surveillance and shift in values encoded in digital infrastructures as well as the diminishing role of citizens design of the public services (Broomfeld and Reutter 2022). In addition, our study points out the growing lack of human encounters and human contact in data driven welfare services that seems to distance people from the idea of a shared collective world and society. This aspect raises concerns over the conditions of social commitment and solidarity, along with equality, that are considered essential for the idea of a welfare state. CDE19 (Dis-) ordering datafication and automation: Towards people-centred ADM

PN 138 De-biasing automated decision-making in the public sector

[Hadley Beresford](#)¹

¹ University of Sheffield, Sheffield Methods Institute, Sheffield, United Kingdom

In recent years, algorithmic technologies have been increasingly relied upon in the UK civil service and the public sector more broadly. As these technologies enter more mainstream use, cases of algorithmic bias have become more prevalent. Algorithmic bias describes how through a combination of social, technical, and probabilistic mechanisms some people are penalised, or denied opportunities, due to their membership of a marginalised group. Concern regarding these cases has led to the development of 'de-biasing' methods which attempt to remove harmful biases from algorithmic technologies and the datasets they rely on. However, it has been argued that discourses focusing on 'bad' algorithms and 'bad' data creates a narrow field of inquiry and limits practitioners' ability to recognise how data and algorithms connect to wider issues of injustice within the context of society (Hoffman, 2019). To counter this, it has been suggested data practitioners must adopt socio-technical algorithmic bias mitigation methods which acknowledge the contextual nature of data, move away from framings which position data as objective and neutral, and critically question "the social relations, activities, and histories that shape any particular setting" (Green, 2020, p9; Selbst et al., 2018). However, to date, little research has been conducted to understand how data practitioners perceive socio-technical algorithmic bias mitigation tools, and the challenges present in adopting them in a civil service context. In this paper, I will discuss my initial findings from a qualitative project which investigated how civil servants perceived socio-technical algorithmic bias mitigation approaches such as VSD (value sensitive design), critical data skills, and AIAs (algorithmic impact assessments). The data for this paper were collected through conducting a series of seven educational workshops on algorithmic bias mitigation, and seven follow up interviews with practitioners in the UK government department, the Department of Work and Pensions (DWP). The workshops focused on how algorithmic bias might develop, and explored bias mitigation tools such as algorithmic impact assessments and value sensitive design. After these workshops participants were invited to take part in a follow up interview, to allow them to reflect on the content of the workshops and its relevance to their working practices. Interviews were analysed using reflexive thematic analysis. Drawing on my research, I argue it is difficult for civil service practitioners to align technologies to the social justice values which underline socio-technical bias mitigation approaches when servicing a large diverse public. Participants explored this issue by talking about the rights and perceived expectations of taxpayers, and how taxpayers often had diverse and conflicting views. Furthermore, civil service practitioners' room for action is limited by the political structures they work within, and government policy approaches may sometimes be in opposition to social justice values.

CDE19 (Dis-) ordering datafication and automation: Towards people-centred ADM

PN 139 Reimagining the interaction between the state and the citizen through a state-wide chatbot

Maris Männiste¹

¹ Södertörn University, Department of Media and Communication, Stockholm, Sweden

Recent years have seen surge in governments interest towards using chatbots, in assisting citizens with their information needs (see, e.g., Simonsen et al., 2020; Verne et al., 2022; Mehr et al., 2017), liberate street-level bureaucrats from time-consuming tasks and increase the quality of the communication channels (Androutsopoulou et al., 2019). The adoption of chatbots is more than often driven by the objective of enabling public agencies to allocate more time to personalised and value-added services for citizens (Sun & Medaglia, 2019). Chatbots as „digital mediators“ in disseminating administrative information and services bring on challenges to both the organisations making use of them as well as the citizens. As research findings illuminate, the use of chatbots can be challenging for citizens who may lack comprehensive domain knowledge, such as specific administrative terminology, or the ability to craft effective prompts (Simonsen et al., 2020; Verne et al., 2022). Contemplating chatbots as the initial point of contact for citizens with public agencies, the accuracy and relevance of chatbot responses hold significant implications for citizens' life situations. This complexity is further compounded when chatbots are designed to emulate the functions of popular voice assistants, as exemplified by the Estonian chatbot currently in development, which aspires to be the "Siri of public sector services" (Grzegorzczak, 2021). The present paper draws on the Estonian case study, part of bigger project, investigating the automatization of the Estonian welfare state, particularly the implementation of the named state-wide chatbot, which is supposed to reimagine the interaction between citizen and state. This study draws upon a qualitative case study where the combination of document analysis and interviews with key stakeholders engaged in the development and implementation of the specific chatbot are used. Findings will illuminate the interrelated relation between the public and private sector as well as the invisible labour chatbot implementation introduces to public agencies.

CDE19 (Dis-) ordering datafication and automation: Towards people-centred ADM

PN 140 'Warm' human interactions vs. 'cold' technological solutions – The case of Maternal Benefit

Emma Hughes¹

¹ University of Leipzig, Media and Communication Studies, Leipzig, Germany

The introduction and implementation of automated decision-making systems (ADM) within the German welfare sector is an ongoing process whose effects on citizens' rights are difficult to capture. In order to explore this area of experimentation, we studied the Maternal Benefit department of the Federal German Office for Social Security. In 2019, the Maternal Benefit department received a bespoke semi-automated ADM system tailored to its requirements to optimise the management and administration of the payments to the maternal benefit applicants, and to simplify the workflow on the 'inside' of the public agency. Data gathered during field research in the Maternal Benefit department allows for a closer look at how the ADM system affects the inner workings of the department. The complex and multifaceted issues of introducing a semi-automated solution to a given structure that was originally built for paper-and-pencil handling ranged from technical to human aspects: Which elements in the processing of data could and/or should be taken over by an ADM system? What would justify the use of the system and what would be ramifications deemed problematic and by whom? Which tasks should remain in the hands of human case workers and who is entitled and competent to make that decision? These issues become tangible in our interviews (N = 12) and participant observation, where employees on both the technical and practical end of the ADM system give their assessment of its function and use. The employees involved find themselves amidst

a negotiation process, reaching terms for and sustaining a solution in which a necessary digitalization of the public welfare sector can coexist with the needs of those whose occupations are at stake. Data from field research in the department Maternal Benefit makes clear that case workers have managed to resist a full automation of the ADM system since its implementation in 2019, which would make most of their jobs in this department obsolete and could cause a possible reallocation to a different department within the public agency. They do so by juxtaposing 'warm' human interaction and 'cold' technological solutions. Hence, next to top-down decisions, our case shows how power dynamics play out on the bureaucratic ground floor when ADM systems are meant to weave into existing structures. Preliminary findings of the Maternal Benefit case study suggest that the implementation of the department's ADM system is not about reaching any final stage but remains in a perpetual state of negotiation. The usage of ADM in the public agency is an ongoing process, influenced by personnel changes, the redistribution of funds, and political influence.

CDE19 (Dis-) ordering datafication and automation: Towards people-centred ADM

PN 141 Critical companionship for good datafield futures

[Stine Lomborg](#)¹, Lisa Reutter¹, Victoria Andelsman¹

¹ Copenhagen University, Department of Communication, Copenhagen, Denmark

Academic narratives of psychic numbing (Zuboff, 2019) and digital resignation (Draper & Turow, 2019) suggest that people have a reduced sense of agency in shaping the data practices of public and commercial actors, despite not being oblivious to harmful sides of datafication (e.g. Kennedy et al 2021; Ruckenstein 2023). In this paper, we discuss how we, as researchers, can probe people's thoughts, feelings, and desires about datafication and thereby cultivate a sense of agency to inform policy making and technology design? We suggest everyday encounters with data about oneself might play an important role in facilitating both personal and collective imagination about data and agency in devising future paths toward good, legitimate, and meaningful datafied living. Lending inspiration from the figure of the researcher as critical companion (Ziewitz and Singh, 2021) and from speculative design (Dunne and Raby, 2013; Farias et al., 2022), we posit that critical consciousness-raising is generated from below, through taking people's everyday encounters with datafying themselves and being datafied by others seriously. Based on this, the paper offers an introduction to a methodological toolkit on how critical consciousness can be cultivated and collectivized, combining three different methodological entry points: longitudinal fieldwork with repeated interviews, visualisations of data flows derived from people's own phones, and speculative workshops on future data practices. These are illustrated with reference to empirical evidence from an ongoing multi-method study of datafied living in Denmark. In this paper we are especially focusing on two mundane forms of datafication that many of our participants encounter nearly every day. Namely billing data from grocery stores and data about children from Danish parenting apps. Through methodological and empirical examples, this paper shows how everyday encounters with data can provide valuable, tangible starting points to discuss and cultivate personal agency and collective visions of good and legitimate datafication practices.

CDE20 News automation: From democratic principles to socio-material practices

PN 149 Who owns transparency at BBC? Mapping the principles-to-practices gap of responsible AI

[Hannes Cools](#)¹, Anna Schjøtt Hansen²

¹ University of Amsterdam, Faculty of Social and Behavioural Sciences, Amsterdam, Netherlands

² University of Amsterdam, Faculty of Humanities, Amsterdam, Netherlands

Transparency and explainability are often considered critical to the development and implementation of responsible (generative) AI. In an era that is increasingly dominated by algorithmic decision-making, this study wants to better understand how principles like transparency and explainability are specifically translated into practices at the BBC. We conducted 22 expert interviews and gathered observations with news workers from various BBC departments to investigate the mechanisms shaping the principles-to-practices gap vis-a-vis responsible AI. Preliminary findings describe a discernible gap between stated principles and actual practices, specifically revealing complexities in ownership structures. While principles of transparency and explainability are articulated at an organizational level in the form of responsible AI policy guidelines and Machine Learning Principles, their interpretation and execution vary across different departments. This research maps the precarious journey of implementing responsible AI, exposing divergences between organizational intent and individual departmental applications. One emerging pattern within the findings highlights the lack of clearly defined roles and responsibilities of specific BBC departments when it comes to responsible AI. The absence of clearly outlined roles and responsibilities may lead to ambiguity and confusion, potentially resulting in an uneven distribution of responsible AI. This ambiguity can create a breeding ground for ethical lapses and inconsistent decision-making across departments, undermining the very principles of responsible AI that the public broadcaster aims to uphold. Unpacking the nuanced interplay between principles and practices in this study not only sheds light on the challenges faced by the BBC in navigating responsible AI but also provides valuable insights for news organizations globally. As the media landscape continues to evolve,

grappling with the ethical dimensions of AI becomes imperative for ensuring journalistic integrity and public trust in an increasingly algorithmically curated news ecosystem and society.

² University of Copenhagen, Department of Arts and Cultural Studies, Copenhagen, Denmark

This article explores the epistemic practices and doxa of data workers in a news organisation in Denmark that is currently developing and experimenting with artificial intelligence (AI)-driven recommender systems and natural language processing solutions. Previous literature on the changing epistemologies of digital journalism has focused on the increased role of metrics and the transformed practices inside newsrooms, as well as on how journalists perceive and articulate the computational. This article advances these studies by focusing on how data scientists perceive and articulate 'the journalistic' when building AI systems for distributing news. The analysis in this article builds on ethnographic fieldwork and in-depth interviews at Ekstra Bladet (EB), a part of the larger media conglomerate JP/Politikens Hus, from February to November 2022. Developing the notion of 'the algorithmic gut feeling', the article highlights different frictions present in the articulations of the journalistic doxa in AI-driven data work concerning (1) how to algorithmically define ethics, (2) how to algorithmically categorise and understand relevance, and (3) how to algorithmically curate 'a good mix' for the front page. Viewing these processes of 'articulating the journalistic' in data work via the lens of doxa, we show how data workers interpret the journalistic translating it into their own domain doxa. Both domains for example evaluate how to curate a 'good mix' for the front page, evaluations done with reference to normative doxic values of what journalism is and should be, but the data workers developed the models to enhance news consumption via clicks and struggled to incorporate softer and less numerical values when using their gut feeling to evaluate what the models did. The developers sought to align computational evaluations with editorial strategies, with the project manager often working as a liaison and knowledge broker between the editorial mission and the data science doxa. It also illustrates the difficulties that the data workers faced in perceiving what the editorial goals were, and even when they knew them, they did not always translate directly into the evaluations of the machine learning models they built. The emerging frictions and algorithmic gut feelings are key to understanding how the doxa of data workers involved and deeply invested in "the good of journalism" at times also transforms journalistic epistemologies of what constitutes 'news' and 'the right mix' in the service of a democratic public.

CDE20 News automation: From democratic principles to socio-material practices

PN 151 "I must have clicked on something" – Assessing news recommendations from an everyday perspective

Árni Már Einarsson¹, Elisabetta Petrucci², Stine Lomborg¹, Jannie Møller Hartley²

¹ University of Copenhagen, Department of Communication, Copenhagen, Denmark

² Roskilde University, Department of Communication and Arts, Roskilde, Denmark

In the news media, there has been a tendency to see news workers as gatekeepers and agenda-setters providing the audience with the information news they need to function in and contribute to democratic societies. With the advent of news personalization and the introduction of algorithmic recommender systems, this intermediary function is increasingly governed by AI-models. Not surprisingly then, the literature discussing and evaluating the role of news recommendation tends to focus on finding the balance between what the users want and what the editorial staff think they should read in the design of such systems (Møller, 2022), according to the normative democratic role of journalism in democracy (Helberger, 2019). Previous literature has productively highlighted the potential benefits and shortcomings of the implementation of algorithmic recommendation for democratic society and the collective, whereas studies rarely situate the evaluations and consequences of personalized news use in the broader context of everyday news use, implicitly seeing users mainly as passive and rational users. When acknowledged, individual choices are presented as a negative factor, with individuals always choosing 'lighter' forms of news – such as entertainment or sport – over more 'serious' kinds of news – such as politics and international affairs (Boczkowski & Mitchelstein, 2013). Adding nuance to the conception of audiences in AI systems in news, our research asks: How does personalized recommended news feed into the existing audience news reading patterns and their expectations of the role and function of news in their everyday lives? Addressing this question, we devised a two-stage experimental workshop format intended to triangulate between users' individual experiences and the collective function of personalized news. This was done by exposing users of the tabloid media Ekstra Bladet to personalized news and carrying out in-depth and individual protocol-interviews with 25 users as they were using the personalized site. The second part of the methodological setup involved 5 focus groups centered around the themes of personalization of news and their collective experiences of this. Thematic analysis of our data material summarizes how audiences make sense of, interact with, and evaluate news recommendations using three

guiding principles: personal relevance, editorial line, and news genre expectations. Aside from providing insights into the challenges of recommender systems automatically determining relevance and governing the editorial line, the results point to a relation between how audiences perceive the function of the news in their everyday lives and their need for systems automatically curating their news interfaces by personal relevance.

CDE20 News automation: From democratic principles to socio-material practices

PN 152 Snapping the news: The dynamic gatekeeping of a public broadcaster reaching youth on Snapchat

[Heidi Røsok-Dahl](#)¹

¹ Oslo Metropolitan University, Department of Journalism and Media Studies, Oslo, Norway

News media struggle to get the attention of young users, essentially at the mercy of platforms, which have their own logic and algorithmic operations (Vázquez-Herrero et al., 2022). Dependencies on platform logics, including datafication and algorithmic filtering driven by commercial rather than public service interests poses challenges for media houses as well as journalists (e.g. Nielsen & Ganter, 2022). This unique ethnographic study from an editorial group within Norway's Public Service Broadcaster NRK explores how the journalists negotiate Snapchat's algorithm in their daily news dissemination on Snapchat Discover. Snapchat has gained significance as a popular platform among youth, with many legacy news media, including NRK, adopting it as a more playful channel for distributing news content. For Public Service Media (PSM) the problem of attracting younger audiences makes it increasingly difficult to obtain near-universal reach in line with their public service remit (Schultz et al., 2019) potentially threatening PSM's popular support and the legitimacy of their public funding. Capturing young people's news interest has thus become a key strategic priority for PSMs. The relationship between journalists and platform companies is intricate, involving dependencies and conflicts. Presence on platforms like Snapchat has advantages, including increased visibility and engagement, especially with elusive younger audiences. However, these platforms also act as gatekeepers, through extensive guidelines and algorithmic filtration impacting the spread of news media's content (Blanchett, 2021; Hermida, 2020; Wallace, 2017). Research on how newsrooms navigate Snapchat's guidelines and algorithmic filtration, such as the "flagging" practice, the ABCD-testing of "tiles" and how editorial decisions and algorithms influence each other on Snapchat, is limited. Addressing this gap through ethnographic fieldwork at NRK in the editorial group "NRK UNG" (Youth), this study identifies complex gatekeeping dynamics between Snapchat's algorithms, journalistic news values, and audience influence. The study expands on existing gatekeeping theory, incorporating recent advancements, and shows how Snapchat's algorithmic gatekeeping influences the whole publication process; before, during and post-publication, highlighting the dynamic gatekeeping between human news judgment based on established values, algorithms, and the young audience.

CDE20 News automation: From democratic principles to socio-material practices

PN 153 Media freedom from AI companies: how European law can address infrastructural capture

[Max van Drunen](#)¹

¹ University of Amsterdam, Department of Information Law, Amsterdam, Netherlands

The media increasingly uses Artificial Intelligence (AI) to gather, produce, and distribute news (Beckett & Yaseen, 2023). An emerging body of literature in journalism studies has mapped out how this use of AI puts the media at risk of 'infrastructural capture' (Nechushtai, 2018) by large US tech companies, particularly Meta, Microsoft, Google,

and Amazon (AI companies). These companies not only supply AI software used for editorial decision-making, but also control much of the hardware, money, data, and research on which the media relies to deploy AI (Simon, 2023). While the scope of AI companies' influence over the news media has become increasingly apparent, the literature remains vague on why this influence is problematic and how it might be addressed. This paper will analyse the role European law can play to safeguard media freedom from infrastructural capture. In doing so it aims to ground arguments on the problematic nature of infrastructural capture in the well-established normative framework of media freedom under art. 10 ECHR and art. 11 of the Charter. The analysis proceeds in two steps. First, the article relies on normative research to contrast literature on infrastructural capture with theories of media freedom. Media freedom imposes a positive obligation on states to create the conditions that allow a wide range of media organisations to contribute to the public debate and expose the public to diverse and high-quality information. Existing literature on media freedom has on platforms' control over what news is shown to large audiences. Literature on infrastructural capture hints at a more pernicious problem: the media can remain in full control over its own audiences, but lose control over the values embedded in the technology it uses to inform the audience (Nechushtai, 2018; Simon, 2023). Secondly, the article will use descriptive legal research to explore the extent to which recent EU regulations designed to curb platform power (specifically the DMA, DSA, and art. 17 EMFA) can address the conditions for infrastructural capture identified in the journalism studies literature. Like theories on media freedom, these regulations focus on tech companies that control access to large audiences and so often do not address infrastructural capture directly. However, their approaches to limiting lock-in and ensuring oversight over the opaque technologies offered by these companies do offer useful foundations from which laws that may avert infrastructural capture can be designed. CDE21 Innovation as a threat to democracy? Effects of local communication's transformation on democracies

PN 154 Navigating interdependence: Innovation in Austrian local communication for economic sustainability

Alwin Baumhöver¹, Leonhard Dobusch¹

¹ University of Innsbruck, Department of Organisation and Learning, Innsbruck, Austria

The landscape of Austrian local journalism and municipal communication encapsulates a microcosm reflecting global transitions in media consumption, community engagement, and technological evolution. Recent technological strides, notably the ascent of freely available news and social media platforms, challenge the traditional roles of local journalism and municipalities as primary news providers for their communities. As media organizations grapple with dwindling advertising revenues (Pickard, 2020), leading to downsizing and closures, municipalities find themselves devoid of robust media platforms to connect with citizens (Cook et al., 2016). This has prompted some municipalities to professionalize their communication departments and adopt journalistic methods (White & Hobsbawm, 2007), but resource constraints often hinder their capacity to disseminate crucial information effectively. Consequently, both entities face an intensified need to secure their importance as local news providers amid limited resources, necessitating novel communication strategies. This study investigates innovative communication strategies, practices, and technologies employed by local journalism and municipal communication in Austria that enable effective news provision and achieve economic sustainability. The primary inquiry guiding this study is: "What innovation is emerging in Austrian local journalism and municipal communication that ensures effective news delivery while being economically sustainable?" Conducting an exploratory study, we initially curated a diverse pool of potential best practices through desk research encompassing random sampling, industry publications, and scholarly literature such as the Journalism Report VII (Kaltenbrunner et al., 2022). Subsequent expert interviews with stakeholders, journalists, researchers, and entrepreneurs furnished in-depth knowledge of innovative strategies, practices, and technologies. Following these steps, we identified two exemplary best practice cases in both innovative local journalism and municipal communication that excel in news provision while ensuring economic viability. An important revelation from this study is the leveraging of scale advantages by local media organizations and municipalities to cement their presence in the local news market. Embracing trial-and-error financing models for new communicative practices and technologies with a hyperlocal focus, they solidify their standing, often becoming pivotal actors within their networks. Notably, the deployment of bespoke digital platforms emerges as a key strategy, enhancing services to the local populace and bolstering financial stability. Furthermore, in regions where local journalism is less entrenched, collaborations between municipalities and media entities burgeon. Municipalities provide information to local journalists, augmenting their limited resources. However, this cooperative facade belies underlying challenges, leading to a potentially competitive or dysfunctional relationship. Instances

where e.g., municipalities inadvertently rival media organizations by hiring their employees exemplify conflicts of interest and blur the lines between journalistic autonomy and municipal allegiance. This panel contribution deepens our understanding of Austria's changing local communication landscape amidst digital transformation, highlighting the significant impact of scale advantages on innovation within this domain. Through synthesizing best practice cases, it presents empirical evidence emphasizing innovative strategies, practices, and technologies that bolster the economic resilience of both local journalism and municipal communication.

CDE21 Innovation as a threat to democracy? Effects of local communication's transformation on democracies

PN 155 Local journalism in Germany: Emerging business models and overarching networks

Malte Meyer¹, Matthias Künzler^{1,2}

¹ Freie Universität Berlin, Department of Political and Social Sciences, Berlin, Germany

² University of Applied Sciences of the Grisons, Applied Future Technologies, Berlin, Germany

Local journalism has long been established in scholarly discourse as a crucial backbone to a vital democracy (Baekgaard et al. 2014; Darr, 2021). However, due to recent technological and economic developments, the existing structures of local news media in Germany have been subject to major challenges. As established print-based business models continually dwindle in their profitability, more and more producers of local news media in the country are struggling for relevance and economic sustainability. These processes have led some to even go as far as to exclaim a threat of mass extinction events for local news media (Weichert et al. 2015, p. 33), as fewer and fewer print publications remain resilient against aforementioned pressures. Described developments thus beg the question 'How is the local news media market in Germany adapting to the move away from print, and the associated issues of business restructuring?'. Aiming to shed light on current developments by means of a systematic analysis of emerging players and the critical engagement with leading figures in the German local journalism market, the present research has found evidence for the formation of a newly revitalized and restructured sector in response to above-described developments, by means of an active fostering of interconnected support systems and structures between stakeholders. To be more precise, this approach was largely informed by employing desk research involving the reviewing of issues of the 'drehscheibe' magazine published by the local journalism program of the Federal Agency for Civic Education (Bundeszentrale für politische Bildung) between 2021 and 2023 as a starting point for a deeper investigation. The magazine in question is explicitly aimed at forming a forum for beneficial ideas and concepts in local journalism and thus offered itself as a suitable starting point for gaining an overview of a range of innovative developments within said market. Based on this investigation, it has become evident that many recently founded news media organizations in Germany, such as 'Krautreporter' or 'KONTEXT: Wochenzeitung', have opted for a digital-first non-profit approach, largely motivated by an increasing difficulty to obtain advertising revenue and due to explosively rising costs in the production of classical print publications. This approach is further characterised by an active seeking of collaboration with other media entities, rather than the previously dominant aim of cornering the market in search of financial gains. Aforementioned collaborative efforts are largely facilitated within supra-local journalistic research networks, such as 'Correct!V' or 'Netzwerk Recherche'. Aiming to provide a strengthening, interconnected framework for the presence of investigative, socially relevant and high quality (local) journalism within the country, both these overarching organizations and non-profit media outlets finance their efforts by means of sourcing funds via socially oriented foundations, crowdfunding campaigns, donations and membership campaigns, and thus non-traditional methods. The insights gained by the research discussed prove to hold value not only to the German market of local journalism, but extend far beyond, as similar efforts in other countries may prove as valuable undertakings in the struggle to future-proof democratic societies against potentially damaging socio-economic pressures.

CDE21 Innovation as a threat to democracy? Effects of local communication's transformation on democracies

PN 156 One size fits all? Content and evidence of strategies in Swiss local media

Urs Dahinden¹, Caroline Dalmus¹, Urban Kalbermatter¹

¹ University of Applied Sciences of the Grisons, Swiss Institute for Information Science, Chur, Switzerland

The digital transformation of media has led to many challenges for both legacy media (e.g., newspapers, TV and radio stations) and digital born media that publish online only. These different types of local media are responding to these challenges with different innovation strategies (Meier et al. 2022) influencing media organizations (e.g., work processes) and their published content. Thus, this panel contribution investigates the effect of innovation on local media content by answering the following research questions: Which quality criteria characterize the content of the various types of local media (fög 2021)? Which are the differences? Do local media outlets employ similar strategies regarding the publication formats (one size fits all) or are they clearly distinguishable? These research questions focus on two challenges. The first one is the multimedia challenge. The digital transformation offers new opportunities for

legacy media that can transform from mono-media to multimedia companies that publish their content in multiple online formats (text, audio and video). The second challenge is related to the journalistic quality and its relevance for democracy: The analysis aims to develop new empirical indicators for journalistic quality that can seize media innovation on the level of media content. In addition, the analysis seeks to assess the performance of local media for democracy by investigating whether all local media intent to fulfil similar performance for democracy (e.g., by a high amount of reporting about policy issues) or if they 'embrace distinctive priorities' (Jenkins & Nielsen 2020, p. 250) like local culture, human-interest stories etc. In this project, the research questions mentioned above are investigated by a quantitative content analysis. The sample includes 12 Swiss media companies that were selected by combination of the following criteria: First, all 12 media companies showed a higher level of innovativeness, that was above the average of other media companies, according to self-reports from a quantitative survey (if data available). Second, these media companies differ maximally to each other about their tradition (legacy vs. digital born), their media type (newspaper, radio, TV and online only) and their language region in Switzerland (German, French, Italian and Rumantsch). The overall sample size was 4'677 publications, which were manually coded by trained staff. The data analysis was done by means of an exploratory factor analysis. This statistical method is best suited for the discovery of new structures in large empirical data sets with many variables. The factor analysis shows that not a single factor, but rather three distinct factors are the statistically best solution for explaining the variability and complexity within the data. These three factors can be labelled as 'F1 traditional quality', 'F2 regional content with multimedia quality' and 'F3 short non-regional content'. At the ECREA conference, the three factors will be compared to general characteristics of the media that might be at the root of these differences.

CDE21 Innovation as a threat to democracy? Effects of local communication's transformation on democracies

PN 157 Innovation, competition and cooperation with local media and municipal communication in France

Simon Gadras¹, Elmira Prmanova¹

¹ Université Lumière Lyon 2, elico, Lyon, France

In recent decades, French local media and municipal communication have faced a number of challenges, some specific to one or the other, others common to both. Even though they dominated the local information market since the middle of the 20th century, regional daily newspapers are having difficulties to adapt to new information consumption habits (Bousquet & Amiel, 2021). They also face various competitors: local radio, TV channels and online local news media. The field of municipal communication keeps growing since the 80s (Paillart, 1993). Research has shown that, despite their growing professionalization, local municipal communication still focuses on the mayor political incarnation (Garcin-Marrou & Hare, 2015). But, since early 2000s, the effective use of digital platforms by local municipalities has not been precisely studied (Wojcik, Mabi & Lupovici, 2023). Both fields – local media and municipal communication – are trying to adapt to the digitalization and the increasing role of digital platforms. (Tredan & Gestin, 2023). In this context, the analysis of six case studies in France allows the following research question to be addressed: How does the adaption of digital tools affect the relationship between media organizations and municipalities? Results presented in this paper are based on seven guided interviews conducted with managing officers for three municipalities communication departments (Lyon, Roanne and Ambert) and three local media outlets (Rue89Lyon, Nice Matin and TV8 Moselle). The paper focuses on two main issues: the level of innovation and the relationship between local media outlets and municipalities. The innovative power varies according to each organization, depending on its general strategy. Some consider themselves as very innovative: On the one hand, 'Rue89Lyon', its founding team created something new in the field of local information 15 years ago. The municipality of Lyon, as the environmental transformation implemented by the mayor implies innovation in many fields, will be the largest city in France run by an ecologist majority from 2020. On the other hand, some see innovation as a change in global society to which they're trying to adapt: 'TV8 Moselle', which is being challenged by digital technologies, or the city of Roanne, which is constantly trying to adapt its communication to new trends. The relationship between municipalities and local media navigates between competition and cooperation. Local media managers explain that they don't do the same work as the municipal administrations, as they are journalistic sources. For municipalities communication directors, local media are seen as an important information transmission tool. Municipalities (still) need local journalists to reach the public, although this seems less true now that they have other means of communication, especially online. The information tools and strategies implemented by local media and municipalities respond both to their respective social missions and to the constraints they face. In this context, innovation seems to be essentially a solution to achieve information goals despite constraints.

CDE21 Innovation as a threat to democracy? Effects of local communication's transformation on democracies

PN 158 Innovation as a double-edged sword: Examining the impact of innovation on Swiss local communication

[Ulla Autenrieth](#)¹, Johanna Burger^{1,2}

¹ University of Applied Sciences of the Grisons, Applied Future Technologies, Chur, Switzerland

² Freie Universität Berlin, Department of Political and Social Sciences, Berlin, Germany

In the current era of economic challenges within the local communication landscape, innovation has emerged as a pivotal concept, heralded as a potential remedy for declining subscriptions and reduced advertising revenues for local media (e.g., Park et al. 2022). The call for innovation is particularly present when talking about the communication landscape on the local level and its resilience. However, our case study on local communication in Switzerland reveals ambivalent effects of innovation: On the one hand, local media exhibit an urge to strengthen themselves through innovations of business models, reporting, and work processes etc., thus predominantly focusing on lean production, rather than journalistic quality standards. On the other hand, municipalities have also started to innovate their communication, which have traditionally relied on official announcements in and coverage by local newspapers. Many municipalities have started to issue their own online or print publications and thus untighten their relation to journalism and local media. Hence this raises the question: To what extent do innovative approaches worsen the relationship between local media and municipal administration and hereby reinforce divisions in local communication? To address this question, we employed a multi-method approach to assess the transformation of local communication in Switzerland: We conducted online surveys targeting all Swiss municipalities (N = 2172; response rate = 19.1 %) and all Swiss local media companies (print, online, TV and radio; N = 473; response rate = 34.7 %). Additionally, we executed twelve qualitative case studies of innovative media companies involving a one-day observation and guided interviews, as well as guided interviews with twelve innovative municipalities. A workshop with representatives from both local media and municipal communications further enriched our understanding of their dynamics. Our findings are disconcerting: Despite concurrent innovation efforts, municipalities and local media are drifting apart, with only 17.4 % of municipalities still considering local media as important players on the local level (Authors 2023: 71). The once balanced power dynamic has tilted in favor of municipalities, leading to a concerning dependency for local media on the latter (Authors 2024*: 61), undermining their role as the fourth estate in democracy. While the municipalities invest more and more resources in and professionalize their communication, local media face a diminishing pool of resources, resulting in a downward spiral of decreasing quality and capacity. At the same time, however, there are also cases where the local balance (still) exists, where the exchange and mutual acknowledgement between local media and local administration is intact. This presentation aims to shed light on the divergence among local communication actors, using Switzerland as a case study. Subsequently, we will display positive examples and explore why the interaction between local communication actors still functions in some parts of Switzerland, while all actors involved are working innovatively and thus overcome the dilemma of innovation as a double-edged sword at the local level. The goal is to highlight the challenges, but also propose potential solutions for fostering a functioning democracy at the local level, thereby preserving social order.

CDE22 Towards understanding activism in Russia and beyond: Organisational practices, technologies and publics

PN 159 Self-organisation for Resilience in Russian Anti-War Networks

[Anna Kalining](#)¹

¹ Leuphana University of Lüneburg, Institute of Sociology and Cultural Organization, Lüneburg, Germany

This contribution delves into the dynamics of self-organisation as a means of resilience for maintaining long-term engagement among dispersed groups in the face of external pressures as well as internal conflicts. Drawing from the empirical material gathered during a PhD project, the contribution builds on the practice approach (Bača, 2022) and presents an analysis of self-organisation practices collected on the instant messaging service Telegram. The goal of this contribution is to showcase the multifaceted and multimodal nature of anti-war activism through the concept of self-organisation with the ambition to puzzle together a set of relations that would be able to explain how subjects persist in finding ways to express their political will and maintain avenues for such expressions even when no apparent transition to mass social mobilisation transpires. Drawing inspiration from Ricardo Nunes' (2021) exploration of collectivity and organisation, the concept of "distributed action" becomes central to conceptualise the non-uniformity of political subjectivity crystallised through many centres operating at various scales. The relevant implication of Nunes' terminology is the recognition that change can originate from the accumulation of uncoordinated individual actions and behavioural changes at small scales. Whether consulting citizens on their legal rights, writing letters to political prisoners, or engaging in volunteer work abroad, the adaptability in unstable organisational environments impacts the notions of what can constitute activism and where instances of collectivity can be found. The research outcomes encapsulate the understanding of activist self-organisation in three

meanings that "self" takes on: First, micro "self" in connection to self-education and self-reliance in facing unexpected challenges, linked to the acquisition of technical expertise and the production of activist knowledge through diverse distribution sources like guides and instructions found on Telegram. Second, meso "self" in its connection to figuring out how to collectively organise without a clear precedent while negotiating a level of reasonable exposure. Such organisation – from militant guerrilla cells to secret anti-war book clubs, presupposes a degree of openness and flexibility of dynamically adapting organisation tactics. Finally, macro "self" as an aspiration for the constitution of a just order within the network of distributed action as it aims to be a self-sufficient ecology constituted by a mixture of protest action (militant and symbolic) and support structures (affinity groups, legal help, etc.). Thus, technologically mediated self-organisation is viewed both as a spontaneous configuration of relationships between distributed groups based on the recognition of the importance of difference and unexpected cooperation and as a way of sustaining engagement even as the incapacity to prompt significant political change is recognized. (2021). *Neither vertical nor horizontal: A theory of political organization*. Verso Books.

CDE22 Towards understanding activism in Russia and beyond: Organisational practices, technologies and publics

PN 160 Conceptualising the constitution of the anti-war frontier and publics

[Svetlana Chuikina](#)¹

¹ Karlstad University, Department of Geography Media and Communication, Karlstad, Sweden

The primary interest of this study is to examine the reconfiguration of publics as a technologically conditioned process of infrastructuring, which bridges activists and publics in a mediatised public space, and in a Russian authoritarian warfare context. The shift from mass to "mass personal" (O'Sullivan and Carr, 2017) communication has transformed the very mode of communication in the public space: the ways in which people engage with public issues on a daily basis. In turn, scholars of social movement studies (Della Porta and Mattoni, 2014), have defined movements as dynamic systems, aiming to embrace the involvement of broader publics into its constitution. Pointing out the intersection of activists and audiences within communicative processes, this article sheds light on the struggle of activists and movements "for public opinion" (Splichal, 2012). I call for an understanding of the practices of diverse activist groups and individuals beyond the "networked" metaphor (Castles, 2015), and as a way to address and form the public. Particular attention needs to be paid to authoritarian contexts, as in the case of Russia, where power is held through "hybrid" control over public space, demolishing the constitution of anti-war publics. When anti-war activists make publicly visible the cases of those who have been arrested for their anti-war opinions, or reveal war crimes and personal stories related to the war, such that would otherwise remain unknown, they address the public. Moreover, this process of publicity is technologically conditioned. Drawing on Kavada and Poell's (2021) observation, in addressing how the material infrastructures of platforms – data, metrics and algorithms, as applied affordances – constitute simultaneous forms of the collective, I make another conceptual move to look at this process as frontier infrastructuring. Aligning with the idea of infrastructuring openness (Larkin, 2013), I treat media infrastructures not only as pipes, lines and material entities, but as part of social relations, as compounds in social systems of human practices, relationships, hierarchies and knowledge. I am interested in examining how the anti-war frontier is infrastructuring its "technological sovereignty" by renegotiating platform surveillance and power, and crafting milieus that sustain orientation among publics and allow for resistance. PN 161 Infrastructuring evasion: a digital helpline for military draft evaders

[Ksenia Ermoshina](#)¹

¹ Mines ParisTech, Center for Internet and Society, Paris, France

The paper focuses on a case-study of "Prizyv k Sovesti", an NGO helping those who refuse to participate in the war with Ukraine. This organisation offers legal advice and often, as a side effect, a psychological support to draft evaders. Using an existing legal frame, such as the right to alternative civil service (as a replacement for military service), the organisation has helped thousands of Russian men who refuse to fight. The study is inspired by the

STS approach, as it looks not on the individual trajectories of evaders or their motivations, but rather on the digital infrastructures and tools chosen by Prizyv k Sovestii in order to understand the impact of tool choices and their architectures and interfaces on the strategies of antiwar campaigning. Indeed, Prizyv k Sovestii relies on a patchwork of tools, such as a Telegram bot used by draft evaders or their relatives to request help, as well as task trackers, and a variety of group chats in secure messengers and text pads. Based on interviews with moderators and developers of the helpline, as well as on web ethnography and an analysis of a sample of anonymized cases from the helpline database, we examine how the helpline technological structure shapes the way evaders communicate about their situation, ask for advice and make final decisions (to go to war or to resist). How the design of the helpline chatbot and the structure of the database impact the narratives of evaders about war, their situation and their choices. We argue that besides providing personal help to the evaders, the helpline tools serve as an instrument of mediatization of the phenomenon of refusal to serve in the army. Indeed, the helpline moderators use the collected data for advocacy and to emphasise the anti-war narratives with individual stories. However, technological infrastructures of the helpline also raise security and privacy concerns, putting a limit to what can be done with the collected data. One of the main questions of this research is to understand how the need to balance between visibility, usability and security forces the helpline team to reorganise their toolings, migrate the hosting of their bot, redesign the database structure.

CDE22 Towards understanding activism in Russia and beyond: Organisational practices, technologies and publics

PN 162 Strategic non-uses of communication technologies and its consequences for political representation

Ekaterina Kalinina¹

¹ Stockholm University, Institute for Media Studies, Stockholm, Sweden

In this presentation, the author explores strategic non-uses of communication technologies by Russian civil society actors as a strategy for survival in the times of war censorship and intensified political repressions. Digital communication technologies not only help to maintain connection between those activists who migrated, fearing increased state surveillance, war censorship and political repression, and those who stayed in Russia, but also make organised action possible providing socio-technological infrastructure, as contributions to this panel show. Indeed, studying uses of communication technologies from the micro level of the community allows to understand how activists build and use communication channels to receive relevant information and be heard, mobilise people for action and bypass hinders created by the authoritarian state. Nevertheless, in order to see what role communication technologies play in the times of disorder, one has to look at the macro level of the political and symbolic representation of these communities. Hence, the paper will deal with two levels of strategic communication technologies (non) uses – the micro level and the macro level. This will be done from an exogenous perspective (Carpentier 2009), i.e. in relation to other sectors in actors of national and transnational societies, by establishing connection between participation and political representation. In order to explore these connections, the study explores the mechanisms and the processes behind the (non)uses of communication technologies for survival, by relying on interviews with activists and experts as well as media reports on Russian civil society during the war. The paper will study how activists who stayed in Russia had to adjust to rapidly deteriorated political conditions and rethink their communication strategies fearing that visibility in the media might result in the seizure of activist networks and operations. As a result, most of the work carried out by civic activists inside of Russia became less visible to ensure the survival of activist networks. Given that social and political interaction is mediated, media and communication invisibility makes symbolic and political representation of Russian civil society almost impossible and has long-term negative consequences, which can be already observed in the spread of a popular misconception that Russian civil society has been completely wiped out during the first year of the war. Drawing on Fraser's (2009), this presentation argues that Russian civil society cannot freely participate in social interaction both inside and outside of the country. Inside of Russia, their communication rights using Peruzzo (2014) terminology, are restrained by surveillance, censorship and repressions. Internationally, the communication right is often denied on moral grounds (staying in Russia and maintaining operation is often considered unethical) and due to the invisibility of the civil action inside the country. Overall, one of the major consequences of the full scale invasion of Ukraine by the Russian Federation is that Russian civil society has lost its communication power, i.e. a power to influence public agenda and introduce social change (Castells 2009).

COH01 Gendered pasts: Communication histories of invisibility, disruption and resilience

PP 0089 Disrupting traditional gender roles in communication: Three women war correspondents report the First World War on the Italian front

Stephanie Seul¹

¹ University of Bremen, Department of Cultural Studies- ZeMKI, Bremen, Germany

Tim Luckhurst (2016) has argued that the First World War 'was reported from an almost exclusively male perspective' and that woman war correspondents 'were immensely rare exceptions'. My paper challenges this view. During 1914–1918, a considerable number of women from belligerent and neutral countries gained access to the frontlines or their vicinities and published their eyewitness accounts and photographs in newspapers and magazines. However, academic studies are scarce. Women are conspicuously absent from Phillip Knightley's (2003) seminal account of war correspondents and other key literature. Only recently have scholars begun to study female war reporters, often with an emphasis on Americans (Dubbs 2020).

Few women were accredited by the military; often they reported in a non-official capacity. However, on the Italian front Austria-Hungary and Italy offered accreditation to several female journalists. Three women in particular stand out: On the Austro-Hungarian side, the Austrian travel writer and photographer Alice Schalek was accredited by the Austro-Hungarian War Press Office and reported from the Italian front during 1915–1917 for the Viennese daily *Neue Freie Presse* and other papers. On the Italian side, the Italian writer and journalist Stefania Türri was accredited by the Italian Supreme Command and visited the front in 1917, writing about her experience in the magazine *La Madre Italiana* and in two books. Moreover, Avis Waterman, an American journalist employed as the Milan correspondent of the *London Times*, was granted accreditation by the Italian Supreme Command and visited the frontlines several times during 1915–1917.

My paper offers a comparative analysis of the wartime activities and writings of these women. The findings of my research derive from articles written by, and about, Schalek, Türri and Waterman in the contemporary press in a variety of countries: Austria, Germany, Italy, Great Britain, Australia, New Zealand, and the United States. Moreover, Schalek and Türri published books about their visits to the front. All three women broke with the traditional gender roles of their times, when women were expected to become housewives and mothers, and they opened up hitherto male-dominated professions to women, such as travelling, journalism and war reporting. The women did not limit their reporting to the 'woman's angle', i.e. the reporting about the home front or the care and nursing of wounded soldiers. Rather, their reporting focused on the men's fighting on the Italian front. However, their war reporting did not go unchallenged. In particular Alice Schalek was met with fierce hostility when male journalists and military figures challenged her qualifications for writing about war as a core male business. In contrast, Waterman was highly respected for her reporting in *The Times*.

COH01 Gendered pasts: Communication histories of invisibility, disruption and resilience

PP 0090 Resilience in the face of a multiple collapse of orders: International feminist peace activism during the Great War

Susanne Kinnebrock¹

¹ Universität Augsburg, Department of Media- Knowledge and Communication, Augsburg, Germany

Resilience in the face of a multiple collapse of orders: International feminist peace activism during the Great War

In many ways, the Great War can be regarded as a breakdown. Politically, Central European monarchies collapsed at its end and new nation-states and democracies were founded. Economically, Europe was at rock bottom and hunger omnipresent. And as far as humanitarian aspects are concerned, moral principles were massively violated during the war, for example, through the use of weapons of mass destruction or the systematic use of sexual violence against the defeated.

Amid this collapse of civilizational achievements dissenting voices also emerged: and a rather marginalized group in terms of political power, namely internationally minded female suffragists, proved to be resilient. In 1915, they organized an international women's peace congress in The Hague which did not only demand the immediate cessation of all acts of war (including sexual violence), but also developed a pioneering counterproposal for a new,

democratically based world order that placed international law and peaceful conflict resolution at its center. International institutions similar to the later established United Nations (1945), the World Trade Organization (1995) or the International Criminal Court in Hague (2003) were drafted at this congress (Baetens, 2010).

The reactions to the drafted new world order varied greatly from country to country. Depending on the involvement into the war (belligerent or neutral countries), the existence of democratic traditions and, last but not least, the prevalence of rigid press control, debates on the proposed new world order took very different forms. In the US, the women's proposals were seriously debated – and partly adopted by US-president Woodrow Wilson in 1918 ('Fourteen Points', Throntveit, 2011). In Germany, however, media coverage and public debates of the Hague Congress were prevented, and its participants persecuted (Kinnebrock, 2022).

Using trilingual journals by the emerging international women's peace movement, personal papers of leading US-American and German pacifists (e.g., Jane Addams and Lida Gustava Heymann), collections of press clippings on pacifist activities, and censorship files of German military authorities, the struggle of female peace activists to keep up resilience and defend humanitarian principles will be traced. The dynamics between finding an international pacifist voice, seeking for public support on a national level, reassuring international solidarity within women's peace movement, and processes of being silenced by local authorities are analyzed hermeneutically. It will be shown that international crises might promote debates on new social or even world orders, but the effects of censorship as well as the persistence of old (social as well as discursive) structures should not be underestimated and remarkably counterbalance resilient voices.

COH01 Gendered pasts: Communication histories of invisibility, disruption and resilience

PP 0091 The 'Wiener Hausfrau' in the 1920s. A sub-public talks about fears and hopes in times of multiple crises in a women's magazine

Eva Asboth¹

¹ Austrian Academy of Sciences, Institute for Comparative Media and Communication Studies CMC, Vienna, Austria

The 'Wiener Hausfrau' is a women's magazine established in 1904 and published until 1939. Due to its specific media functions, this kind of weekly newspaper that appeared in the first half of the twentieth century, had an unexpected participatory character. Women's magazines offered forums for the exchange of knowledge and experience, the establishment of social relationships and social networks, and the possibility to evaluate and feedback situations provided by women who searched for advice and understanding. Emotions were transported and entertainment created, social needs of women were discussed alongside women's ideals, as the magazine allowed anonymity and broke with taboo topics. This made the women's magazine a sub-public for the community it created.

The possibility of creating and participating in a woman dominated sub-public in Austria was especially important in the 1920, when the high female employment rate was pushed back, and jobs were reserved for men who had returned home after the war or war captivity. Women experienced a conservative roll-back, who experienced little public and political participation. However, the housewives, mothers, female workers had a lot on their plate, because they lived in times of multiple crises: the aftermath of the war and the returning husbands and sons as well as the economic situation with hyperinflation, food shortage, increasing rents, unemployment, and resulting health issues. Existential fears and anxieties about the future are a profound moment in the lives of many women, who had to take care of a household and children. Above all, the 1920s are a period in which 'the modern woman' is presented in the public sphere, an independent and self-reliant female worker. In fact, to bring forward the image of a housewife and of a modern woman was a difficult and paradox task to fulfill. However, questions about work or having a job are a constant topic in the magazine.

The 'Wiener Hausfrau' is considered to be a unique source to find traces of how uncertainty, but also hope was communicated. Through its participative format in sections like 'exchange of opinion', 'to the editors', cooking plans and recipes, or questions to the medical doctor, it gives insight in the lives of female readers. In times of multiple crises, the 'Wiener Hausfrau' offered more than information, but support and advice, it acted as a pool of resources and resilience that women and girls could draw on and access at the same time. In my presentation, I would like to show first results of the content analysis and software-based automatic analysis of those issues of the 'Wiener Hausfrau' that are online available on ANNO and were published in the 1920s. My research question is: How are existential fears and taboo topics as well as the images of housewives and modern women communicated and

negotiated in the 'Wiener Hausfrau' during the Austrian interwar period? The multi-method approach of a classical content analysis is combined with digital analyses, such as automatic image coding and text mining.

COH01 Gendered pasts: Communication histories of invisibility, disruption and resilience

PP 0092 'We do not recruit young ladies into technical categories': Gendered labour and technology at the BBC

[Jeannine Baker](#)¹

¹ University of Newcastle, Humanities- Creative Industries and Social Sciences, Newcastle, Australia

Understanding the gender disparity within media work necessitates looking beyond mere statistics to examine how individual jobs are gendered. Feminist scholars have demonstrated that institutional structures and production cultures are themselves gendered (O'Brien, 2019) and analysed the relationship between the materiality of labour and the value placed on men's labour processes over women's. Stein (2016) found in relation to the printing industry that it 'was not merely the jobs that came to be gendered, it was the things, too', and Baker and Hall (2022) extended this idea to television camera work, arguing that assumptions about men's natural affinity with technology impacted the design as well as the use of television equipment. While the equation of technology with masculine labour continues to be a barrier to women's full employment in the media, there is a lack of understanding about the entrenched structural discrimination and gendered practices that have contributed to this disparity.

1974 marked a turning point in the BBC's employment policies, as the organisation began recruiting women into previously male-only technical areas. That year, Barbara Franc was employed as a television studio camera operator, Penny Kift as a technical operator in radio, and Alison Stevenson as a television engineer. This paper draws on oral history interviews with these three former women technicians to analyse the relationship between gender, labour and technology within television production. It discusses the ways that women's entry into technical areas disrupted gendered workplace cultures and power hierarchies at the BBC. In doing so, it redirects our attention from the male auteur and considers women technicians as creative workers within a collaborative production environment. It argues that listening to women's experiences is crucial for understanding the ways that women's skills were valued and defined within production communities, and the workplace cultures, practices and structures that have contributed to a persistent underrepresentation of women in technical areas.

COH01 Gendered pasts: Communication histories of invisibility, disruption and resilience

PP 0093 A gender perspective on the foundation of communication research: Women's contribution to the proposal of two-step flow theory

[Esperanza Herrero](#)¹

¹ University of Murcia, Department of Communication, Murcia, Spain

Two-step flow is one of the most used theories in mass communication studies. Traditionally, it has been assigned to Elihu Katz and Paul Lazarsfeld, the researchers who first proposed the existence of a "two-step flow of communication" back in the 1950s. They were the authors of *Personal Influence* (1955), the book where two-step flow was first formally proposed, following a previous remark included in *The People's Choice* (1945) by Lazarsfeld, Berelson and Gaudet. The historiography of the field has widely accepted this foundational narrative, embracing Katz and Lazarsfeld as the founding fathers of the theory and, consequently, as two of the main voices in the proposal of limited effects theories. However, this narrow account dismisses the relevant role that women researchers had in the first proposal of two-step flow and the limited effects paradigm, a research proposal that was way more collaborative than the individualistic and masculine story that has officially been told.

Women researchers were a constitutive force of the Bureau of Applied Social Research (BASR), the research center at Columbia University where limited effects theories were first proposed. Up to 60 women were working on media and audiences analyses between the 30s and 50s. They were authors or coauthors of, at least, a 40% of the projects conducted at BASR, including those that studied personal influence. In fact, women were very active in the Erie County (1940) and Decatur (1946) projects, where interpersonal influence was first analyzed. Both of these projects were eventually published in book-form as *The People's Choice* and *Personal Influence*.

The main objective of this communication is to identify the role played by women researchers in the proposal of two-step flow. Our research questions are:

- What was the role of women researchers in the proposal of two-step flow?
- How did women contribute to the Decatur and Erie County projects?

- Which women had a leading role in the proposal of two-step flow?

To answer these questions, we develop a methodology of archival analysis of the records of the BASR (Columbia University Archive). In particular, we analyze a total of 50 documents (620 pages) – including grey literature, correspondence, and unpublished work – related both to the Erie County (1940) and Decatur (1946) projects.

Our results show that female contribution to the theory was twofold: Firstly, women constituted the majority of interviewees and were in charge of identifying and profiling opinion leaders among their interviewees. Secondly, female researchers were in charge of interpretation and some of the work authored by them was essential in the identification of two-step flow. In particular, we recover the figures of Helen Dinerman, Hazel Gaudet and Leila Sussmann, who authored some of the first references to interpersonal influence and two-step flow ever made.

As a conclusion, this work represents a critical reading of the intellectual history of a theory – two-step flow – that is regaining recognition in current communication research. We also propose an historiographic recovery of lost female voices in order to construct a fairer, more plural, more trustworthy, and more inclusive history of the field we inhabit.

COH02 Future pasts: Old challenges, novel directions and uncharted territories of communication history

PP 0192 Presentism and the challenge of history and (technological) futures

Olivier Driessens¹

¹ University of Copenhagen, Communication, Copenhagen, Denmark

A widely held assumption across the humanities and social sciences is that we (sic) live in a time characterised and defined by presentism. Presentism is the temporality of the 'omnipotent and omnipresent present' (Hartog 2015), experienced through the now, real-time, immediacy, live-ness, acceleration, timeless time (Castells 2000), synchronicity and short-termism. While it is easy to think of examples of all these aspects in the context of media and communication, we do not have to look too far to find many counter-examples and counterevidence either. Media and communication historians have demonstrated the central importance of nostalgia and memory, for example, whilst depictions and predictions of the future in terms of AI or climate change seem evermore present.

Therefore, I want to call into question the validity of the claim that presentism is defining our social (dis)order. I will develop my argumentation in two steps. First, by building upon critiques in the literature, especially in the areas of theoretical history, the social theory of time, and media anthropology. Second, by showing how (implicit) understandings of the relationships between past, present and future in discourses and ideologies underpinning recent technological developments in Artificial Intelligence (AI) further expose the limitations of presentism.

I approach the question of presentism not in philosophical terms and instead of asking ontological questions, the focus is on temporality and on how time is experienced. Hartog's (2015) concept and historical-anthropological work on 'regimes of historicity' is used as the central starting point for such a discussion. He proposed 'regime of historicity' as a heuristic to think about the changes over time in the interrelationships of past, present and future. Based on this, he discerned between five regimes. Following the fourth 'Modern' regime of historicity, which is characterised by a strong orientation to a future of progress and promise, we are now in the regime of presentism, according to Hartog.

Although his regimes as ideal types are a useful instrument to think about our temporal condition, they also show some limitations. What does not fit into Hartog's presentism tends to be explained away as breaches or as symptoms of presentism (Bouton 2019). Memory, for example, is then an "instrument of presentism" (Hartog 2015:125). Similarly, instead of the 'disappearance' of the future in presentism, we need to consider new future modalities (Baschet 2018, Tamm 2020), such as prognosticable futures, expected futures and technological futures (Simon & Tamm 2023). With regard to the latter, the paper then analyses the temporality in (especially Silicon Valley) discourse around AI, specifically its dominant distant future orientation known as 'longtermism'. This view preserves a central role for technology to bring us to utopia and is willing to sacrifice short-term well-being for that of future generations.

Ultimately, the question is how many 'breaches' of presentism we can tolerate before we should consider its replacement by a different regime of historicity – not necessarily a successor, but at least a revised version of our contemporary condition that recognises both pasts and futures as more than subsumed in the present.

COH02 Future pasts: Old challenges, novel directions and uncharted territories of communication history

PP 0193 Making order. The Longue Durée of maintenance in communication infrastructures

Gabriele Balbi¹, Roberto Leggero²

¹ USI Università della Svizzera italiana, Institute of Media and Journalism, Lugano, Switzerland

² USI Università della Svizzera italiana, Laboratorio di Storia delle Alpi, Mendrisio, Switzerland

Communication and media studies have often been obsessed with new, innovative, and disruptive forms of communications. As a consequence, there is a scarce consideration of old and persistent media over time (Balbi et al. 2023), but also of maintenance of existing communication technologies.

This paper aims to put maintenance at the center of communication and media studies and, especially, of the historical dimension and to make a reflection on the long term character of communication maintenance. The main goal is to expand maintenance theory from STS (Henke & Sims 2020; Weber & Krebs 2021) and history of technology (Edgerton 2007; Vinsel & Russell 2020) to communication and media studies. In this respect, it is a theoretical contribution based on secondary literature and historical case studies.

Communication and maintenance are linked because all forms of communications need to be kept in good order to keep them function – “keeping in good order” comes from the etymology of maintenance as well (OECD 2023). But they are also linked because maintenance is a long-term action, with political and financial consequences, which can be understood in the *Longue Durée*. In 1958, French historian Fernand Braudel developed the concept of *Longue Durée*, a temporal construction that, during the times when he was prisoner-of-war, introduced the idea of “very long time” and so would allow to analyze history through centuries and disciplines, as an “infrastructure” (Braudel 1958).

Despite the fact that communication infrastructures such as telegraph, telephone, or Internet networks, as well as communication practices or tools need to last over time, communication and media studies, including media history, have not frequently included *Longue Durée* in their analysis. But efficiency and longevity of communication routes, services, and tools are crucial: efficiency is a constant effort secured by several technical practices and maintenance above all; longevity is secured by building technologies which last or making decisions that can be evaluated in long terms.

The focus on the paper is then to recombine communications, maintenance and *Longue Durée*, starting a theoretical and case study-based reflection on the topic.

COH02 Future pasts: Old challenges, novel directions and uncharted territories of communication history

PP 0194 On non-connection: Making mediated avoidance with people, paper, and magnetic tape

Sadie Couture¹, Torbjörn Rolandsson²

¹ McGill University, Art History and Communication Studies, Montreal, Canada

² Linæus University, Department of Media and Journalism, Kalmar/Växjö, Sweden

This paper sheds light on mediated avoidance, an understudied category of media practices that people engage in to avoid others. Drawing on archival studies of 19th century women’s magazines, qualitative online surveys, and semi-structured interviews with senior citizens in Sweden and Canada, we study how answering machines, peep-holes and calling cards have been employed in the service of mediated avoidance. In this work, we ask: How have people made use of answering machines, peep holes and calling cards to enact avoidance? How has mediated avoidance been facilitated by specific social structures? How have people made sense of avoiding others and

being avoided themselves? And, what does the historical study of mediated avoidance tell us about our digital media presents?

Through an examination of historical media practices related to interpersonal mediated avoidance, we aim to make empirical and theoretical contributions to the expanding field disconnection studies (Syvertsen, 2022). While sharing some of our interests, this field tends to focus on how people attempt to avoid entire communicative infrastructures, for example by attending digital detox camps (Syvertsen & Enli, 2020). And often, studies of disconnection display a certain degree of presentism (Lomborg & Ytre-Arne, 2021). For instance, when interpersonal avoidance has been studied, it has nearly exclusively centered app-facilitated ghosting (Šiša, 2022). One of our study's empirical contributions is thus providing historical context to interpersonal mediated avoidance through the examination of pre-internet technologies.

Studying mediated avoidance constitutes a break with media studies' long standing interest in how media technologies produce the impression of presence by challenging the boundaries of space-time (Sconce, 2000). Instead, we want to contribute with insights into aspects of communication that are "inherent to the process of transmission" (Krämer, 2015, s. 67) but often get treated as external to it, namely interruption. In this context, we propose that mediated avoidance can be understood as a set of media practices and techniques intended to produce impressions of absence. Previous theorizations of mediated avoidance have regarded avoidance as a technological phenomenon, as in Plaut's (2015) studies of Technologies of avoidance. We intend to move theoretical focus away from technologies towards cultural techniques. That is, how "operative chains composed of actors and technological objects that produce cultural orders and constructs" (Winthrop-Young, 2015, p. 458), like impressions of "avoidance" and "absence." By shifting from technologies toward habituated practices and techniques we enable more comprehensive discussions of the various ways in which people and things interact in order to produce avoidance.

In our analysis, we show how our cases exemplify different constellations of people and things, and how they interact to enact avoidance of various kinds. We also discuss how instances of mediated avoidances relate to the social structures of a given time and place, as well as how people have ascribed meaning to avoiding others, and to the experience of being avoided themselves. In closing, we suggest some areas where mediated avoidance could be fruitful to study going forward, and how such studies could be conducted.

COH02 Future pasts: Old challenges, novel directions and uncharted territories of communication history

PP 0195 Press Start to Continue: The Quest for a Research Agenda for Digital Gaming in Media and Communication History

Erik Koenen¹, [Christian Schwarzenegger](#)¹

¹ ZeMKI – Centre for Media – Communication and Information Research, Department 9: Cultural Studies – U of Bremen, Bremen, Germany

In our proposed contribution, we outline digital games and gaming as both carriers and accelerators of media change, serving as an interface between media industries, technologies, cultures, and practices. This makes them an ideal case to analyze societal and media-cultural transformation processes resulting from mediatization, digitization, and datafication in a long-term perspective. Beyond Games and play, we argue, digital gaming provides an ideal test case for the understanding of digital transformation processes, the advent and extinction of digital technologies and the peripheral communication that evolved around games (gaming journalism, community forums, game streaming etc). The presentation is planned as a conceptual contribution proposing a framework and research agenda for communication history explorations into digital games and in the history of digitization of society through the observation of games. We argue that a heightened awareness for digital games and gaming is paramount to overcome current shortcomings and blind spots in our comprehension of the digital society. This holds true for communication research at large, but communication historiography in particular.

Digital games are no longer a peripheral phenomenon in society. Computer and console games, as well as mobile games, are now an integral part of deeply mediatized lifeworlds. Over the last decades they have become one of the dominant sectors in the media industry. Games and gaming have been catalysts for the emergence of unique media cultures, playing a crucial role in mediatized everyday culture for several generations of players. Game development has become well-established and professionalized, fostering innovative forms of media expression, communication contexts (e.g., video game journalism, game streaming, fan-fiction, modding). Additionally, under the concept of gamification, game principles and elements are increasingly transferred to non-gaming contexts (e.g., health prevention, educational settings). The deep integration of games into everyday practices, social relationships, and their diverse intersections with other phenomena of media communication and digital transformation raise various communication, ethical, educational and media scientific questions.

While the phenomenon of computer games has been comparatively underexplored in communication and media studies, our contribution suggests a holistic perspective that switches from the analysis of games to a broader notion and understanding of gaming as part of shifting media environments. This positions computer games and gaming

as a comprehensive subject in communication and media studies, demanding transmedia, diachronic, situational, and long-term transformative perspectives of (dis)empowerment and (in)equality.

Computer games are, therefore, portrayed as focal points for media and communication history. They allow us to observe long-term transformation processes of digital transformation but also to zoom in on peculiar cases and specific dimensions (media appropriation, technology acceptance, social and individual consequences, new communication formats, innovative practices of learning, implications for memory culture, and the mediation of discursive worldviews, knowledge, and values) and their evolution over time. The research agenda for communication historiography of the digital transformation of societies will be presented along with examples and cases from different fields.

COH03 Constructed pasts: Memories, predictions and speculations

PP 0285 Revisiting conceptualizations of memory objects

Christine Lohmeier¹

¹ University of Salzburg, Department of Communication, Salzburg, Austria

Memory objects constitute a fundamental component in the intricate tapestry of processes of remembrance. The proposed presentation focuses on mediated memory objects – such as films, analogue photographs, digital images, NFTs and other gadgets – and revisits and questions some of the implicit, underlying assumptions of conceptualization of memory objects.

A substantial body of research has scrutinized the mechanisms involved in the selection, curation, and storage of memory objects (for example Esposito 2017). Scholars have focused on the influence of algorithms on the selection of mediated memory objects, as well as the indispensable role of search functions in facilitating access to desired materials. The ephemeral nature of digital memory objects, especially prevalent in the realm of social media, poses a dual challenge – they are both easy to store and manipulate, yet elusive and often difficult to locate or recover.

Moreover, the omnipresence of memory objects in networked environments has transformed the landscape of mediated memory work. The sheer volume of digital objects has been perceived as overwhelming, hindering or cancelling completely their impact for memory work. A number of tech companies therefore offer solutions to order and curate material for users – for example by grouping similar images in people's smart phone galleries.

While memory objects have implicitly been considered a temporal constant – meaning that they potentially pass through temporal layers, lasting for years and perhaps decades – they are, in reality, subject to change over time. Factors such as wear and tear, as well as technological innovation, contribute to the dynamic evolution of mediated memory objects. In the process, memory objects undergo a metamorphosis, losing their original materiality as they transition to new devices and undergo various forms of manipulation (Kopelman & Frosh 2023). This transformative process goes far beyond preservation and transferring a mediated memory objects to another device: actors within these networked environments exhibit a remarkable creativity in reinterpreting and reshaping memory objects in ways that may not have been foreseen initially.

To exemplify the dynamic metamorphosis of mediated mnemonic artifacts over temporal progression and in tandem with their engagement with individuals, I focus through three case studies: (1) Non-Fungible Tokens (NFTs) called "Organic Growth: Crystal Reef," whose transformative states are contingent upon the specific wallets in which they are located. (2) Tamagotchis undergo evolutionary shifts dependent upon the manner in which they have been nurtured and managed. (3) Robotic entities retain a form of 'memory' concerning their past interactions with individuals, thereby potentially manifesting different responses in subsequent engagements.

The presentation underscores the need for a nuanced understanding of memory objects in contemporary media environments. It sheds light on the delicate balance between the ease of storing and manipulating these objects and the challenges associated with their ephemeral nature. By exploring the dynamics of mediated memory objects, this presentation aims to contribute to a deeper understanding of the complex interplay between remembering, socio-technical practices and mediated memory objects.

COH03 Constructed pasts: Memories, predictions and speculations

PP 0286 Remembering old mobile phones: Joy of nostalgia through embodied material engagement

Yanning Chen¹

¹ Loughborough University, Centre for Research in Communication and Culture, Loughborough, United Kingdom

The currently widespread telecommunication devices, mobile phones, were introduced to the Chinese market in the late 1980s and became mass products in the late 1990s and 2000s. Their popularisation paralleled marketisation informed by the Chinese Economic Reform (1978-) and global technological advancements of the second and third generation mobile network services, anchoring consumers' individual, social, and technological remembering (van Dijck, 2004). This study addresses how Chinese enthusiasts circulate and perform nostalgia

for old mobile phones, predating the dominance of Apple and Android smartphones, within their second-hand consumption practices. It focuses on embodied engagement with second-hand mass products and its mnemonic consequences.

Based on online qualitative interviews with 30 enthusiasts, three types of embodied material engagement related to nostalgia for old mobile phones were identified: maintenance and repair, displaying and sharing, and playing. Maintenance and repair involve routine and exceptional efforts to preserve object vitality. Enthusiasts act as 'nostalgia conservators', and old mobile phones are an intermediary state between remembering and forgetting, resembling archived historical heritages and relics. Displaying and sharing elicit and circulate memories of old mobile phones in online and offline settings. Enthusiasts highlight the display values of objects and cautiously distance their collections from threats to object authenticity and sacredness, such as mundaneness in offline settings and commercialisation in online settings. Playing is composed of two distinct categories, recollective playing and creative playing, each embodies diverse embodied practices, nostalgic forms and temporal orientations. Recollective playing reenacts conventional usage of old mobile phones in a contemporary context, performing restorative tech-nostalgia, while creative playing emphasises imagination and innovation, performing reflective tech-nostalgia (van der Heijden, 2015).

This study contributes to a larger project on the nostalgia industry and consumption to address the lack of concern about economic activities in memory studies (Niemeyer & Keightley, 2020; Pfoser & Keightley, 2021; Sturken, 2007, 2008). It aligns with recent calls in memory studies for turning to joy and other positive attachments to the past from typical focuses on negative forms of remembering (Arnold-de Simine, 2019; Davidson, 2023; Rigney, 2018; Wolf, 2019). It also addresses the conference's overall theme, 'communication and social (dis)order', and the division's concern about memories, by centring on joyful tech-nostalgic practices through which people establish a sense of order amidst ecological challenges related to e-waste (Rigney, 2017), social transitions in the reform China, and technological acceleration.

PP 0288 Modelling the past: How text-generative AI deals with information about the Holocaust in Ukraine and its instrumentalization

Victoria Vziatysheva¹, Mykola Makhortykh¹, [Maryna Sydorova](#)¹

¹ University of Bern, Institute of Communication and Media Studies, Bern, Switzerland

The rise of generative AI signifies a fundamental shift in history-related communication. While large language models (LLMs) powering chatbots such as ChatGPT or Google Bard open new possibilities, they also raise numerous concerns, in particular, whether they can facilitate the manipulation and instrumentalization of historical information in the context of modern conflicts. In this study, we investigate how different AI-powered conversational agents deal with information about mass atrocities using the example of the Holocaust in Ukraine. Not only is the Holocaust often the target of denialist and anti-Semitic manipulation campaigns, but references to the Holocaust in the Ukrainian context are actively instrumentalized by the Russian authorities as part of their aggression against Ukraine.

We manually generated outputs for two AI-powered chatbots – ChatGPT and Google Bard – using a set of 74 unique prompts related to the Holocaust in Ukraine in three languages (English, Russian, and Ukrainian). The prompts were in the form of questions and asked about specific episodes or actors of the Holocaust. For each question, we determined the correct answer (baseline), which ranged from a 'yes/no' response to the specific number or indication that the question is disputed by historians. The outputs were coded by two researchers using a custom codebook.

Our preliminary findings show a relatively low number of correct responses. The highest proportion of outputs matching the baseline (54%) comes from Google Bard responding to prompts in English. The lowest number is

observed for ChatGPT responding to prompts in Ukrainian (30%). A striking proportion of no response (i.e., the chatbot refusing to answer the question) was found for Bard responding to prompts in Russian (31%).

We found the unequal distribution of incorrect responses depending on the actor blamed for the specific case of mass atrocity: for example, over 50% of the responses mentioning Ukrainians in general or particular Ukrainian organizations were incorrect. In many cases, these responses falsely claimed Ukrainian actors to be the main perpetrators in the atrocities committed by the Nazi units. We also found a striking proportion of the outputs related to the episodes of anti-Ukrainian violence being inaccurate (93%). In most cases, they contained claims that victims were exclusively Jewish or that Ukrainians themselves were perpetrators (in spite of us specifically selecting instances of violence where there was no historical proof for this). An in-depth examination of the incorrect outputs showed that sometimes chatbots do not only provide an inaccurate answer (e.g., a wrong number of victims) but also add additional distortions, such as the invention of historical personalities, organizations, and eyewitness quotes.

This study is one of the first attempts to examine how LLM-based chatbots deal with information about mass atrocities. Using prompts about the Holocaust in Ukraine, we found that ChatGPT and Bard often generate incorrect statements on this topic. Under these circumstances, there is a risk of generative AI not only distorting historical facts but also being exploited to amplify instrumental uses of history.

COH03 Constructed pasts: Memories, predictions and speculations

PP 0289 Divination, data, and predictive devices: Toward a media archaeology of speculation

[Leona Nikolić](#)¹

¹ Concordia University, Communication Studies, Montréal, Canada

Present debates about the nature of artificial intelligence (AI) and its capacity as a technology of speculation (Natale, 2021; Pasquinelli, 2023) point to longer traditions of producing predictions and meaning about the world through data aggregation, algorithmic calculation, and pattern recognition—highlighting recurring questions about epistemological and ideological distinctions between speculative practices like divination, statistics, computation, and artificial intelligence (Benqué, 2021; Lazaro, 2018).

From the ancient to the contemporary, human civilisations and societies have sought to foresee the future in order to mitigate uncertainty, circumvent crises, and engineer favourable scenarios (Andersson, 2018; Daston, 1995; Steyerl, 2018). Techniques for speculation, accessible even today largely only to those in positions of power, have been in use long before the advent of AI: occult prophesy, astrology, weather forecasting, demography, epidemiology, financial markets, and strategic foresight, for instance – each performed with devices designed for their specific purposes. Situating AI within the historical and conceptual framework of these speculative practices, I will investigate their cross-temporal interdependencies to determine how they have and continue to shape one another across shifting cultural and societal contexts.

With a media archaeological approach (Parikka, 2012) that encompasses archival methods, a close reading of historical texts, and critical discourse analysis, I examine a selection of technologies of speculation beyond their linear or teleological historiographies in order to formulate a rhizomatic representation of their relationships to one another. Interweaving chronologies, I analyse the ancient Greek Antikythera mechanism, an analogue computer for astrological divination; Islamic Golden Age astrolabes for astrometeorological forecasting; Pascal's calculator, a seventeenth-century gearbox for executing actuarial calculations; the role of the mid-twentieth-century ENIAC computer in producing weather predictions; and Chat GPT, a present-day AI chatbot that uses probability to generate human-like patterns of language.

How can we observe socio-cultural shifts through these technologies of speculation and how do these technologies both reflect and inform hegemonic structures of their time? What is the relationship between the kinds of data that these technologies are designed to analyse and the narratives and myths that they uphold? In other words, what kinds of futures do these technologies produce and how do these futures function to either maintain or disrupt societal order, social cohesion, and collective realities?

This investigation reveals not only original historical perspectives on how we predict futures and the socio-cultural function of prediction-making, but also insight about the deep-rooted entanglements of speculation with sites of hegemonic contention. Moreover, my research demonstrates how the lines between pseudo-science and science, magical thinking and secular rationality, and divination and speculation have consistently been redrawn in efforts by ruling classes to maintain political and economic control over populations.

Spanning media studies, science and technology studies, and communication history, my intention with this paper is not to rewrite the history of speculation, but to uncover hidden, forgotten, or ignored stories that are integral to dispelling prominent myths about the omnipotence of technology and for alerting scholars, software developers, and the broader public to real-world repercussions of speculation in world-building.

COH04 Preserving pasts: Visual testaments, archival silences and securing sources

PP 0399 Visiting Kardelj in Ljubljana's Clinical centre: Censorship of photojournalism in Yugoslavia and mute evidentiality of Tanjug's photographic archive

[Ilija Tomanic Trivundza](#)¹

¹ University of Ljubljana, Media and Communication Studies, Ljubljana, Slovenia

The visual legacy of Yugoslav photojournalism remains for the most part inaccessible – locked in mostly unattended archives of media institutions, scattered among eclectic array of museums and galleries, or simply kept in boxes and attics in the attics of photographers or their heirs. The photographic archive of Yugoslav press agency Tanjug is one of a handful of fully preserved photographic archives of media institutions from the period of Socialist Federal Republic of Yugoslavia. Tanjug's photo archive is not only the largest among preserved ones, but also the only one with public, non-profit access. As such, it is an invaluable resource to researchers of Yugoslav (media) history. But at the same time, it is also to a significant degree, a mute archive.

Although systematically catalogued and filed, the contact sheets rarely carry extensive accompanying textual information beyond the date and location of the event, basic description of the event and the name of the photographer. There is no track of selection or distribution of images. Moreover, there are no other written records on production of images, training manuals, editorial guidelines, testimonials or memoirs. Apart from a handful of images made for Tanjug's anniversary publications, its vast image archive remains mute on the working conditions and operating procedures that guided the production of news photographs. It is a potent reminder of Allan Sekula's (1975) claim that all photographs are "incomplete utterances". By combining archival analysis and secondary sources with semi-structured interviews with seven former photojournalists and photo editors of Tanjug and former Yugoslav media, this paper will complete the "utterance" of two images from Tanjug's vast archive from the perspective of censorship.

The images in question depict an official visit to a prominent politician Edvard Kardelj in Ljubljana's Clinical centre on 10 January 1978. Unhappy with an "unhealthy" look on Tanjug's photographs, the party officials ordered a non-Tanjug photographer Joco Žnidaršič to cover a re-enacted visit of the delegation with instructions to produce livelier images. Kardelj died exactly a month after the re-enactment. Žnidaršič, an influential photo editor of Slovenia's main daily newspaper who accompanied Tito as his official photographer, claims that this was a unique and atypical intervention. Unlike countries of the Soviet bloc, Yugoslavia started dismantling the system of pre-publication censorship already in late 1950s and through subsequent changes in media legislation, introduced a model of post-publication censorship. This gave birth to a less formal system of censorship, which relied heavily on self-censorship, but at the same time allowed continuous testing of the limits of tolerated critical reporting.

This enabled development of a degree of professional autonomy of journalists and photojournalists, who not only learned the red lines of taboo topics, but were also able to explore the grey zone by evoking their role as "socio-political workers", tasked to contribute to elimination of internal contradictions of socialism within Yugoslavia's convoluted self-management system. The paper draws on semi-structured interviews to explore specific limitations imposed on photojournalists and their striving for professional autonomy, which are not visible in Tanjug's photo archive.

PP 0400 Data Solicitation for Media History. A new approach to study the CERN mailing list of the World Wide Web, 1991–1995

[Michele Martini](#)¹, [Martin Fomasi](#)¹, [Deborah Barcella](#)¹, [Eleonora Benecchi](#)¹, [Gabriele Balbi](#)¹

¹ USI – Università della Svizzera Italiana, Institute of Media and Journalism, Lugano, Switzerland

Mailing lists have the potential to be important sources for media historians. Due to their structure, these sources inform us about the inner functioning of a group and allow us to investigate issues such as consensus building, decision-making, conflict resolution, issue evolution, language development, inclusion/exclusion mechanisms, and power negotiations. And yet, despite being often accessible, mailing lists are not fully exploited as a source of data. Accordingly, in this paper, we propose an innovative co-constructive approach, coined as "Data solicitation", which integrates traditional historian praxis with digital methods and focus group discussions.

Data Solicitation is designed to help historians analyzing the significant volume of messages exchanged among many actors longitudinally. This method is structured in four main steps: (i) the construction of an exhaustive and organized digital database (ii) the analysis of the database through network analysis, (iii) the analysis of the database through text mining and (iv) the discussion of the obtained data with both informants and expert panels.

The Data Solicitation approach was developed and first applied to investigate the WWW talk mailing list. Established at CERN in 1991 by Jean-François Groff and Tim Berners-Lee, this mailing list was intensively employed to discuss central issues concerning the development of the web from 1991 to 1995 and even later. In line with the Data

Solicitation approach, we first scraped data and metadata from the online repository and organized them into a single database. We then employed network analysis to observe the appearance, disappearance, and permanence of different groups of interest over the years. After identifying the leaders of the various groups, we selected their messages and employed text mining tools, such as corpus analysis and topic modeling, to trace significant linguistic transformations and analyze topic distribution over the years. The acquired data were subsequently visualized, correlated with notable historical events in the history of the Web, and ultimately discussed with informants and expert panels. Participants were invited to articulate their opinions regarding the suggested correlations, propose potential impacts of other historical events on the trends, or offer alternative interpretations.

The core innovation of our Data Solicitation approach lies in its data-driven discussions, where quantitative data is not treated as a final product but rather as sources to be assessed, interpreted, and potentially disqualified. By fostering a dialogue between data analytics and human interpretation, this novel approach holds the potential to broaden our understanding of historical processes, uncovering new and unforeseen directions of inquiry. This method not only highlights the potential for effectively managing a multitude of online sources, thereby expanding the sample size for media historians, but also underscores the importance of employing a mixed-methods approach.

PP 0401 Mapping the Austrian News Media Landscape: Challenges and progress in the development of a scientific News Media Infrastructure

[Andreas Schulz-Tomancok](#)¹, Josef Seethaler¹, Gabriele Meliscek¹, Eva Asboth¹

¹ Austrian Academy of Sciences, Institute for Comparative Media and Communication Research, Vienna, Austria

Research infrastructures (RI) are indispensable for the digital future of research. The observable lack of transparency and availability of, among other things, media structure data in communication science but also in civil society makes it necessary to make corresponding data on the media-political public available in a concentrated and systematised way. When it comes to media data, especially in Austria, there is a lack of transparency and availability in communication science, which is the aim to be changed by the establishment of an Austrian News Media Infrastructure. The planned contribution will briefly outline the development of this digital Research Infrastructure and address the copyright and media policy challenges that have significantly determined the project and contributed to its re-conceptualisation. Initial insights will be given into the platform structure and the immanent relationships between media outlets, companies and genres in their diachronic and synchronic dimensions. Our RI-project is currently still in the programming and implementation phase and should be available in a beta version in spring 2024.

The media data itself, which is made up of media supply, usage, meta and content data is currently being transferred to a graph database. The RI combines primary research data for print (from 1848), radio (from 1924), TV (from 1955) and the online sector (from 1995) with market and usage data from various data originators and data collection institutions (from 1953) with whom bilateral agreements on data reuse have been concluded.

For legal reasons, the platform will currently only be available to scholars and (academic) teaching, although there are plans to open it up to other target groups, such as those from the field of media education. Registration is planned to be free of charge but subject to registration. Users will then be able to use a dashboard to carry out longitudinal and cross-sectional analyses of media and media company contexts, create and download coverage and market share tables and graphs, but also participate through thematic blog posts on the infrastructure website. The data offered is scientifically contextualised by the team and information is provided on the respective survey modes.

This reflection is intended to contribute to the relatively young field of German-speaking research infrastructure discussion for media and communication studies and thus to participate in the proclaimed "cultural change" of the Research Infrastructure Working Group of the German Communication Association (DGPK).

COH04 Preserving pasts: Visual testaments, archival silences and securing sources

PP 0402 Web archives in times of crises: Navigating global challenges and collaborative solutions

Susan Aasman¹, Anat Ben-David², Niels Brügger³

¹ University of Groningen, Media and Journalism Studies, Groningen, Netherlands

² Open University of Israel, Sociology – Political Science and Communication, Haifa, Israel

³ Aarhus University, School of Communication and Culture – Media Studies, Aarhus, Denmark

In an era marked by pandemics, global conflicts, socio-political upheavals, and rapid digital transformation, the importance of preserving digital content has never been more critical. This paper delves into the intricate challenges and imperatives of web archiving of crisis events and the opportunities it holds for transnational research making use of these archives.

As the digital landscape becomes a primary arena for communication and historical documentation, the vulnerability of online content from censorship, deletion, or alteration intensifies during tumultuous times. Consequently, web archiving emerges as an important tool in capturing, preserving, and safeguarding historical narratives that chronicle the multifaceted dimensions of conflicts and crises. As Astrid Erll observed in 2020, during the COVID-19 crisis: "It is the first worldwide digitally witnessed pandemic: a test case for the making of global memory in the new media ecology" (Erll 2020, 867). It is not hard to read her words as a call to both researchers and archivists to think critically about processes of heritagisation of born-digital materials of the live web, and which of the web's "mediated experiences, beliefs, and narratives will make it into dominant memory discourses" (idem).

This paper will discuss the ethical, legal, methodological, and technical complexities inherent in working with web archives within volatile contexts. Drawing upon case studies from the forthcoming edited volume *The Routledge Companion to transnational web archive studies*, we will present the lessons learned by web archivists and researchers about the challenges of analysing entire national web domains from a transnational perspective; reflections on the opportunities of archiving and researching transnational events – such as climate change or the recent COVID-19 pandemic; the challenges of using digital methods in web archive studies; and assessments of the politics of web archives as collections.

Furthermore, building on the experiences of the European-based WARCnet community which acted as an active group of web archiving practitioners and researchers during 2020–2023, the paper underscores the need to develop meaningful international and interdisciplinary collaborations. If we aim to further web archiving as a space for safeguarding historical memory in an increasingly volatile world, it calls upon media historians, archivists, and policymakers to invest in robust archiving infrastructures and research initiatives based on the principles of transparency, accessibility, and integrity.

PP 0403 The first social medium: Postcards and narratives of history

[Kenneth Andresen](#)¹, [Abit Hoxha](#)¹

¹ University of Agder, Department of Nordic and Media Studies, Kristiansand, Norway

Postcards, with the combination of images in the front and short messages on the back offers a discovery of what some call an early social medium. In less than one hundred years, the postcard has shifted from a ubiquitous part of daily life to an obscure and occasional academic footnote and is only now beginning to re-emerge as a valuable documentary form for researchers of communication history. This paper presents a study of a historical collection of postcards as an early social media in the Western Balkans. The data for the current study is from image analysis and text analysis of a unique private collection of over 1.700 historical postcards from Kosovo, dated from 1900 to 1999. The analysis of the collection focuses how multimodal narratives present a history of social order and disorder in an area undergoing multiple dramatic transitions. The paper seeks to discuss a typology of the postcards as communication (social medium, direct communication, multimodal narration, and historical documentation). Since the late 1800s, Kosovo was occupied by the Ottoman Empire, the Austro-Hungarian Empire, Nazi Germany, Bulgaria, Italy, and Serbia. Military and civilian personnel left their mark in an, until today, unseen, and unwritten part of history through sending postcards from Kosovo to their loved ones back home. Along with that, they sent personalized but still very important stories that represent a time capsule from the past events and accounts. Additionally, these postcards carry images of Kosovo and the representation of exclusive, unpublished images of Kosovo. This paper analyses how Kosovo's history is represented through the postcards' images of people, landscapes, architecture, and other visual content from 1900 to 1999. These images were either taken by external photographers or local photographers and were meant to show living conditions and developments of notable events in Kosovo. The images represent a multitude of ethnic, religious, and national significance and they communicate fragments of the historic images that were used as direct communication through an early social. The postcards were sent from soldiers based in Kosovo, but also from students, tourists, businesspeople and from people living in Kosovo with relatives elsewhere in the former Yugoslavia. They show tourists landscapes with now non-existing architecture and infrastructure showing the old market, old mosques, and churches. These historical postcards represent aesthetic and visual value, and a study of an early social medium providing narrations of troubled pasts.

COH05 Imagined pasts: Troubled pathways, disruptive discourses and dreamy visions of (digital) media futures

PP 0516 How governments privatize: Germany's case of the Treuhand and the post-socialist press

Mandy Tröger¹

¹ Universität Tübingen, Institut für Medienwissenschaft, Tübingen, Germany

For people worldwide, the fall of the Berlin Wall on November 9, 1989, stood symbolic for hopes of democratic transformation and liberation. Millions of East Germans went to the streets to protest state repression and censorship, voicing their demands for freedom of opinion, and a free and democratic media. One year later, the German Democratic Republic (GDR) joined the Federal Republic, reuniting Germany. While much has been written about East Germany's subsequent media transition from a state-controlled propaganda apparatus to that of a free democratic media system, there has been no historical analysis of the underlying political economic forces that shaped this transition and/or the newly established media.

Based on extensive archival research, this paper looks at the privatization of the East German press and shifting ownership patterns administered by the *Treuhand* (THA), a public administrative body responsible for privatizing the entire East German economy. With regard to the press, the leading question is in how far the democratic potential that existed in the moment of revolutionary change in 1989/1990 found its institutional and/or political implementation in the post-socialist East German press due to THA policies.

This question is highly controversial in Germany, not the least because the privatization of newspapers became a major battle field among different interest groups. In particular financially strong West German publishers had secured their future market shares, as early as spring 1990. By means of preliminary joint venture agreements primarily with the fourteen former regional papers of the Socialist Unity Party (SED) – privileged, mass-circulating papers with quasi-monopoly positions in their respective regions – they had divided the market amongst each other. Thus, when in August 1990, the privatization of these papers fell to the THA, its sphere of influence was limited. It often followed pre-established joint ventures and did not, as was the initial reform goal, break their monopoly structures. The THA thereby enabled centralized newspaper monopolies, once established under a political dictatorship, to continue for market reasons. This resulted in a dying of newly established local papers and a highly concentrated press market.

The archive of the THA opened only recently. This paper, thus, gives first archival glimpses into the struggles of the post-socialist press, the privatization practices of the THA and the role of federal government in this transition.

COH05 Imagined pasts: Troubled pathways, disruptive discourses and dreamy visions of (digital) media futures

PP 0517 The death of the news' paper – The e-paper as imaginary media in Swedish newspaper history

Karin Larsson¹, Ingrid Forsler¹

¹ Södertörn University, Media and communication studies, Huddinge, Sweden

In the late 90s, most newspapers began publishing online, alongside their print editions. The digital newspaper could be updated multiple times a day, allowing news to reach the reader more rapidly. However, the digital newspaper lacked the mobility associated with the printed paper since most readers accessed the content through a desktop computer. This posed a challenge for newspaper organizations that began searching for a solution that combined the digital connectivity of the online newspaper with the mobility of the traditional print media. In Sweden, one such project was initiated by the national publishing organization "Tidningsutgivarna" in collaboration with several national as well as local newspapers (Ihström Eriksson 2013). Initiated in 2007, the actors involved in the project investigated different alternatives and even contributed to the development of a prototype tablet based on the same technology as today's Kindle. The prototype was never put into production and the project ended in 2010 when the first iPad was introduced and became the standard device for media productions.

This paper delves into the era preceding the launch of the iPad, examining the conceptualizations influencing discussions about the nature and future of newspapers. Employing the framework of *imaginary media archaeology* (Kluitenberg 2011), it investigates unrealized media devices designed for newspaper reading within the Swedish e-paper project. This includes prototypes, visual and textual representations, as well as internal discussion reports. By spotlighting projects that faltered or lingered at the ideation stage, this methodology disrupts the conventional linear narrative of progress in media history and underscores the contingency inherent in technological development. The paper argues that this Swedish e-paper project reveals how the death of the newspaper was always already inherent in the news' paper itself, as the paper, confronted with its failed e-twin, emerges as what Krämer (2015) has framed as *the dying messenger*. However, as the news' paper died, the news themselves lives on in other material (plat)forms whose inherent mortality is yet to be imagined.

COH05 Imagined pasts: Troubled pathways, disruptive discourses and dreamy visions of (digital) media futures

PP 0518 The troubled path of Cineca: Success, crisis and disruptions in the history of the main Italian supercomputing center

Lara Marziali¹, Paolo Bory¹

¹ Politecnico di Milano, Design, Milano, Italy

Relying on a preliminary set of primary and secondary sources this presentation aims to identify the main causes behind the success of Cineca, an interuniversity consortium founded in 1969 by four universities (Bologna, Firenze, Padova and Venezia) and the support of the Italian Ministry of Education (Ministero della Pubblica Istruzione).

The consortium was meant to provide computational services for scientific research in Italy. Today, Cineca is the main Italian supercomputing center, recognized worldwide for its important role, as it hosts "Leonardo" the 6th most powerful supercomputers worldwide according to the Top500 list. Cineca is also an important actor of the European strategy in science computational support and high performance computing (HPC). However, despite its importance, there are no proper historical studies tracing its origins and developments.

In the 1960s, Cineca was just one among the computing centers in Italy, but over the decades it became the most prominent one in the country. The history of Cineca, as for many other digitization projects (Balbi & Magaudda 2022), is a story of success and failures. For example, in 1985 the Italian Ministry of Education gave Cineca the resources to buy a Cray X-MP/12, the first supercomputer to use vector processors and the latest model distributed in Europe. This technology brought the consortium to the top of its glory. Following some key governmental changes, though, the subsequent lack of economic support, alongside the heavy expenses undertaken so far, put Cineca in a difficult position so much that in 1989 was thought to be near its end.

Tracing the history of Cineca is relevant for several reasons:

- first, Cineca's history highlights the deep connections between science, digitization, and politics, which – as Mobach and Felt point out – is having greater importance in debates around policy and beyond nowadays (Mobach&Felt, 2022);
- second, Cineca's development enlightens a privileged case study for drawing the political discourses lying behind supercomputers;
- finally, drawing Cineca's history provides historians with a privileged lens to analyze the geopolitical order of the Cold War, years in which Cineca was founded, grew, and nearly died.

The demand for a continuous increase in computational capability by hard sciences places supercomputers at the heart of the relation between scientific communities, digital technologies and nation-states, as the high costs in public infrastructure and computing competences can only be sustained by governments. Those interlinks are continuously highlighted in Cineca's case. As Misa pointed out (Misa, 2007) computing practices are a product of local circumstances and distinct cultures. This case study helps us to have a wider knowledge of the different computing practices that changed the world.

COH05 Imagined pasts: Troubled pathways, disruptive discourses and dreamy visions of (digital) media futures

PP 0519 Retracing closure strategy of controversial interpretation with discourse analysis: The case of the Web in the press and TV

Fomasi Martin¹

¹ Università della Svizzera italiana, Istituto Media e Giornalismo, Lugano, Switzerland

The Web started to be developed at CERN in 1989 and it quickly spread beyond the boundaries of the laboratory, reaching social worlds other than science. The narrative of the founding fathers of the Web emphasizes their role in its promotion and diffusion among experts. Press articles and TV programs also played a role by introducing the web to the general public. However, sometimes these media reported an interpretation of the web that triggered a reaction of CERN employees and the global community of web developers.

This research adopts the Social Construction of Technology approach (SCOT) and introduces the term "controversial interpretation" to denote a set of meanings associated with a technology by a relevant social group, leading to controversy and thus, specific reactions from other social groups seeking closure. Methodologically, this study proposes a new and robust integration of SCOT with discourse analysis to elucidate how social groups align the others with a specific interpretation. The tools considered are modality, exclusion of social actors, and metaphor. The nature of sources allows for the systematic analysis of modality used in the reactions of CERN employees and web developers against the interpretations presented in Press and TV, explaining how social groups attempted to align with their interpretation. Additionally, metaphor and the exclusion of social actors can be selectively applied to detect controversial elements of the interpretation and to explain a particular strategy for alignment, respectively.

The primary sources consist of two collections: the "World Wide Web, WWW (Archives)" from CERN and the WWW-talk mailing. The former was classified for 30 years and comprises non-digital documents collected during the development of the web. The latter is the mailing list of web developers requested by Tim Berners-Lee, the inventor of the web, to discuss about technicalities, news and everything related to the improvements of the web.

In these two collections, I identified three different controversial interpretations of the press and TV. The first is the web interpreted as the Internet. Some articles and TV programs confused the role of the web with that of the Internet. The second is the Web interpreted as a U.S technology. The web was invented in Europe by a European organization but sometimes its origins are not mentioned or are wrongly indicated. The last case is the Web interpreted as the Mosaic browser. Mosaic was a very popular browser and sometimes was presented as the Web. In addition to these three cases, the discourse analysis of certain WWW-talk messages reveals web developers' perspective on the reason behind the controversial interpretations and the solutions they put forth to address the issue.

COH05 Imagined pasts: Troubled pathways, disruptive discourses and dreamy visions of (digital) media futures

PP 0520 Disruptive discourses of the digital revolution: Sociotechnical imaginaries of the Dutch web between 1994–2004

Nathalie Fridzema¹, Susan Aasman¹, Tom Slootweg¹, Rik Smit¹

¹ Rijksuniversiteit Groningen, Letteren, Groningen, Netherlands

The early 90s marked the period for most Western countries in which the digital revolution began as a result of the public availability and spread of the World Wide Web. The novel communication network brought forward a range of social (dis)orders actualized in understandings like the information society or new economy. The Netherlands was home to many influential Web initiatives that each interpreted ontological, internet ideals (i.e. freedom, openness, creativity) differently. These meanings – often expressed through common metaphors like information highway or global village – are highly context-dependent; while the United States' cultural hegemony drove some interpretations of the Web, others are best situated in Europe's or, more specifically, Amsterdam's particular creative culture in the 90s. To understand these various meanings, the research identified sociotechnical imaginaries of the Dutch Web between 1994 and 2004, focusing on disruptive discourses and positioning them in historical contexts. This time is critical to study because the decade before Web 2.0 was a dense period including the disruption of traditional media, the emergence of various sociotechnical orders, and the normalization of a web culture that influenced our contemporary media landscapes.

The research affirms that technologies are never merely material but are actively constructed in discourse and through practice. Their meaning and uses are imagined by actors who are embedded in specific socio-cultural and historical contexts, and who have different degrees of discursive efficacy. The meaning of the Web is, therefore, a site of discursive struggle and power dynamics. The concept of 'sociotechnical imaginaries' (Jasanoff & Kim, 2015, p. 4) is employed to thoroughly study these phenomena. By deconstructing sociotechnical imaginaries and connecting them to their historical contexts, one can gain insight into the relationships between meaning (how

was the Web interpreted), materiality (how were meanings inscribed in the Web), and morality (how life ought to be lived enabled through the Web). The study focuses specifically on the usage of metaphors (Lakoff & Johnson, 2008; Markham, 2003) and its role in the emergence of utopian, dystopian, hegemonic, and ideological imaginaries (Flichy, 2007).

Based on a critical discourse analysis of various Dutch media and canonical science books, the research demonstrates that multiple, interconnected sociotechnical imaginaries of the Web existed between 1994 and 2004 which can be summarized in five themes (civic, societal, economic, cultural, ontological). The study reveals an evolution in socio-digital orders transitioning from early grassroots democratic ideals to hopeful entrepreneurial visions, culminating in more critical perspectives post-2000. Within this analysis, hegemonic and counter-hegemonic narratives are identified which contribute to alternative readings of an idealized past and thus demystify grand notions.

Methodologically, the research demonstrates how an explorative analysis of discourse can be leveraged to critically examine historical phenomena, revealing the production, enactment, and dynamics of power within social (dis) orders. Additionally, it contributes to the historiography of the Dutch web which enables a comparative analysis between under-studied narratives against the backdrop of dominant interpretations in the field of Internet History. This comparative aspect enriches our understanding of diverse, often underrepresented, perspectives of our digital reality.

COH06 Controlled pasts: Cases of censorship, connection, and control in communication history

PP 0627 Postal connection Venice-Constantinople: Control over international information flows and the soft power of a Renaissance State

Juraj Kittler¹

¹ St. Lawrence University, Performance and Communication Arts PCA and English Departments, Canton, USA

The control over international flows of information constitutes one of the core elements of the soft power of a modern state. This claim has been previously studied by communication historians mainly in the case of the nineteenth century telegraph or the twentieth century broadcast. However, very few academic sources examine this claim from the perspective of the postal service. Working within this premise, this study examines the strategic advantages gained by controlling the postal exchange between Europe and the Middle East during the late sixteenth/early seventeenth century. This objective was achieved by the Republic of Venice, which unilaterally dominated most of the commercial and political information flows reaching the continent from Constantinople – to the point that French King Francis I (ruled 1515–1547) famously said: “There is no news from the Levant if not by way of Venice.” The earliest notions about the dispatches of postal couriers between Venice and Constantinople are from the 1330s and their movements are sporadically documented during the ensuing centuries. However, the earliest known contract establishing a regular connection dates only from the 1530s. It outlines a bifurcated postal line that relied upon a small fleet of postal boats transferring mail between Venice and Kotor, then carried in bags across the Balkans by groups of Montenegrin pedestrian couriers. Their destination was the office of the Venetian envoy (*bailo*) in Pera/Constantinople, from where other couriers were dispatched further along, providing regular connections with European trading enclaves in Aleppo, Damascus, and Tripoli (Lebanon). Several other European powers (e.g., the French or Polish royal posts) repeatedly attempted to undermine the Venetian postal monopoly with the Middle East, but – as this study demonstrates – their efforts always failed. To preclude any potential competition, the Venetians opened their postal service for free to the rest of Europe and in the second half of the sixteenth century the government subsidized the connection with Constantinople in the amount of 3,250 gold ducats a year. By the early seventeenth century, this service was almost a victim of its own success: the mail was shipped in bi-weekly intervals from the Ducal Palace, the operation employed five boats staffed by 40 sailors, and the mail bags were carried by a cohort of 150 couriers. The total journey took more than three weeks. Yet all this was considered a worthy investment by Venice, since it forced other European powers to retain their embassies and postal offices in the city. In essence, maintenance of this postal monopoly enabled the Republic of Venice to survive its growing political obscurity and to remain a relevant player in the European context at the time when it was fast losing its former economic positions as well as its naval dominance in the Mediterranean. The republic unilaterally controlled the postal exchange between Europe and the Middle East until the mid-eighteenth century, when its dominance was successfully challenged by the Habsburg posts of Vienna.

COH06 Controlled pasts: Cases of censorship, connection, and control in communication history

PP 0628 Revolutionary television and the memory of the dictatorship – Practices of torture and imprisonment in televised journalism (1974–1976)

Carla Baptista¹, Jacinto Godinho²

¹ NOVA FCSH/ICNOVA, Communication Sciences Department – Nova University of Lisbon, Lisboa, Portugal

² University Lusófona, Communication Sciences, Lisboa, Portugal

The longevity of the Portuguese dictatorship (1933–1974), crystallized in the expression *Estado Novo*, is due to the effectiveness of a cultural and symbolic imaginary that legitimized Salazar's policies. Part of this imaginary builds on the repudiation of the previous regime – anti-republicanism, anti-parliamentarianism and anti-liberalism – the other part founded new values operationalized by the official ideological apparatus – nationalism, parochialism, personalized power and a strong and authoritarian state. This communication focuses on the reverse movement, that is, how the popular and political culture that anchored the dictatorship was dismantled and replaced by revolutionary values, identified with progressivism, equality and cosmopolitanism.

The media, particularly television, played a central political role in constructing the revolutionary imaginary and the new civic culture. As democracy was invented, values clashed, and the new imaginary never entirely coincided and was experienced agonistically. In this context, we will look at the documentary programs produced by Portuguese television (RTP) between 1974 and 1975, focused on denouncing the repressive practices of the *Estado Novo*, namely imprisonment for political reasons and torture.

We argue that television was the main builder of the traumatic memory of the dictatorship, unveiling episodes from the (very) recent past that remained unknown to most of the Portuguese population. Outside of family experience, politicized niches or close circles, most people were kept ignorant of the horrors of political prisons, massive intimidation, the impact of censorship and the lack of freedom of expression. After April 25, under military administration and driven by a political program aimed at revolutionary objectives, RTP became the people's historian, making visible the stories of the victims and survivors. This movement articulates a broader discussion about the social mission of (television) journalism in the revolutionary context, with emerging journalistic practices and formats and with the disputes over memory that arose between the various political parties involved in gaining social relevance and visibility.

This communication aims to contribute to a critical knowledge of the symbolic processes that helped to construct the democratic culture in Portugal, impacting the current perceptions and operations related to collective memory and national identity.

COH06 Controlled pasts: Cases of censorship, connection, and control in communication history

PP 0629 Idealised pasts: How newspapers portrayed the 1940 commemoration of the Exhibition of the Portuguese World

Inês Fernandes¹

¹ Universidade Católica Portuguesa, Faculty of Human Sciences, LISBOA, Portugal

This study aims to understand how the Portuguese press portrayed the inauguration of the Exhibition of the Portuguese World in the year of 1940. This event was organized as a moment to embrace and showcase the Portuguese Empire, its tradition and history, idealising the past of what was once one of the biggest empires of the world. How the newspapers portrayed this celebration in the mist of the Second World War is what the main question aims to answer.

The *Estado Novo* regime, instated in Portugal in 1933 and led by António de Oliveira Salazar, was characterized as a dictatorship embedded in tradition and moral values.

The regime Secretariat of National Propaganda and Censorship Office worked together in determining what was newsworthy (Ribeiro, 2015) and creating the narrative of an historical Portuguese empire and his colonies, promoting the regime itself and celebrating Portuguese nationalism (Gori, 2018).

In the year of 1940 Portugal was not only celebrating the birth of the nation in 1140, but also its independence from Spain in 1640. As such, this year is recall by researches and historians as a moment of strong presence and dominance of national propaganda, namely regarding the celebration of the Portuguese empire and its greatness (Ribeiro, 2019).

Departing from this landscape, this investigation tries to understand how the commemoration of this historical dates, that culminated in the Exhibition of the Portuguese World, where portrayed in the two main daily newspapers *O Século* and *Diário de Notícias*, and how it compares with the news outlet *Diário da Manhã* from the regimes political party (*União Nacional*).

Taking the front covers of the newspapers and the sections dedicated to the *Centennial Commemorations*, one can perceive the impact that the national propaganda had in the portraying of the Exhibition. In keeping with

the regimes agenda of not reporting on the Second World War and, at the same time, enhance the national achievements, not only was there a clear prevalence given to the celebrations, but also the chosen words are of national pride, patriotic value and imperialistic achievements. At the same time, and presenting the celebrations as an event that would gather every corner of the country and his colonies, the newspapers are meticulous in the covering of the activities taking place in various locations, along with the international personalities that were present in different moments of the event. This apparent normality of events and everyday life takes centre stage to a fundamental moment of the Second World War (the fallen of France), and is paramount to understand the efforts the national propaganda took in order to keep the idea of a country neutral and unaffected by the war and, at the same time, with an historical background that showcases the magnificent Portuguese Empire.

Overall, the role of the Censorship Office and the national propaganda is clear in assuring that the newspapers would publish positive news, that enhanced the Portuguese achievements, idealising for the 1940 a future where the past was to be celebrated and preserved.

COH06 Controlled pasts: Cases of censorship, connection, and control in communication history

PP 0630 Monkey King's Nordic Tour: China's journey to the West via North

[Laura Saarenmaa](#)¹

¹ University of Turku, Media Studies, Turku, Finland

In April 1979 Finnish television broadcasted a rarity: an animation film *Monkey King: Havoc in Heaven* (*Da naio tian gong* 1961) from the People's Republic of China. Today considered as one of the masterpieces of Chinese animation, the film was not in favor of Mao Zedong. It was shelved during the Cultural Revolution (1966–1976) and got its European re-premiere after Mao's death in 1978. The film was thus perfect marker of the cultural and economic opening of China, and perfect call card for China's cultural diplomacy and soft power in the West.

In the Nordic countries, the television broadcasting of *Monkey King* accompanied the Nordic tour of the vice-premier Gen Biao's in the spring of 1979. The tour began from Stockholm, and then continued to Helsinki, Oslo, and finally Reykjavik. The tour faced public criticism because of China's attack to Vietnam earlier that spring. But the film was warmly welcomed and highly appreciated by film critics and Nordic tv-audiences. The most favorable reception the film received in Sweden, where the film was broadcasted with Swedish voice over narration by the famous Swedish author, Hans Alfredson. Perhaps because of the popularity of Alfredson's voice over, the Swedish version of *Monkey King* was also released in VHS-format in 1983.

In this paper it is suggested that the tv-broadcasting of *Monkey King* in the Nordic countries in 1978–1979 was a determined act of public diplomacy operated by Chinese embassies, driven by politically motivated aims to improve the national image of the People's Republic of China, and to pave the way to prosperous trade relations between China and the Nordic countries. The paper recollects the beginning of the new global order, the economic rise of China to a global super power in digital communication technologies. Looking back in history, the early phase consisted of persistent small-scale maneuvers of cultural diplomacy, such as circulating an animation film between Nordic public service television companies.

COH06 Controlled pasts: Cases of censorship, connection, and control in communication history

PP 0631 Terrorscapes of modernity: brainwashing, human automatons, and the welfare citizen in Sweden and Denmark, 1950–1970

[Marie Cronqvist](#)¹, [Rosanna Farbøl](#)²

¹ Linköping University, Department of Culture and Society, Linköping, Sweden

² Aarhus University, Department of History and Classical Studies, Aarhus, Denmark

In a time of international tensions and disinformation warfare paired with warnings of the disruptiveness of AI technologies, historical inquiries into Cold War imaginaries about human automatons can help us to reflect on mental resilience in its sociotechnical context, and to problematize both past and current discussions about social (dis)order. This paper investigates the conceptual career of "brainwashing" in two Scandinavian countries, Sweden and Denmark, throughout the 1950s and 1960s.

The choice of these countries is key to our argument. In conventional Scandinavian historiography, the postwar period is understood in terms of the realisation of the welfare state model led by strong social democratic governments (e.g. Finn Christiansen et al 2006). The period has been framed as an optimistic era with an expanding industry, economy, and collective vision for the society where universalism, equality, and solidarity are ensured by a protective state, a dreamscape of modernity (Jasanoff & Kim 2015) with bright expectations for the future based on solid advances in science and technology. Less highlighted in existing scholarship are the more dystopian narratives, that were not only surfacing in the 1970s with student leftist movements critiquing previous postwar visions, but existing throughout the period. Indeed, daydreams and nightmares, such as the decapitated human automaton, co-existed.

In our paper, we show how the concept of brainwash and the image of the human automaton were introduced in the early 1950s in the wake of the Korean War and follow their trajectories until 1970. Our sources are leading newspapers of various political orientations, as well as domestic and translated books by psychologists and laymen that were published and circulated at the time. In order to identify general patterns as well as specific differences, we use a scalable model of approaching the sources, including both a distant reading of published newspaper material in the two relevant national databases, and qualitative close readings of selected reportages and articles from both countries.

Our findings show how the concept almost immediately, after a short period of semantic instability, became a battleground for different political agendas, but also how it developed in the late 1950s into a dark narrative of the dangers facing collective freedoms, security, and democracy. In its Scandinavian version – counter to that in some other Western countries, and most notably the US (Carruthers 2009; Selisker 2016) – this tapped into discussions of the resilient welfare citizen, modernity, and social equality. Here, we find similarities between the two selected countries. But there are also differences, one being the higher number of academic books in Sweden. This, we argue, must be seen in relation to the higher degree of scientification and theorisation of civil defence, psychological defence and propaganda in Sweden, which we have discussed elsewhere (Björnsson et al, forthcoming 2024; Cronqvist 2019). In scientific circles as well as in public discourse, brainwashing was a terrandscape of modernity and social disorder with not only absent-minded and unfree, but also unproductive and un-solidaric, individuals.

COH07 Controversial pasts: Commemorative conflicts, dominant discourses, and disruptive voices

PP 0887 Ideas of the public sphere in the labor movement: Concepts of a communication order between ideals and fears

Niklas Venema¹

¹ Leipzig University, Institute of Communication and Media Studies, Leipzig, Germany

The European socialist labor movement since the 19th century strove for a fundamentally different social order, including communication and media. Regarding the public sphere, communication freedom was a key programmatic demand in view of state repression (Hardt, 2000). At the same time, actors in the movement perceived the emerging commercial media order as a threat (Löblich & Venema, 2020). Against this backdrop of ideals and fears, the question arises as to how representatives of the movement imagined an order of public communication that went beyond the rising bourgeois public sphere and a party press that had to assert itself in a commercial media system. Therefore, the paper addresses the research problem of which concepts of the public sphere the socialist labor movement pursued and how these changed over time. It thus extends previous research, which looked at public communication in the labor movement particularly from an organizational perspective, to include the history of ideas dimension of (proletarian) public spheres (Calhoun, 2010).

For this purpose, qualitative textual analyses of books and theoretical journals of the then leading German labor movement are conducted for the period between the advent of the movement as well as the emergence of a commercial media market in the mid 19th century and the rise of fascism in 1933. The analyses are guided by a heuristic framework derived from public sphere theory. The categories comprise actors and their biographies as well as their ideas regarding public communication and, first, the relationship to politics, economy, media, and science, second, arenas of interaction, assembly, or media publics, and third, the respective roles of communicators and recipients (Imhof, 2011, 90–99). The publications of the key figures Ferdinand Lassalle, Karl Marx, Frederick Engels, and August Bebel are analyzed. Further, books and contributions of less prominent actors in the intertwined milieu of youth, education, media and party work to social democratic and communist theoretical journals (*Die Neue Zeit*, *Die Internationale*), independent leftist-intellectual magazines (*Die Weltbühne*), and professional journals of socialist journalists (*Mitteilungen des Vereins Arbeiterpresse*) are examined.

The analyses reveal the tension between the basic principles of communication freedom and non-commercial organization, which, for example, Bebel combined in an outlook for an expansion of the public sphere in a socialist society. While social democracy increasingly focused on its own press and defended freedom of the press in the bourgeois-democratic society, individual representatives developed more radical ideas on the socialization of newspapers or film industry. By dealing with past discourses, the proposal highlights how communication and social orders were challenged and hints to alternative approaches that gain in relevance in view of current crises.

COH07 Controversial pasts: Commemorative conflicts, dominant discourses, and disruptive voices

PP 0888 Nationalisation of childhood during conflict: An analysis of the nationalist discourse in the Turkish Cypriot children's magazines published in the late 1960s

[Mazlum Kemal Dağdelen](#)¹

¹ Charles University, Institute of Communication Studies and Journalism, Prague, Czech Republic

Conflicts influenced many societies throughout the twentieth century, and Cyprus was no exception. From the early twentieth century, Cyprus bore witness to armed conflicts driven by two ethnic-nationalist movements of the major communities living on the island, namely Greek Cypriots and Turkish Cypriots. The late 1950s and 1960s marked the emergence of intense inter-/intra-communal armed conflicts, known as the Cyprus Problem, profoundly impacting the lives of every woman, man, and child on the island. In this context, where the warring parties attempt to align childhood with their discursive constructions of the self and the enemy (Jabri, 1996), childhood inevitably intersects the nationalist discourses in myriad ways. Children's magazines of this period reflect not only the harrowing violence but also the hegemonic nationalist discourses, exacerbating conflicts in Cyprus.

This study examines the construction of nationalist discourse within children-focused media, using a Turkish Cypriot children's magazine as a sample against the backdrop of the Cyprus Problem, to understand how childhood is incited, suppressed, and moulded to embrace the hegemonic claims of the nationalist discourse. The theoretical backbone of this research is developed through Ernesto Laclau and Chantal Mouffe's discourse theory (DT). As a part of a poststructuralist tradition, DT sees discourse as a framework of intelligibility providing meaning to social phenomena. Accordingly, this research approaches nationalism as a discourse and considers childhood a discursive construct whose meaning is subject to political contestations.

This research focuses on a particular Turkish Cypriot children's magazine, *Tuncer*, published between 1965 and 1970, a period when armed conflicts gradually escalated and left their mark on the social body, with war and military institutions becoming internal to society and the hegemony of the Turkish (Cypriot) nationalist discourse became more sedimented in Turkish Cypriot community. The selected data comprise twelve issues released between January 1967 and May 1968. This timeframe is pivotal, coinciding with significant conflict escalations involving (para-)military groups.

To better understand how the nationalist discourse is articulated in these children's magazines, a discourse-theoretical model is developed first through the discourse-theoretical rereading of the literature on nationalism and childhood. For the analysis, this research employs the discourse-theoretical analysis (DTA), an analytical variant of DT developed by Carpentier and De Cleen (2007) as a method to operationalise DT by building a bridge between DT and qualitative research methodology, particularly through the activation of the methodological tool of the sensitising concepts. Additionally, multimodal analysis techniques are employed to support DTA. Methodologically, this research adopts a retroductive (Glynos & Howarth, 2007) approach engaging in iterative exchanges between the theoretical framework and empirical analysis, both of which cross-fertilise each other. This also implies that the theoretical framework is not a rigidly pre-determined template. Although the analysis proceeds cyclically, for practical reasons, this paper first sketches the theoretical components and then reports on the analysis.

COH07 Controversial pasts: Commemorative conflicts, dominant discourses, and disruptive voices

PP 0889 Broadcasting agency in the Portuguese empire: Disrupting the dominant discourse through media tactics

[Nelson Costa Ribeiro](#)¹

¹ Catholic University of Portugal, Faculty of Human Sciences, Lisboa, Portugal

This paper will discuss how the private radio clubs established in the Portuguese former colonies demonstrate the failure of the State's imperial broadcasting strategy, while also representing a tactical appropriation of the new technology by the expats whom the Lisbon government denied a central role in the administration of the overseas territories (Rosas, 2005), restringing their power in the context of the Empire. The success of these stations established outside the official imperial policy was later on recognized by the regime itself during the wars of independence. The Portuguese government would then turn to these private stations to disseminate colonial propaganda and later on inaugurated state-controlled broadcasters in Angola and Mozambique that were modelled on those stations.

When addressing the official stations established in the colonies in the 1960s, a particular focus will be placed on *Voice of Mozambique* and *Voice of Angola*, both used as weapons of war to counter the pro-independence messages that reached the Angolan and Mozambican population through shortwave broadcasts produced in the neighbouring new-born nations, namely Tanzania and the Republic of Congo. The programmes from the independence movements constitute an example of how radio technologies became tactical weapons used by those fighting the colonial domain.

Based on documental research conducted in Lisbon, Maputo and Luanda, the chapter will focus on the development of broadcasting institutions by the Portuguese colonial regime, the Portuguese expats and the African independence movements. It will be argued that the most successful radio stations in the Portuguese Empire were those set up by social groups that best understood the colonial context and the aspirations of those who were listening in Africa. Such groups took a hands-on approach to broadcasting, testing and altering technological infrastructures and programmes instead of following an overarching strategy set by the Lisbon government. This, I believe, will demonstrate how the white expats and the independence movements managed to use broadcasting to acquire recognition among radio listeners in the colonies. Ultimately this chapter will showcase how those who aim to challenge established power structures can do so by the appropriation of media products and technologies, i.e. by resorting to what De Certeau (1984) defined as tactics.

COH07 Controversial pasts: Commemorative conflicts, dominant discourses, and disruptive voices

PP 0890 Shared memory? A comparative analysis of (post-)communist remembrance in Germany and Poland

Anke Fiedler¹, Tomasz Rawski², Krzysztof Świrak²

¹ Universität Greifswald, Institute for Political and Communication Science, Greifswald, Germany

² University of Warsaw, Sociology, Warsaw, Poland

As public memory can never fully represent private recollections, every society is marked by memory gaps. Taking Poland and (East) Germany as examples, this paper uses a social constructivist-poststructuralist approach and a qualitative research design to investigate how the (post-)communist past is remembered in private everyday discourse and its differentiation from the hegemonic public memory discourse. The underlying question asks whether each country has developed distinct memory gaps due to their divergent post-Cold War trajectories.

Both countries serve as excellent objects of comparison due to their parallels in hegemonic memory practices: In post-1989 Poland, anti-communism became the default position for most politicians, intellectuals, and journalists. The same is true for the German case: Historical analyses and empirical studies generally conclude that an anti-communist stance characterizes the public memory of the GDR in Germany. These anti-communist tendencies fit into a more comprehensive overall picture of anti-communist rhetoric in the European Union.

To analyze how the hegemonic public discourse of memory manifests in the everyday discourse of the Polish and East German population and how it is distinguished from the latter, we conducted interviews and focus groups in both countries from December 2018 to May 2020 (N = 120). For this, we used the theoretical concept of "everyday discourse" according to Waldschmidt et al. (2008), which is based on Berger and Luckmann (1991) and Foucault (1972). Demographic characteristics, such as gender, age, educational background, and origin were varied to obtain as broad a picture as possible of everyday discourse.

Our results show that there is a mnemonic convergence of narratives between the two country cases: recalled memories about the communist era are strikingly similar in Poland and East Germany. Negative and positive memories exist side by side, and nostalgic views and criticism are interwoven in the image of the past—in part independent of generational affiliation, as memories of the generations that actively experienced communism are passed on to children and grandchildren. Unsurprisingly, private memory is thus far more differentiated than anti-communist public memory. In both cases, however, subjective knowledge (whether first-hand or transmitted) about the communist past is interpreted against the background of hegemonic knowledge, which spans a normative value framework that no one can defy.

Where the two countries differ relates to the legitimacy of the public-private memory gap. While in Poland, respondents accentuate the perspective of an elitist constructed political and media discourse as a carrier of hegemonic narratives, which is entirely different from their lived everyday experience, in East Germany, this argument plays out along historically situated quasi-ethnic dividing lines. Thus, the study empirically shows that the perception and interpretation of the private-public memory gap determines the societal (re)production of group-specific identities in mnemonic conflicts.

COH07 Controversial pasts: Commemorative conflicts, dominant discourses, and disruptive voices

PP 0891 The structuring effects of the Stasi discourse – A history of the Berliner Zeitung since 1989

Elisa Pollack¹, Maria Löblich¹

¹ Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

For a long time, the discourse about the socialist past of East Germany in the leading German media has focused on repression in the German Democratic Republic (GDR), above all on the 'Stasi' (the State Security Service). While research has focused on its consequences for East German memories so far, we ask how this hegemonic media discourse has structured journalism and thus the communicative preconditions of an East-West dialogue. The *Berliner Zeitung* – a former party-controlled paper, privatized and sold to the West German publisher Gruner + Jahr in 1990 – is a case suited to pursue this question. From early on until today, the *Berliner Zeitung* has received media

attention due to so-called Stasi-cases, at first after a study in 1994 investigated Stasi-newsroom relations. In 2008, the appointment of a 'honorary council' by the paper highlighted again the special position of the *Berliner Zeitung* in the discourse. This council studied Stasi cases within the editorial team and gave advice regarding future employments. A Stasi contact of the newest, GDR born, owner of the paper, put into public visibility by Springer's newspaper *Die Welt* in 2019, forced the newspaper to take action once again.

Using the example of the *Berliner Zeitung*, we analyse how the Stasi discourse has structured the organization, its institutions and its journalistic actors in a long-term perspective. How did this discourse shape the relationship between East and West within the *Berliner Zeitung* after 1989 until today, and thus the preconditions for what the newspaper offered its readers?

The theoretical framework of our study combines Foucault's discourse theory, Bourdieu's concepts of field, habitus and capital and assumptions of neo-institutionalism regarding (newspaper) organization and institution. This framework enables us to develop a differentiated notion of journalism and its influencing factors at the micro, meso and macro level. A system of categories developed on this basis guides the qualitative research process. Empirically, our study is based on interviews with journalists, document and content analyses. Our interview sample consists of journalists who are (or were) employed at the newspaper. We include a broad variety of interviewees and recruit according to origin (East/West), gender, duration of employment, position in the editorial office. Document and content analyses draw on selected articles of the *Berliner Zeitung*, coverage of leading media, documents as well as publications by other actors involved. Our findings will, in a differentiated and contextualized way, describe how the Stasi discourse structured journalistic working conditions, e.g. employment and career conditions, influenced newsroom 'policies' regarding addressing the GDR past as well as journalistic self-understanding, both on the part of West German as well as East German journalists.

Our study sheds light on the relation between discourses and the (re-)production of the public sphere, or in other words between discourses and the representation (or marginalization) of social groups. Moreover, we contribute to the research about the communicative conditions of post-socialist transformations and the apparent (discursive) East-West divide. This divide seems to be particularly relevant in view of the current situation in Europe.

CLP01 Public service and the public interest in European Media

PP 0046 Framing Nordic public service media

[John Grönvall](#)¹, Kari Karppinen¹

¹ University of Helsinki, Media and communication studies, Helsinki, Finland

The aim of the article is to analyse how the role and remit of public service media (PSM) and its relationship to current media and societal developments is framed in recent media policy discourses in Finland, Sweden, Norway and Denmark

Introduction

The appropriate role and remit of public service media is a perennially contested topic in all countries where such media exist. Even in the Nordic countries, where the role of public service media has remained relatively stable, its role has been subject to challenges from various directions, including both market-liberal and populist political arguments, commercial media industry lobbying, and the power of global digital platforms.

In part, these challenges reflect changing material realities, such as conflicting economic interests and changing technological realities. On the other hand, the debates also reflect discursive contestations over the definition of public service, the values it is associated with, and its framing as a problem or a solution in relation to various developments in society and media (e.g. Puppis & Ali 2023). For some, PSM have gained renewed relevance as a potential antidote to the problems, such as disinformation, polarisation and the crisis of commercial news media. For others, PSM is a relic with declining relevance in the changing media landscape.

In this paper, we analyse how the remit and contribution of PSM have been framed in Nordic media policy documents and assessments in the last decade. Through framing analysis of recent reports and policy documents, Entman(1993). We determine the values associated with public service as well as the problem definitions, causal interpretation and possible remedies invoked in the respective PSM policies.

In line with the tradition of interpretative or discursive policy analysis, our aim is primarily not to compare the policy actions taken by the four countries. We do not regard the policy documents simply as descriptions of the state of the PSM policy in different Nordic countries. Instead, we argue that the specific framings of the policy context and current developments entrenched in policy debates can have a crucial impact on future policy options and considerations.

Research questions:

- How is the role of PSM framed in relation to current problems and changes in the media landscape in Finland, Sweden, Norway, Denmark?
- How do the national differences in the framing of the PSM remits manifest ideologically?

The material consists of 154 documents from the years 2013–2023 from Sweden, Denmark, Norway and Finland.

These documents include all (relevant) official government policy reports related to the PSM ethos, workings, and assessments. This group provide an outside view of the PSM providers. To compare and contrast, we analyse all internal yearly reports of the PSMs. Finally, the national government programmes are added to cover the overarching national perspective.

Preliminary results indicate that the Nordic PSM's are largely on defence, reacting, not acting. The ongoing platformization, a perceived increase in competition, and the fragmentation and individualization of media consumption all greatly affect their domains and duties. As a result, in what has become a turf war, their obligations to citizens have become incoherent and elusive.

CLP01 Public service and the public interest in European Media

PP 0047 Advancing AI governance: Comparative analysis of European public service media policies and guidelines

[Sara Pérez-Seijo](#)¹

¹ Universidade de Santiago de Compostela, Communication Sciences, Santiago de Compostela, Spain

Algorithms and automation have become widespread in news media, increasingly determining editorial decisions. The integration of artificial intelligence-driven tools within media enterprises brings forth novel opportunities and advantages, both from the perspective of innovation and daily journalistic practice. Public service media (PSM) also benefit from the possibilities offered by the introduction and implementation of AI systems. However, its use and experimentation have introduced new challenges and risks related to the fulfillment of the core values committed to by these organizations (e.g., universality, independence, diversity, or distinctiveness). Therefore, the application of AI for production, selection, filtering, or distribution of content becomes a complex issue that raises concerns on data protection, the production of inaccurate or biased outputs, the creation of filter bubbles, or the lack of transparency, among others. Considering this scenario, several PSM have formulated guiding principles, policies,

standards, and/or ethical frameworks based on public service values to serve as a reference point when integrating AI and automation within their companies.

In particular, the aim of this study is to conduct a comparative analysis of the proposals that specifically European PSM have designed to prevent the compromise or impact on the core values of these organizations resulting from the use of this technology. Four research questions are posed in this research:

RQ1: In which AI-driven tools or systems do the guidelines focus?

RQ2: What applications are permitted and prohibited within the media company?

RQ3: Which public service values and journalism principles are emphasized in the guidelines?

RQ4: What role is assigned to the human professional in the implementation of technology, and in which processes or applications is transparency advocated?

To address this inquiries, this research relies on a mixed-method design, combining a quantitative content analysis and a qualitative thematic analysis –for this purpose, an adaptation of the codebook developed by Becker et al. (2023) is used–. A total of 11 European PSM AI guidelines are included in the study (BR, Yle, SRF, BBC, RTS, ZDF, SR, SVT, SWR, VRT, and RTVE). Although it is an ongoing research, the data collected thus far substantiates that these proposals share three central purposes: safeguarding the legitimate adoption of AI systems, ensuring a responsible use of technology, and upholding the mission of public service inherent to the operations of these organizations.

CLP01 Public service and the public interest in European Media

PP 0048 Ensuring visibility of European public service media? An analysis of policy, industry and academic views on prominence measures in Belgium

[Tim Raats](#)¹, [Adelaida Afilipoaie](#)²

¹ Vrije Universiteit Brussel, smit, Brussels, Belgium

² Vrije Universiteit Brussel, imec-smit-VUB, Brussels, Belgium

Public service media, in a reconfigured platformized and online TV landscape, fear for the access and visibility of their services and urged policymakers to ensure their prominence (Garcia Leiva & Mazzoli, 2023). Notions of prominence, findability and discoverability are indeed advancing at the national and European policy level. The 2018 Audiovisual Media Services Directive stipulates the optional provision for Member States to “take measures to ensure the appropriate prominence of audiovisual media services of general interest” (Article 7a).

However, the implementation of prominence is complex (Rozgonyi, 2023). First, there is a definitional confusion between the concepts of ‘prominence’ and ‘discoverability’ (Mazzoli & Tambini, 2020; Johnson, 2020). Moreover, discussions consider a variety of spaces (e.g., EPGs, hardware shortcuts, TV apps, smart TV interfaces, smartphone apps, voice assistants and streaming service catalogues). Second, Article 7a allows for arbitrary classifications of what is considered a service of ‘general interest’, opening a regulatory battlefield between players who advocate their services or parts thereof to be recognized as ‘general interest’, and those who prefer a limited interpretation. Third, considering the lack of algorithmic transparency, monitoring prominence measures becomes difficult. National Regulatory Authorities, particularly, in line with other forms of platform co-regulation, place the responsibility to demonstrate how prominence is ensured, on platforms, with limited options to validate claims (Ranaivoson et al. 2023). Four, policy contexts in Europe differ markedly. Additionally, path-dependency with existing measures (Kostovska et al. 2022), definitions (e.g. requirements for *must carry/must offer* or events of ‘major interest’) (Lefever, 2010) exist. Consequently, the regulatory fit differs for each market. Thus, transposing lessons across policy contexts becomes difficult.

Most Member States that adopted Article 7a, transposed the article into national laws without further clarification. Measures in Member States that did opt for a more thorough clarification, are diverse and context-specific. Considering these complexities, this paper presents a case study of Flanders (Belgium) which reveals the tensions and interests surrounding Article 7a. In 2021, Article 7a was transposed in Flanders into the Media Decree, but the government committed to implement further definitions and measures. The paper employs a media policy analysis approach (Braman, 2004; Freedman, 2014; Van den Bulck et al. 2019) to identify different stakeholder positions in the policy process and address how stakeholders attempt to set the agenda by introducing or refraining from introducing measures. Theoretically, we frame our research within existing scholarly work on ‘policy windows’ (Sundet & Ihlebaek, 2020), ‘policy transfer’ (Benson & Jordan, 2011) and ‘Advocacy Coalition Frameworks’ (Van den Bulck & Donders, 2014). The stakeholder inquiry relies on 20 interviews and written consultations conducted between 10/2023–04/2024 with public, private, and regional broadcasters, distributors, smart TV manufactures, content producers, consumer organizations, media and legal scholars, the media regulator, and streaming platforms. Key findings concern (i) the different interests of industry, policy, and academic stakeholders, (ii) the legal thresholds of implementing proposed measures in Flanders, (iii) the desirability and risks of introducing prominence measures and, (iv) their enforceability.

CLP01 Public service and the public interest in European Media

PP 0049 Transparency as an ordering force in PSB governance: Insights from a comparative study

Dominik Speck¹

¹ TU Dortmund University, Institute of Journalism, Dortmund, Germany

Transparency is a highly influential concept of modern governance across sectors (e.g., de Fine Licht & Naurin, 2022). Within the media industry, public service broadcasters (PSB) in particular have faced demands for greater transparency, which has been praised as a key condition for maintaining public legitimacy (e.g., EBU, 2015). Public value-style reforms and EU interventions in the name of competition law have contributed to the implementation of PSB transparency mechanisms in many European countries (e.g., Donders, 2021). Based on a theoretical model that brings together frameworks from interdisciplinary transparency studies and findings from qualitative research on four European countries, this contribution aims to assess how transparency functions as a form of ordering (Flyverbom, 2015) in the context of PSB policymaking and governance.

The underlying conceptualization is less concerned with measuring the amount of PSB transparency or whether it achieves its declared goals, such as increased trust or legitimacy. Rather, it focuses on how transparency is used to 'negotiate underlying social problems' (Heimstädt & Dobusch, 2020, p. 9), situating transparency efforts in the context of larger media policy trends and debates. The contribution acknowledges the processual, recursive and dynamic nature of transparency (e.g., Meijer, 2013). It explores how stakeholders in the field of PSB 'make sense of, negotiate and engage with transparency ideals and practices' (Flyverbom, 2015, p. 173), thereby translating demands for openness into concrete governance settings or organizational practices.

In brief, the contribution examines how PSB transparency efforts are being shaped by, and, in turn, shape the particular contexts in which they develop. It draws on a comparison of how transparency plays out as an ordering force in the context of PSB governance in Germany, France, the UK, and Switzerland. It gathers results from a) an analysis of relevant legal, policy and organizational documents that set the rules for, implement, or evaluate PSB transparency efforts, and b) in-depth interviews with stakeholders such as PSB executives, representatives of regulatory and supervisory bodies, policymakers, representatives of audience groups, journalists covering the field or media scholars.

The study identifies and compares the institutional rules and structures, actors and events that have shaped – strategically or unintentionally – the respective frameworks of PSB transparency in the countries under study. Moreover, it focuses on the ideas and beliefs associated with PSB transparency efforts. Initial findings show that while the specific translations of demands for greater openness into concrete rules and practices vary considerably, the appeal of transparency as a decisive force in ordering PSB policymaking, governance and organizational activities is present in all countries under study.

CLP01 Public service and the public interest in European Media

PP 0050 Proposals for a future-proof European 'Digital Media Concentration Law'

Theresa Josephine Seipp¹, Natali Helberger¹, Claes De Vreese², Jef Ausloos¹

¹ University of Amsterdam, Institute for Information Law, Amsterdam, Netherlands

² University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

In the rapidly changing digital media environment, understanding power dynamics is key to preserving democratic values. The rise of digitalisation, platformisation, automation, and AI has necessitated a reevaluation of strategies to address media concentration and safeguard media pluralism and editorial independence. The inadequacy of current legal tools to capture these new power dynamics becomes apparent as media concentration laws, designed to prevent dominant opinion power, appear outdated in their current form. At the same time, regulatory tools addressing platform power (DSA and DMA) and regulating AI (AI Act) struggle to effectively tackle

the normative and public interest concerns for the media. The EU acknowledges the urgency and advocates for effective concentration controls in the 2020 Democracy Action Plan and delineates a proposal for assessing media concentration in the European Media Freedom Act (EMFA) proposal.

Using a legal doctrinal and normative method, we discuss Europe's approach to addressing the threats posed by media concentration and shifting opinion power in digital media. We identify several shortcomings, offering starting points for making future-proof suggestions. First, in the era of AI-driven and automated news, the concentration of power over public and individual opinion is triggered by new sources of power, including technological, data, computing, algorithmic, and infrastructural power. As the "power of big techs is a combined construct – a collective power – governing much of the economy and society precisely because the economy and society have digitised" (Gerbrandy & Phoa, 2022), the various layers of power need to be dealt with and platforms need to be regulated for what they are – "active political actors in their own right" (Helberger 2020). Treating them merely as access and distribution platforms seems narrow-minded and short-sighted (considering their evolving role in journalism production and as infrastructures on which journalistic processes depend), while the proposed criteria for assessing media concentration are missing crucial structural and infrastructural components (Simon 2023). Although the introduction of a normative component in Article 21 EMFA to assess the implications for media pluralism and editorial independence is noteworthy, these concepts are neither commonly defined nor is there any coherent guidance on how to interpret them. Particularly specific rules on protecting public interest and local journalism are lacking. Finally, a lack of institutional safeguards for independence of national media authorities, tasked to ensure implementation, oversight and accountability, add legal uncertainty.

Forming the final part of a larger research endeavour on digital media concentration and the regulation of platform opinion power, this article addresses two main questions. First, do current regulatory approaches at EU level (effectively) address media concentration and opinion power in increasingly digitalised, platformised, automated and AI-driven media ecosystems? Second, how should and could a European 'Digital Media Concentration Law' look like? We make concrete suggestions on developing future-proof European media governance that is able to address the truly concerning issues at hand: unregulated powerful actors in the media – platforms, infrastructure and cloud providers, and AI companies –, and growing media consolidation, leading to a worrisome decline of public interest and local journalism.

CLP02 Approaches to media regulation

PP 0139 From co-regulation to outsourcing: The role of platforms in enforcing the Media Freedom Act in the EU

[Charis Papaevangelou¹](#)

¹ University of Amsterdam, Institute for Information Law, Amsterdam, Netherlands

As we are entering a novel era in platform governance, one that is characterised by a multiplicity of new rules and regulatory models, especially in the EU it is crucial to understand some of the more nuanced layers of this new reality. In particular, the issue of enforceability of platform regulation is fundamental to ensuring that passed regulation is effective or not. As GDPR has shown us, regulators are not only vulnerable to issues of capture by vested -national or private- interests but also lack the material and technical capacities to fulfil their responsibilities. In that sense, the recent attempts by the Commission to up its enforceability game in light of the EU's new digital playbook by expanding its human resources, as well as reconfiguring the governance of regulators through the creation of new roles and structures is telling that policymakers have understood this shortcoming. Thus, the EU's approach to governing online services is doubling down on multi-stakeholderism and co-regulation. Yet, as this submission argues, we might be heading towards a situation where instead of sharing responsibility and accountability over the governance of our digital spaces (Helberger et al., 2018), we are outsourcing significant pieces of that power to tech companies.

This submission takes the European Media Freedom Act (EMFA) as a case study and critically examines its provisions relating to the multifaceted relationship between news media organisations and online platforms. In particular, a highly contested issue of that relationship pertains to content moderation and how platforms' content governance rules and automated mechanisms clash with the values of news media, moderating editorial content and harming news media. To that end, the EMFA seeks to regulate this aspect of the relationship by introducing a media privilege, that is a regime wherein editorial content stemming from distinct news media is treated with elevated care compared to content deriving from other sources.

The EMFA introduces a complex process, which envisions a heavy involvement of online tech companies like Meta and Alphabet, whereby those companies will create an interface for news media to self-declare as compliant organisations to benefit from privileged treatment. However, the verification process will be carried out by platforms, while the role of civil society is trivial and mostly framed as advisory. Thus, despite some checks and balances introduced in the EMFA by the European Parliament during the regulation's trilogue phase, the fact remains that platform companies are increasingly institutionalised and reaffirmed as custodians of our information ecosystem. Consequently, we run the risk of allowing ostensible co-regulatory models to legitimise tech companies as

governance stakeholders by delegating important democratic processes for issues that corporate values are not fit to understand and care for.

CLP02 Approaches to media regulation

PP 0140 Can't touch this. How selective Europeanization of Swiss platform governance avoids regulating market power

[Sabrina Heiland](#)¹, Manuel Puppis¹, Michelle Kulig¹

¹ University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland

The digital structural transformation of the public sphere (Habermas, 2022) is radically changing the way how people receive and interact with information. While the emergence of new intermediaries like platforms entails many opportunities, it also poses serious challenges for democratic societies. Platformization raises concerns regarding the dissemination of illegal and of legal but harmful content (e.g., Gillespie, 2018; Lecheler & Egelhofer, 2022; Siegel, 2020), the ramifications of commercially-driven algorithmic selection (e.g., Helberger, 2018; Just & Latzer, 2017; Mansell & Steinmueller, 2020), the adverse effects of market and opinion power (e.g., Helberger, 2020) as well as an exacerbation of the financial crisis of traditional media (e.g., Curran, 2010; McChesney & Nichols, 2010). The European Union has become very active in platform governance aimed at mitigating such risks. While the Digital Services Act (DSA) addresses illegal content and the Digital Markets Act (DMA) introduces ex-ante regulation for dominant gatekeepers, the copyright directive introduced a controversial neighbouring right to support newspaper publishers.

However, while the EU's activities in platform governance and implications for member states are often discussed (see e.g., Cole et al., 2021; Heldt, 2022; Savova et al., 2021; Schlag, 2023; Turillazzi et al., 2023), few studies focus on processes of Europeanization of non-member states. Little is known about how non-member states are responding to platformization and how they are influenced by EU regulations and directives. Existing research shows that European (media) policy is not limited to member states but affects non-EU members (EEA countries, acceding countries, third countries) as well (e.g., Author2, 2012; Sciarini et al., 2004). Focusing on Switzerland, it becomes clear that the country has no legal obligation to adhere to EU regulations or transpose EU directives into national legislation (Sciarini et al., 2004). Nevertheless, Switzerland is often adapting its legislation to the "acquis communautaire" (Mach et al., 2003). Such adaption generally can take two different forms: bilateral agreements or autonomous adaption (Sciarini et al., 2004).

Concerning platform regulation, Switzerland took the path of autonomous adaption with plans for a new law on communication platforms mirroring parts of the DSA and for the introduction of an ancillary copyright for news publishers. Yet there is no intention for a DMA-like law. This raises the question of how exactly platform governance in Switzerland is Europeanized and why government proposes to only adapt to some parts of the EU's new digital rulebook. Based on a qualitative analysis of documents (legal documents, government reports etc.), proposed changes in Swiss platform regulation were looked at, focusing on arguments raised during the political process by advocacy coalitions with different deep core beliefs (Van den Bulck, 2019).

Results show that the usual advocacy coalitions in media policy were at play in discussions about the so called "DSA light". Yet this was not the case with respect to the copyright law reform: Actors that otherwise support an active media policy were opposing the proposed changes. Instead, they called for an effective regulation of platforms' market power which lacks support by government and industry alike.

CLP02 Approaches to media regulation

PP 0141 Unwritten media policy in Sultanate of Oman: 2000 to 2020

[Shamisa Abdallah Alnuumani](#)¹

¹ University of East Anglia, School of Politics – Philosophy – Language and Communication Studies, Norwich, United Kingdom

The Sultanate of Oman is one of the oldest countries in the Arabian Peninsula, and has had TV, radio, and news media since the 1970s but still lacks formal written policy to regulate this sector. Based on an investigation of the formal and informal sources of Oman's media policy, I argue that despite some media-relevant institutions and laws in Oman, media policy definitely exists, but most is not written down.

This study investigated the formal and informal sources of Oman's media policy. It identified media policy junctures that have shaped the framework of this policy. It provided answers to the questions: (1) What are the sources of Oman's media policy? (2) How has media policy changed and developed in Oman from 2000 to 2021?

This study employed a mixed-method approach, combining semi-structured interviews, analysis of documents and archival material, and thematic analysis (TA). I conducted 12 interviews from January 2023 to March 2023 with key sources in media sector in Oman, such as editors-in-chief, decision-makers, and journalists. In addition, I analysed different sort of media-relevant documents, such as laws, legislation, royal decrees, directives, and effective speeches which were issued in the period from 1970 to 2021.

This study used historical institutionalism (HI) as a conceptual framework. HI is suited to study of institutions over a long period of time and the identification of significant decisions that lead to changes in the policies, which is convenient for Oman's situation.

This study offers three main contributions. First of all, it is the first scholarly examination of media policy in Oman. Second, as much of the existing research on media policy has focused on the written policies and mechanisms of governance, my contribution reveals the unwritten media policy. Third, because the current research on media policy has been conducted mainly in a Western liberal democratic context, my study provides a better understanding of the "unwritten media policy" in non-western culture in general, and Sultanate of Oman in particular and its form of governance.

CLP02 Approaches to media regulation

PP 0142 Competing, conquering or correlating? The interplay of concepts on diversity in European legal frameworks, policies and codes of ethical conduct

[Krisztina Rozgonyi](#)¹, [Sophie Duvekot](#)², [Tobias Eberwein](#)¹, [Yael Haan de](#)², [Kristina Juraitė](#)³, [Marko Milosavljević](#)⁴, [Melita Poler Kovačič](#)⁴, [Marie Rathmann](#)¹, [Erik Uszkiewicz](#)⁵

² University of Applied Sciences Utrecht, Research Centre Journalism in Digital Transition, Utrecht, Netherlands

³ Vytautas Magnus University, Department of Public Communications, Kaunas, Lithuania

⁴ University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

⁵ Hungarian Europe Society, Hungarian Europe Society, Budapest, Hungary

Diversity in media refers to the representation and reflection of various cultural, social and political perspectives on the level of access, contents, genres, outlets, and ownership. In normative media theory, diversity is attached to the democratic role and social responsibility of the media to protect norms and values and enable the exercise of the fundamental human right to freedom of expression. Furthermore, media diversity often serves as the normative justification for policies (Karpainen, 2013), such as the provision of "internal pluralism" and the requirements for diversified and balanced contents and programs.

However, the question of how to achieve media diversity is challenging. Several notions encapsulate source- and content diversity (Napoli, 1999), while the era of digital content abundance raised major questions about exposure diversity (Napoli, 2011); (Helberger et al., 2018), specifically in regard to news content (Bernstein et al., 2021). On the policy level, the concepts of the diversity of sources and content became obsolete (Valcke, 2011) and called for more attention to the media users' perspective (European Commission et al., 2022). Traditionally, from the journalistic perspective, diversity has been defined by professional norms and values in ethical codes (Loeberbach et al., 2020). However, since the participatory turn in ethics (Eberwein, 2022), along with the efforts to redefine the foundations, scholars have urgently called for the recognition of diversity as a key guiding principle of communication (Fourie, 2022).

Driven by the ambition to respond to this call, our work within an ongoing Horizon Europe project aims to explore the interplay of concepts of diversity embedded in European policies, legal standards and a variety of codes of ethical conduct found in eight European countries (Austria, Estonia, Finland, Hungary, Lithuania, the Netherlands, Slovenia, and Switzerland) and on an international level with European relevance. In this study, we first conducted a qualitative content analysis of codes of ethics and guidelines for all kinds of public communication (370 in total on the country level and 80 on the international level) covering journalism, public relations, advertising, corporate communications, public institutions, and guidelines for media users, such as those using social media. We specifically searched for the formulation, the scope and the interpretation of diversity displayed in specific sections of the codes. Next, we linked our empirical results to the normative concepts of diversity provided in the national legal contexts and Europe-relevant legislation, such as the European Convention on Human Rights, the Fundamental Rights Charter, the Audiovisual Media Services Directive and the European Media Freedom Act, after a policy-oriented legal analysis (Milosavljević & Poler, 2019).

The preliminary findings show that broad, dialogic and participatory public communication ethics, addressing all types of journalistic communicators, both professional and non-professional, offer valuable possibilities for new concepts of media diversity, which in turn could inform future European policy-making on resilient standards and

norms. Thus, we make recommendations for developing a Civic Code of Good Communication Conduct, an inclusive and new media accountability instrument that can be applied in a broad spectrum of different public communication settings.

CLP03 Defending epistemic rights: Means and ways of combatting disinformation and propaganda

PP 0246 AI and epistemic rights: A mission impossible?

Minna Horowitz¹, Hannu Nieminen¹

¹ University of Helsinki, Social Studies, Vantaa, Finland

The buzzword for communications policy discussions and public debates has, in 2023, undoubtedly been artificial intelligence (AI). While guidelines and even regulations for AI have been under consideration for some time, the rise of generative AI (GenAI) has prompted calls for regulations about the direction of its development. It has been argued that risk-based discourses and approaches around AI tend, in the end, to promote the interests of tech giants as the most "reliable" developers of the technology (e.g., Schneier & Sanders, 2023).

A less-considered aspect is that AI development is intricately entrenched with the expansion of tech giants' power in developing technological infrastructures. This further solidifies global technological dependencies that policy approaches regulatory efforts such as the AI Act cannot address. At the same time, certain national AI developments, for instance, regarding military technology, remain outside of public and policy debates.

Existing policy research tends to focus either on empirical perspectives on AI governance arrangements or normative approaches to evaluating governance arrangements (Tallberg et al., 2023). In this paper, we focus on the latter by addressing approaches to global AI governance from the perspective of epistemic rights (Nieminen, 2024).

AI, in its many forms and applications, significantly impacts how we access, gather, and process information and thus significantly alters what is embedded in the idea and ideal of democracy and what could be called an 'epistemic commons': a shared forum for trustworthy knowledge and culture (Nieminen, 2014). What has enabled the formation and citizens' participation in such commons in the mass media and early digital media era is their access to and availability of diverse content, as well as privacy and dialogical modes of public communication. These features could be conceptualized as 'communication rights' (e.g., Nieminen, 2019; Ala-Fossi et al., 2019), here indicating normative but empirically detectable features of the information environment that reflect the ideal of the epistemic commons of shared knowledge and culture, from the perspective of citizens. It has been argued that communication rights can preserve and remove restrictions on the epistemic commons. In the era of AI, these rights are equally, if not more important, and can be seen as epistemic rights, that is, rights to knowledge.

While the vast new possibilities of creating and disseminating disinformation are often expressed as a critical concern regarding generative AI, its implications can be understood even more broadly as endangering citizens' knowledge rights. This paper reflects on what kind of epistemic rights are especially central for a citizen-centric approach to Generative AI. In those reflections, we discuss these rights from the perspective of global governance, assessing the proposals and visions put forward, e.g., the EU, USA, UK, OECD, and WEF (see, e.g., EU 2020; White House 2022; Gov.UK 2023; OECD 2023; WEF 2023). We then suggest types of policy initiatives and regulatory solutions that might best serve the promotion of 'citizens' epistemic AI rights.'

CLP03 Defending epistemic rights: Means and ways of combatting disinformation and propaganda

PP 0247 The use of self- and co-regulation in regulating disinformation and hate speech: Australia, Europe and the UK

Derek Wilding¹, Karen Lee¹

¹ University of Technology Sydney, Faculty of Law, Sydney, Australia

From 2019 to 2023 Australia followed the lead of the European Union in addressing the risks of disinformation via a self-regulatory code of practice. This was despite initial recommendations of the competition regulator to implement a co-regulatory model. However, following a 2022 review that highlighted significant shortcomings in the self-regulatory code, the government released draft legislation in 2023 that adopted a co-regulatory approach. The draft legislation was not well received. The proposed arrangements have been the subject of vocal and sustained criticism from, for example, civil liberties groups but also from news organisations, based on perceived threats to freedom of speech. This is despite the draft bill's explicit carve-out for news media. Meanwhile, academics and civil society groups have argued that the bill does not go far enough to combat the threats disinformation on digital platforms poses. Australia's experience in regulating disinformation has therefore come to resemble that of the UK, where fierce opposition to possible incursions on free speech resulted in the dismantling of the original provisions addressing disinformation in the recently passed Online Safety Act.

By contrast, hate speech in Australia has largely remained outside the communications regulatory framework, and a recent proposal from the Australian Government to bring hate speech on digital platforms within the scope of regulation was received with little opposition. Hate speech will be brought within the scope of an executive

government determination known as the Basic Online Safety Expectations, a form of co-regulation that nominates certain matters to be addressed by service providers but allows companies to design their own schemes for meeting the expectations.

In this paper we propose that an important reason for the different reception to the regulatory measures addressing disinformation and hate speech is the way in which they have been framed as the subject of regulation. Australia has split regulatory responsibility for these matters, with disinformation sitting within broadcasting law overseen by the media regulator and hate speech located in the more recent domain of the Online Safety Act, overseen by a specialist eSafety regulator. This has resulted in hate speech being characterised as an 'online harm' alongside image-based abuse and cyber bullying, while mis- and disinformation occupy a disputed space that is seen to intrude on the fiercely defended territory of professional news.

This paper will include an international comparative analysis to identify where the Australian approach sits in relation to the current approach under the Digital Services Act in the EU and the Online Safety Act in the UK. It will present findings from a study of policy submissions to the Australian government's consultation on the draft disinformation legislation to identify differences in the positions of the media sector, digital platforms, and civil society. Finally, it will suggest that Australia's disinformation and hate speech initiatives can be seen as examples of new hybrid forms of co-regulation whose development has been prompted by the unique environment for digital platforms that presents challenges for some longstanding co-regulatory methods and practices.

CLP03 Defending epistemic rights: Means and ways of combatting disinformation and propaganda

PP 0248 Untouched Minds in a Tangled web: Navigating 'Epistemic Welfare' amidst digital propaganda

Aaron Hyzen¹, Emine Ozge Yildirim-Vranckaert²

¹ Antwerp University, Communication, Antwerp, Belgium

² KU Leuven, Center of IT and IP Law- Faculty of Law and Criminology, Leuven, Belgium

Combining insights from legal studies, particularly in the realms of Media and Information Law, with an in-depth understanding of digital propaganda in communication studies, this contribution proposes 'Epistemic Welfare.' This framework is designed to evaluate and resolve issues of "mental harm" resulting from propaganda driven by emerging technologies. Propaganda continues to be of great significance worldwide, particularly in modern, 'liberal' democracies where the values of free speech and open debate have found tensions in the so-called 'post-truth' era of fake news, alternative facts and conspiracy theories. Political polarization and a societal wave of skepticism have collided with the digital transformation of the public sphere and the so-called Web 3.0, e.g., automated bots, deepfakes and generative AI. The latter has allowed for an unprecedented production and distribution of disinformation and, particularly computational propaganda. This situation, coupled with the growing institutional distrust, has led scholars like Peter Dahlgren to assert that we are in the midst of an epistemic crisis—a crisis of our knowledge base. The challenges of combating mis/disinformation and conspiracy theories, exemplified during the COVID-19 pandemic and the rise of the anti-vax movement, demonstrate the potential of propaganda to inflict societal harm, be it epistemic, physical, or mental.

Importantly, this harm can be insidious and intangible, often materializing through coercive or deceptive means without leaving physical marks, unlike, for instance, the requirements of the US concept of 'intentional infliction of emotional distress.' Propaganda, as a tool for manipulating and distorting reality, presents a challenge for the legal system in protecting individuals' mental integrity. Despite strong protections afforded to the right to freedom of thought and conscience, current interpretations of human rights law and the First Amendment of the U.S. Constitution fall short in safeguarding against such harms in practice.

To tackle this issue, it is imperative to redefine mental harm in a manner that does not rely solely on somatic injury. To this end, we propose the notion of 'Epistemic Welfare' as a framework centered on fostering the necessary conditions and capabilities for individuals to exercise their epistemic agency and promote a well-functioning media and information ecosystem. Specifically, this framework aims to facilitate the accurate and voluntary assimilation of information, thereby preventing or mitigating harms.

By adopting the principles of relational autonomy, we emphasize the critical role of mental autonomy—safeguarding individuals' capacity for self-determined thought and decision-making within their social contexts. The capability approach further compels us to assess how mental harm curtails individuals' freedom to pursue well-being. This revised definition creates a concrete legal threshold for mental harm, measurable through its impact on a person's cognitive and emotional wellbeing.

Therefore, we suggest a reevaluation of the legal thresholds for mental harm that recognizes the capacity for propaganda to cause such harm and that provides legal recourse that reflects the seriousness of these non-physical injuries. A recalibrated legal framework, more aligned with contemporary understandings of human dignity and autonomy, would offer tangible means to address the complex challenges of mental harm in the digital information age.

CLP03 Defending epistemic rights: Means and ways of combatting disinformation and propaganda

PP 0249 Trying to fight disinformation without jeopardizing media and speech freedom: Comparative analysis of eight European countries' approach to a sensitive topic

[Alice Nemcova Tejkalova](#)¹, Anna Shavit¹, Kateřina Turková¹, Nicole Stremmlau², Veronika Macková¹

¹ Charles University, Institute of Communication Studies and Journalism, Prague, Czech Republic

² University of Oxford, Centre for Socio-Legal Studies, Oxford, United Kingdom

Disinformation has been a part of hybrid wars and impacts both communication and social order (Bennet & Livingston, 2018). In Europe, it became a topic after the Russian annexation of Crimea in 2014 when Russian troll factories started intervening through online content in politics in various countries, creating communication disorder; this situation even deepened by the migration crisis in 2015–2016 (Humprecht, 2018), and each following major crisis, namely COVID-19 pandemic and war in Ukraine.

Frequent ways to approach disinformation in communication research have been content analyses of legacy or social media. This paper focuses on this topic from a different perspective. Based on the comparative research of the situation in eight European countries (Austria, Belgium, Czechia, Germany, Ireland, Norway, Spain and the UK) for the Horizon Europe project, media legislation and governmental responses to disinformation (and possible security threats) connected to COVID-19 pandemic and war in Ukraine, spread in the online environment, were analyzed. We were particularly interested in whether any legislature or institution focused specifically on disinformation and potential hybrid threats and how it had (or had not) been involved in combating the disinformation connected to these two crises mentioned above.

The countries under study adopted various approaches towards disinformation and combated threats on different levels. In the case of the COVID-19 pandemic, the governments mainly relied on fact-checking organized by Very Large Online Platforms (VLOPs) for their content, specifically (dis)information about the COVID-19 vaccine. However, in the UK, the government's Counter Disinformation Unit (founded in 2019) intensely focused on health and COVID-19 disinformation, followed it and referred it to social media companies. It continues to do so with the war in Ukraine, supported by the Defending Democracy Taskforce (founded in 2022 to protect the democratic integrity of the UK from threats of foreign interference), chaired by the Security Minister.

Czechia, which Russia has traditionally considered as a part of its influence area, intensified in 2022 its efforts to fight Russian disinformation media and switched them off for three months. However, a new governmental envoy for media and disinformation who was supposed to deliver a law against disinformation had not survived more than a year in his function and was never replaced due to the public opposition against any limitations on press freedom. Freedom of speech has been the core argument for other countries, especially Norway, Ireland and Spain, to avoid developing any specific legislation regarding disinformation. Germany banned Russia Today on its territory before it was officially banned on the EU level (March 2023), but in line with also very regionally divided Belgium, there were not any specific measures applied against (Russian) disinformation. In Austria, the Communication Platforms Act, according to which, when reported, unlawful content must be taken down by the provider immediately, cannot be used against platforms based in foreign countries (that is the case of most VLOPs). To conclude, the different approaches in studied countries reflect both historical and cultural realities, while they are also continuously shaped by current local (and global) events.

CLP03 Defending epistemic rights: Means and ways of combatting disinformation and propaganda

PP 0250 Coping with deepfakes – A global overview of the regulatory landscape

[Alena Birrer](#)¹, Natascha Just¹

¹ University of Zurich, Department of Communication and Media Research IKMZ, Zurich, Switzerland

The question of how to deal with deepfakes has been widely discussed among scholars, policymakers, and the public since the phenomenon first gained prominence in 2017. Described as the manipulation or synthetization of audiovisual media through deep-learning techniques (Kietzmann et al., 2020), deepfakes have elicited widespread concern of an "epistemic apocalypse," (Habgood-Coote, 2023) where the distinction between authentic and artificial content becomes increasingly indiscernible, potentially leading to various individual and societal harms. While research has begun discussing the regulation of deepfakes and the adequacy of current laws, there has been relatively little scholarly focus on dedicated regulatory responses, and as of now, no systematic overview exists. To bridge this gap, this article comprehensively maps the regulatory landscape related to deepfakes by conducting in-depth qualitative content analyses of 50 policy and legal documents. Special attention is paid to examining and evaluating the rationales driving the need for regulatory action, identifying the accountable actors, and assessing the adequacy and efficacy of the proposed measures in the context of existing empirical research on deepfakes. The findings reveal a diverse spectrum of responses, spanning from market-driven initiatives to state-imposed command-and-control regulation, and various forms of self- and co-regulation in between. Policymakers predominantly

prioritize public awareness and transparency over criminalization and strict control of harmful deepfakes. Moreover, existing laws, occasionally extended in scope, are generally considered sufficient to address deepfakes, but concerns about enforcement and efficacy persist, making critical oversight and periodic review essential. Additionally, existing instruments may not fully resolve current and future challenges posed by deepfakes. Instead, the ever-evolving landscape of deepfake technology calls for adaptive policy approaches aimed at mitigating harm while safeguarding individual rights and addressing broader societal issues related to trust and truth. This must also include careful consideration of adequate governance arrangements, including both appropriate state and private involvement. Altogether, this underscores the importance of conducting more empirical research to deepen our understanding and effectively address the evolving regulatory challenges posed by deepfakes.

CLP04 Platforms, content moderation and social (dis)order: Transformations of platforms and their governance

PN 064 The making of misinformation: A longitudinal analysis of platforms' misinformation policies

[Christian Katzenbach](#)^{1,2}, [Andrea Roca](#)³, [Daria Dergacheva](#)³, [Adrian Kopps](#)^{2,3}, [Vasilisa Kuznetsova](#)³

¹ ZeMKI Centre for Media Communication and Information Research, University of Bremen, Bremen Deutschland, Germany

² HIIG, Alexander von Humboldt Institut für Internet und Gesellschaft, Berlin, Germany

³ Centre for Media Communication and Information Research ZeMKI, University of Bremen, Bremen, Germany

Debates on misinformation have dominated discourses about platforms and their role for society and social (dis)order for quite a while now, and social media platforms have invested (partly) substantial efforts towards the control of online misinformation. But this has not always been the case. These efforts, and the policies governing misinformation on their sites have only been installed piece by piece over the course of years and as a response to public and policy pressure (Annany & Gillespie, 2016; Barrett & Kreiss, 2019; Katzenbach, 2021). These policies are also changing constantly, particularly in contexts such as epidemics or elections. This paper reconstructs the emergence and development of misinformation policies of five major social media platforms. Although there are some studies of platforms' misinformation policies, they usually explore cases of single platforms (Iosifidis & Nicoli, 2019), certain categories of misinformation such as COVID-19 (Krishnan, 2021), or providing an overview in a particular moment of time (Meese & Hurcombe, 2020). This paper, to our knowledge, is the first attempt to analyse all policies of five major social media platforms starting from the beginning of their existence until the present day in connection to the concept of misinformation. The analysis focuses on two dimensions: a long-term perspective on policy change and a cross-platform comparison. Considering the variance between the expert definitions of misinformation (Altay et al., 2023), we also seek to find out which specific dimensions or categories of misinformation are incorporated in the platforms' policies and how they changed over time (from spam to political misinformation). Empirically, we analyse Community Guidelines and Terms of Service of five major social media platforms (YouTube, Facebook, Instagram, X/Twitter, TikTok) over a period from their launch until the second quarter of 2023. The analysis relies on a mixed method approach. We first apply a research-driven computational keyword selection (Zhang et al., 2023) to get a better semantic understanding of misinformation policies and to identify keywords and dimensions that are associated with misinformation across platforms. We then use these keywords to detect relevant parts of texts and conduct critical discourse analysis (Van Dijk, 2015). The preliminary findings reveal that misinformation policies have considerably expanded over time across major social media platforms. The number of concepts (dimensions) that are associated with misinformation – although dissimilar for different platforms – has also increased. The term itself appears in platforms' policies relatively late, for example, YouTube started using it only in 2014, then stopped after 2016, and continued only in 2021. Thus, our research uncovers frames and discourses around closely semantically related words, such as misleading, fake, deceptive, spam, impersonation and others (Zhang et al., 2023). The research traces how these concepts were changing in time and on different platforms, incorporating both private corporate values (Scharlach et al., 2023) as well as media discourses and public values imposed by the changing legislation, such as, for example, the Network Enforcement Act in Germany (2018) and Digital Services Act in the EU (2021).

CLP04 Platforms, content moderation and social (dis)order: Transformations of platforms and their governance

PN 065 The transformation of hate speech and its regulation through platform governance

[Paloma Viejo Otero](#)¹

¹ Centre for Media Communication and Information Research ZeMKI, University of Bremen, Bremen, Germany

The second paper focuses on hate speech as a key site of debate about platforms and social (dis)order. The specific angle of the paper highlights that introduction of measures to combat hateful content on platforms has not only transformed digital platforms themselves but also the historical definition and purpose of hate speech regulation – with the result that it now protects content production. From 2016 to 2019, major online platforms, notably Facebook and YouTube, adopted substantial hate speech policies, enforced by what we colloquially and academically know as content moderation. As it stands today, hate speech moderation is arguably a process that initially allows users the technical freedom to upload diverse content. This content is then subject to multifaceted (and diverse levels of) scrutiny led by platforms. It involves a range of techniques, both automated and manual, and actions ranging from leaving content as is to deleting it, or alternatively, shadow banning or highlighting certain content. Consequently, hate speech regulation and its enforcement balance the platforms' professed commitments to freedom of expression with their mission to ensure the safety and security of users. Hate Speech Moderation has therefore led to a significant transformation in platform governance of hate speech, evolving from mere conduits of free information flow to becoming curators of content streams. When compared with previous periods when hate speech was on the political and public agenda (e.g., 1980s campus hate speech codes of conduct), the manner in which platforms interpret and apply speech regulation is novel. To such an extent that it opens to inquiry if the introduction of hate speech regulation on platforms has also contributed to the overarching discourse on what hate speech is and what it should achieve. As such the question that this paper poses is the following: have social media redefined the concept of hate speech? And if so, does it serve their own interests? To address this question, the paper undertakes a historical discourse analysis spanning from 1946 to 2020, examining the diverse perspectives of various stakeholders in defining hate speech. This is juxtaposed against the definitions and enforcement of hate speech regulation by key platforms operated by Meta (Facebook, Instagram) and Alphabet (Youtube) and Byte Dance (TikTok). The findings reveal that historically, hate speech has been understood and utilised by different actors primarily as a tool for promoting equality, combating discrimination, or preventing a return to fascist ideologies. In contrast, very large platforms have repositioned hate speech regulation as a mechanism to ensure security and foster a hostile-free environment by allowing circulation while avoiding the scarcity and accumulation of hateful content. This has implications for the broader question of this panel and the conference on the kinds of social (dis)order that platforms enable. By framing hate speech regulation as a security measure, Meta, Alphabet or Byte Dance do not combat a social order that includes discrimination but instead more simply keep a hostile-free environment that effectively safeguards content production.

CLP04 Platforms, content moderation and social (dis)order: Transformations of platforms and their governance

PN 066 Mental health-centric platform governance: policies and platform values

[Rebecca Scharlach](#)¹

¹ Hebrew University of Jerusalem, Department of Communication and Journalism, Jerusalem, Israel

The third paper addresses the topic of mental health and platform governance: Matilda's life improved drastically after being diagnosed with ADHD, a revelation she made after learning about common symptoms of female ADHD on TikTok (Boseley, 2021). In contrast, Kianna initially believed she had a personality disorder based on symptoms and personal stories she encountered on the platform. However, consulting medical experts revealed that her struggles were related to pandemic-induced isolation (Caron, 2022). These cases highlight the popularity of potential algorithmic diagnoses of mental illnesses on TikTok's For You Page (FYP), often based on vague yet relatable symptoms. The increasing ambiguity between helpful and misleading mental health content prompts questions about its regulation. While social media was not originally designed to support or harm mental health, its centrality in the lives of so many raises concerns about the responsibilities of social media companies toward user wellbeing. Recent years have seen heightened awareness of mental health, particularly among younger users (Livingstone, 2016, 2023), juxtaposed with social media companies' perceived inaction on the matter (Gerrard, 2020). Social media platforms face the challenging task of balancing their interests with those of individual users, third parties, policymakers, and other stakeholders (Gorwa, 2022), determining who and what should be visible. In essence, platform companies govern values. While infrastructural elements such as policies (Scharlach et al., 2023) or design (Scharlach & Hallinan, 2023) have enjoyed academic attention, there has been a lack of systematic investigation into the role of mental health as a foundational factor for platform governance. This paper addresses this gap by analyzing TikTok's mental health-related policies. While many platforms feature mental health-related policies like

auto-detection of suicidal ideation or self-harm, there lacks a systematic overview of what qualifies as an issue of mental health. Thus, the study responds to: (1) What existing TikTok policies relate to emotional, psychological, and social wellbeing? (2) What values are promoted? Employing a mixed-method approach (Scharlach et al., 2023), it involves an overview of TikTok policies and public-facing documents connected with mental health, coupled with a critical analysis. Focusing on the platform values associated with mental health will enhance the understanding of TikTok's conceptualization of its relationship with mental health. The study's findings lay the theoretical foundation for proposing a mental health-centric platform governance approach.

CLP04 Platforms, content moderation and social (dis)order: Transformations of platforms and their governance

PN 067 Generative AI and the production of "moderate speech"

[Emilie De Keulenaar](#)¹

¹ University of Groningen, Media and Journalism Studies, Groningen, Netherlands

Paper 4 turns to the role of generative AI in platform governance, and what this means for social (dis)order. For the past year, using large language models (LLMs) for content moderation appears to have presented solutions to some of the perennial issues of online speech governance. Developers have promised 'revolutionary' improvements (Weng, Goel and Vallone, 2023), with large language models considered of consolidating – indeed, "platformising" – incomparably large amounts of human language, and eventually bypassing semantic and ideological ambiguities that hinder moderation at scale (Wang et al., 2023). More specifically, LLMs are trained to generate "moderate speech" – that is, not to utter offensive language; to provide neutral, balanced and reliable prompt outputs; and to demonstrate an appreciation for complexity and relativity when asked about controversial topics. But the search for optimal content moderation obscures broader questions about what kind of speech, and thus social order, is being generated. How does generative AI speak "moderately"? That is: under what norms, training data and larger institutions does it produce "moderate" language? By examining the regulatory frameworks of AI labs, comparing responses to moderation prompts across three LLMs and scrutinising their training datasets, this paper seeks to shed light on the norms, techniques and regulatory cultures around the generation of "moderate speech" and content moderation as another form of platform governance. Empirically, this paper uses digital methods and contributions from platform governance and content moderation studies to examine how content moderation is trained and reproduced in three LLM models — both private and more "black-boxed" models such as various iterations of GPT, and more hybrid and open-source alternatives such as Llama, Mistral and BLOOM. There are three steps to this analysis: The first step is to examine regulatory and training frameworks. This implies studying a model's architecture and training through documentation scattered in code repositories (Hugging Face, Github), academic papers, interviews with LLM lab developers, or other documentation. In one sense, this analytical step involves getting a sense of what is considered objectionable by a given LLM lab, what moderation techniques are designed by these labs to mitigate said content, and what regulatory frameworks these labs rely on. The second is to compare responses to moderation prompts and auto-completions between GPT, Llama and BERT or BLOOM, across multiple versions, in three languages. By "controversy prompts", I refer to questions that will prompt the LLM to generate some form of "moderate speech". This means probing an LLM about questions that lack widespread consensus and often call for the adoption of opinions, positions, arguments or even "deep disagreements" (Fogelin, 1985). Finally, the third step is to examine training datasets to scrutinise possible moderation biases. Biases may emerge in the form of reductionism, partisanship, or absence of opposition and minority voices in a controversy prompt response. Where biases emerge, one can return to the training datasets – such as Common Crawl, Webtext2, Wikipedia or other – to check, where possible, what view is most represented in relation to the queried controversy (ibid).

CLP05 Time to talk about rights

PP 0462 Disorders on social media platforms and the victimisation of law enforcement officers: A rights-based approach to risk mitigation

[Yen Nee Wong](#)¹, [Shane Horgan](#)¹, [Liz Aston](#)¹

¹ Edinburgh Napier University, School of Applied Sciences, Edinburgh, United Kingdom

Operating in a public-facing role to enforce public order, police officers face several occupational risks in their line of duty. While risk factors such as physical harm, occupational stress due to shift work and psychological harm from traumatic encounters have largely been recognised and addressed through risk prevention strategies, new threats emerging from digital cultures remain unrecognised and unaddressed. Disorders fostered through digital cultures subject police officers to new risks of online victimisation, which can translate into physical and psychological harms offline. An example involves the online abuse and trolling of a hate crime officer in Leicestershire Police in 2022, after she introduced her role on Twitter. Another incident relates to the glorification of violence against police officers in South London, where physical attacks against officers were filmed and shared on social media.

This paper highlights the importance of shifting our attention towards communication disorders on social media platforms and investigating strategies for reducing their negative consequences on police officers. A mixed methods approach is adopted to examine what the online threat landscape looks like for police officers and risk mitigation strategies employed by police services in the United Kingdom. To evaluate online risk perceptions and mitigation strategies within police services, we conducted a poststructuralist discourse analysis of 46 documents constituting social media guidance, protectively marked training materials, intranet resources for police officers, and broader level documentation from the Home Office and Independent Office for Police Conduct relating to social media engagement. Findings from our document analysis are triangulated with 48 semi-structured interviews conducted with managerial police officers and staff from four partner forces.

Our findings suggest that police officers are subjected to multiple forms of online risks as a result of their police identity and policing role, such as online harassment, reputational damage due to citizen journalism and identification. These risks negatively impact officers' physical and psychological well-being. Yet, active media representation of police officers as perpetrators rather than victims of online social disruptions resulted in organisational responses focused on disciplining officers' online behaviours. Such a focus diverts attention away from the protection of officers and prioritises individual responsibility over organisational and civil responsibility. To address police officers' online risks and harms, we propose a rights-based approach to internet regulation. Internet regulation should ensure a digital environment which treats police officers as having the same fundamental rights as ordinary citizens. The protection of police officers on digital platforms needs to become a civil, social and organisational responsibility. Achieving the above will require regulation which aims at increasing accountability and transparency on social media platforms and a co-regulation framework involving police organisations in the moderation and criminalisation of harmful online content. Our study draws attention to the importance of looking beyond the individual and police organisations, to include other stakeholders such as platforms, private companies, policymakers, auditors, regulators and civil society in the protection of police officers from online risks and harms.

CLP05 Time to talk about rights

PP 0463 Privacy framing in legislative hearings after Cambridge Analytica in Europe and in the US

Dmitry Epstein¹, Rotem Medzini²

¹ The Hebrew University of Jerusalem, Federmann School of Public Policy, Jerusalem, Israel

² University of Birmingham, Birmingham Law School, Birmingham, United Kingdom

Privacy is an increasingly important area of study in communication research. Prior research has advanced both conceptual and empirical understanding of how citizens think about privacy and enact privacy-related behaviors in networked environments. Yet scandals such as Cambridge Analytica (CA) reveal a gap in perceptions of privacy held by the users vs. those who design and regulate information networks. Against this tension, we ask how do policy and technological elites talk about privacy? And how does this talk differ in Europe and in the US? Engaging with these questions, we aim to contribute to the literature on communication policy framing and agenda setting.

Conceptually, we leverage research that distinguishes between vertical (institutional) and horizontal (social) orientations of privacy, and build on framing literature, which links frames in communication and frames in thought. Empirically, we conduct a quantitative content analysis of the 2018 US Senate and House hearings, as well as three out of five sessions of the European Parliament, that followed the CA scandal. We developed and validated a dedicated coding scheme, which captures both privacy-specific attributes (e.g. vertical and horizontal orientations, proximity to the acting agent, value- and cognate-based frames) and more general frame attributes (e.g. positive vs. negative, thematic vs. episodic, attribution). Upon initial training, about 30% of the interventions were coded by two coders to establish intercoder reliability.

Our preliminary results point towards an overall dominance of vertical privacy framing in privacy policy discourses involving the government and the industry (particularly in the EU). This stands in contrast with earlier findings about the dominance of horizontal framing among the users of social media. Additionally, our findings highlight both the differences between the industry and the lawmakers in their framing of privacy, and the political nature of privacy as a vessel for normative perspectives and ideological positions of the elites. Facebook leadership is relatively more likely to use horizontal framing (also employing richer frames), compared to parliamentarians in both the US and the EU. Facebook leadership is also more cautious in its use of infringement framing, compared to parliamentarians (particularly in the EU), whereas there are no significant differences in the use of protection framing when it comes to privacy.

Similarly, conservative parliamentarians are relatively more likely to use horizontal framing (also employing richer frames), compared to their liberal counterparts (who are more likely to use vertical privacy frames that are also relatively richer). At the same time, liberal parliamentarians tend to use richer infringement framing, compared to their conservative counterparts (particularly in the US).

Our research effort is well underway. As we progress with completing the manuscript, we will draw a more nuanced and pronounced picture of the emerging dynamics outlined above, and clarify our comparative perspective. It is

our aspiration in this project to contribute to the study of communication technology policy framing and agenda setting. By analyzing framing in actual policy deliberation, we demonstrate how different stakeholders contest the definitions and regulatory approaches towards a pivotal communication policy issue.

CLP05 Time to talk about rights

PP 0464 Navigating algorithmic disruptions: epistemic welfare as a guide for media governance

Michelle Patricia Kulig¹, Aaron Hyzen², Steve Paulussen², Manuel Puppis¹, Hilde Van den Bulck³

¹ University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland

² University of Antwerp, Department of Communication Studies, Antwerp, Belgium

³ Drexel University, Department of Communication, Philadelphia, USA

Adopting a conceptual perspective based on communication studies and social epistemology, this contribution explores the notion of epistemic welfare as a guide for media governance amid algorithmic disruptions. Due to the digital structural transformation of the public sphere (Eisenegger & Schäfer, 2023; Habermas, 2022), media consumption predominantly takes place online (Newman et al., 2023). This development is accompanied by an increasing dependence on algorithmic recommender systems for content selection (Bodó, 2021). While acknowledging the opportunities of recommender systems, communication scholars frequently highlight (potential) disruptions, including dissemination of mis-/disinformation (e.g., Author 1, 2023; Bennett & Livingston, 2020), polarization (e.g., Bruns, 2019; Zuiderveen Borgesius et al., 2016), bias (e.g., Noble, 2018), surveillance (e.g., Zuboff, 2015), profit-oriented and fragmented distribution of content (e.g., Author 3, 2018; Just & Latzer, 2017; Mansell & Steinmueller, 2020; Napoli, 2015; Van Dijck et al., 2018), and algorithmic unaccountability (e.g., Ananny & Crawford, 2018; Diakopoulos, 2015). Taken together, these algorithm-related issues contribute to an epistemic crisis in public discourse (Dahlgren, 2018).

As a response, numerous governance proposals have emerged and continue to evolve (e.g., Saurwein et al., 2015; Van Dijck et al., 2018). Communication scholars have explored normative principles to guide the design and governance of recommender systems (e.g., Helberger, 2019; Shin, 2020), preliminarily focusing on news media and the importance of diversity (e.g., Heitz et al., 2022; Helberger et al., 2018; Joris et al., 2022; Sax, 2022). Recognizing the limitations of this focus in tackling the entirety of algorithm-related concerns, we advocate for a more comprehensive approach that aims at addressing the above-mentioned disruptions underlying the epistemic crisis, namely “epistemic welfare”.

Drawing from social epistemology (e.g., Godler et al., 2020; Goldman, 1987) and welfare literature (e.g., Kaun et al., 2023), we define epistemic welfare as an endeavor to create and maintain conditions and capabilities for epistemic agency for citizens in the public sphere. Diverging from typically paternalistic normative perspectives, epistemic welfare strives to foster user agency, allowing individuals to pursue epistemically valuable states (such as true and justified beliefs, Goldman, 2011) at their own choice. To ensure the necessary conditions and capabilities for such agency, epistemic welfare encompasses the development of a digital knowledge infrastructure, including algorithmic recommender systems, that is informed by the epistemic standards of reliability, power, fecundity, speed, and efficiency (Goldman, 2011).

Guided by these epistemic standards, we identified and operationalized associated societal values – such as transparency, explainability, and diversity – to systematically assess the attainability of epistemic agency in the context of media recommender systems. By measuring conditions and capabilities for epistemic agency, the epistemic welfare approach carries profound implications for both the governance and the design of algorithmic recommender systems: Shifting away from merely responding to content-related issues, the epistemic welfare approach aims at a more profound alignment of (established) societal values with underlying structures of digital media. It can guide policymaking in its attempts to reshape the communication order in the contemporary public sphere by prioritizing epistemic agency and centering the governance of media, and recommender systems specifically, around epistemic welfare.

CLP05 Time to talk about rights

PP 0465 A right to constructive optimisation

Laurens Naudt¹, Natali Helberger², Michael Veale³, Marijn Sax¹

¹ Institute for Information Law IVIR, Faculty of Law, Amsterdam, Netherlands

² University of Amsterdam, Institute for Information Law, Amsterdam, Netherlands

³ University College London, Faculty of Law, London, United Kingdom

This paper proposes a new perspective on the role and regulation of recommender systems on platforms. So far, recommender systems are generally seen as a feature of the digital infrastructure platforms offer, subject to the control and authority of the providers offering them as a lawful service to consumers. But recommenders are more. In the digital environment, users increasingly rely on recommendation algorithms as tools to navigate the abundance of information online and find information that is relevant to them and that they can trust. As such,

recommenders are not exclusively tools or services that a platform controls; they are part of the infrastructure of the digital public sphere and, as such, have an important societal dimension.

This societal dimension is in part already recognised in the European Digital Services Act (DSA), though primarily through the lens of the potential risks to consumers, society, and fundamental rights. Such a mere risk-based approach fails to account for the critical role of recommenders as a means to make a positive and meaningful contribution to the realisation of users' rights to self-determination and self-development. We, therefore, make a concrete suggestion for a more value-based approach. Users should not only have a legitimate interest to be protected from risks that recommenders pose to fundamental rights or other legitimate interests. Instead, there is also a need to acknowledge and respect the freedom to advance their rights to self-development and self-determination through the use of recommender systems as means of discovery, learning and the ability to pursue the information goals they deem valuable. Combining approaches from political philosophy and normative legal analysis, we sketch the contours of a new right to constructive optimisation.

The paper will then explore the potential role of the law, and of the DSA in particular, to further such a right. To do so, we need to move beyond naïve approaches, which implicitly assume that 'the recommender system' is an identifiable, discrete 'unit' that can be addressed and regulated as such. Instead, the paper develops a 'stack approach' to understanding recommender systems inspired by communication systems studies. We argue that instead of regulating 'the recommender system', effective governance approaches must consider how each individual layer of the stack is relevant for the realisation of a right to meaningful optimisation, and hence a potential entry point for intervention: mandating different recommendation options to choose from at the user interface level, scrutinising the diversity of training data sets at the data input level, mandating the effective representation of the interests of citizens and society at the operations level, or offering room and rewards for experimenting with more value-driven approaches at the engine level, etc. The overall argument of the paper is that constructive optimisation of recommender systems is not simply a matter of technology design but of the design process and how the legitimate interests of users are taken into account across the different levels of the technology stack.

CLP06 Getting to better media policy – Attitudes, concepts and imaginaries

PP 0573 Contesting digital futures: UN Global Digital Compact and alternative socio-technical imaginaries

[Outi Puukko](#)¹

¹ University of Helsinki, Faculty of Law, Helsinki, Finland

This paper investigates different visions about digital futures and asks, how are the desired futures constructed, contested, and mobilized in transnational digital policy. The first part of the paper develops a theoretical framework that attends to discursive construction of digital futures as "socio-technical imaginaries" (Jasonoff, 2015). While these imaginaries can be considered as institutionalized forms of discourse, they nevertheless remain open for contestation (Carpentier 2011; Laclau 1990). The paper discusses how socio-technical imaginaries are put to work in policy debates through fantasmatic logics related to the desired future state, where current limitations can be overcome (Glynos, 2021; Carpentier 2011). Building on this framework and recent research on datafication and platformization, hegemonic imaginaries articulate future through a primacy of digital, e.g. associated with unstoppable technological development and necessity to overcome associated problems. However, counter-imaginaries are articulated by a plurality of mobilizations that resist hegemonic knowledges, call for political engagement with technologies, and highlight possibilities for imagining (digital) futures otherwise (e.g. Kazansky & Milan, 2021).

The second part of the paper focuses on the UN Global Digital Compact as a transnational digital policy process, where multiple socio-technical imaginaries are at work. The paper engages and thinks with elements of imaginaries present in civil society submissions to the process. The paper asks, how are digital futures contested and imagined in these public documents and illustrates these questions with examples. Finally, the paper discusses possibilities for mobilizing alternative imaginaries in the context of research that advances rights-based approaches to transnational communication governance (e.g. Horowitz et al. 2024; Padovani et al. 2024).

CLP06 Getting to better media policy – Attitudes, concepts and imaginaries

PP 0574 The regulatory attitude towards social media platforms in Denmark and its implications for digital creators

[Sara Kepinska Meleschko](#)¹, Bjarki Valtýsson¹

¹ University of Copenhagen, Department of Arts and Cultural Studies, Copenhagen S, Denmark

In this article we investigate how social media platforms are regulated in Denmark and what implications an increasingly critical regulatory attitude towards these digital platforms has for Danish digital creators.

Since Denmark is a member of the European Union, the country's legislation is highly affected by EU legislation and its implementation and adaptation to the Danish national context. In terms of the regulation of social media platforms, the EU has taken important regulatory steps, which the AI Act, the GDPR, the DMA, the DSA, and the directive on improving working conditions in platform work demonstrate. As these initiatives exemplify, the European Union is a regulatory frontrunner regarding digital platforms. What these examples also demonstrate is the complexity of a regulatory landscape where attempts are made to govern global digital platforms via supranational regulation followed by legislative implementation in different national contexts.

The focus of this article is on the national context of the Danish welfare state. The Danish government has in recent years taken a firm stance on trying to regulate social media platforms and the growing influence of tech giants. However, just as the case is with the EU, there are multiple different stakeholders with varied political and economic interests vying for influence when it comes to regulating digital technology and culture in Denmark. Therefore, we are interested, not only in analyzing Danish legislation in the area, but in analyzing the current debate regarding the regulation of social media platforms and the various regulatory attitudes exhibited by the different governmental and non-governmental stakeholders. We are also interested in how the different dimensions of the country's regulatory landscape impacts Danish digital creators since their working conditions are and continue to be affected by the Danish government's legislative agenda and the various stakeholders' regulatory attitudes.

Methodologically, this article engages with document analysis (Bowen, 2009) and qualitative interviews (Creswell & Poth, 2018; Bryman, 2016) to map and analyze the various regulatory initiatives and attitudes within the Danish national context. We therefore identify and analyze the laws, proposals, reports and agreements provided by different governmental and non-governmental institutions and organizations that concern the regulation of the dominant social media platforms operating in Denmark. This mapping reveals the complex regulatory landscape and consequent regulatory debate currently taking place within the context of the Danish welfare state, which we further seek to illuminate by interviewing key actors and stakeholders. Theoretically, the article engages with literature on platforms and platformisation (Gillespie, 2018; van Dijck et al., 2018; Poell et al., 2019; Poell et al., 2022), the governance and regulation of platforms (Helberger et al., 2017; Gorwa, 2019) and the distinctiveness of the digital welfare state (Schou & Hjelholt, 2018; Andreassen et al., 2021; Jørgensen, 2021; Collington, 2022; Dencik, 2022).

CLP06 Getting to better media policy – Attitudes, concepts and imaginaries

PP 0575 Regulatory dilemmas in disconnection: What's (im)possible to regulate and why?

[Gunn Enli](#)¹

¹ University of Oslo UiO, Department of Media and Communication, Oslo, Norway

A key argument in disconnection research, as well as studies of big tech and surveillance capitalism is that politicians and the authorities should regulate digital media (Zuboff, 2019). The question is, however, to what degree it is possible to regulate digital media use in democratic societies with high standards of freedom of speech and free market ideals. The main aim of this paper is thus to investigate how the calls for regulatory interventions resonate with users, political parties, and industry leaders, and to, in turn, pinpoint the main regulatory dilemmas in disconnection in the context of western liberal democracies; what are the current possibilities and impossibilities in this new regulatory field? Norway is selected as case country because of the Nordic regions tradition for regulating media, in addition to an advanced digital infrastructure and a digitally connected population. The methodological approach is a combination of two kinds of datasets:

The main empirical material survey data of users set collected in 2023, representative of the Norwegian population (n = 1142). The quantitative findings are supplemented by qualitative interviews with relevant politicians, users and representatives of media/tech industry. Theoretically, the paper is based on insights from research on digital disconnection, political regulation of digital platforms, and responsabilization.

The analysis pinpoints, and is structured according to, three key regulatory dilemmas: (1) although there is a broad agreement about the problem of intrusive media, there is no unison support for political intervention and regulatory

measures. (2) although there is broad agreement that the industry should be responsible, there is very limited trust in the industry to reduce the pressure to be always-on, and (3) although there are individual politicians and political parties who support regulation, they seem to lack regulatory measures except for children and elementary schools. In sum this analysis demonstrates that although there are movements in the direction of regulation of big tech internationally and at a supranational level (EU), it is dilematic to identify national measures to address intrusive media as a societal problem and a new realm of political regulation, because neither the voters, the industry, or the politicians seems to identify a suitable balance between the benefits of digital media and the curse of digital distractions and intrusive media.

CLP06 Getting to better media policy – Attitudes, concepts and imaginaries

PP 0576 Disinformation campaigns as a systemic risk under the Digital Services Act

Rita Gsenger¹, Prisca von Hagen²

¹ Free University Berlin Weizenbaum Institute, Media and Communication Studies, Berlin, Germany

² Weizenbaum Institute Humboldt University, Faculty of Law, Berlin, Germany

The Digital Services Act (DSA) (Regulation 2022/2065) defines categories of systematic risks that need to be assessed and mitigated by very large online platforms (VLOPs) and search engines (VLOSEs). Various types of content can contribute to these risks – one mentioned explicitly by the regulators are “coordinated disinformation campaigns” (Rec. 83). Furthermore, automatic means might contribute to these campaigns (ibid.). Research is divided on the harm of disinformation – many discuss the negative consequences (Iosifidis & Nicoli, 2021; Bayer et al., 2021; McKay & Tenove, 2021). However, proving harm due to consumed information is often challenging. Some researchers argue that such a correlation cannot be proven and that the concept is not theoretically developed (Altay et al. 2023). Moreover, the actual consequences are difficult to establish (Zywietz, 2018). Additionally, the terminology is still unclear, and various terms such as disinformation, fake news, propaganda, or conspiracies are often used interchangeably. Especially legal scholars and regulators do not differentiate enough. For an example, see the DSA commentary (Hofmann & Raue, 2023) that uses some terms interchangeably. This paper makes two contributions based on an interdisciplinary socio-legal methodology. Firstly, it defines and differentiates disinformation campaigns in their context. Secondly, it provides answers to how society’s perception of the dangers of disinformation for democratic societies can be weighed against factual dangers and harms and argues for a focus on targeted disinformation campaigns. This research creates a framework for disinformation regulation by identifying four aspects based on which disinformation campaigns can be identified and: 1) the type of information, 2) the method of information dissemination, 3) the intention and origins, and 4) harm and effects. The type of information disseminated includes whether the information is protected by freedom of speech – as opinions, for instance, cannot be true or false and cannot be proven. More critical to identifying a disinformation campaign is the method of dissemination, as the use of bots and targeted advertising increases the potential harm. Accordingly, the intention of the disseminator is to be considered, which, however, is not accessible. However, the origins – centralized, commercial, political, and institutional (see Benkler et al., 2018) allow some conclusions regarding the intentions of disseminators. Finally, the harm and effects are crucial to evaluate the necessity of disinformation regulation. That refers to public harm and threats to democratic processes and decision-making. In that regard, the balance of protecting constitutional rights must be considered. This framework provides a nuanced conceptualisation of disinformation campaigns that can be operationalised for the purposes of regulation. It provides a basis for answering the question of the scope of the disinformation regulation needed. Furthermore, this research provides a framework for risk assessment under the DSA that applies to other risks, such as the threat to civic discourse and elections, public health and public security, gender-based violence, discrimination, and negative consequences on a person’s well-being. This research results benefit other jurisdictions and regulators taking on disinformation on online platforms, such as the UK’s Online Safety Bill.

CLP06 Getting to better media policy – Attitudes, concepts and imaginaries

PP 0577 The digital histories of press support schemes: A life course approach to media policy as strategic action fields of media industry interests

Mary Lynn Young¹, Helle Sjøvaag², Ragnhild Christine Olsen³, Raul Ferrer Conill⁴, Alfred Hermida¹

¹ University of British Columbia, Journalism Writing and Media, Vancouver, Canada

² Universitetet i Stavanger, Department of Media and Social Sciences, Stavanger, Norway

³ OsloMet, Department of Journalism and Media Studies, Oslo, Norway

⁴ University of Stavanger, Department of Media and Social Sciences, Stavanger, Norway

Many media systems such as those in Scandinavia and Canada provide direct and indirect support to journalism organizations, often amounting to hundreds of millions in value. However, exactly how these policies are shaped remains an open question. Even more opaque is the role of media industries representatives invited to these committees. Policy makers are usually rather unwilling to talk about the processes and strategies involved in designing such schemes, at least as long as they still serve industry roles. To get around this methodological problem, we

approach recently retired key strategic players in the media industries in Norway and Canada who have served on policy committees shaping the industries at large, and present them with a semi-structured interview design, the aim of which is to answer the following two research questions: 1) what factors most affected their decision making and contributions to journalism policy conversations? 2) how did digitalization (a significant generational event) affect their perspectives and patterns of responses?

As this sample is necessarily strategic and small, we interview 12 retired industry leaders (six in Canada and six in Norway), conducted during spring and summer 2024. We aim for retired chief editors and CEOs of news organizations, spanning the press and broadcasting sectors in both countries. The rationale for comparing the two countries lies with the relative (and increasing) similarities in their press support systems, corporative processes of parliament, and comparative motivations for state intervention in the press, resting with the democratic role of the press in society. We ask informants about their strategies going into these committees, how they worked to promote the interest of their owners/employers and the journalistic institution, journalism innovation and their interpretation of the process overall. The life course approach allows informants to focus on the fact that they were all affected by a shared sudden systems change (digitalization).

Results are analyzed within the institutional framework of strategic action field theory, where a strategic action field is a meso-level social order where actors interact with knowledge of each other under a common understanding of the rules, relationships, and purposes of the field, and what is at stake. This approach is appropriate to gain insight into the digital histories of the media, as informants went through the challenges of digitalization together. We expect results to show that industry members of policy committees performed in line with strategic action field theory particularly in pushing narratives of financial crisis, the impending destruction of journalism, and technological threats, particularly from US-based platform players. The life course approach is also expected to yield rich and deep behind the scenes stories of actors who were regularly given seats at the table when laws and support schemes were designed in both countries, uncovering what actually happened as vast resources shifted to digital from print, with significant government funding increasingly going to journalism organizations in Canada to support their survival.

CLP07 Policy in media ownership transparency: Results and challenges of cross-country comparison

PN 098 Media ownership policy in Austria: high standards and need of improvement in PSM and distribution

Tales Tomaz¹, Josef Trappel¹

¹ University of Salzburg, Communication Studies, Salzburg, Austria

This paper presents the EurOMo framework for assessing regulatory risks in the EU and an analysis of the Austrian case. Following recommendation by scholarly literature and recent EU policymaking (Council of Europe, 2018; Audiovisual Media Services Directive (AVMSD), 2018; Picard & Pickard, 2017), EurOMo assesses the suitability of legal frameworks in five areas: (1) national application of the AVMSD, (2) provisions on concentration, (3) provisions on managerial independence, (4) provisions on state/public funding transparency, and (5) transparency requirements for digital platforms. We have created a laws database and developed 20 indicators to assess them. The project seeks for information in media, company and competition laws (Picard & Pickard, 2017). According to this methodology, Austria has a strong regulatory framework in many areas. The "media law", for example, provides for transparency of beneficial owners to the public (Mediengesetz, 2021), making the country one with the highest levels of ownership transparency. Austria also has strong provisions for transparency in public funding, again leading to the best results across European countries. However, managerial independence, especially for PSM, is still an issue. This is reflected in a recent decision by the Austrian constitutional court that requires the parliament to discuss a new PSM law shielding the foundation board from political influence (Fidler, 2023). Finally, in terms of regulation of digital platforms, Austria is a forerunner with the enforcement of its "platform law", covering several aspects, for example advertising tax in the national operation of foreign platforms (KoPI-G, 2020). But the law does not cover provisions that are more relevant for the distribution of news media content, and, as in most EU countries, the NRA expects the DSA and DMA to set the main framework, whose enforcement is yet to be seen.

CLP07 Policy in media ownership transparency: Results and challenges of cross-country comparison

PN 099 Incomplete media transparency – flawed democracy: the case of Bulgaria

Bissera Zankova¹

¹ Media 21 Foundation, Media 21 Foundation, Sofia, Bulgaria

The struggle for genuine working media transparency as a crucial prerequisite for the operation of a healthy democratic media system has been part and parcel of the process of democratic building in Bulgaria after the collapse of communism. However, the practice has been rather controversial. Media development has been driven predominantly by the owners and journalists and their associations have not had a major say in it. During the first stage of the democratic transition due to lack of expertise and the delayed adoption of an appropriate regulatory framework powerful political and economic groups entrenched their interests in the media sector (Zankova, 2020). Nowadays the state continues to be a major factor in the field through various mechanisms – public media financing, state advertising in loyal media outlets, media support of municipalities and election advertising (Indzhov, 2021). Generally such approach has a negative impact on the media environment – a trend that stood out clearly during the more than 10-year governance of GERB. In most of the cases, it is implemented by the circumvention of the Public Procurement Act (PPA) and results in media corruption. The picture so far is unstable with a lot of risks and unclear future. On a broader scale these features stem from the Bulgarian media system being a formation of a semi-consolidated or flawed democracy (Dobek-Ostrowska, 2015). In this respect on the one hand, the whole media system needs reformation and strengthening of the guarantees to serve the public good while on the other, special safeguards for enhancing media transparency demand significant attention. By and large the improvement in the sector requires a complex of measures which include also amendments in the ways of media financing. A solid foundation of the reforms should be the changes in the regulatory framework (RTA, the Protection of Competition Act, the Public Procurement Act, etc.) and its better implementation. An unalienable element of these transformations should be the reinstatement of the registries in force and particularly the registries at the Council for Electronic Media (CEM) and the Ministry of Culture (MC). The analysis and recommendations are based on the work of the Bulgarian team in the second phase of the EurOMo pilot project (2022–2023).

CLP07 Policy in media ownership transparency: Results and challenges of cross-country comparison

PN 100 Formation and implementation of media ownership transparency policy in Lithuania

Deimantas Jastramskis¹, Auksė Balčytienė²

¹ Vilnius University, Department of Journalism, Vilnius, Lithuania

² Vytautas Magnus University, Department of Public Communications, Kaunas, Lithuania

The paper examines how the media ownership transparency policy is formed in Lithuania and how decisions of this policy are implemented. Since 1996, when the Law on Provision of Information to the Public was passed, there have been several stages of media ownership transparency policy making. In the first stage, 1996–2001, the legal norm to ensure transparency of ownership of media organizations was not implemented and was finally abolished (VIRSIŠ, 2024). Since 2002, following changes in legislation, media organizations have begun to declare their ownership relationships with two institutions: the Ministry of Culture and the Lithuanian Radio and Television Commission. This process was quite fragmented – many organizations disclosed only part of the ownership relationships and the final beneficiaries often remained unpublic (Jastramskis, 2019). Therefore, a political decision was made to integrate the state's information resources and create a unified register of media organizations' ownership and financial activity (beneficial owners, turnover, profit, profit from direct and indirect sources: government support/advertising, etc.) declaration – the Information System of Producers and Disseminators of Public Information (VIRSIŠ), which was supposed to start operating in 2019 [Law on the Provision of Information to the Public, 2019]. This system (VIRSIŠ) started on January 1, 2023, but a half-year deadline was set for media organizations to submit data. Our

analysis regarding national media organizations shows, that disclosures of media ownership to the VIRSIS and to the public are provided partially. If the owners of media companies are legal persons, their property owners are not indicated often, i.e., the main owners of the patronising companies are not disclosed. There are instruments to penalise those media groups/owners who ignore such an obligation; however, such measure has not been applied so far since the introduction of this provision of the Law in 2017. A similar situation exists on the websites of the media organizations themselves. Media organizations themselves usually do not publicly provide detailed information about their owners. Most information is accessible about first-generation media owners. There are a few cases when direct and beneficial owners are mentioned on the media company's website (Balčytienė, Jastramskis, 2022). Finally, when discussing the ownership transparency problem, it should be mentioned that it is important not only to ensure higher standards for economic/business transparency of media entities, namely considering the aspect that is termed as 'competitive' dimension. However, the rapidly evolving communications arena, marked by infrastructural changes (Helberger, 2020) and persistent uncertainties in the geopolitical context in Europe give rise to new challenges. Hence, several new questions linked to information/communication disruptions, with a particular focus on the dynamics of opinion power, must be addressed also within the context of ownership transparency. CLP07 Policy in media ownership transparency: Results and challenges of cross-country comparison

PN 101 Media ownership in Portugal: advanced legal settings, but weakness in origins and public advertising

[Elsa Costa e Silva](#)¹, Joaquim Fidalgo¹

¹ University of Minho, Communication and Society Research Centre, Braga, Portugal

This paper analyzes the Portuguese case regarding the EurOMo framework for assessing regulatory risks in the EU. Following the methodology to assess risks for the transparency of media previously presented, we aim at presenting the main features of the Portuguese media system. According to this methodology, Portuguese has a low risk in terms of the legal framework concerning ownership transparency, as Portugal has an advanced legislation that makes it mandatory for media groups to declare beneficial owners to the regulatory agency. However, not all media groups have the names of beneficial owners in their site (only the company's name). To find most beneficial owners a consultation to the Transparency Portal run by the media regulatory agency (ERC) is needed. Media ownership can still be an issue as there is a high vulnerability of Portuguese media groups to foreign capital with possible hidden interests, namely originating in autocratic regimes, such as Angola and China. The Portuguese media ownership is organized in a complex tangle of companies and financial holdings, with most information laying behind intricate networks. Also, media companies are owned, in some cases, by holdings looking for better tax environments, which means that some owners are based in countries such as the Netherlands. Visibility of ownership is guaranteed, but that does not mean total transparency regarding the financial information of media companies. The chain of ownership is publicly available at the transparency portal run by ERC, but information on the revenues and staff employed is unknown for most of the companies, and there is, according to the Journalists' Union, a concerning lack of public information in regard to financial flows. The level of State intervention in media support is an area in need of attention. Although there are no direct subsidies to national media in Portugal and public advertising is regulated by law, namely to guarantee fairness in what concerns the balance between national and local media, there are reasonable doubts about the real dimension of values involved. The information provided by the annual report of the media regulatory agency has raised some doubts given the low values notified and even the media owners' association (Associação Portuguesa de Imprensa) has expressed some concern. This year, the national body which controls public spending has recommended a revision of the legislation. Also, aggregated information is presented by media sectors, but not by outlets individually. Therefore, it is not actually possible to know how much each medium or media group receives.

CLP08 Combatting online harms in policy and practice

PP 0781 Combating illegal content on social-media platforms: Do precise takedown deadlines make a difference?

[Natascha Just](#)¹, Sangyeon Kim², Filippo Menczer², Florian Saurwein¹, Bao Tran Truong²

¹ University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

² Indiana University, Luddy School of Informatics Computing and Engineering, Bloomington, USA

The rise of social media has opened up new communication opportunities but also facilitated the spread of illegal content. Navigating this challenge has proven difficult for both Internet platforms and governments. Rather than imposing general internet monitoring obligations, governments have opted for a regulatory approach based on

conditional immunity and notice-and-takedown procedures. Simultaneously, Internet platforms have developed community standards and content-moderation systems, sparking controversial debates on over-blocking, freedom of expression, and effective moderation of illegal content.

Dissatisfaction with content moderation prompted new platform regulations in various countries such as Germany (NetzDG), Austria (KoPI-G), France (Loi Avia), Australia (Online Safety Act) and the EU (Digital Services Act, DSA). These typically require platforms to operate notice-and-action procedures, but they differ in detail. While some regulations (e.g. NetzDG) set explicit "takedown deadlines" for the removal of illegal content, others, such as the EU-wide DSA, simply require decisions to be made "in a timely manner".

From a governance perspective, the presence or absence of takedown deadlines raises questions of whether and how Internet platforms comply with these requirements, and whether specific deadlines impact the dissemination of illegal content. Although research on the effects of the timing of content removal is scarce, available evidence indicates that timely reactions matter (Bak-Coleman et al. 2022). While platforms assert in their transparency reports to remove most problematic content within 24 hours, the effects of takedown deadlines remain inadequately researched. This article closes this gap by investigating how takedown deadlines affect the spread of illegal content on social-media networks. For this endeavor, we employ an agent-based model that simulates information diffusion in social media (Author et al. 2023). By incorporating an algorithm that removes illegal content, we aim to quantify the impact on user exposure to this content. While we anticipate that longer deadlines will result in more users being exposed to illegal content, the possible non-linear relationship between the two dynamics of takedown and exposure will be elucidated by the experiment.

This analysis aligns with the conference theme of reconsidering communication and social (dis) orders by assessing and evaluating the effects and effectiveness of regulatory instruments for moderating illegal content on Internet platforms. It helps determine whether the lack of specific takedown deadlines in the DSA is a reasonable regulatory decision or impedes efforts to combat illegal content on social-media platforms.

PP 0782 Smart home harms: An enquiry into smart technology-enabled domestic abuse to explore design, legal, ethical, and policy responses

[Deborah Chambers](#)¹, [Shola Olabode](#)¹

¹ Newcastle University, School of Arts and Cultures, Newcastle upon Tyne, United Kingdom

Digital harms are recognised as ethical and legal challenges facing all users of digital technologies. Such harms extend to IoT (Internet of things) including smart home technologies. Internet-connected home electronic devices and systems encompass smart TVs, smart speakers, baby monitors; home security systems from door locks to cameras; and remote-controlled lighting and heating. The widespread domestic adoption of smart technologies reflects their growing affordability in developed regions. Situated in intimate living spaces, these digital tools can be invasive and can cause harms. While they meet certain needs by automating daily routines, smart home harms entail the unwarranted release of information, falsification of sensing information, and unauthorised access to system controls (Buil-Gil et al. 2023). Research reveals a surge in gender-based smart technology-enabled domestic abuse, also named technology-facilitated domestic and family violence, digital coercive control technology, or "tech abuse". Perpetrators employ tactics assisted by digital tools to monitor, harass, and abuse victims using GPS location tracking, spyware, and mobile phones (see Afrouz 2023; Olabode et al. 2023; Powell and Henry 2019; Slupska and Tanczer 2021). Such actions raise vital design, safeguarding, governance, and legal issues.

The findings of a case study that determines smart-enabled domestic abuse risks is presented to mitigate harms by establishing and devising effective ethical design, regulation, and policy. This enquiry forms part of a large UKRI/ EPSRC project, 'AGENCY: Assuring Citizen Agency in a World with Complex Online Harms'. The findings of workshop dialogues with relevant stakeholders in the UK are presented, using reflexive thematic analysis. The outcomes establish common scenarios comprising perpetrator motives; risk factors that render women and children vulnerable; devices and situations implicated; and impacts on victim/survivors. The findings underpin research stages that generate user-centred co-design solutions via collaborative design-led workshops with users and stakeholders. The modelling of harm-reducing smart technologies discerns design and policy solutions steered by Human-Computer Interaction (HCI) principles. Drawing on Science and Technology Studies and feminist policy principles, the findings support a critical assessment of feminist care ethics to pinpoint appropriate design values and to establish robust legal and policy responses that can mitigate smart risks by accounting for gendered techno-social inequalities within

smart-enabled domestic environments. The results of this study may provide insights for non-Western contexts where development and acceptance of smart technologies are at different stages.

CLP08 Combatting online harms in policy and practice

PP 0783 The state of regulatory harmonisation and implementation of age verification measures by video-sharing platforms

Ivana Kostovska¹, Sally Broughton Micova²

¹ Vrije Universiteit Brussel, SMIT – Media Economics and Policy unit, Brussels, Belgium

² University of East Anglia, School of Politics- Philosophy – Language and Communication Studies, Norwich, United Kingdom

Laws to regulate online platforms and better protect citizen/consumers, especially minors, are being adopted in many jurisdictions. The EU's Digital Services Act and the UK's Online Safety Act are two recent and prominent examples. They, like many others, both include obligations for platform providers to implement age verification measures to protect minors. Age verification, however, is hardly an unproblematic measure for policymakers to require, nor is it well-defined. As Nash (2021) has pointed out it presents both normative and practical challenges, many of which stem from the data that must be gathered about minors for implementation.

Some forms of age verification have been in use for years, arguably in response to public pressure and the threat of regulation. EU level regulation did come in 2018, when the Audiovisual Media Service Directive (AVMSD) was revised to cover video-sharing platforms (VSPs). The Directive requires Member States to ensure that VSPs in their jurisdiction take measures to "protect minors from programmes, user-generated videos and audiovisual commercial communications" through, among others, "establishing and operating age verification systems" (Art. 28b). The AVMSD's requirement has been in transposed in most Member State for at least two years, providing an opportunity to better understand this popular regulatory tool.

This paper contributes new evidence from an investigation into the requirements for age verification set by 27 EU Member States and the United Kingdom, and from an examination of the systems used by 11 of the most widely used VSPs in Europe. Data was gathered through doctrinal analysis of laws, questionnaire responses from a network of national experts, questionnaire responses from VSP operators, and testing of VSP functionalities in 2023.

The evidence identifies vast differences in states' approaches to clarifying (if at all) their expectations for age verification, though several states have confirmed in law or guidance that self-certification is not considered sufficient to qualify. National level application of GDPR plays a role with 18 jurisdictions imposing age requirements higher than thirteen. Standards for age verification are being set but are only beginning to address the use of AI tools, which we found are being relied upon by several of the larger VSPs, especially ones for 18+. Five age verification methods were identified: use of official identification documents, selfie, facial age estimation based on video selfie, social vouching, and use of other documents such as school ID card or company loyalty card. Smaller VSPs across the states were reported to be lacking in any form of age verification.

Based on this evidence we argue that given the ever-greater weight being put on this measure in platform policy, harmonisation of expectations and standards for age-verification is needed. It is crucial both because of the lack of take up by smaller services, including adult services, and because of the increasing use of automated systems, which as others (Van der Maelen, 2019) have found do have significant downsides that should be controlled for.

CLP08 Combatting online harms in policy and practice

PP 0784 Illegal loot box advertising on social media: An empirical study using the Meta and TikTok ad transparency repositories

[Leon Y. Xiao](#)¹

¹ IT University of Copenhagen, Center for Digital Play, Copenhagen, Denmark

Loot boxes are gambling-like products inside video games that can be bought with real-world money to obtain random rewards in about 80% of top mobile games. Loot boxes are widely accessible to minors under 18, unlike traditional gambling. Loot box spending has been linked to problem gambling, and stakeholders are concerned about potential financial harms, e.g., overspending. Gambling law cannot be used to address the issue because most loot boxes do not satisfy the narrow legal definition of 'gambling' in most countries. The UK advertising regulator has held that video game advertising must disclose, if relevant, that a game contains (i) in-game purchases (i.e., the possibility to spend real-world money) and (ii) loot boxes in particular. The regulator has also previously taken enforcement actions to punish companies that have breached this rule. Two studies were conducted using the ad repositories provided by Meta and TikTok. Content analysis was conducted on advertising materials to attempt to identify disclosures for in-game purchases and loot boxes. Study 1 focused on Meta-owned platforms (i.e., Facebook, Instagram, and Messenger). Amongst 188 adverts for popular games known to contain loot boxes examined, 167 (88.8%) failed to disclose the presence of generic in-game purchases and 175 (93.1%) did not disclose loot box presence. These adverts related to 63 game titles, of which the vast majority did not ever disclose either type of content. Even amongst the small minority that did make disclosures, most did not do so consistently. Only the adverts of two games (3.1%) consistently disclosed in-game purchases, and only those of one single game (1.6%) always disclosed loot boxes. Study 2 examined TikTok. Amongst the most viewed 920 TikTok adverts, 130 (14.1%) pertained to games with in-game purchasing and 100 (10.9%) were for games also selling loot boxes. Only 9 of 130 ads (6.9%) disclosed the presence of in-game purchasing, and just 7 of 100 ads (7.0%) disclosed loot box presence as required. The vast majority of social media adverts across various platforms were therefore non-compliant with UK advertising regulations and presumably also EU consumer protection law (upon which the UK advertising rules were based). The illegal TikTok adverts that failed to disclose loot boxes were viewed a total of 292,641,000 times in the UK alone, which is approximately 10 impressions per active user. Many people have therefore been repeatedly exposed to prohibited and socially irresponsible advertising that failed to provide important and mandated information. Additional advertising rule violations, such as inaccurate gameplay depiction and objectification of women, were observed. Implementation deficiencies with ad repositories, which must comply with transparency obligations imposed by the EU Digital Services Act, are also highlighted, e.g., not disclosing the beneficiary. The present study demonstrates that information disclosure requirements imposed by law empower the public with data access, which can and should be used by researchers. Policymakers beyond the EU should consider enabling more such opportunities for the public benefit.

CRC01 Crafting corporate crisis communication strategies

PP 0241 Communicating uncertainty during crises: The dual impact of hedges and pledges on perceptions of competence and sincerity

Gijs Fannes¹, An-Sofie Claeys²

¹ KU Leuven, Institute for Media Studies, Leuven, Belgium

² Ghent University, Department of Translation – Interpreting and Communication, Ghent, Belgium

Uncertainty is an intrinsic component of crisis events. Especially in the early stage of a crisis, there is often a shortage of information. Ambiguity might initially exist regarding the impact of the crisis, the cause, who is responsible, and how to ensure people's safety (Liu et al., 2016). Despite the well-recognized role of uncertainty in crises, research has not examined how the public perceives crisis messages that reveal uncertainty. Therefore, this study examines the causal impact of linguistic cues of uncertainty on public perceptions about the organization in crisis. Through three experiments, we also uncover potential boundary conditions and the underlying mechanisms.

More specifically, we examined whether communicating linguistic indicators of (un)certainly in a crisis message, such as hedges (e.g., "maybe"), pledges (e.g., "definitely"), and hesitations (e.g., "uhm"; Blankenship & Holtgraves, 2005), impact an organization's reputation through competence and sincerity perceptions. On the one hand, best practices recommend organizations in crisis to acknowledge and express uncertainty (Seeger, 2006). An organization that is truthful about what is known and what not may come across as honest and sincere. On the other hand, the public expects an organization in crisis to capably handle the situation and demonstrate confidence (Claeys & Cauberghe, 2014). The competence of an organization that shows uncertainty could therefore be questioned.

Three experiments were conducted, which all manipulated a fictitious crisis response with either linguistic cues of certainty or uncertainty. Each study additionally manipulated a different moderator, namely crisis nature (i.e., operational vs. reputational crisis; $n = 322$), crisis disclosure strategy (i.e., thunder vs. stealing thunder; $n = 273$), and crisis response strategy (i.e., ethical base response vs. denial vs. apology; $n = 317$). The results show that in most cases adopting certain language in a crisis message positively affects organizational reputation through an increase in both competence and sincerity perceptions. The findings demonstrate that, overall, the public evaluates a CEO who conveys uncertainty regarding an ongoing crisis through language more negatively.

CRC01 Crafting corporate crisis communication strategies

PP 0242 Employee perceptions of Crisis Spillover Risk: The role of crisis relevance, severity, and corporate response strategies

Yijing Wang¹, Sabine Einwiller², Daniel Laufer³

¹ Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

² University of Vienna, Department of Communication, Vienna, Austria

³ Victoria University of Wellington, School of Marketing & International Business, Wellington, New Zealand

Crisis spillover risks refer to the likelihood of events in an external organization creating concern, uncertainty, or perceptions of harm for another organization (Veil et al., 2016). When a crisis spillover occurs, a company can be linked to a crisis that is affecting another company such as a competitor in the same industry, and the negative consequences of crisis spillover can be significant when stakeholders make assumptions of guilt by association (Laufer & Wang, 2018). While the spillover effect of crises has become an emerging research topic in the field of crisis communication, little attention has been given to how employees perceive the risk of crisis spillover due to a corporate misconduct of another company (Wang & Laufer, in press). The risk inherently yields ambiguity and uncertainty in the internal context of an organization, and it can directly or indirectly affect employees' workplace and job security. Therefore, understanding the likelihood of the crisis spillover effect will help unpack the mechanisms underlying employees' judgments of crisis spillover risk, and unravel the effectiveness of different crisis response strategies. Drawing on Social Identity Theory and Reputation Commons Perspective, the current research

addresses how crisis relevance, crisis severity, and corporate response strategies affect employee perceptions of crisis spillover risk.

An online experiment was conducted among employees (N = 300) working in the retailer sector in the United States. Our findings revealed a significant effect of perceived crisis severity on crisis spillover risk to other companies in the same industry, and this effect does not depend on the crisis type. On the contrary, the results reveal an insignificant effect of crisis relevance on spillover risk to other companies. Furthermore, we found a significant interaction effect of spillover risk and response type, implying that the impact of spillover risk on employee perceptions depends on the type of corporate response: When the spillover risk is high, employees perceive issuing a denial more effective than taking no response. With respect to how employees perceive the likelihood of crisis spillover to their own company, we found a highly significant effect of spillover risk on perceived likelihood of crisis spillover to their own company. However, the impact of response type was insignificant, and the interaction of spillover risk and response type was found to be insignificant as well. Interestingly, the results suggest that when employees sense a high spillover risk of a crisis in their industry, they will be very concerned about the spread of the crisis to negatively influence their own company, and this concern is regardless how their company responds to the crisis. In addition, we found that positive megaphoning among employees is significantly higher when the company issues a denial than when it remains silent, though we could not confirm how positive megaphoning among employees corresponds to the likelihood of crisis spillover risk.

This research provides valuable insights on how the likelihood of crisis spillover affects employee attitudes and help us gain a better understanding of how organizations should respond to spillover crises.

CRC01 Crafting corporate crisis communication strategies

PP 0243 Optimizing message efficacy and engagement through visually focused information

[Amitabh Verma](#)¹, Brooke Fisher Liu², Yan Jin³

¹ University of Georgia, College of Environment+Design, Athens, USA

² University of Maryland, Department of Communication, College Park, USA

³ University of Georgia, Grady College of Journalism and Mass Communication, Athens, USA

Ongoing global transformations initiated in the wake of COVID-19 underscore the urgent need to enhance messaging efficacy in order to protect lives, livelihoods, public welfare, and social order. Following critical post-pandemic analysis, researchers advocate for a range of improved strategies to prevent undesirable outcomes such as message fatigue (Street & Finset, 2022) through thoughtful integration of visual modalities (symbols, iconography, infographics, photos) for greater impact (Verma, 2022). Despite the recent, unprecedented proliferation of social media and its popularization of visual messaging, there remains a surprising dearth of theory and research on the influence of visual design, storytelling (Lankow et al. 2012; Liu et al. 2020), infographics (Yarborough, 2019; Sutton & Fisher 2021; Jaleniauskiene & Kasperuniene, 2022), and psycho-emotional connotations (Ho & Siu, 2012) on how communities receive and process crisis information (Samson & Gross, 2012; Hitti et al. 2021).

To remedy this shortcoming, we propose a new theoretical framework that identifies visual presentation modalities likely to be most persuasive in moderating community members' behavior and promoting safety during crises. Based on a systematic review of crisis communication and visual design literatures, we map out different visual presentation structures ideal for impactful communication based on different crisis characteristics. We also identify potential unintended consequences which must be mitigated to ensure accurate and comprehensive reception by the public.

Situated within lessons learned from the COVID-19 pandemic as well as prior mega-crises, our project proposes strategies for visual crisis communication messaging which would be most appropriate for deployment during future crises. Additionally, we offer a research roadmap to further test the proposed framework to ensure its continued relevance within a dynamic landscape characterized by constant technological disruption, ever-changing patterns of social media usage, and evolving behaviors of information processing. Rooted in the conviction that it is imperative for scholars and practitioners to map out how impactful visual crisis communication could support long-term crisis resilience, our work seeks to build a foundation for developing more efficient communication paradigms for future crises.

CRC01 Crafting corporate crisis communication strategies

PP 0244 Public relations practitioners' role in organizational crisis decision-making

[Laurence Balliu](#)¹, An-Sofie Claeys¹

¹ University of Ghent, Department of Translation- Interpreting and Communication, Ghent, Belgium

Crises are unpredictable, major events which can negatively impact the organization and its stakeholders (Coombs, 2023). Therefore, organizations often turn to multi-disciplinary crisis management teams (Frandsen & Johansen, 2017). A crisis management team (CMT) can be defined as the decision-making unit in charge of preparing for

and handling a crisis (Coombs, 2023). While some sources claim that public relations practitioners play a leading role in the CMT (e.g., Lee et al., 2007), others suggest a more executive, supporting role (e.g., Claeys & Opgenhaffen, 2021).

Several factors may influence an organization's decision-making process regarding the crisis response (Huang & Su, 2009). For instance, the organizational structure will determine the extent to which the public relations department is granted autonomy, is sensitive to encroachment and is part of the dominant coalition (Bowen, 2006; Marra, 1998). Furthermore, the organizational communication culture can either reinforce or undermine public relations efforts during crises (Marra, 1998). We want to explore the specific role of PR-practitioners during crisis response decision-making, potential factors that affect their role and the strategies they use to maximize their impact.

In 2021, we conducted 17 semi-structured in-depth interviews with senior public relations consultants from either Belgian communication agencies or the Belgian branch of international agencies. The PR-practitioners were asked about the extent to which their clients suffering from an ongoing crisis adopt their recommendations, the circumstances under which their advice is or is not followed, and the strategies they use to convince clients of their approach. In the following months, the interview transcripts will be subjected to an inductive data coding process through NVivo.

The preliminary findings indicate that PR-practitioners from external communication agencies can adopt both an advisory and an executive role during organizational crises. While the decision-making process is often a tug-of-war between different disciplines, public relations advice is generally taken into serious consideration. Still, there are several factors which are perceived as facilitators (e.g., trusted client-agency relationship) or inhibitors (e.g., legal and financial consequences of the recommended strategy).

CRC01 Crafting corporate crisis communication strategies

PP 0245 How emotions shift within and between arenas: a new framework of crisis emotional flow

Rongting Niu¹, Yan Jin¹, [Winni Johansen](#)², Finn Frandsen², Timothy Coombs³, Augustine Pang⁴

¹ University of Georgia, Grady College of Mass Communication & Journalism, Athens, USA

² Aarhus University, Department of Management, Aarhus, Denmark

³ Centre for Crisis and Risk Communications, Advisory Board, Calgary, Canada

⁴ Singapore Management University, Lee Kong Chian School of Business, Singapore, Singapore

Publics consume crisis information through a multi-stage and multivocal process rather than a direct, singular approach (Frandsen & Johansen, 2022). In crises violating public safety and interests, the progressive revelation of information and communication among multiple voices may prompt a dynamic flow in the publics emotional spectrum, such as the shift in the numbers and valence of emotions (e.g., Yi et al., 2022). This study defines crisis emotional flow as the changing emotional experience during and after a public crisis causing psychological harm. According to the rhetorical arena theory (RAT; Frandsen & Johansen, 2010), when a crisis erupts, a rhetorical arena and sub-arenas open where multiple voices start communicating *to*, *with*, *against* and *past* each other about the crisis, creating various patterns of interactions, and leading to various levels of crisis knowledge as well as dynamic ongoing flows of emotions among affected publics. However, the dynamic flow of shifting emotions in and across sub-arenas is understudied.

Furthermore, even though publics' crisis coping behaviors (e.g., Jin et al., 2007, 2012) and how crisis emotions act to mitigate organizational reputation damage (e.g., Coombs & Holladay, 2005) have been examined from

a cross-sectional perspective, what remains understudied is how crisis emotions flow *during* and *after* a crisis via a longitudinal approach. As Lazarus (2006) argued, longitudinal research is essential to conduct "observations necessary to show the change in coping that constitutes a process" (p. 226). Therefore, to advance our understanding of crisis emotional flow and its function in crisis communication, this study proposes a new conceptual framework integrating RAT and crisis emotion theory, which identifies: (1) the series of crisis emotions experienced by publics following a crisis outbreak; (2) the patterns crisis emotions shift during and after a crisis; and (3) the impact of crisis emotional flow on publics' coping strategies.

Specifically, this framework integrates two theoretical pillars in crisis communication. The first is RAT with the fundamental assumption that when a crisis occurs, the rhetorical arenas will open and various voices collectively construct the crisis. Since voices (communication) can convey emotions (Nabi, 2015), publics' emotions within arenas can flow with the dynamics of diverse voices present within these spaces. Additionally, each large arena contains various sub-arenas where publics' emotional reactions may vary across sub-arenas. Although arenas have boundaries, they are porous, allowing voices from other sub-arenas to go in and out and facilitating the flow of crisis emotions between different sub-arenas (Frandsen & Johansen, 2022). The second pillar is the scholarship centering on crisis emotions (e.g., Jin et al., 2007, 2012) grounded in Lazarus' appraisal theory (e.g., 2006) and emotional flow studies in persuasion research (e.g., Nabi, 2015), describing the crisis emotional flow as manifested in differential sequence, arousal, and valence of emotions, as well as emotional contagion.

This new framework provides the conceptual foundations that will (1) enrich the understanding of publics' crisis emotional flow experience, (2) predict publics' coping strategies, and (3) guide crisis communication strategic decision-making in dynamic situations.

CRC02 The digital frontline: Social media dynamics in crisis communication

PP 0341 What did social networks change? Analysis of the crisis communication in the official papal texts

Renata Sedláková¹, Veronika Mullerová¹

¹ Palacký University, communication studies, Olomouc, Czech Republic

The evolving landscape of communication technology has catalysed a profound transformation in the communication strategies of the papal office over the last two decades. As other world leaders, popes also have extended their communication into the digital space and the period of a digital papacy started. Since we are seeing the growth of a community following the Pope on social media (Pope Francis has over 50 million followers on X), the research takes a closer look at the communication channels and style adopted by popes Jan Paul II, Benedict XVI, and Francis amid the expansion of virtual spaces and social networks. This paper describes the transformations on the crisis-related discourse and its evolution within the papal messages spanning from 1995 to 2022. After analysis based in the annual texts published by the Holy See for World Communications Day, we have analysed 4015 texts (1205 by John Paul II, 1256 by Benedict XVI, 1554 by Francis) published on the official webpage vatican.va in English using NVivo software.

Utilizing text mining methodology, the study reveals a discernible shift in language and tone employed within these texts. Initially, the term 'must,' previously pervasive in papal messages, has notably vanished from recent communications. This gradual disappearance of imperatives was followed by rise in the use of inclusive pronouns 'we' and 'our' in papal discourse. This linguistic shift is further underscored by a distinct correlation between the increased occurrence of the term 'crisis' and the emergent prevalence of inclusive pronouns. This correlation reflects a clear alteration in the wording and communicative approach of the papacy. Additionally, the study identifies topics that, despite being predominantly labelled as crises in public discourse, have not been labelled as such by the popes. These are mainly cases of sexual abuse by clerics. Drawing from Pennebaker (2011) who showed a significant increase in the usage of the noun 'we' during times of crisis, this research delves into the variations of the term 'crisis' and examines the changes of the crisis narrative across different papal tenures. In summary, John Paul II understands crisis as something to be overcome and gotten rid of, while Benedict XVI approaches crisis as a means for spiritual growth, and Pope Francis advances the understanding of crisis as a necessity that comes from God. Differing from his predecessors, he challenges letting ourselves to be thrown into crisis. (Francis, 2021)

The study presents a comprehensive narrative of the 'digital papacy,' highlighting an evolution in the texture, structure, and responsiveness of papal discourse to the contemporary societal milieu. It not only demonstrates linguistic changes but also reflects shifts in socio-cultural relations and the changes in authority signifying a pivotal transformation in how the papacy engages with the Catholic community in the age of social media and digital religion.

CRC02 The digital frontline: Social media dynamics in crisis communication

PP 0342 How to make sense of platformized crisis?: (Algorithmically) Analysing discursive patterns in social media messages during moments of mobilization and issue formation

Tim De Winkel¹, Maya Sappelli², Laura Meijer¹, Anne Kessels¹, Marije Vrijmoeth¹, Dianne Teunisse¹, Annette Klarenbeek¹

¹ University of Applied Sciences Utrecht, Social Interaction in Public life, Utrecht, Netherlands

² HAN university of applied sciences, artificial intelligence, Arnhem, Netherlands

Social media platforms are increasingly important during crisis situations (Westerman et al., 2014; Saroj & Sokumal, 2020). They are used by citizens to find and exchange information, express concerns, coordinate relief efforts, and eventually memorializing those affected (Takahashi et al., 2015). Conversely, social media can also escalate an online discussion or issue into an offline crisis event (van Dijk et al., 2013; Breuer, 2016). Institutions that deal with crisis management have started using social media as a tool. However, research finds that communication professionals of public institutions experience a hesitance to (re)act upon the forming of online issues. The amount of discourse and data is experienced as cacophonous, which leads to the diffidence to act (Harmelink et al., 2018; Sneijder et al., 2019; 2021).

As the research group Social Interaction in Public life at the Utrecht University of Applied Sciences we consider the capacity of communication professionals of public institutions to respond adequately to ongoing issues of crisis on social media of great importance. For this reason, we formed a consortium of communication professionals from partnering public organizations in 2022, and started the interdisciplinary research project called 360 Newsroom to address the aforementioned concerns. We developed a learning environment called the BEP (Birds Eye Perspective) that trains communication professionals in effectively recognizing and navigating discursive practices on social media associated with potential to escalate an issue into a crisis. We established this environment by analyzing four case studies of online issue formation through a discursive psychology analytical framework (Potter, 1996; Potter & Edwards, 2001) with which we identified discursive practices employed by social media users during crisis. We annotated this crossmedia dataset to encapsulate the patterns in language that signal the devices of mobilization, and subsequently developed algorithms to classify these language patterns within non-annotated tweets. As such the algorithms provide enrichment to our overall analytical framework. Using these devices as building blocks we work towards automated detection of patterns such as mobilization while maintaining transparent and controllable. Preliminary results were able to affirm the discursive patterns that provide insight into how certain discursive devices contribute to rumour spreading and mobilisation on social media, which in turn can lead to issue formation and eventually are predictive of crisis events. Furthermore, the study found that developing language sensitivity for certain patterns in online public discourse is vital for identifying potential issues on social media at an early stage, and that the use of algorithms can be successfully employed to foster this sensitivity. In our conference contribution we'll follow up on the 360 newsroom project by interpreting the empirical findings through the theoretical framework of issue formation and crisis communication in the platformized public sphere (De Winkel, 2023). We will address what discursive patterns – that occur in social media messages – have the potential to mobilize audiences, how these can be identified at an early stage, and what this means for crisis communication. Finally, we discuss the possibilities of algorithms in untangling the complexity and entropy of datafied and platformized communication.

CRC02 The digital frontline: Social media dynamics in crisis communication

PP 0343 Tweeting through the COVID-19 crisis: A quantitative comparative analysis of crisis communication on Twitter by key public actors in Germany

Franziska Schier¹, Nariman Sawalha¹, Constanze Rossmann¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

The outbreak of COVID-19 pandemic in early 2020 demanded swift yet coordinated crisis communication from authorities, politicians, and experts. Initially, however, risk assessments were ambiguous and hastily implemented containment measures contributed to public uncertainty with regard to preventive measures in Germany (Betsch, 2020). According to the Social Amplification of Risk Framework (SARF; Kasperson et al., 1988), public risk perceptions and response to risks following a crisis event are vastly shaped by the information flow via *amplification stations*, i.e., politicians, institutions, scientists as well as traditional and social media. Correspondingly, through the lens of *framing theory*, framing messages about a crisis as either amplified (e.g., emphasizing consequence, uncertainty, or conflict) or attenuated (e.g., emphasizing action, reassurance, or new evidence) potentially contributes to an *amplification* or *attenuation of risk perceptions* in the public (Shieh et al., 2008; Rossmann et al., 2018).

We aim to contribute to existing SARF and framing literature on risk amplification/attenuation during crises. While previous research applied SARF to risk framing in traditional news outlets, we focus on understudied amplification stations and channels: The COVID-19 crisis offers a prime example of how *key public actors*, i.e., politicians, institutions, scientists, have become pivotal information sources and interpreters of risks for the public – often bypassing

legacy media in Germany (Viehmann et al., 2020). Thereby, the relevance of *social media*, particularly Twitter (now: X) for rapid information dissemination became apparent, as public actors increased their communication on this platform to cater to the heightened information needs.

To comprehend the dynamics of crisis communication during the COVID-19 pandemic in Germany, we analyzed Twitter communications from key public actors over time: former Minister of Health Jens Spahn, prominent virologist Christian Drosten, the Federal Ministry of Health (BMG), and the Robert Koch Institute (RKI). This allows for a comparative analysis between political (Jens Spahn, BMG) and scientific voices (Christian Drosten, RKI), as well as between individual communicators (Jens Spahn, Christian Drosten) and institutional entities (BMG, RKI). Conducting manual quantitative content analysis on a sample of $N = 1270$ (re-)tweets from these actors over 12.02.2020 to 28.12.2021, we assessed risk-amplifying and risk-attenuating message framing, along with the tone and degree of emotionalizing language in their (re-)tweets (Rossmann et al., 2018).

Descriptive analyses and χ^2 -tests revealed distinct patterns in how the four actors framed their COVID-19 crisis communication. Virologist Christian Drosten leaned towards a more negative tone, aligning with his use of risk-amplifying framing. Conversely, politician Jens Spahn demonstrated a more emotionally charged language, coupled with risk-attenuating framing. The institutions BMG and RKI employed more risk-attenuating frames but maintained an overall neutral tone. However, communication styles changed over the course of the pandemic. In-depth results and limitations will be presented at the conference.

Comparing crisis communication on Twitter amid the COVID-19 pandemic indicates colliding strategies between scientific and political communicators, potentially explaining the prevalent public uncertainty and social disorder regarding risks arising from these differences. Our study underscores the importance of coordination between experts and government actors in strategically communicating risks and containment measures for effective crisis communication.

CRC02 The digital frontline: Social media dynamics in crisis communication

PP 0344 Reinforce Negativity or push Positivity during Crises? Investigating direct and conditional Effects of negative and positive Sentiments in Newspapers' X/Twitter Posts on Audience Engagement during the Covid Pandemic

Reshmi Gopalakrishna Pillai¹, Bartosz Wilczek²

¹ Vrije Universiteit Amsterdam, Faculty of Social Sciences – Communication Science, Amsterdam, Netherlands

² LMU Munich, Department of Media and Communication, Munich, Germany

News organizations have been disseminating news on X/Twitter to reach (new) audiences. As negativity is a core journalistic value, the question arises how and under what conditions negative and positive sentiments in news organizations' X/Twitter posts affect audience engagement with the X/Twitter posts. Early studies have found that negative sentiments are stronger related to audience engagement than positive sentiments. However, these studies have not considered possible specific dynamics during crises.

This study investigates direct and conditional effects of negativity and positivity sentiments in news organizations' X/Twitter posts on audience engagement based on the example of the Covid-19 crisis in the Netherlands. More specifically, drawing on behavioral economic theories, we investigate the following research questions (RQs): 1) How do negative and positive sentiments in Dutch newspapers' Covid-related X/Twitter posts affect audience engagement with the X/Twitter posts? 2) How do negative and positive sentiments in Dutch newspapers' Covid-related X/Twitter posts affect audience engagement with the X/Twitter posts during stronger (strict lockdowns) and weaker (no strict lockdowns) phases?

To investigate our RQs, we collected Covid-19 related posts from the official X/Twitter handles of the 10 leading (in terms of number of X/Twitter followers) newspapers in the Netherlands (5 national newspapers and 5 regional ones) during the period of three years from 01.01.2020 to 31.12.2022 using the python-based tool 'snsrscrape'. The final dataset consisted of 63'443 tweets (40'387 tweets from national newspapers and 23'086 tweets from regional ones). Independent variables: The number of words with negative and positive sentiments in the tweets was determined using the Lilah lexicon in Dutch. Moderator variable: Based on the information from the RIVM (Dutch National Institute for Public Health and the Environment), we created a variable to indicate whether the tweets were published during a period of strict lockdown measures (March–June 2020, December 2020–June 2021, December 2021–February 2022) or not. Control variables: Using regular expressions, we found the number of URLs, usernames and hashtags within each tweet. We also controlled for media type (national vs. regional). Dependent variable: For each tweet, we determined the sum of the number of likes, retweets, quotes, replies and divided it by the number of followers in 100k to normalize the effect of larger audiences on engagement. To investigate RQ1, we conducted a linear regression with R. To investigate RQ2, we conducted two moderation analyses with the PROCESS macro for R.

The findings show that positive sentiments in newspapers' Covid-related X/Twitter posts are more impactful in increasing audience engagement than negative sentiments, though no differences are found depending on the

pandemic phase (strict lockdowns vs. no strict lockdowns). This suggests that during crises positive sentiments overrule negative sentiments and motivates further research about the impact of sentiments on audience engagement in social media posts during crises.

CRC02 The digital frontline: Social media dynamics in crisis communication

PP 0345 Navigating a pandemic in the age of digital platforms: Transforming lessons learned into a practical guidebook for effective social media-based crisis communication

Saman Choudary¹, Xavier Ramon¹

¹ Universitat Pompeu Fabra, Communication, Barcelona, Spain

Being declared as an infodemic of social media (WHO, 2020), COVID-19 pandemic embodied a communication crisis, requiring a fast and timely response from world leaders, health organizations and mass media (Ngai et al., 2020). It has brought forward the significance of crisis communication and communication tools specifically social media platforms in effectively responding and managing the public health crises (Tsao et al., 2021). In purview of COVID-19 pandemic, scholarship is growing in the area of crisis and risk communication, however social media-based crisis communication has received limited attention as there is a sufficient gap in terms of development of adequate best practices grounded on social media-based research and practice. This area needs more scholarly investigation based on comparative case studies and insights from real time lived experiences of response actors.

This study fills in this research gap and seeks to advance a guidebook for effective social media-based crisis communication by adopting COVID-19 pandemic as a case study. Grounded on Framing theory and Crisis and Emergency Risk communication (CERC) Model, the study employs mixed method research design to examine how COVID-19 pandemic was framed and communicated by public health organizations on social media and how these organizations utilized and navigated social media platforms in practice during the initial phases of this mega crisis. The study builds on a dataset of 12,558 tweets published by World Health Organization (WHO), Centers for Disease Control & Prevention (CDC), and Médecins Sans Frontières (MSF) between January 1 and December 31, 2020, and 20 in-depth interviews with social media managers, communication experts, and scholars.

The study found that public health organizations have employed varying frames and communication strategies exhibiting a close correspondence with their mandates, and having significant differences in the level of embedded CERC principles in their communications. The interview material indicates actual motivations of using social media, challenges faced when countering disorder in digital platforms, and lessons learned in real time for communicating with audiences. Drawing on the findings from the empirical material, 15 operational recommendations emerged from the data that are used to develop a guidebook for official crisis communication on social media platforms. The proposed guidebook places emphasis on targeting cultural subgroups, actionable messages, interactive messaging, strategic partnerships, and active social media listening. The guidebook advances the practice and theory driven research within crisis and risk communication and digital media environments that will benefit scholars and practitioners as a productive resource for carrying out effective social media-based crisis communication during future crises.

CRC03 Combating misinformation in times of crisis

PP 0457 Debunking misinformation in times of organizational crisis: The dilemma of myth repetition or facts-only rebuttal and backup by employees or influencers

Aurélie De Waele¹

¹ Ghent University, Department of translation – interpreting and communication, Ghent, Belgium

Organizations in crisis are often confronted with misinformation about the crisis. This false information can harm the organizational reputation and the public's wellbeing. It is therefore important to know how to handle this misinformation as an organization. A few studies have looked at how organizations can debunk misinformation in times of crisis. It is shown that elaborately reinforcing the correct facts is better than a simple rebuttal using fewer arguments. However, it is not clear if it is better to focus solely on these facts without repeating the misinformation or to repeat misinformation and then debunk it. Looking at research on debunking misinformation in other contexts

(e.g., health communication, science communication, consumer research), conflicting findings are observed. Some studies argue that repeating misinformation creates a familiarity backfire effect, leading to an increased belief in the misinformation. Other research does not substantiate this negative impact, with some studies even showing favorable outcomes of repeating misinformation and debunking it, compared to facts-only rebuttals. This study wants to examine whether repetition of misinformation helps or hinders organizational efforts to correct misinformation in times of crisis.

Another factor that might affect the success of debunking misinformation is backup of the organization's corrective response by another source. Research shows that when employees back up an organizational corrective response in times of crisis, it leads to favorable organizational outcomes. Although employees are a trusted source of information during crises, their social media reach is usually more limited than social media influencers with a large number of followers. PR practitioners indicate that these influencers can help set the record straight when fake news is shared about an organization. However, an experimental study shows that consumers are suspicious of crisis response messages by influencers, because of their affiliation to the organization. This study wants to clarify the impact of influencers and employees backing up organizational corrective responses.

A 2 (facts only vs. myth + facts) × 2 (employee backup vs. influencer backup vs. no backup) between-subjects experiment will be conducted through an online survey. Participants will see a news article about a (fictitious) crisis for which the organization is not responsible. Afterwards, they will see a Facebook post from a group claiming that the organization is fully responsible for the crisis. Then, they will see a Facebook post by the organization to correct this misinformation, either focusing on facts only, or repeating the misinformation and then debunking it with facts. Finally, they will see a Facebook post by either an employee of the organization in crisis or an influencer, in which strong support is shown for the organizational corrective statement, or they will see no such post (control condition). After exposure to these stimuli, participants will fill in a questionnaire measuring corporate reputation, crisis responsibility, credibility of the corrective statement, trustworthiness of the source and manipulative intent.

Findings of this study will help fill the theoretical void concerning crisis misinformation and will lead to practical recommendations for communication professionals about how to handle misinformation in times of crisis.

CRC03 Combating misinformation in times of crisis

PP 0458 The "misinfodemic" dilemma: How German authorities counter disinformation in protracted crises – A multi-method study

Johanna Radechovsky¹, Kathrin Schleicher¹, Martin Löffelholz¹

¹ TU Ilmenau, Research Group Media Studies- Institute of Media and Communication Science, Ilmenau, Germany

Recent crises such as the COVID-19 pandemic are often described as "infodemics", where an oversupply of rapidly spreading unverified and often false information can lead to mistrust of authorities and risky behavior among citizens (WHO 2023, Chou et al. 2021). Although state authorities play a crucial role as communicators to educate the public, provide preventive information (Sellnow et al. 2017) and strengthen resistance to misinformation, research on how government actors respond to mis- and disinformation in times of crisis is insufficient. Germany, with an alarming mistrust of journalism and authorities, a relatively high resistance to vaccination (Jones & Chazan 2021) and increasing political polarization, is similar to other Western democracies and serves as a suitable case study.

This study uses the example of the Covid-19 pandemic to examine how German authorities counter disinformation in protracted crises. The multi-method design comprises (1) 55 semi-structured interviews with executives at federal, state and municipal level (conducted in 2022/23) and (2) a representative online survey in 2023 among authorities of districts and cities (N = 383; gross response rate: 46%).

The interviews revealed that state authorities were confronted with rumors and misinformation spread by individuals and groups on social media, but also by legacy media. The following quotes show the range of responses from government representatives to misinformation: "Correcting disinformation should only be the means of choice in very exceptional cases." / "By and large, the scientific literature shows that it makes sense to debunk misinformation." / "Better to communicate too much than not to inform at all. If you have a lack of information, rumors form." / "Correcting false information can often even lead to the disinformation being perpetuated and spun further."

At state level, respondents criticized the media for publishing untrue news for the sake of fast reporting and clicks. In response, the respective state government held a press conference to disclose its work processes. At local level, interviewees stated that they actively seek dialogue with citizens who spread rumors on social media. Others established editorial teams: "Moderating topics is very important in social media. Otherwise you have [...] comments questioning everything you say. This damages your credibility." However, systematic approaches to communication against misinformation were only used in a few cases overall.

In the representative online survey, less than half of the municipalities stated that they had taken appropriate measures against misinformation (44%) and 41% saw untrue information as a problem. Respondents were more satisfied with their transparent admission of mistakes and the comprehensible communication of risk messages

– characteristics that represent suitable communication strategies against disinformation (Amazeen 2013; Dan 2020). Authorities cited time pressure and uncertainty of facts during the pandemic as obstacles, suggesting that they were unable to adequately fulfill their function as clarifiers of misinformation. However, there are signs that local authorities want to do better in the future: 58% want to expand their presence on social media and 53% plan to communicate more proactively with citizens.

CRC03 Combating misinformation in times of crisis

PP 0459 What's going on? Collaborative journalism and civil society during local crises

Bengt Johansson¹, Emil Östlund¹

¹ University of Gothenburg, Journalism – Media and Communication, Göteborg, Sweden

News media is a central resource for citizens' ability to receive crisis information, both in terms of instructive information, possibilities to hold responsibility into account and information helping to recover and rebuild society and social networks (Johansson et al., 2023a). Even if contemporary society is described as a high choice media environment with multiple channels to choose from, recent research emphasizes the importance of traditional news media for citizens' information seeking during a crisis (Johansson et al. 2023b).

Crisis communication during a local crisis has different prerequisites compared to national or international crises. Seen from a citizen perspective, there are more possibilities to communicate using interpersonal communication, but also to gather information by personal experience. However, the access of local news media is often limited, where one single news organization is an important channel in the local communication environment (Firmstone & Coleman, 2017).

Local journalism has faced severe problems in terms of diminishing revenues and circulation during the last decades which has led to staff cuts and a need to deliver more desktop journalism. Even if local journalism is under pressure, local news organizations are still a central institution in disseminating, fact-checking, accountability work and community building, not at least during local crises.

One way to strengthen local journalism during local crises is adapting collaborative journalism, referring to journalistic practices where news organizations work together with individuals or/and organizations to create, publish, and disseminate news stories (Alfter, 2016). In doing so local news organizations can obtain more "eyes and ears" in the local community to verify information, being eyewitnesses of what is going on during a crisis, finding sources etc.

This paper evaluates the innovation project "Strengthened local journalism during crises" where two local news organizations and civil defense organization Swedish Women's Voluntary Defence Organization (SWVDO) participated in an innovation project aiming to strengthen local journalism during local.

Based on semi-structured interviews with the project leaders, editors, journalists, and members of the SWVDO the paper analyzes how collaborative journalism works during local crises. Learning processes and innovation as well as limitations and obstacles are discussed, both on a more general organizational level as well as in journalism practice.

CRC03 Combating misinformation in times of crisis

PP 0460 Fibs, Fiction, and Facts: Visual misinformation shaping climate narratives during COP28

Grace Omondi¹, Anders Nilsen¹

¹ Kristiania University College, School of Communication- Leadership- and Marketing, Oslo, Norway

Keywords: *climate change, visual misinformation, COP28, crisis communication, risk communication*

The impact of climate change is visible and increasingly undeniable, evidenced by more frequent extreme weather events that compromise biodiversity and natural ecosystems, reduce water availability, and impact food production – and therefore poses a threat to human life, sustainable development, and economic growth. Climate change is a global risk that requires collective and meaningful climate action responses. Despite general global consensus on

climate science, climate misinformation remains a critical barrier to addressing climate change and stifles climate action. Misinformation negatively impacts decisions and actions by creating fear, panic and skepticism and can cause the public to stop believing the facts altogether. This is especially true for climate change (Budak et al., 2011; Lewandowsky et al., 2017; Treen et al., 2020; Van der Linden et al., 2017; Zhou & Shen, 2022).

Extensive research has so far focused on textual misinformation on mainstream and social media, public perception of climate imagery, and how to understand strategies for public engagement through effective climate change communication (Chapman et al., 2016; O'Neill, 2013; Schäfer & Schlichting, 2014). However, gaps exist in research on visual climate misinformation during global climate meetings, which will be focus of this paper.

Today's visualized media and information environment requires a deep understanding of climate visual misinformation and strategies to mitigate it. The approach will be a case study of visual climate misinformation specifically looking at the Conference of the Parties (COP) 28 climate meeting held in Dubai, United Arab Emirates in November 2023. Research highlights that COPs are important events that hold the power of contingency and collective memory, can spark motivation for climate action, and have the potential to reshape the public discourse around climate change (Schudson, 1992; Staggenborg, 1993; Tobin & Schmidt, 2020).

The paper will apply the theories of visual framing, visual fabrication, and climate change communication (King & Lazard, 2020; Rodriguez & Dimitrova, 2011) and use a quantitative content analysis approach to investigate climate misinformation visuals between 1 October and 30 November 2023, the time period before and during COP28. Visual data will be collected from factchecking organizations tracking misinformation on climate change. The paper will answer the question: *What is the role of visual climate misinformation in disrupting climate action priorities?* It will also provide recommendations for how global climate conferences can counter disorder from visual misinformation.

CRC03 Combating misinformation in times of crisis

PP 0461 Table-top exercise for identifying communication-related vulnerabilities in disasters

[Sten Torpan](#)¹, Sten Hansson¹, Kati Orru¹

¹ University of Tartu, Institute of Social Studies, Tartu, Estonia

Uncontrolled and often false information has become a hampering problem for crisis communicators. Accurate information is particularly important during emergencies, when the protection of human life, health and property depends on rapid decisions based on accurate information. Crisis vulnerability does not only cover predetermined groups, but late literature has rather explained vulnerability as intersectional, a trait depending on the specific circumstances where an individual might find themselves. A subset of those circumstances is communication-related vulnerability which explains how existing hazards can be amplified by miscommunication, especially by false information that could harm the population and impede normal crisis management.

A part of crisis communication challenges during emergencies is tackling people's problems with accessing (e.g., difficult or no access to relevant crisis information), understanding (e.g., difficulties in differentiating and understanding truthful messages and false information), and reacting to crisis-related information (e.g., neglecting protective measures based on false information). Several studies have addressed false information tackling strategies in times of crisis, however, existing research has not addressed nor tested vulnerability to false information within a tabletop exercise – a format commonly used to train crisis management practitioners. Table-top exercises combined with scenario-based frameworks can be modified to accommodate elements from all sorts of scenarios – including the intricate and multi-dimensional problems with communication during emergencies.

To explore how disaster management table-top exercises can be used to identify communication-related vulnerability factors related to false information, we presented 25 participants from Estonian emergency management, neighbouring institutions and stakeholders (e.g., local governments, local NGOs) a crisis scenario. We found that stakeholders mostly focused on problems of accessing information as the source of communicative vulnerability and only a handful brought up problems with understanding and reacting. This might indicate that stakeholders overfocus on the populations' problems with accessing information, and thus not put too much emphasis on making their messages understandable, tailoring them to different audiences, or thoroughly thinking of how those messages might make people react. Drawing on the actual exercise results, we present policy and strategy recommendations.

CRC04 The conceptual and methodological evolution of global crisis and risk communication research: Emergence, future, and cultural dynamics of a multidisciplinary field

PN 077 Effective Instructional Messaging, Dialogue, and Self-Protection: The Need to Study Global...

[Deanna Sellnow](#)¹, Timothy Sellnow¹

¹ University of Central Florida, Nicholson School, Orlando, USA

Effective Instructional Messaging, Dialogue, and Self-Protection: The Need to Study Global Instructional Risk and Crisis Communication in the Context of Disasters and Disease A review of the crisis communication literature published between the first and second editions of the Handbook of International Crisis Communication Research (Schwarz et al., 2016) reveals limited research based on international data sets. Though the first edition of the handbook called for more collaborative research among nations, most studies published are still single nation based. This limitation is problematic because crises are not typically limited to a single nation. Diseases spread across borders, a single organization or industry engulfed in crisis can be present in myriad countries, and disasters can afflict massive global regions simultaneously. Thus, our failure to account for the interaction of nations during crises is a consistent challenge to the validity of crisis communication research. One area where collaborative research is particularly vital is the study of warnings and instructional messages for self-protection. Considerable research focusing on instructional risk and crisis communication has been published since 2016. This instructional research focuses on affective, cognitive, and behavioral learning during crises or high-risk contexts. Instructional communication also emphasizes dialogue, giving diverse stakeholders, including those of multiple nations with varying levels of economic security, opportunities to influence the flow of essential information during crises. Thus, we assert that instructional risk and crisis communication affords an opportunity, theoretically and methodologically, for conducting international research. To further clarify and support this assertion, we describe the IDEA Model (a model explaining the interaction of affective, cognitive, and behavioral instruction in the context of crisis message distribution) as an exemplar for instructional risk and crisis communication research, particularly in the study of international crises and disasters. The utility of the IDEA model in assessing communication during such international crises as pandemics and food safety/insecurity, and disasters such as earthquakes and tsunamis is described. Ultimately, instructional risk and crisis communication is offered as an opportunity for expanding crisis communication research to include collaboration among international scholars, practitioners, and stakeholders.

CRC04 The conceptual and methodological evolution of global crisis and risk communication research: Emergence, future, and cultural dynamics of a multidisciplinary field

PN 078 Opportunities and Pitfalls of Computational Communication Science for International Risk...

[Andreas Schwarz](#)¹, Daniel Vogler²

¹ Ilmenau University of Technology, Media and Communication Science, Ilmenau, Germany

² Universität Zürich, f0g - Forschungszentrum Öffentlichkeit und Gesellschaft, Zürich, Switzerland

Opportunities and Pitfalls of Computational Communication Science for International Risk and Crisis Communication Research Crisis communication scholars increasingly highlight the international dimension of risk and crises. In the digital media environment, risks and crises are, by default, international in scope. Communication on digital channels like social media platforms enables crises to quickly spread internationally. Thus, many risks and crises are potentially global and can only be understood in a comprehensive manner when including their international dimension. However, the study of risk and crises often remains restricted to regional or national contexts. Research in risk and crisis communication has only slowly started reflecting the global environment and diverse crisis and risk contexts (Diers-Lawson & Meissner, 2021) and taking into account emerging issues that are global in their manifestation and treatment, like environmental threats, global security, war, and terrorism. Even though advances in the direction of more diverse scholarship have been made in recent years, the focus of scholarship remains on Western countries. In contrast, studies of countries from the Global South or other regions, including but not limited to Latin America, Africa, Southeast Asia, and Eastern Europe, remain scarce. These shortcomings have already been articulated by communication scholars in general (Cruz & Sodeke, 2021) as well as by risk and crisis communication scholars in particular (Diers-Lawson & Meissner, 2021). Computational communication science (CCS) offers the possibility to overcome the limitations and biases outlined above. At the same time, it is also susceptible to reproducing them (Lazer et al., 2020). Risk and crisis communication has not yet fully embraced these new methods. Thus, many recent studies on crisis communication that use computational methods do not apply theories and concepts from risk and crisis communication which often leads to missing analytical depth or insufficient theoretical foundation. Thus, to implement CCS into international risk and crisis communication research beneficially, we need to be more aware of the opportunities, challenges, and pitfalls of its methods and procedures. In this conceptual paper, we will provide central definitions, give an overview of the state of research of CCS in the field of risk and crisis communication, and discuss the opportunities, challenges, and pitfalls of computational methods. The paper concludes with suggestions on how to address the limitations and leverage the opportunities of CCS in international risk and crisis

communication research. We outline five areas that need to be addressed in the future for further advancing CCS in risk and crisis communication research: (1) an integrative and reflexive view on CCS; (2) the combination of CCS with theories from risk and crisis communication; (3) method triangulations of CCS with established quantitative and qualitative research methods of communication research; (4) accessibility to data, tools, and training; and (5) the development of multilingual CCS methods.

CRC04 The conceptual and methodological evolution of global crisis and risk communication research: Emergence, future, and cultural dynamics of a multidisciplinary field

PP 0571 Government communication strategies in protracted crises: A comparative multi-method study in six European countries and the USA

Martin Löffelholz¹, Yi Xu¹, Pauline Gidget Estella¹

¹ Technische Universität Ilmenau, Institute of Media and Communication Science, Ilmenau, Germany

While there is a wealth of literature on risk and crisis communication, few studies analyze government strategies, particularly in protracted crises and in a cross-national perspective. This study therefore comparatively examines the risk and crisis communication strategies used by governments in Germany, Italy, the Netherlands, Spain, Sweden, the United Kingdom and the United States over a three-year period to mitigate the effects of protracted crises, using the Covid-19 pandemic as an example. Central to the comparative approach is the notion that crises are defined, perceived, communicated and managed depending on cultural values, citizens' trust in governments, the characteristics of political and media systems, the degree of autonomy within political systems, the course of a crisis and the differences in "risk cultures" (Cornia et al., 2016): individual-oriented (Netherlands, UK, USA), state-oriented (Germany, Sweden) and fatalistic risk culture (Italy, Spain).

Against this background, this study focuses on two research questions: (1) What communication strategies do the governments of Western democracies employ to mitigate the impact of protracted crises? (2) Which extra-organizational factors shape the development and application of these communication strategies? To answer these questions, we used a multi-method design comprising two closely coordinated empirical studies: In a quantitative content analysis, we analyzed a total of 6,598 press releases on Covid-19 published by governments between January 1, 2020 and December 31, 2022 (Germany: 220, Italy: 481, Netherlands: 724, Spain: 1,530, Sweden: 866, UK: 1,622, USA: 1,155). The codebook is based on the IDEA model (Sellnow & Sellnow, 2019) and theoretical considerations with regard to strategic political communication. Seven teams of coders underwent six rounds of reliability tests to code press releases in Dutch, English, German, Italian, Spanish, and Swedish (final average agreement 94.11%, final average Fleiss' kappa 0.89). In addition, a total of 116 semi-structured interviews (duration: 45 to 120 minutes) were conducted in 2022/23 with high-ranking representatives of politics, public health, and government communication at national, regional and local level, which were systematically analyzed with the support of MAXQDA and triangled with the results of the content analysis.

Both studies have produced a large number of findings showing that none of the mentioned extra-organizational variables alone can explain communication strategy differences. A hierarchical clustering by main components revealed three main patterns for crisis-related press releases: In Germany and the Netherlands, preventive measures tended to be presented as mandatory and policy measures were more frequently explained. In contrast, the press releases of the Spanish, Dutch and British governments report more frequently on successes in crisis management, while the press releases of the Swedish, British and US governments express more sympathy. In all countries, government communication focuses primarily on informing and explaining the pandemic, while calls for interaction are rare. Emotionalizing elements are mainly used in Sweden, while in the Netherlands and the UK the focus is on mobilizing citizens. Overall, the results show that in addition to extra-organizational factors, inter- and intra-organizational factors (such as preparedness, inter-organizational coordination, simultaneity of crisis and political communication during elections) must also be considered.

CRC04 The conceptual and methodological evolution of global crisis and risk communication research: Emergence, future, and cultural dynamics of a multidisciplinary field

PP 0572 Making sense of unstructured data. Challenges in developing social media listening solutions in the current digital landscape

Corina Buzoianu¹, Monica Bira¹

¹ National University of Political Studies and Public Administration, Communication and Public Relations, Bucharest, Romania

The development of new communication technologies as well as monitoring and listening tools and software have been acknowledged as a significant factor of change in crisis communication due to their capacity to enhance efficiency, reach wider stakeholders and audiences, and understand the interactions between all parties. Without a doubt, emerging technologies and the development of listening software increased the expectations related to the outcomes that crisis communication can obtain from drawing on social media data. To meet these

expectations, practitioners face challenges related to resources and know-how, to which we may add the fluidity of data and constant changes in social media's platforms algorithms. Unlike traditional monitoring systems, the quantity of data to be stored and treated, the ongoing updates, and the high velocity of information spreading can only be managed through the employment of artificial intelligence, machine learning, and robots (Kibria et al., 2018).

Both scholars and practitioners have put significant efforts into making use of the current development of technologies for monitoring and listening to what social media users are talking, expecting, and feeling about specific events and situations. To some extent, sophisticated analyses are provided by listening software providers and consultancy agencies, such as clustering analysis and behavioral analysis. Deciphering stakeholders' emotions towards organizations through social media listening, foreseeing how they'll give meanings to certain messages and events, and choosing the most appropriate channels and timings for online communication have recently become an important part of crisis communication practitioners. Looking at the current practices of social media listening employed in agencies and corporations, on the one hand, and available academic research and studies, on the other hand, enables a deeper understanding of the challenges and limitations of using social media listening in risk and crisis communication. As expected, practitioners tend to make use of existing tools by gathering and processing quantitative data, and afterward conducting qualitative analysis of selected conversations and running sentiment analysis. On the other hand, scholars focus on the validity and representativity of the corpus and on conducting qualitative analysis. Based on mixed methods research, our study looks to further investigate current means and practices of using social media listening in crisis communication by both practitioners and scholars. In doing so, first, we analyze ten social media reports issued by agencies for different clients, by looking at the monitored metrics, corpus selection criteria, the method used for conducting sentiment analysis, and data analysis. Second, we compare these reports with academic literature on social media listening published between 2020 and 2024 in five digital libraries, to identify and understand differences and similarities in terms of methods, metrics, and treatment of data. Third, we conduct ten semi-structured interviews with practitioners to further explore the current means and practices of using social media listening in risk and crisis communication.

CRC05 Understanding readiness in organizations: A vital link between preparation and execution in crisis communication

PN 093 The Readiness State of Mind: The Key to Organizational Physicality, Discipline, and Composure

Yan Jin¹

¹ University of Georgia, Journalism, Georgia, USA

To see around the corner and one-step ahead is a goal for organizational communication leaders. As communication scholars and practitioners around the world identify effective ways to co-address sticky crises, manifested as challenging, complex, and recurring critical issues, readiness emerges as a new construct connecting yet going beyond preparedness and resilience in the domain of proactive communication management. Grounded in seminal crisis communication and strategic conflict management literature, crossing over public relations, organizational communication, and mass communication, this presentation discusses readiness as a mindset, which is built upon practitioners' individual self-efficacy and organizational efficacy at communication team and C-suite levels, demonstrated in physicality (resource fit based on threat appraisal), discipline (motivation, commitment, and creativity), and composure (emotional leadership, confidence, and mental adaptability).for developing, sustaining, and improving systems and procedures for appropriate, sufficient and timely responses to challenges from within and without, ranging from threats, risks, conflicts, crises, to sticky crises.

CRC05 Understanding readiness in organizations: A vital link between preparation and execution in crisis communication

PN 094 Efficacy as a Core Element to Readiness: A Multi-Level Approach

Timothy Coombs¹

¹ Centre for Crisis and Risk Communication, Centre for Crisis and Risk Communication, Calgary, Canada

Crisis readiness is a mental state reflecting a willingness to engage in crisis management. One of the core elements of readiness is efficacy. Efficacy is multi-level in organizational efficacy. At the base is self-efficacy (people believe they have the capacity to reach a goal) for the individual team members. Next is team efficacy, how capable people perceive the crisis team in executing its crisis responsibilities. Finally, there is organizational efficacy which centers on the support the organization provides for crisis management efforts. This presentation explores how these three levels of efficacy relate to crisis readiness and the implications for crisis communication.

CRC05 Understanding readiness in organizations: A vital link between preparation and execution in crisis communication

PN 095 Readiness for Crisis Spillover: Spillover Types, Risk Factors, and Response Strategies

[Yijing Wang](#)¹

¹ Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

In an age of social media increasing the speed by which a crisis can spread from one organization to another, corporate crisis spillover has become an emerging research topic in the field of crisis communication. Crisis spillover effects reflect one category of crisis risk as part of the crisis readiness model. When a crisis spillover occurs, an organization can be linked to a crisis that is affecting another organization such as a competitor, and the negative consequences of crisis spillover can be significant when stakeholders make assumptions of guilt by association. To tackle crisis spillover effects, organizations need to understand how to evaluate the risk of crisis spillover and how to develop effective response strategies to mitigate the risk of spillover effects. This presentation will address these questions and discuss how companies can combat uncertainty of crisis spillover to foster a strong crisis readiness.

CRC05 Understanding readiness in organizations: A vital link between preparation and execution in crisis communication

PN 096 Readiness, Mediatization and Distrust

[Toni van der Meer](#)¹

¹ University of Amsterdam, Social and Behavioural Sciences, Amsterdam, Netherlands

Another key element to crisis readiness is the dynamic information environment that organizations have to navigate. Over the past decades, through processes of mediatization, organizations have become inherently intertwined with their media surroundings. Being constantly on the media agenda and in the public eye has resulted in organizations' heightened focus on maintaining and renewing a silence to operate. With the politicization of public debates, we increasingly see how organizations decide to or are pressured to engage in socio-political issues. Here two challenges can be identified that ask for organizations' attention in the context of crisis readiness, namely the political polarization of stakeholders and public debate and the alleged "crisis of trust" challenging societies across the worlds. Political polarization makes it difficult for organizations to navigate issues that fuel emotionally loaded debate, risking alienation of stakeholders with opposing views. With both institutional distrust and low trust in information ecosystems, an additional layer is added to organizations' communication with their surroundings, making it necessary for organizations to establish trust before engaging in societal involvement. An issue arena approach can be valuable here, where organizations should adopt a strict issue monitoring approach, viewing themselves as part of dynamic communicative environments, and staying vigilant about issues central to public and media debate to enhance crisis readiness.

CRC05 Understanding readiness in organizations: A vital link between preparation and execution in crisis communication

PN 097 Employees' Part in Organizational Crisis Readiness

[An-Sofie Claeys](#)¹

¹ KU Leuven, Translation Interpreting and Communication, Ghent, Belgium

Organizations can prepare for crises by designating responsibilities to crisis team members, developing crisis plans, and exercising them through crisis simulations. Preparing only the crisis team, however, is not enough to create readiness among the entire organization. Organizations should consider employees as partners in crisis management, rather than merely as one of many stakeholder groups. They play crucial roles in crisis prevention, crisis management and crisis communication. Employees who perceive malpractice, for instance, are likely to address these issues internally. Without effective internal voice mechanisms, however, they can turn into whistleblowers. Organizations should also facilitate employees' sensemaking processes. When employees face ambiguity or uncertainty, they engage in sensemaking to increase their understanding of an event. At worst, the actions employees take to address ambiguity can develop into a crisis. At best, their actions enable them to detect warning signs early and prevent a crisis, or help to solve a crisis. Organizations should also enable and encourage employees to be scouts for criticism, both offline and online. Finally, organizations should maintain strong relationships with employees under routine circumstances. Doing so increases the likelihood that employees will feel ready to act as advocates during crises.

CRC06 The COVID-19 pandemic and the public: Navigating trust and risk perceptions

PP 0800 Public reactions to the government's inconsistent crisis communication

Minsi Li¹

¹ University of Twente, Public administration, Enschede, Netherlands

The government's crisis communication is expected to be reliable. However, the dynamic nature of crises necessitates frequent updates and potential overturning of communication messages, affecting the understanding of crisis causes and severity. These adjustments introduce incongruencies and inconsistencies, leading to public confusion, distrust, and non-compliance. For example, the fluctuating regulations on facial mask usage during the COVID-19 pandemic eroded public trust. This study argues that comprehending public reactions to crisis communication changes allows the government to transparently address its insufficiency in its crisis communication, fostering public acceptance.

This study explores people's responses to changes regarding crisis severity in the government's crisis communication. It examines the extent of public acceptance and the factors influencing these responses and delves into the factors that people emphasize when accepting or rejecting these changes.

This study examines public reactions to changes in crisis communication amid the COVID-19 pandemic in China. Initially, the Chinese government asserted that the outbreak was a controllable crisis confined to Wuhan city. However, it later recognized the widespread scope of the pandemic. By focusing on the government's social media account on Weibo, this study ensures that public reactions were influenced by official messages. Known to many as 'Chinese Twitter', the microblogging platform Weibo was launched in 2009 and is one of China's most popular social media platforms. Using topic modelling and sentiment classification, it investigates the public's reactions to changes in crisis communication messages and explores the factors emphasized when evaluating the government's communication.

This study adds to crisis communication studies by identifying factors that improve or impede public acceptance of changes in official crisis communication. Acknowledging the inherent uncertainty of crises, the research takes initial steps toward identifying remedies to sustain public acceptance during evolving crises.

Keywords: Changes in the government's crisis communication; Crisis severity; Public acceptance; COVID-19 pandemic

CRC06 The COVID-19 pandemic and the public: Navigating trust and risk perceptions

PP 0801 A matter of risk perception? The dynamics of media use during the COVID-19 pandemic

Ahrabhi Kathirgamalingam¹, Dominika Betakova¹, Mirjana Čirjak¹, Pamina Syed Ali², Hajo Boomgaarden¹

¹ University of Vienna, Department of Communication, Vienna, Austria

² University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

In democracies, the role of an informed citizenry becomes especially important during public health crises: citizens need to stay informed about the situation, including the current measures, risks and government recommendations, as not staying informed might potentially lead to uninformedness or even misperceptions, further jeopardizing public health. However, even though there is vast availability of information in the current high-choice media environment, the actual usage of different news media may vary drastically between individuals. The current research shows that media use or non-use is influenced by not only situational and contextual, but also individual-level factors. Such differences can stem from not only stable socio-demographic characteristics, but also from the perceptions of the current crisis situation. This creates a dynamic media environment where individual media use or non-use is affected by the interplay of individual and contextual factors. In this particular case of COVID-19 pandemic, when the media environment is highly saturated, individual news use may especially also relate to perceived health and economic risks, state of mental health and more. The current research on news consumption during the

COVID-19 pandemic paints a nuanced picture: while media use initially surged at the onset of the crisis, it swiftly decreased below pre-pandemic levels soon after (e.g., so-called crisis fatigue).

Against the backdrop of a high-choice media environment, our study engages in a comprehensive exploration of the dynamics of media use in Austria during a global crisis, in particular the COVID-19 pandemic. Specifically, the work in progress focuses on the impact of self-reported perceived health and economic risk, mental health state, and socio-demographic characteristics on media usage of quality media, tabloids, public broadcasting and social media. For that, we rely on a unique dataset from the Austrian Corona Panel Project, a panel survey study consisting of 35 waves ranging from March 2020 to July 2023 and a mixed analysis strategy consisting of a model to assess and explain the intra-individual change across six panel waves and a cross-sectional time-series model including more than 20 waves to replicate the above-mentioned intra-individual analysis. For the latter in particular, we include health and economic related real-world indicators such as positive COVID-19 cases, lockdown phases, vaccination rates, GDP, unemployment rates, and inflation. By doing so, we contribute to the literature in at least two ways: Firstly, by gaining a nuanced comprehension of individuals' media consumption habits in a crisis situation and assessing the explanatory power of our predictors, we gain crucial insights and map which factors matter in crises situations. Secondly, these findings hold the potential to inform and enhance health communication initiatives, inform policy making decisions, and guide not only the adaptive practices of journalists and media organizations, but also government initiatives ensuring a more effective and targeted response to public needs during challenging times.

CRC06 The COVID-19 pandemic and the public: Navigating trust and risk perceptions

PP 0802 Navigating trust: Comparative insights into crisis communication strategies and public perception

[Christian Schwadeler](#)¹

¹ University of Innsbruck, Department of Political Science, Innsbruck, Austria

The reciprocal dynamics of crisis communication are inherently tied to a concern for trust, a central factor influencing the implementation of restrictive containment measures and the apprehensions of politicians seeking re-election. Existing research stresses the negative impact of experiencing shared threats during crises on political trust, an effect largely attributed to negative information regarding crisis management. Simultaneously, as politicians conveyed COVID-19 measures on television, the public engaged in real-time discussions and critiques on social media platforms. However, studies predominantly rely on survey and experimental methods to examine the effect of negative perceptions on trust, thereby neglecting the central role of communication between public and politicians. Addressing this gap, this study investigates actual communication settings to unravel the connection between government communication strategies and public perception during the initial phase of the COVID-19 pandemic to answer the question on how government communication strategies impact public perception and trust in crisis management, and what discernible patterns and adaptations emerge through an analysis of these communication dynamics. Leveraging data from two distinct sources in nine OECD countries, the study utilizes transcripts of 392 governmental press conferences during the initial phase of the pandemic and samples of public tweets issued concurrently. This approach facilitates a direct comparison of government communication and public perception. By contrasting press conferences and public tweets, the study allows for an in-depth examination of the actual content of communication between the state and the public. Employing a combination of manual coding and quantitative methods, the research illuminates discernible patterns in state communication strategies that play a pivotal role in shaping public perception and fortifying trust in crisis management. Furthermore, this methodological approach enables an exploration of learning processes, providing insights into how states adapt their communication strategies in response to public feedback. The findings aim to contribute valuable insights into effective crisis communication and trust-building, offering implications for both theoretical understanding and practical applications in crisis management. By investigating the reciprocal dynamics of crisis communication, this research lays the foundation for enhancing crisis response strategies and fostering a more resilient and informed public during future crises.

CRC06 The COVID-19 pandemic and the public: Navigating trust and risk perceptions

PP 0803 Political competition in time of crisis: Analyzing communication tactics of Norwegian politicians during the COVID-19 pandemic

[Roy Aulie Jacobsen](#)¹

¹ Kristiania University College, Department of Communication, Oslo, Norway

Politicians face challenges that extend beyond electoral dynamics, encompassing their role as critical information providers during a crisis. The recent COVID-19 megacrisis put pressure on politicians to provide timely, accurate, and consistent information while managing complex policy issues. Successfully meeting these challenges requires a versatile set of strategies, especially when delivering messages across different social media platforms, each with

a unique architecture. Popular and scholarly accounts of the media point to the ability of these architectural features to shape and mold the message.

The type of content on different social media platforms depends on trends in political communication, the types of strategies politicians use, and platform characteristics. Based on existing research, these characteristics are synthesized into a framework of nine tactics. These are: (1) accommodative, (2) defensive, (3) self-enhancement, (4) action, (5) framing the crisis, (6) framing the organization, (7) routine communication, (8) inter-organizational relationships, and (9) input seeking. These tactics are drawn partly from crisis communication and partly from political communication and synthesize tactics used by politicians in government and in opposition. The difference between politicians in government and opposition can be apprehended through a perspective of political competition, where government politicians tend to rely on crisis communication. In contrast, politicians in opposition rely on political communication tactics. A political competition perspective is useful in explaining the choice of crisis tactics by government actors and political communication tactics by those in opposition. The selection of these tactics is contingent on platform characteristics, with platformization theory playing a central role in explaining how politicians convey their messages.

This article uses a comparative and longitudinal design consisting of empirical analyses of political communication on social media between Norwegian politicians in government and opposition during three lockdowns. The comparative design extends across platforms and incumbent status, while the longitudinal perspective allows for examining the adaption of tactics depending on the severity of the crisis. This article addresses two research questions: (1) How do politicians adapt their communication strategies across various platforms during lockdowns? (2) How does communication change different lockdowns? Empirically, this study relies on social media messages from three lockdown periods in Norway ranging from March 12, 2020, to February 1, 2022. Data were collected using CrowdTangle (Facebook and Instagram) at the end of December 2022. Through a content analysis of social media posts on Facebook and Instagram, tactics derived from synthesizing crisis and political communication literature are analyzed using multilevel modeling.

The results show that self-enhancement and informational tactics are common on Instagram, contrasting the defensive or anti-social tactics on Facebook. The results aim to look into the type of crisis management politicians give during distinct pandemic phases on different platforms and how crisis management develops over time. The practical implications revolve around effective crisis communication by political actors, showcasing variations across social media platforms.

CRC06 The COVID-19 pandemic and the public: Navigating trust and risk perceptions

PP 0804 Evaluating governmental crisis communication during the COVID-19 pandemic: A retrospective qualitative interview study among citizens in seven countries

Robin Janzik¹, Johanna Geppert¹, Severine Koch¹, Natalie Berger²

¹ German Federal Institute for Risk Assessment, Department Risk Communication, Berlin, Germany

² Independent, Researcher, Berlin, Germany

Background

During the COVID-19 pandemic, ineffective crisis communication by governmental institutions had detrimental consequences on public health. To be effective, communication from local, regional, and federal actors has to address audience needs. Previous research suggests factors contributing to message acceptance. It is important to discriminate which elements of communication, e.g., communicator and appropriate channels, play which role for an overall positive evaluation of communication efforts. Moreover, message acceptance has been shown to be associated with higher levels of trust, e.g., in the government.

This study addresses these research gaps by retrospectively examining citizens' perspectives on governmental crisis communication during the COVID-19 pandemic. Unlike most previous research, the study follows a multinational approach encompassing seven countries with varying past mortality rates, media systems, and trust in federal governments: Germany, Italy, Spain, UK, Netherlands, Sweden, and the US. The following research questions help to understand citizens' perspectives: How did citizens perceive governmental communication (RQ1)? Which sources did they rely on when seeking information (RQ2)? How are their evaluations of communication linked to trust (RQ3)?

Methods

Twelve semi-structured interviews per country ($N_{\text{Total}} = 84$) were conducted online in late 2023 in the respective national language. The sample was stratified by age ($M = 44$ years), gender (50% female), and education (94% medium-to-high education) both within and between countries. The interview guide included thematic areas of evaluation of governmental communication, information behaviour, and trust. Audio recordings were transcribed, translated into English, and analysed using qualitative content analysis.

Preliminary Results

Overall, interviewees' evaluations of governmental communication (RQ1) were tied to their assessment of implemented measures and the communicators' assumed integrity and expertise while expressing an understanding for mistakes made due to extraordinary circumstances. Regarding information behaviour (RQ2), interviewees built individual media repertoires. Interviewees viewed information on social media with scepticism showing awareness of misinformation. Governmental websites and press conferences were used only occasionally, while public broadcasters were perceived as direct and convenient governmental communication. Levels of trust played a crucial role in evaluations of governmental communication (RQ3). Perceived honesty, transparency, and consistency of communication, both in relation to decisions made and unity between governmental authorities were reported to be key factors influencing trust and overall perception of communication.

Discussion

The preliminary results provide starting points for improving future crisis communication strategies. Extending explanations, e.g., as to who communicates with which intention, could help citizens identify the relevance of information to their own situation. With varying media repertoires and public broadcasters often perceived as governmental communication, governmental institutions could better denote the added value of their independent, evidence-based information in competition to other media content. Ensuring trust in both communicators and ways of conveying information provides a basis for citizens to discard scepticism and develop understanding for dynamic situations. Internationally shared factors influencing evaluations of governmental communication enable strategies applicable in international contexts.

Due to the study's qualitative nature, its findings are not generalizable; the documented views should be confirmed in population-wide surveys. Nonetheless, the results stress the importance of considering facilitating conditions of effective communication for future crises.

CRC07 Media reporting and political discourse in wartime

PP 0902 Caught in between government and separatist forces; The story of journalists covering the Cameroon Anglophone crisis

Edwin Tamfuh Nfor¹

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

Since 2016 Cameroonian journalists have reported on the anglophone crisis, that is an offshoot of longstanding grievances of the English-speaking minority population. As journalists strive to present balanced reporting of the crisis, they are faced with the challenge of government censorship and separatist control. The aim of this study is to examine government and separatists actions to control reporting on the anglophone crisis and how these actions have influenced general reporting. We therefore set out to answer three main research questions: 1. What kind of control measures and censorship do the government and the separatists exert on journalists reporting on the Anglophone crisis? 2. What limitations arise from journalists' position of being in between state and separatist? 3. What psychological, communicative, and professional strategies do journalist adopt to negotiate and cope with the perceived tensions?

The theoretical basis of this study is the strategic censorship model postulated by Peter Lorentzen in 2014 which highlights autocratic government double standards in controlling reporting on certain topics while allowing a window of reporting for other topics, giving an impression of media freedom. In depth qualitative interviews were conducted with 41 reporters from both public and private print, broadcast, and online sources. The data was analyzed through inductive thematic analysis to bring up themes from the data set. Due to the sensitive nature of the topic, the data was pseudonymized during transcription. The findings show significant similarities in the government and separatists' method of controlling reporting among local reporters. The government, in addition uses state machinery to control reporting at the international level. Also, with the fear and uncertainty instilled by the two camps, some reporters outrightly abandoned the journalism profession, while others have fled to exile. Those who have continued to report on the crisis have resorted to using pseudonyms, while others have toned down their reporting. The study is particularly significant as it highlights both state and non-state efforts to influence reporting on the same news events. It also provides an opportunity to provide insight into new censorship model from an African context. Also, the study presents new realities of media freedom in Cameroon, as earlier studies have concentrated on the late eighties and nineties.

Keywords: Cameroon, anglophone crisis, censorship, press freedom

CRC07 Media reporting and political discourse in wartime

PP 0903 War's echo: How mainstream online media mirror military logic and the powerful in Ukraine conflict

Thomas Hestermann¹, Florian Meissner²

¹ Macromedia University of Applied Sciences, Faculty of Culture- Media- and Psychology, Hamburg, Germany

² Macromedia University of Applied Sciences, Faculty of Culture- Media- and Psychology, Cologne, Germany

1. Research interest

The Ukraine war is one of the most important media topics of our time. Against the backdrop of existing research on war reporting, this study examines to which extent news media mainly follow government lines, whether they include a variety of different voices and how they evaluate these voices.

2. Theoretical framework

Our research question is: How are the respective conflicting parties evaluated, who gets a say and how?

Our two research-leading theses are:

- War reports primarily depict the elites. We test this thesis with reference to indexing theory (Bennett, 1990, 2017; Eilders & Lüter, 2002, Hussain & Jehangir, 2023; Oh, Banjo & Jennings, 2022; Jungblut, 2023).
- War is a media topic, peace is less so. We test this thesis with reference to the research of Hanitzsch (2007) and Wolfsfeld (2004).

3. Method

A number of analyses focus on a limited time horizon and a narrow selection of media on military conflicts, such as the 1990 Gulf War, or the wars in Iraq and Afghanistan. In these cases, newspapers were typically examined, but rarely online media.

We aim to focus on the ongoing war in Ukraine from a broader perspective. From the 100 online media with the highest reach in Germany, Austria and Switzerland over two complete years (Jan 1, 2022 till December 31, 2023) 1.087.566 articles about the Ukraine war were extracted and subjected to an automated content analysis to show how the reporting evolved over time and which actors were represented to what degree in the media.

Building on our initial analyses, the first research steps of which we already presented at Crisis7 in Gothenburg, a manual analysis of a selection of 400 articles is planned in order to analyze the content of the central actors' statements in more depth. For this purpose, we identified four peaks in the overall media coverage for closer investigation: 1) the outbreak of the war; 2) the fall of Mariupol in Southern Ukraine; 3) the attacks on the gas pipeline North Stream II; and 4) the anniversary of the war's outbreak, coinciding with a larger demonstration in Germany calling for immediate peace negotiations and a halt of arms deliveries.

4. Results

As our automated analyses show, online media report surprisingly similar – government sources are quoted far more often than the voices of the opposition, military experts appear about three times as often as peace researchers, and non-governmental organizations play a minor role. On the surface, the reporting primarily reflects government action and is predominantly characterized by military logic. The ongoing manual analysis shall help to understand more precisely the content and the weighting of different voices represented in the reporting with a view to indexing theory. The results of the manual in-depth analysis will be available by September 2024.

CRC07 Media reporting and political discourse in wartime

PP 0904 Performative turn in the war time video reporting: How the Ukrainian Ministry of Defense is utilizing new forms of video expression in its strategic communication

Anssi Männistö¹

¹ Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

In my presentation I will discuss of the findings in a study which explored the video genres Ukrainian Ministry of Defense (UMD) utilized while reporting of the Russian war of aggression in Ukraine. The material (245 videos) was collected from the official Twitter account of the UMD (twitter.com/DefenceU) in the trench war phase 1.1.-31.5.2023.

The videos were observed as being part of strategic communication exercised by the UMD. According to Hallahan (et. al. 2007, 3) strategic communication is defined as "the purposeful use of communication by an organization to fulfill its mission". In this view communication is "the constitutive activity of management" (27).

This theoretical framework raised several questions for the study: how the organization (here the UMD) is "presenting and promoting itself" and how does it "interact with its audiences" (16). Central in the strategic communication is the "idea of influence: (...) persuasion is the essence of strategic communication". (24). Thus, the third question for

the material was: what kind of persuasion the narratives of the videos are suggesting and what kind of matters they address.

One key concept in the study was the "strategic narrative". For Miskimmon and O'Loughlin (2017, 284) strategic narratives are "a means for political actors to construct a shared meaning of the past, present, and future of international politics to shape the behavior of domestic and international actors." According to Roselle (et. al. 2014, 79) study of strategic narrative is "central to understanding how all aspects of a conflict are defined, constructed and understood and how different episodes are narrativized".

The strategic narratives were searched from the captions or text published with the videos. The analysis then used the concept of *framing* as defined by Entman (1993, 52-53): "To frame is to select some aspects of the perceived reality and make them more salient (...) in such a way as to promote a particular problem definition, causal interpretation, moral evaluation (...)"

Videos were divided into nine genres utilizing the typology of "documentary modes" described by Nichols (2001). Genres were further grouped in three subcategories: non-narrative, narrative and performative videos.

Central theme for the UMD was to stress that Russian aggression not only threatens the sovereignty of the Ukraine but also the Ukrainian culture. What is remarkable is that Twitter videos in the hands of the UMD turn out to be flexible tools to demonstrate and persuade the local and international audiences that the Ukrainians belong entirely to the Western and European community of values. This was highlighted with the constant publishing of videos filled with references to well-known pieces of Western popular culture: movies, tv-shows, music genres, celebrities, typography, styles, etc.

Videos belonging to performative genres stand out with exceptionally bold audio-visual language. They might be extremely fast cut, like music videos, celebrating e.g., co-operation with the allies or success in the battlefield. They all reject the neutral ideal of traditional news reporting and they might subjugate the observative or expository documentary mode to something that make parody of or ironize the subject – the enemy.

Communicative authoritarian populism is characterized by a conspicuous shift away from informed argument, moving towards emotional dramatization and "infotainment" (Thussu 2007), where information is reduced to simplified slogans or populist antagonisms to catch the attention of audiences. Authoritarian populists make use of this media populist zeitgeist, relying on complicity between the traditional and online communicative channels in order to reproduce an affective discourse and rhetoric to set the political agenda, frame or exacerbate "a crisis", and popularise their narrow political idioms and forms. In this paper, we compare authoritarian populist discourses in the context of the Russo-Ukrainian War across five different European countries: Austria, Croatia, Hungary, Slovenia and Turkey. We are interested in the reproduction of populist messages, examining how authoritarian populists use traditional media in televised speeches on public and private TV channels in the production of 'politics of fear', 'exclusionary and divisionary discourse' and 'populist truth' (Waisbord, 2018). We particularly focus on affects and emotions that are reproduced by populist leaders, whether through spoken messages they convey to the public or through their body expressions and performance. Using discourse and video analysis methodology, our research addresses the following questions: what are different populist discourses that evolve around Russo-Ukrainian War? How are authoritarian populist actors politicising the war within the televised domains in different national contexts, and how do they frame exclusionary ideas? Can they circumvent journalistic gatekeeping with their authoritarian populist rhetoric in televised speeches? Why and how are different affects and emotions being used by populist politicians in order to achieve certain public response? For each country, we identify the most prominent authoritarian populist leader and analyse a selection of their televised speeches (interviews) in one year period on public and private TV channels.

PP 0906 Communication on the war ground. Advertising creativity as an essential tool in times of crisis

[Maria Mustatea](#)¹

¹ Babes-Bolyai University, Communication- Public Relations- and Advertising, Cluj-Napoca, Romania

The escalation of war is at the center of communication disorder. The turmoil that followed the Russian invasion of Ukraine in February 2022 stirred the attention of many scholars on the main societal pillars: politics, economy, social impact, etc. The role advertising plays in such turmoil has yet to be explored, stemming from its promotion potential. There have been a couple of initiatives looking at the importance of online advertising in the prevalence of this subject (Yeung et al., 2023) and using social platforms to understand the displacement of the Ukrainian population (Leasure et al., 2023; Minora et al., 2023). Nevertheless, the key themes of advertising campaigns designed to support the Ukrainian cause have not been systematically analyzed. The sustained efforts of brands and NGOs to promote and convey the Ukrainian cause led to impressive campaigns since the beginning of the invasion.

The present paper focuses on advertising creativity as an essential tool in crisis communication. We look at international campaigns through the lens of creativity, extracting the most significant themes and messages that carried on Ukraine's appeal to help. It has been discussed in the literature that creativity enhances the impact of the message (Ang et al., 2007; Smith & Yang, 2004). The literature also revealed contrasting empirical results in terms of creativity, its outcomes, and how it should be assessed (Modig & Dahlen, 2019; Rosengren et al., 2020; Smith et al., 2008).

Adding to the existing empirical creativity research, this study proposes a case study on creativity analysis in times of crisis. For this, an inductive thematic analysis is carried out on more than 150 international campaigns from February 2022 to February 2024. Few studies use thematic analysis in creativity research, although it provides crucial insights. The advertisements for the empirical part – both free and subscription-based- are gathered from two of the most extensive advertising databases: adforum.com and adsoftheworld.com. These platforms gather the creative works of agencies across the globe and provide a systemized collection of campaigns, allowing a more thorough selection process. The analysis is carried out using ATLAS.ti and follows two dimensions: a commercial one, represented by brand campaigns, and a social one, with campaigns from NGOs and other humanitarian organizations.

The analysis is still in progress, but the preliminary results indicate several communication pillars to consider related to traditional culture, popular culture, social disruption, art, etc., and creative concepts and tools that enhance campaign messages.

CRC08 Building trust through effective risk communication

PP 1003 Crisis communication and trust: On the long-term individual effects of a disaster on public trust in societal institutions

[Lina M Eriksson](#)¹, [Kalle Ekholm](#)¹, [Kåre Vernby](#)²

¹ Uppsala University, Department of Government and Centre of Natural Hazards and Disaster Science CNDS, Uppsala, Sweden

² Stockholm University, Department of Political Science, Stockholm, Sweden

In times of crisis, effective communication plays a pivotal role. The societal response to a crisis is set in motion through crisis communication channels directed at the public, spearheaded by key institutions like authorities, elected representatives, and the media. The success of this communication relies heavily on maintaining a high level of public trust in these societal institutions. Without such trust, the functioning of society, both on an individual and collective scale, is compromised. Research has shown that, in connection with some crises, there are signs of reduced public trust. This is worrying as, if people do not have confidence in the authorities, elected politicians, or the media who communicate to the public in the event of a major crisis, great difficulties can arise for the authorities and politicians in handling the crisis. In the worst case, mistrust can lead to people not taking instructions and information to heart. Therefore, a broad societal trust is crucial for a functioning crisis management capability. In acknowledging the important link between crisis communication, public trust in societal institutions, and effective crisis management, we take on a unique and unprecedented study, where we lay out evidence of how an extensive natural disaster affects public trust in societal institutions 20 years after the disaster took place.

We present the first large-scale, individual-level and long-term study of the impact of natural disasters on public trust in societal institutions. To do this, we rely on two data sources. First, we utilize unique and detailed individual-level administrative data of approximately 16,000 Swedish tourists who survived the 2004 Boxing Day-tsunami, that hit South-East Asia in 2004. We match this data against other individuals in the entire Swedish population registry on several pre-tsunami characteristics, allowing us to better isolate the effect of disaster exposure on measures of public trust in societal institutions – collected via a survey. The survey is administrated to 10,000 individuals in our data (half of which were exposed to the tsunami), allowing for more nuanced long-term measures of public trust in societal institutions and control variables, including exposure severity to the tsunami. In combination, these

data allow us to study the long-term effect of natural disaster exposure on public trust in societal institutions in a completely novel and unique way.

In summary, the tsunami victims have a generally lower trust in authorities and politicians, and their ability to handle crises almost 20 years after the disaster. They also seem to assess the authorities' ability to handle other natural disasters negatively, but not their ability to handle other types of crises. In addition, they also have less trust in evening newspapers/tabloids (and their crisis reporting) but not less trust in public service or morning papers. These effects are all driven by those who were severely exposed to the tsunami.

CRC08 Building trust through effective risk communication

PP 1004 Saying the right thing at the right time: A study on the correlation between type and timing in messages about forest fires

Bianca Persici Toniolo¹, Gisela Gonçalves²

¹ University of Beira Interior, LabCom Communication and Arts / Foundation for Science and Technology, Covilhã, Portugal

² University of Beira Interior, LabCom Communication and Arts, Covilhã, Portugal

The Loop of Forest Fire Risk and Crisis Communication (Loop Model) (Toniolo, *unpublished*) is structured around a 12-month cycle made up of 6 chronologically delimited phases that are repeated endlessly: (1) Prevention; (2) Preparation; (3) Alert; (4) Rescue; (5) Recovery; and (6) Evaluation. According to the author, each chronological phase is correlated to specific communication objectives aimed at preserving the physical, emotional and material safety of the communities that were victims of the rural fires. These objectives, in turn, unfold into 36 qualitative categories of messages that are identified with the informational perspective of risk and crisis communication. Based on Wukich (2016); CERC (2014); Reich, Bentman and Jackman (2011); and Reynolds and Seeger (2005), the Loop Model prescribes a set of themes for the development of key messages that can (and should) be distributed by public actors/organisations before, during and after a forest fire or any other type of disaster situation, with appropriate adaptations.

The message is the most important variable in the Loop Model, but it is not just about saying the right thing ("what is said"). It is also about saying the right thing at the right time ("when it is said"). Hence, one correlation that the Loop Model implies is between the qualitative typology of the message and its respective chronological phase. To check if this correlation is found in a concrete communication case, in this paper we analysed 1,151 messages about the forest fires theme issued by 9 public Portuguese actors/organisations' websites and digital social media profiles on Facebook and Twitter in the years 2017 (N = 399), 2018 (N = 482), and 2019 (N = 270). These messages were classified according to their chronological phase and to their qualitative category of message, testing the existence of correlation between these variables. Our study concluded that, in 2017, there was a correlation between the qualitative category of the message and its respective chronological phase in 4 phases: Preparation; Alert; Rescue; Recovery; and Evaluation. In the messages issued in 2018, we identified the correlation in 3 phases: Preparation; Alert; and Rescue. In 2019, the correlation was found in only 2 phases: Alert and Rescue.

As the data shows, the Portuguese public actors/organisations have shown a gradual reduction in the degree of correlation between the chronological phase and the qualitative typology of the message issued, with this correlation only occurring consistently in the Alert and Rescue. During the Alert phase, communication should focus on warning the population of the imminent danger of occurrences, while during the Rescue phase communication efforts need to be dedicated to protecting the population, guiding them to act safely, increasing their perception of risk, and, consequently, complying with the guidelines. This shows that public actors/organisations put more emphasis on the crisis itself than on the pre-crisis and post-crisis and are unprepared to use communication to prevent and prepare the population to deal with the risk of forest fires or to increase the resilience of affected communities.

CRC08 Building trust through effective risk communication

PP 1005 Risk communication and the introduction of Small Modular Reactors (SMRs) – An analysis of media reporting on SMRs in Sweden

Åsa Thelander¹, Henrik Rahm²

¹ Lund University, Strategic communication, Helsingborg, Sweden

² Lund University, Centre for Languages and Literature, Lund, Sweden

The aim of this paper is to increase the understanding of the re-introduction of nuclear power in Sweden, in particular how benefits and risks are amplified by news media. Underlying this focus are the climate and energy crises which have led governments to take measures for their energy policy. At COP28 countries launched a declaration to triple nuclear energy capacity by 2050. Sweden is one of the countries. The government has declared a shift from decommissioning nuclear power to the construction of new nuclear generating capacity up to two large scale reactors by 2035. The scaling up of nuclear power includes creating conditions for construction and operation of Small Modular Reactors (SMRs). SMRs as technology is still under development but it is introduced to the public. At

this stage, when much is still uncertain and unknown, media reporting is crucial. Risks and promises about the new technology are articulated and shape different actors' expectations and attitudes towards the technology. We find it particularly interesting as the technology is not new, rather a development of nuclear power which has been debated for a long-time regarding risks such as nuclear accidents, terror attacks and nuclear waste disposal.

Based on the social amplification of risk framework (SARF), we study how SMRs are presented in Swedish news media, which amplifications that are discernable, how risks and promises are covered, and how these factors create acceptance and skepticism towards SMRs in Sweden. To this end, a content analysis of reporting on SMRs in Swedish newspapers from 2020 to 2023 is conducted. The emphasis is mainly on types of texts, images, tone, content and perspective. A qualitative analysis is conducted where risks and promises are identified. In total 200 articles are analyzed.

The analysis shows an increased reporting on SMRs since 2020 in number of texts. SMRs are introduced with focus on the technology and its large potential to contribute to the increased energy demand, stability in the energy system and to meet climate goals. Few risk issues are covered and SMR is not associated with risks connected directly to nuclear power energy such as waste disposal or indirectly such as terror attacks. Taken together it is a media agenda with potential to generate a hype resulting in high expectations on SMRs. The reporting creates little awareness on risks or uncertainties related to SMRs, i.e. attenuation of risk rather than amplification. On the one hand, the reporting may contribute to acceptance of SMRs, on the other hand, the narrow agenda can result in mistrust in expertise and authorities and development of resistance in later stages of the process.

The insights of this study contribute to crisis communication research in two ways: (1) it discusses the need of risk communication by exploring media reporting on a complex technology introduced in times of crisis; (2) it advances the discussion on the need of risk communication.

CRC08 Building trust through effective risk communication

PP 1006 Trust-building factors in the risk communication of a German state institution from the recipient's point of view. A qualitative analysis

Melanie Leidecker-Sandmann¹, Cecilia Buz¹, Anja Köngeter¹, Philipp Niemann¹

¹ National Institute for Science Communication NaWik, Research @NaWik, Karlsruhe, Germany

One disruption modern societies are experiencing is an 'erosion' of trust in governments and institutions in recent decades (e.g. Edelman 2018; Siegrist 2001). Although the majority of citizens in Europe trust science (e.g. for the German case: Wissenschaft im Dialog 2023) institutions that try to protect the population from (health) risks, for instance, are exposed to critical voices of dissent that question their recommendations, sowing mistrust. This can cast doubt on which information is correct and which sources of information can be trusted.

The question of when (risk) communication is considered trustworthy is therefore of social relevance. We address this question from the perspective of the recipients. We conducted 40 one-hour, qualitative guided face-to-face interviews with a cross-section of the German population. During the interviews, participants were shown various risk communication materials (on radon and mobile phone radiation) from the Federal Office for Radiation Protection (FRP).

Participants were first asked in general terms what they understand by trust and which factors they believe influence whether they trust institutions. Second, during and after the reception of the communication materials, participants were asked whether there were specific aspects of the communication that they considered to increase or decrease trust. Third, they were interviewed about their risk perception and their trust in the FRP before and after reception.

The interviews were transcribed and analyzed according to Mayring's (2022) qualitative content analysis (using MAXQDA software).

Our results show that the most important trust-building factors for the interviewees are prominence of and positive experiences with the institution (e.g. an impression of interest in the well-being of citizens), perceived professional competence (e.g. research activities), independence, incorruptibility, and reliability – largely in line with the trust dimensions of the Muenster Epistemic Trustworthiness Inventory (expertise, integrity, benevolence; Hendriks et al. 2017). These were supplemented by our participants with the dimensions of transparency and willingness to engage in dialogue (also considered by Reif et al. 2023). The communication material promoted trust if it seemed easy to understand, up-to-date, objective/ fact-based, reliable, not interest-driven, transparent, relevant, with reference to everyday life, professionally designed and published by a 'reputable' communicator. After reception of the communication material, recipients' trust in the FRP tended to increase as well as risk perception, implying that communication may affect perceptions of trust.

CRC09 Crisis coverage: Media insights on communicating risk and emergency

PP 1105 Framing threats and responses to the COVID-19 pandemic in Europe and the United States: A comparative analysis of news media coverage in seven countries integrating framing and risk communication theory

Francis Alpers¹, Andreas Schwarz¹

¹ TU Ilmenau, Public Relations and Technic Communication, Ilmenau, Germany

Research on media representations of public health crises has increased significantly in the past, but particularly during the COVID-19 pandemic (e.g., Bhatti et al., 2022; Dan & Raupp, 2018). However, a systematic literature review of the latter found that most studies were limited to one national context and that most authors refrained from linking their methods and findings to risk and crisis communication theory (Schwarz et al., 2023).

This study uses Entman's (1993) conceptualization of framing functions or frame elements (problem definition, causal interpretation, evaluation, treatment recommendation) and integrates these framing functions with established concepts of risk communication (e.g., societal threat and efficacy) and attribution theory (e.g., causal attributions). The resulting framework was used to develop a complex codebook for quantitative comparative content analysis of leading online news media in Germany, Italy, Netherlands, Spain, Sweden, UK, and the US. The sample includes news articles about the COVID-19 pandemic during several stages between 2020 and 2022 (N = 11,200).

Data analysis is ongoing. We are using principal component analysis to identify underlying constructs of frame indicators and to reduce multicollinearity in follow-up analyses. Subsequently, two-step cluster analysis will reveal patterns (i.e., frames) of news media coverage of the pandemic to answer the following research questions: How did the news media frame threats and responses to COVID-19? How do frames differ between European countries and the US based on different degrees of the pandemic's severity and politicization in each country.

Conclusions are drawn about the role of the news media from a risk communication perspective in seven countries at different stages of the pandemic. The findings contribute to the literature by integrating framing and risk communication theory and analyzing media comparatively across seven countries based on a large sample of politically diverse countries and news media outlets. Further implications are discussed for strategic media relations of authorities during a pandemic.

CRC09 Crisis coverage: Media insights on communicating risk and emergency

PP 1106 Social (Dis-)order in Journalism: Challenges and Changes of Intermediary Crisis Communication in Germany in the Context of the COVID-19 Pandemic

Kirsten Ulbrich¹, Carolyn Pliquet¹, Udo Bomnüter², Michael Beuthner¹

¹ SRH University of Applied Sciences, School of Popular Arts, Berlin, Germany

² Macromedia University of Applied Sciences, Media Management, Berlin, Germany

A comprehensive understanding of crisis events is essential as they significantly "shape[...] our understanding of future possibilities and necessities" (Boin & t' Hart, 2022, p.17). While crises alone do not invariably lead to policy reform, they can be considered potential precursors for change (Birkland, 2016) since they delegitimize the status quo (Boin & t' Hart, 2022). The role of journalists as intermediaries in crisis communication (Shoemaker & Voss, 2009) has been significantly impacted by the information overload accompanying the COVID-19 pandemic (Zaracostas, 2020), e.g., in the submission and verification of information and the communication of health risks (Perreault & Perreault, 2021). Consequently, journalists needed to adapt to the unprecedented challenges of the pandemic, necessitating significant changes in their work practices and interactions with the public to maintain their legitimacy.

Our study explores how the crisis has served as a catalyst for change within the journalistic landscape. Through semi-structured interviews with 30 German journalists identified through a media analysis of pandemic-related online articles published in Germany during January/February 2022, we used thematic analysis to investigate journalists' experiences in disseminating government information, interacting with the public, and the adaptation of their work practices during the pandemic.

The analysis of the interviews revealed that journalists prioritize the dissemination of government information in a clear and comprehensive manner. In their intermediary role between authorities and the public, they answered citizen inquiries, clarified government regulations, and promoted public health measures to mitigate the spread of COVID-19. Moreover, journalists were engaged in bridging the gap between the public and the scientific community by translating complex medical findings into comprehensive formats.

The analysis of the interviews identified three key trends emerging in the pandemic: 1) an emphasis on data journalism for comprehensive information visualization, 2) a heightened engagement with the public through innovative news formats such as FAQs, multimodal data charts, and the inclusion of readers' feedback for topic selection, and 3) significant changes in the journalistic workflow, including the establishment of cross-departmental collaborations.

The study's findings shed light on the obstacles encountered by journalists in effectively communicating risk during the pandemic and the transformation of their reporting practices. However, due to the limitations of a small sample size, further research is needed to assess whether these observed trends represent broader transformations among news outlets. Additionally, further research could delve into current trends in journalism and determine if the pandemic-induced changes are of a lasting nature.

CRC09 Crisis coverage: Media insights on communicating risk and emergency

PP 1107 Dealing with misinformation among underserved groups. How intermediaries for people lacking access to mainstream journalism tackled misconceptions and fake news during the COVID-19 pandemic

David Blanco-Herrero¹, Toni van der Meer¹, Bas van den Putte¹

¹ University of Amsterdam, Amsterdam School of Communication Research ASCoR, Amsterdam, Netherlands

Among the multiple challenges presented by the COVID-19 pandemic, the proliferation of health misinformation has been considered one of the most perilous. While some research has paid attention to the way journalists addressed this matter (Perreault & Perreault, 2021), less is known about the activities of information intermediaries for underserved groups that are not reached by mainstream journalistic media, such as individuals with migration background, low income or low levels of literacy. In the Dutch setting, where the study is based, those intermediaries can be community and religious leaders, health and social workers (e.g., GGD-staff), NGOs, neighborhood workers (*buurtwerkers*), etc. Understanding how these information intermediaries tackled health misinformation during the

pandemic is critical, given the large amount of false information that circulated during this period and the substantial health risks posed by health misinformation. Unlike journalists, these intermediaries were usually not information professionals, which made the challenge even greater. Especially considering that the underserved groups for which they acted as intermediaries often faced additional vulnerabilities that increased the risks of misinformation.

Focusing on the perceptions and experiences of these specific information intermediaries, and using those of journalists as a point of comparison, our study goes beyond previous attempts to systematically comprehend how different actors dealt with misinformation during the health crisis. In accordance with the two-step flow of communication theory, this is crucial not only because information is filtered by opinion leaders and other intermediaries, but also because underserved groups lack access to mainstream media and original sources. Moreover, this research contributes to past works on frame building theory and journalistic roles, exploring the application of these theories to information intermediaries beyond professional journalists.

To this end, we conducted a set of 28 semi-structured reconstruction interviews with these intermediaries (half with journalists and half with other intermediaries). This reconstruction approach follows Brüggemann (2013) and allowed us to structure the conversation around specific experiences, facilitating a focused discussion on the roles, strategies, and challenges. Following preregistration and ethical approval, interviews are taking place between December 2023 and January 2024. Some preliminary results anticipate a diversity of roles when dealing with misinformation, usually connected to the situation of vulnerability of the target groups. Thus, most intermediaries felt that countering and correcting misinformation was part of their roles, not from a journalistic perspective, but as a way to help people. Therefore, information was not an end by itself (as it was often the case with journalists), but a mean to prevent the consequences of the disease. Much of the work focused on vaccination, trying to limit the impact of anti-vaccination narratives and reassure vulnerable groups about the vaccine's safety. Finally, some of the difficulties and deficiencies faced by the different information intermediaries were related to the lack of financial means, the limitations of the lockdown, and their own lack of professional communication skills. In total, the study is expected to help addressing misinformation challenges in non-journalistic settings and preparing for interventions during future health crises.

CRC09 Crisis coverage: Media insights on communicating risk and emergency

PP 1108 Media framing of business crises in Italy: An exploration of discourse surrounding restructuring plans and layoffs

Francesco Nespoli¹

¹ LUMSA - Libera Università Maria Ss. Assunta, Human Studies, Rome, Italy

Over the past decade, the world has faced three major economic crises (2007/8, 2011/12, 2019–2020) that have caused an increase in the number of companies experiencing a decline in demand, leading to downsizing, plant shutdowns, business termination, or relocation. These actions may result in large-scale redundancies aimed at reducing labor costs (De Meuse 2023).

Undertaking these restructuring measures can attract significant media attention (Brimeyer et al., 2012; Caruso et al., 2012; Orrù, 2018; Martin, 2019). This can result in reputational crises, increasing the business costs of reorganization in many ways.

Layoffs can cause concern among shareholders about the sustainability of the business and deteriorate customers' perception of the product quality, thus having negative effects on brand strength (Stäbler, et al., 2023) and sales (Landsman & Stremersch, 2020).

However, the audiences' understanding of the specific reasons behind restructuring choices can be influenced by the perspectives of collective stakeholders, such as trade unions and political entities.

Trade associations are integral components of Rhetoric Arena Theory, also known as the multivocal approach to crisis communication (Frandsen & Johansen, 2016). Unions have their own power within the gatekeeping process (Shoemaker & Vos, 2009) and may present layoffs as a means of improving margins by cutting jobs rather than as a way of ensuring the survival of the company. Otherwise, unions may propose alternative strategies (diversification, innovation, investment in employee development, Hayter, 2011). Then, in the context of Coombs' (2007) taxonomy, restructuring crises could fall into the intentional cluster, where stakeholders strongly attribute responsibility to the firm.

Trade unions can thus bring ethical aspects of business conduct into play when restructuring plans are discussed in the media (Nespoli, 2018). This may prompt companies to reconsider or delay their plans.

However, several studies have analyzed the media discourse on downsizing in national contexts, highlighting that the intensity and quality of news coverage of restructuring crises can vary depending on numerous factors (Martin, 1997; Lamertz et al., 2009; Hollister, 2009).

Elaborating on An & Gower's (2009) news analysis framework, I conducted a quantitative and qualitative analysis (content and thematic analysis) of 348 business crises' news stories published in Italian national newspapers over the past 15 years (2008–2022).

The study examines three dimensions of news coverage: traditional news values, mainly the power and popularity of the people involved (Golding & Ross, 1979); specific features of business crises that mitigate or increase reputational effects (company's nationality, sector, competitive positioning, and the scale of layoffs) and subjective framing implying the attribution of responsibility.

The research questions are:

- What are the distinguishing framing of highly and minimally covered crises? Is the attribution of responsibility frame common?
- Does media coverage reflect the magnitude of layoffs?

The preliminary findings indicate that media coverage of corporate restructuring crises does not always correspond with the magnitude of layoffs. Additionally, the outcomes highlight the important role of politicization as a significant feature of media exposure. This politicization has important implications for trade unions' ability to use media coverage and framing to influence a company's behavior during crises.

CRC09 Crisis coverage: Media insights on communicating risk and emergency

PP 1109 A deep dive into Coca-Cola HBC's response strategy in the Croatian contamination scare through the lens of situational crisis communication theory

Nikolina Lednicki¹, Klement Podnar¹

¹ Faculty of Social Sciences – University of Ljubljana, Communication, Ljubljana, Slovenia

In November, health authorities in Croatia instructed Coca-Cola HBC to withdraw certain products and imposed a temporary distribution ban. This action follows reports of poisoning incidents in three cities nationwide (O'Donoghue, 2023). Amidst a surge in social media, rumours of poisoning tied to a non-alcoholic drink spread widely. Lacking specifics, the story rapidly went viral, with social messages suggesting Coca-Cola consumers suffered acid poisoning and severe oesophageal damage (Litvan, 2023).

This study investigates the application of the Situational Crisis Communication Theory (SCCT) and its principles on the case of Coca-Cola HBC contamination scandal in Croatia. More specifically, to what extent can organisations successfully apply the SCCT in the context of a health scare to strategically manage and mitigate reputational threats in the dynamic landscape of digital media. Namely, the research focuses on evaluating the crisis type, crisis history and prior reputation to exhibit the reputational threat and public perception of the contamination and health scare related to Coca-Cola HBC case.

It should be noted that there is a significant gap in global social media and crisis communication research, especially lacking representation outside the U.S (Cheng et al., 2022, p. 51). Cheng (2018) indicates limited global adoption due to method and theory mismatches between U.S. and non-U.S. scholars (ibid., 2022, p. 51). In addition, Hong et al. (2023, p. 6) stress the need for future research on different perceptions of blame, minimising issues, and denial strategies, particularly in health crises—all strategies that were used in this case study.

A qualitative case study approach was used as a main research method. Data on the Coca-Cola crisis in Croatia was collected through a review of media coverage, which included official statements from Coca-Cola HBC and Croatian health authorities, as well as public reactions during and after the above-mentioned crisis on social media. It is important to emphasise that the SCCT serves as a theoretical framework for the analysis.

The crisis typology was determined and is categorised as the intentional cluster. Namely, within the intentional cluster, Coombs and Holladay (2002) observe robust attributions of crisis responsibility, encompassing human-error accidents, human-error product harm, and organisational misdeeds. They highlight that the event is seen as purposeful (as cited in Coombs, 2007, p. 167). This incident was unprecedented for Coca Cola in Croatia, damaging its previously positive image. Poor handling of the situation has led to fear and distrust toward Coca-Cola and health institutions. Moreover, unchecked social media rumours have significantly harmed Coca-Cola's reputation.

The findings of this study provide an insight for organisations facing crisis in digital media environments. Most importantly, how to align crisis communication strategies with the principle of SCCT which in turn can help to navigate various reputational threats. Furthermore, this study highlights the significance of proactive crisis communication planning for diverse scenarios, emphasising the crucial role of swift responses within the dynamic digital media landscape.

DMM01 Journalism and media consumption practices

PP 0016 Ethnic diversity in Italian media: Challenging narratives of belonging?

[Max Mauro](#)¹

¹ Bournemouth University, Communication and Journalism, Poole, United Kingdom

This paper presents the preliminary findings of an exploratory study of ethnic diversity in Italian media. Drawing on interpretative theoretical frameworks influenced by Cultural Studies and post-colonial theory, this research investigates the experiences of young (under 35) journalists and media professionals of immigrant background with the aim of understanding the extent to which the media reflect the social and cultural changes occurred in Italian society over the past thirty years. This is a novel area of research in a country which only started to receive consistent flows of immigration in the late 1980s. So far, ethnic diversity has been the subject of research essentially in relation to the ways mass media cover migration issues, as migration continues to play a key role in public and political discourse in Italy. The contribution of second-generation journalists has arguably implications also for the articulation of national belonging amid the persistent racialisation of black and ethnic minority population.

As of 2020, about 11.2 per cent of the population is made of people with an immigrant background; they are 15 per cent among the under 18. These figures evidence the level of ethnic diversity in contemporary Italian society. However, such diversity is only marginally visible in the cultural industries, and especially in the news media. Based on 10 semi-structured in-depth interviews with young second-generation journalists and media professionals (video-makers, podcasters, writers), diversity editors and editors of news media, this paper will provide the first overview on ethnic diversity in Italian media.

Journalists of immigrant background are almost absent in the newsrooms of both public and private national broadcasters and major print media, while a slightly more inclusive culture appears to emerge in new digital media and radio. Young journalists of immigrant background work in large part as free-lance, a fact which reflects the increasing precariousness of journalistic work and the downsizing of newsrooms, similarly to what happens in other countries, but also the multiple challenges they face to enter the news media industry, based on their ethnic "foreign" origin and social class barriers. They tend to operate across media, for example contributing to mainstream newspapers while producing their personal podcasts or running new media initiatives. Some produce content in different languages, for international audiences, about migration issues, a fact that foregrounds patterns of diasporic media which are meaningful beyond Italy.

Previous studies on ethnic diversity and news media in Western European countries (i.e. Germany, Sweden, Finland) focused on the implementation of state or industry diversity policies. So far, in Italy, "diversity" has been promoted essentially in relation to gender equality in the journalistic profession. The findings of this study emphasize the importance of media, and particularly news media, in the articulation of national consciousness and public discourse on ethnic diversity. It also shows how the nation-state represents a limited frame for the understanding of the workings of media and national identity in "liquid modern times".

DMM01 Journalism and media consumption practices

PP 0017 Between lands: The everyday news consumption of immigrants in the digital landscape

[Camila Melicia Valgas](#)¹, [Yael de Haan](#)², [Sanne Kruijemeier](#)³, [Tim Groot Kormelink](#)⁴

¹ University of Applied Sciences Utrecht and Wageningen University & Research, Quality Journalism in Digital Transition, Utrecht, Netherlands

² University of Applied Sciences Utrecht and Rijksuniversiteit Groningen, Quality Journalism in Digital Transition, Utrecht and Groningen, Netherlands

³ Wageningen University & Research, Strategic Communication, Wageningen, Netherlands

⁴ Vrije Universiteit Amsterdam, Faculty of Humanities- Communication, Amsterdam, Netherlands

Several European countries have evolved into dynamic migration societies in recent years, marked by a significant influx of immigrants. Due to this demographic shift, there is an urgent need for proactive policies aimed at facilitating the cultural adaptation of immigrants into European societies. Traditionally, journalism forges a shared understanding among citizens, fostering a common reference point to comprehend society and one another. However, despite the recognized importance of proactive policies in providing immigrants with information on current issues and aiding in their cultural adaptation, European news organisations fall short of effectively reaching and engaging with the immigrant demographic.

Existing literature, meanwhile, indicates that immigrants consume news from various sources, including mainstream and alternative media from their current country of residence, international outlets, and media from their countries of origin. However, much of previous research dates back to the early stages of the online and social media era, leaving questions about current media consumption patterns in an overloaded digital media landscape.

This study aims to address this gap by unravelling the news consumption patterns of immigrants living in the Netherlands, a country experiencing a growing influx of immigrants and serving as a pertinent case study within the international context, particularly given the prevalence of immigration as a common challenge in the European

Union. The study employs the Uses and Gratifications Theory (U&G), an audience-centred framework that helps to elucidate the motivations driving media preferences and enriches our comprehension of the immigrant audience and their media consumption. Data were collected from 30 immigrants from diverse nationalities living in the Netherlands. Participants were selected using maximum variation sampling, seeking to generate a wide range of data by including a broad spectrum of immigrants. Hence, we could understand differences among respondents who came to the Netherlands for different purposes, and who have diverse levels of education, language skills, and cultural access.

Over three days, participants shared examples of consumed news media (screenshots, links, and photos of news they consumed) and provided screenshots of their mobile phone usage (total screen time and most used apps and websites), enabling the mapping of the most frequently used news outlets and media forms among respondents. Subsequent in-depth interviews explored participants' experiences with the news, including discussions on their consumed media and mobile phone usage. A sorting cards exercise was also employed to understand respondents' motivations for following the news. Interviews were recorded, transcribed, and thematically analyzed.

The research addresses pivotal questions about immigrants' news consumption, examining the relationships between respondents' news choices and their personal, social, and political contexts. By shedding light on the motivations guiding their everyday media practices, this study contributes not only to academic understanding but also offers valuable insights for policymakers and media professionals seeking to enhance cultural adaptation and inclusive communication strategies in the context of increasingly diverse societies.

PP 0018 Migration and forced displacement as transnational phenomena of journalism research and journalism education

Susanne Fengler¹, Michel Leroy¹, Monika Lengauer¹, Anna-Carina Zappe¹, Ana Pinto Martinho², William Tayeebwa³, Sara Namusoga-Kaale³, Monica B. Chibita⁴, John Semakula⁴, Andrew Kaponya⁵

¹ Erich Brost Institute for International Journalism/TU Dortmund University, Erich Brost Institute for International Journalism, Dortmund, Germany

² University Institute of Lisbon, Iscte, Lisbon, Portugal

³ Makerere University, Department of Journalism and Communication, Kampala, Uganda

⁴ Uganda Christian University, School of Journalism- Media and Communication, Mukono, Uganda

⁵ Malawi University of Business and Applied Sciences, Department of Journalism and Media Studies, Blantyre, Malawi

Unprecedented numbers of people are on the move in modern times. The latest available global statistics count over 280 million international migrants by mid-2020 – 3.6 percent of the world's population (UNDESA, 2020). These numbers were accounted for prior to the Ukraine war, the civil war in Sudan, and the Gaza-Israel war. The European Union Agency for Asylum (EUAA) forecasts significantly more than 1 million asylum applications to Europe by the end of 2023, a record high since 2015–16. While "Western" media coverage of the refugee crisis of 2015/16 has been criticized for de-humanizing migrants (Chouliaraki et al., 2017), "Western" coverage of forced migration from Ukraine has been accused of postcolonial perspectives (Seib, 2022; Ellisor & Andrews, 2022; Mezahi, 2022; Bakwesegha-Osula, 2022).

Large movements of refugees and migrants have political, economic, social, developmental, humanitarian and human rights ramifications. Migration is a cross-cutting, cross-cultural and interdisciplinary subject that requires transnational efforts in mass communication research. While the body of cross-national research has been steadily growing in the past years (Eberl et al., 2019; Kreutler et al., 2022), comparative research involving origin, transit and destination countries has remained scarce. Also research originating from the Global South is still underrepresented in the global mass communication discourse. Just one example: Discussions about migration have had a considerable impact on election outcomes across Europe (Harteveld et al., 2018), but the issue has also become a major issue in African election campaigns (Wara, 2016; Whitaker, 2019; Squazzin, 2019; Kaponya & Ntaba, 2023).

This paper summarizes first results from an EU-funded project on migration coverage in sub-Saharan Africa. It also aims to develop a research-based African narrative on migration and mobility, where the issue is severely underreported, or has a "Western" framing (Assopgoum, 2011; Fengler et al., 2019; Harber, 2015; Jaiteh, 2015; Serwornoo, 2018). In order to raise awareness and empower African citizens to counter the misinformation and disinformation often associated with migration issues, media coverage is crucial. Our project aims to build a distance learning platform on this topic for journalists and future journalists in Burkina Faso, Uganda, and Malawi, before expanding to other African partner countries. The project is aligned with our UNESCO train-the-trainers project on migration and forced displacement, and a pilot MOOC on media and migration we have conceptualized and implemented for German media practitioners.

New analyses on media coverage of migration in sub-Saharan Africa is now being provided in the context of our project. We will present insights from qualitative interviews with 28 media managers and newsroom practitioners in Burkina Faso, Uganda, and Malawi, as well as a quantitative study of 92 current and former journalism students in the three countries. According to the interviewees, negativism, sensationalism, and a focus on problematic economic effects of migration characterize coverage in African news media. The coverage is also heavily impacted

and limited by the interest of the authorities. Yet, the quantitative survey of African journalism students reveals a keen interest of future media practitioners in the topic, coupled with substantial knowledge of migration issues.

PP 0019 From Syria to Ukraine: Mapping the migration discourse in the Italian Twittersphere

[Sercan Kiyak](#)¹, [David De Coninck](#)², [Stefan Mertens](#)¹, [Leen d'Haenens](#)¹

¹ KU Leuven, Institute of Media Studies, Leuven, Belgium

² KU Leuven, Centre for Sociological Research, Leuven, Belgium

In an age of heightened global migration and digitalisation, the convergence of political communication on social media about migration and refugees has become a pivotal topic for the field of communication studies (de Rosa et al., 2021; Dehghan & Bruns, 2022; Eberl et al., 2018; Heidenreich et al., 2019; Shah & Ogden, 2021). This study embarks on a comparative exploration of the political communication landscape within the Italian Twittersphere during two pivotal refugee movements—those emanating from Syria in 2015 and from Ukraine in 2022. The divergent treatment of Syrian and Ukrainian refugees has become a subject of considerable discussion, as the latter received a distinct set of rights and privileges that diverged markedly from the experiences of the former (Coi et al., 2022). Differences in gender, religious, political, and cultural aspects between Syrian and Ukrainian refugees can either foster similarities or generate sentiments of hostility within the social context of the receiving countries (David D. Laitin, 2022; De Coninck, 2023). However, there are concerns that the radically divergent responses and policies might stand as a testament to the intersection of racism, religion, and political realities in shaping refugee treatment as opposed to universal principles (Drazanova, 2022; Gorodzeisky & Semyonov, 2019). Our study addresses these issues by examining social media networks, which are increasingly becoming primary channels for information dissemination and political influence.

Analysing discursive communities on an online social network (Twitter or X), our research is aimed at answering two research questions:

1. What are the characteristics of community structures and influential users within retweet networks during these crises?
2. How do polarised communities' temporal communicative patterns interact and counteract during these crises?

The dataset consisted of about 400,000 tweets and 200,000 user data points and covered about a month of the peak periods of both crises (September 2015 and February 2022). We generated, visualised, and analysed retweet networks of the communication and mined the data for links and collocations related to refugees. Finally, we analysed the battle of visibility between polarised communities by looking at temporal patterns of retweet activity.

Our findings align with the "silent majority" and the "amplification of the right" theses. Despite not comprising the largest cohorts, anti-refugee communities, spearheaded by charismatic far-right opinion leaders with issue ownership, gain a magnification of their voices through a high level of user engagement within their community. However, the emergence of the Ukrainian refugee crisis acted as a catalyst, reconfiguring the virtual discursive landscape and causing dramatic shifts in the influence and composition of the discursive communities and their influencers. Our findings underscore the significant role of digital platforms in the diffusion and transformation of political opinions through an in-depth analysis of communication networks during two refugee crises.

PP 0020 When the refugee becomes human (Refugee Grata)? Analyzing media representations of Syrian refugees in the Turkish press

[Burak Ozcetin](#)¹

¹ Bilkent University, Department of Communication and Design, Ankara, Turkey

Drawing inspiration from Agamben's (1995) notion of "bare life" and Rajaram's (2004) assertion that refugees exist beyond the jurisdiction of the law, this presentation posits refugees as modern-day *homines sacri*, stripped of agency and rights upon seeking refuge. Building upon the existing literature that highlights the construction of refugees as either "good" or "bad" (Szczepanik, 2016), this study extends the discourse to understand how the Turkish press shapes the identity of the "welcomed Syrian refugee" (*the refugee grata*).

For our study, an exhaustive collection of every available news item related to international migration, migrants, asylum seekers, and refugees was conducted from January 2011 to December 2020. This dataset was extracted from eight nationally significant Turkish newspapers. Employing an extensive list of keywords, including "migration," "immigrant," "asylum seeker," "refugee," "guest," "refugee camp," "Syrian," "Afghan," "Iraqi," and others, a total of 120,000 related and unrelated news items were initially gathered. A systematic simple random sampling technique was employed, resulting in the selection of 2,285 relevant news items, representing the entire population of news

items with a 2% margin of error and a 95% confidence level. The final dataset was then subjected to a rigorous qualitative content analysis. The analysis was conducted under 27 different themes, ranging from news frames to specific narratives surrounding the identity of Syrian refugees.

This presentation aims to extend the content analysis of media coverage on Syrian refugees, specifically examining when individuals from Syria transition from being generalized as "the Syrian" to being depicted as "acceptable individuals" in the Turkish press. The study seeks to identify patterns by analyzing instances where Syrian refugees are portrayed positively and humanized. The analysis will focus on common frames used in such news stories, including assessing whether they present success stories or emphasize the humanitarian aspects of the issue. As defined by Neuman et al. (1992), news frames are conceptual tools used by media and individuals to convey, interpret, and evaluate information, aiding the audience in locating, perceiving, identifying, and labeling information in their surroundings (Goffman, 1974).

This comprehensive methodology ensures a nuanced exploration of the Turkish press's role in constructing the identities of "good Syrian refugees." The major aim of the presentation is to focus on the contradictions of the press's humanization strategies in attributing stamps of public acceptability (Raz, 1994) to refugees. The presentation will show that humanization strategies do not necessarily empower individual agency. On the contrary, humanization, empathy, and compassion may backfire and eliminate individual subjectivity.

By employing content analysis on a carefully selected and representative sample, this research aims to contribute valuable insights into the intricacies of media representations, societal perceptions, and their impact on the experiences of Syrian refugees in Turkey.

DMM02 Real existing journalism in the world? Towards new epistemology of exile journalism

PN 020 Exile experiences of East African and Latin American journalists as an existential ideology

Louisa Esther¹

¹ University College Cork, School of Languages Literatures & Cultures, Cork, Ireland

Global press freedom is under attack. The number of killings of journalists continues to rise. In 2023, the International Federation of Journalists recorded the highest number of killed journalists in recent years. Consequently, an increasing number of journalists worldwide are forced to flee and continue reporting from exile. International media support organisations such as Reporters Without Borders and the Committee to Protect Journalists have documented a significant increase in support required for exiled journalists over the last few years. This trend has also triggered heightened academic interest in the journalistic practice in exile, as exile media continue to play a crucial role as the often only remaining sources of information from authoritarian countries. Numerous case studies of exile journalism from different geographical and socio-political contexts show that exile imposes practical and normative challenges on journalists. Examining these, previous studies mainly examine how exiled journalists create and engage in digital networks to stay connected to home audiences, act as conflict mediators, handle precarity and continued threats in exile, and renegotiate their journalistic role perceptions. However, existing research has so far put an emphasis on single-case studies and predominantly situates them in different existing frameworks, such as hybrid or advocacy journalism, or compares them to western-dominated idealistic professional standards of journalism. This paper breaks with this trend by proposing a comparative study of exile journalism from East Africa and Latin America, two regions largely under-researched despite the prevalence of exile journalism there for decades. Based on semi-structured interviews with twenty exiled journalists from Nicaragua, Venezuela, Eritrea, and Burundi, this paper identifies differences and similarities in their exile experiences and proposes to centre their lived experiences and the very condition of exile in the creation of an independent conceptual understanding of exile journalism. Doing so, it becomes clear that exiled journalists are driven by and working for the survival (1) of themselves as displaced persons facing similar challenges as other refugees, (2) of themselves as journalists often left without organisational structures, structural support, or professional opportunities in exile, (3) of the information, which depends on the functioning of their networks and the safekeeping of their sources remaining inside the country, (4) of journalistic practices that stand in contrast to traditional journalism relying on eye-witnessing, transparency, or access to information from official sources, and (5) of journalism itself, as they are in most cases the last generation of trained journalists coming from a country where the emergence of new journalists is unlikely under continued authoritarian power. Therefore, it will be argued that exile journalism, encompassing all its facets, practices, norms, and changes, can be conceptualised as an existential ideology as opposed to an occupational ideology of general journalism.

DMM02 Real existing journalisms in the world? Towards new epistemology of exile journalism

PN 021 Between Journalism and Activism: Navigating Professional Roles by Russian Journalists in Exile

[Anna Litvinenko](#)¹

¹ Freie Universitaet Berlin, Institute for Media and Communication Studies, Berlin, Germany

Following Russia's invasion of Ukraine in February 2022 and the subsequent suppression of what remained of the free press, numerous journalists departed Russia to continue their work from abroad. The growing number of autocratic regimes over the past decade, known for their violent suppression of journalists, has made the topic of journalism in exile increasingly relevant in media and communication studies (Michaelsen, 2018; Porlezza & Arafat, 2021). Prior research has underscored significant challenges in journalistic work in exile, such as the blurring boundaries between journalism and activism (Porlezza & Arafat, 2021), threats to journalists and their families (Michaelsen, 2018), difficulties in finding and protecting sources, building trust with audiences back home, and the collapse of business models alongside "donor fatigue" (Arafat, 2021). Despite the growing body of literature on this subject, a systematic understanding of the transformation in journalists' role perception and performance in exile, compared to their work in their homeland, remains understudied. This paper seeks to explore the evolution of Russian journalists' role perceptions during the first two years of their exile. It is an ethnographic study based on participant observation over various periods within two years, complemented by at least 25 semi-structured interviews. Observations include attending both formal and informal journalist meetings, engaging in conversations, and visiting media hubs in Berlin, Riga, and Tbilisi. The unique work circumstances of these journalists necessitate a departure from traditional newsroom ethnography and suggest a need for a reconsideration of approaches to journalism ethnography. The challenges discussed by journalists resonate with findings from previous studies. These challenges are amplified by the ongoing Russia's war in Ukraine. Preliminary findings indicate a trend to a deliberate shift of journalistic role perception towards (more) activism. Building on Claudia Mellado's assertion that "journalistic roles are by no means static, but are instead situational, dynamic, and fluid" (Mellado 2020, 4), this paper discusses how the role perceptions of exiled journalists transform during the first years of their emigration and examines the factors at macro, meso, and individual levels that shape the ongoing development of journalism culture among Russian independent media in exile.

DMM02 Real existing journalisms in the world? Towards new epistemology of exile journalism

PN 022 The socio-professional conditions of the information's producers about Syria from Turkey

[Maena Berger](#)¹

¹ CESSP Centre Européen de Sociologie et de Science Politique, EHESS, Paris, France

In addition to having been a land for millions of Syrians since early 2011, Turkey has also been one of the privileged places to produce information on the situation in Syria. The cities of Antakya and Gaziantep, close to the Syrian border, have become real "rear bases", media hubs, where the main actors of this production (humanitarians, international and local media, fixers-journalists) circulated and where journalistic initiatives were born (including professional training offered by news agencies and media development agencies). Based on thirty interviews with Syrian "fixers" (the "fixers" are the intermediary people who are guiding foreign – mostly Western – media), conducted within a six-month fieldwork in the south of Turkey, this presentation will concern their journalistic work about North-West Syria, from Turkey, and will focus especially on their work conditions in a situation of exile. To do so, we will follow a chronological line of the political context. Most of the "fixers" in this corpus started to work inside Syria, they began from their involvement in the revolution, which started in March 2011. They learnt this job in a war context which means they are trained mostly at war reportage, which is limited in terms of journalistic skills. Also, being in their own country means, among other things, broader access to local people and appropriate authorities. In 2013, due to the territorial implantation of the Islamic State of Iraq and Syria (ISIS) in the Aleppo region, most of them started to go to the south of Turkey. In 2015, when Russia got military involved in Syria, no journalists were allowed to cross the border. The role of the "fixers" at this time was mostly to help foreign journalists crossing illegally the border. 2016 was a turning point as Turkey also got involved militarily on the Syrian territory. This completely changed the conditions of production of information on North-West Syria both inside Turkey and inside Syria. In both cases, their displacements are strictly limited and controlled by Turkish authorities which have strong impacts on their professional practices and opportunities. This presentation will detail those conditions and will expose examples from the interviews.

DMM03 Media representations, migration and borders

PP 0217 "I will not allow a foreign court to block flights": The Rwanda asylum scheme in the British press

[Iñaki Garcia-Blanco](#)¹, Maria Kyriakidou¹

¹ Cardiff University, School of Journalism- Media and Culture, Cardiff, United Kingdom

Since its inception in the spring of 2022, the Rwanda asylum scheme has become an indispensable part of Britain's political agenda. This is so to the extent that even the main opposition party (which opposes the Rwanda plan and dismisses it as a 'gimmick') is considering a scheme to process asylum claims offshore as an alternative. A policy designed to relocate asylum seekers and those identified in the UK as illegal immigrants to Rwanda for processing and resettlement, the plan has met both political reactions and public resistance, as well as with legal challenges signalling how it is contrary to international law. Relevant arguments ranged widely, including the legality of the scheme, its economic costs, its inhumanity and concerns about the safety of asylum seekers. This paper aims at illustrating how the British press discussed the plan, thus framing relevant public debates.

Conceptually, the paper draws upon the literature on the mediation of migration and the interplay between humanitarian and securitization discourses (Chouliaraki and Georgiou, 2022). Empirically, the discussion is based on the content analysis of the UK press over a period of two years, from the inception of the project to its legal challenges in the British Courts (April 2022–24). During this time, we look at the *Guardian*, the *Telegraph*, the *Daily Mail* and the *Mirror*, in an attempt to capture varieties in coverage both in terms of political leniencies, as well as within the tabloid and broadsheet press.

The analysis will particularly look into the following three questions: how the scheme is framed in press (e.g. as a securitization, humanitarian or economic issue), how the figure of the refugee is being constructed in these reports and, finally, how the UK itself is represented with regards to migration. Ultimately, the paper aims at contributing both to debates about immigration and the function of media as symbolic borders, as well as discussions about how the press frames political issues and public debates.

DMM03 Media representations, migration and borders

PP 0218 Revealing the emotions of pro-migration activists through film: Confronting violent ignorance on the border of Ceuta and Melilla

[Silvia Almenara Niebla](#)¹

¹ Vrije Universiteit Brussel, Communication Studies, Brussels, Belgium

In recent decades, the border fences of Ceuta and Melilla have become an important visual representation of the concept of 'Fortress Europe'. The images of pushbacks, police abuse and deaths of people during crossing constitute a performative representation of the macro-politics of borders. The visual imposition of fences – and the spectacle that accompanies them (De Genova, 2012) – has opened up a debate on how the visual relates to border politics and migration control (Van Houtum, 2010; Mezzadra and Neilson, 2013). While much research has been done on how migrants and refugees themselves document their border crossings (Binimelis-Adell and Varela-Huerta, 2022), the emotional component of fences for those living in cities has been little explored. For the inhabitants of these places, this emotional landscape related to migration control is navigated through ignorance (Jones, 2021) and compassion fatigue (Moeller, 2018), on the one hand, and contestation and solidarity (King, 2016), on the other. This presentation investigates the mixed, contradictory and complex emotional landscapes of those who are intentionally transforming and contesting the current situation of migration containment in Ceuta and Melilla. It focuses on the experiences of local activists who have resisted the politics of migration containment.

Through a close examination of the dominant media representations surrounding these cities, the social impact of the fences and the effect of migration policies on everyday life, this presentation aims to uncover the civic emotions that underlie the lived realities of activists. While research on emotions in activism has addressed common frames of mobilization based on collective identities and repertoires of contention (della Porta et al., 2018), little attention has also been paid to the methodological issues involved in researching emotions and activism. By employing emergent methodologies to investigate social emotions, this study integrates visual elicitation methods into ethnographic research. The evocative power of cinema allows films to act as visual stimuli that convey activists' intimate narratives, which encompass compassion, outrage, or fatigue in the context of mobilizing on behalf of migrants. Thus, this presentation delves into the intersection of emotions, activism, and borders to confront the violent ignorance of migration control.

Keywords: borders, activism, ignorance, compassion, visual elicitation, Ceuta and Melilla

DMM03 Media representations, migration and borders

PP 0219 Colonial iconographies in crisis: The clashing representations of racialized migration in traditional Spanish media and "Third Sector" networks

Brunella Tedesco Barlocco¹, Ana-Aitana Fernández-Moreno²

¹ Pompeu Fabra University, Communication, Barcelona, Spain

² International University of Catalonia, Communication, Barcelona, Spain

Images of small migrant boats arriving at Spanish shores, immigrants and refugees entering through the Spanish-Moroccan frontier, and street vendors of African origin – "manteros" in Spanish – hawking saturate the Spanish media agenda and constitute the majority of mainstream journalistic representations of racialized individuals in Spain. The narratives these images propose, linked to the current migratory waves from the Global South towards the Global North, emphasize a notion of "crisis" or "threat". Furthermore, they perpetuate hegemonic neo-colonial discourses that invisibilize the agency or positive representation of racialized immigrants and refugees, who are thus either criminalized or victimized.

Our hypothesis is that migrant and antiracist collectives in Spain, through their social networks, have developed a visual counter-discourse that has put into crisis the iconographies perpetuated by traditional media in recent years. To inquire into such images, this paper will focus on a comparative analysis between the covers and Instagram accounts of Spanish newspapers *El País*, *El Mundo* and *La Vanguardia* (from 2017 onwards), and the Instagram accounts of alternative media and "third sector" organizations such as *Afrofeminas*, *Afrocolectiva*, and *Top Manta* (with tens of thousands of followers), which propose a space for self-representation.

The framework for this analysis is the concept of the "visual motif", an "iconographic model of cultural representation that is transmitted and reinterpreted throughout the history of images" (Balló, Salvadó & Cairol, 2020), and regards the inherently narrative and affective aspect of images, which can mobilize the viewer's cultural imagery. As our sample reveals, most of the images found in traditional media outlets focus on the process of border-crossing (De Genova's "border spectacle", 2013), which entails an invisibilization of life beyond the instant of "infracture" and a reduction of the individuals to transgressive subjects. In these cases, the most salient motifs found in Spanish press are (1) the "white savior", a white individual holding a racialized immigrant in a gesture of shelter and comfort, an image of solidarity and rescue that continues to reproduce racially-motivated hierarchies; (2) the barrier, the shore or the fence as a liminal space where the concepts of transgression and illegality become materialized as a bodily act against a physical threshold; and (3) the mass of immigrants, an agglomeration of anonymous and dehumanized bodies, where the magnitude of the group and its numeric threat is highlighted over their individual conditions of existence. On the other hand, alternative media and "third sector" social networks, led by racialized immigrants or second-generation immigrants, either use these very visual motifs to problematize them and highlight their underlying racial hierarchies and stereotypes, or reappropriate other motifs which are allegedly not racially-coded (i.e., are implicitly "white"), proposing a notion of speech and agency. Against the anonymization of the motif of the "mass" of immigrants, for instance, we have found a usage of the portrait as an image of individualization and testimonial – thus, discursive – potency, while photographs of labor and education undertaken by racialized individuals work against associations with irregular and illegal – thus "threatening" – work and welfare.

DMM03 Media representations, migration and borders

PP 0220 Romania's first lessons on humanitarianism. A thematic analysis of investigative media reports on the Ukrainian refugee crisis

Elena Negrea Busuioc¹, Florenta Toader¹

¹ National University of Political Studies and Public Administration, Department of Communication, Bucharest, Romania

Russia's military invasion of Ukraine has caused the biggest humanitarian crisis in Europe since the Second World War. The plight of forcibly displaced Ukrainians triggered a widespread public solidarity manifest in the

unprecedented mobilization of citizens across Europe, especially in the neighboring countries, to assist the refugees the best possible way. The Ukrainian exodus has put Romania on the map of host countries for refugees and, at the same time, it has tested the limits of the country's (and Romanians') solidarity with the Ukrainians. At the onset of the conflict, in the absence of a coherent Government response, many grassroots initiatives sprang up at the Romanian northern border to provide the refugees with immediate support such as food, clothes, shelter, medical assistance, transportation. Volunteer-led efforts to assist Ukrainians fleeing the war were widely covered by the media, particularly by investigative journalists who often were active volunteers. This study aims to examine how the refugee crisis was reflected in three prominent Romanian investigative journalism platforms. Drawing on solidarity from humanitarianism (Boltanski, 1993; Chouliaraki, 2013) and its critique (Ambrosini, 2022), we analyze articles published between February 24, 2022 and October 2023 by *Decât o revistă*, *Scena9* and *PressOne*. We use thematic analysis to answer the following questions: a. how does solidarity emerge from media reporting on Ukrainian refugees? b. which forms does it take?, and c. what kinds of practices are involved? Findings show that solidarity with the refugees has been framed as extraordinary humanitarianism during the first three months of the war. Starting from September 2022, reports on solidarity with Ukrainians focus on volunteer burnout, transition to state support for refugees, increasing anxiety among in the Romanian society that Ukrainian refugees receive more financial and social benefits than Romanians. Our analysis of investigative journalism articles on the Ukrainian refugee crisis reveals a waxing and waning of public support of the refugees. This finding adds to the ongoing theoretical and public debates over the limits of grassroots mobilizations and the compassion fatigue in describing solidarity with refugees. Interestingly, the analyzed articles also include interviews with displaced Ukrainians who have sought and received protection from Romania as war refugees. The refugees get to tell their story and share their perception of the mobilization of ordinary Romanians and of the long-term support and integration measures taken by the state. By giving a voice to the refugees these media platforms empower them and legitimize narratives in which the refugees are not necessarily helpless and vulnerable. We discuss the role of the media in fostering 'expressional solidarity' (Woods, 2020) by exposing refugees as agents, too, not only as voiceless people in need of immediate material assistance.

PP 0311 Representations of the Portuguese diaspora. Multiple readings of ethnic humorous content from YouTube

Simone Petrella¹, Manuel Antunes da Cunha¹, Clárisse Pessôa²

¹ Catholic University of Portugal, Communication Science, Braga, Portugal

² Universidade Europeia, Ipaam, Porto, Portugal

Ethnic humour is one of the places where questions of identity and belonging are played out. In an intercultural context, it can be either a strategy of social control or a mechanism of emancipation and subversive creation. It is one of the discursive spaces that best allows us to gauge the status of a minority group in any society, as well as the dynamics of the hybridisation of identities. Through this research, we seek to understand the different receptions of this type of humour among Portuguese and Luso-descendants living in France and Portugal and its role in (re) creating feelings of belonging, but also stereotypes. This empirical study uses questionnaire surveys in French and Portuguese to understand the different receptions and analyse their role in the symbolic construction of audiences living in the countries of origin and in the host countries.

Based on the above issue and considering the plural readings that humour can evoke in its audience, we chose as our object of study one of the productions of one of the most recognized comedic duo Ro & Cut on the YouTube platform: "Vamos a Portugal" (1M views). The aim is to understand the diversity of interpretations of the video, which is a caricatured reconstruction of the return journey to Portugal by a group of Portuguese emigrants living in France, based on variables such as gender, age, migratory experience, area of residence, academic background, and socio-professional category, among others. From a total of 461 responses (234 in France and 227 in Portugal), it can be seen that individual and collective paths influence the reception process. The results show that although most of the respondents in the general sample found the video amusing, they felt that it did not portray Portuguese emigration in France in a current and objective way. However, interpretations vary according to place of residence, migratory experience, and academic background. Some see it as a caricature intended to be read in second grade. Others regret that negative stereotypes about the Portuguese diaspora continue to be perpetuated. Still,

others recall with some nostalgia the experiences of the 1970s and 1980s through a production that they interpret as a tribute to the pioneers and a symbol of belonging to an ethnic community.

PP 0312 Constructing the Other in news maps and infographics

Camilla Haavisto¹

¹ University of Helsinki, The Swedish School of Social Science Soc&kom, Helsinki, Finland

In this paper, we examine news maps and infographics on migration and migrants in Finland in the Nordics. With the help of such concepts as *cartographic cleansing* and *imaginaries of certainty*, introduced by scholars in political cartography and media and migration studies (e.g., van Houtum & Lacy 2020; Usher 2020), our aim is to answer if maps and infographics manage to consider migrant vulnerability, or if they only drive threat discourses and scapegoating.

The paper is structured around three 'gloomy' cases, namely, migrant infection rates during the Covid19-pandemic, so-called urban gang violence in the neighboring country, Sweden, and border crossings by third country nationals at Finland's eastern border. The material consists of 60 news maps and infographics published in ten newspapers and periodicals during 2020, 2021 and 2023. The first case is part of a large media monitoring project on migrants and the pandemic where newspapers were systematically gathered and analyzed during three months in 2020 and three months in 2021. For the two other cases, a more purposive sampling was used.

Our preliminary findings show that journalists and graphic designers hardly ever experiment with more alternative types of presentations. Rather, they reuse a few standard types of news maps and infographics to categorize, factualize and simplify the narrative of the main story, which often strengthens a threat discourse. Counter narratives, humanizing perspectives, such as so-called deep maps, or categories or symbols shedding light on migrant vulnerabilities are lacking. At the same time, however, there are neither any explicitly agitating graphic elements like arrows typically used in invasion maps and in so called Frontex maps depicting global migration. Instead, the maps and infographics contribute to a "new aesthetics of danger" (Wallace 2009) in more subtle ways.

Usher, N. (2020). News cartography and epistemic authority in the era of big data: Journalists as map-makers, map-users, and map-subjects. *New Media & Society*, 22(2), 247–263. <https://doi.org/10.1177/1461444819856909>.

PP 0313 Destigmatizing Việt Kiều: Vietnamese diaspora's self-representation and community formation on YouTube

My Pham¹, Saif Shahin¹, Jos Swanenberg¹

¹ Tilburg University, Department of Culture Studies, Tilburg, Netherlands

More than 5 million people of Vietnamese origin live outside the country. Known as "Việt Kiều," they are not always viewed positively by Vietnamese residents, especially when they come from families that fled after the Vietnam War (Nguyen, 2021). A number of Việt Kiều reside in Europe. Social media have allowed them a means to share their stories, not only with each other but also with people back in Vietnam.

This research examines the comments posted on videos from three Việt Kiều YouTube channels, two based in France and one in Germany, to understand how the platform serves as a site of self-representation and community formation for Vietnamese migrants. These videos recount the "overseas life" of the Vietnamese diaspora while challenging stereotypes. A total of 3,000 comments were collected from two videos from the France-based channels, which focus on the stereotype of "Getting Married to Western Men." The two Germany videos, which address another common stereotype—"Getting Easily Rich in Germany"—had 2,927 comments. Data were analysed using a mixed-methods design combining sentiment and discourse analysis.

Sentiment analysis was carried out using the NRC Word-Emotion Lexicon, comprising eight emotion categories, available through the "syuzhet" package in R (Mohammad & Turney, 2013). Trust emerged as the most prevalent emotion in both France (38%) and Germany (45%) samples. But a close reading of comments featuring high levels of Trust showed the reasons were quite different. In France, the Việt Kiều videos earned the approval of many users while some comments attempted to "debunk myths" about overseas life. In the comment with the highest level of Trust, the emotion represented a user's confidence in former U.S. President Donald Trump's low-tax policy—as opposed to the "socialist" policies of European governments. In contrast, Trust in the Germany sample was often found in comments recounting experiences of discrimination. However, users also believed learning the German language and following local regulations were reliable means of success.

Discourse analysis of comments that garnered the most replies revealed more conflict among users. In the France-based channels, which share the experiences of Vietnamese-origin housewives living in Europe, there were plenty of resentful comments/replies. Many users suggested these women married Western men only to get foreign citizenship. Despite its tongue-in-cheek topic, the Germany-based channel emphasizes the need for hard work to succeed but also suggests that life abroad is better. Many comments and replies under its videos argued that Việt Kiều should not trust information about Vietnam they receive from Western sources.

Our research suggests that YouTube serves as a platform for the geographically divided Vietnamese diaspora to connect with each other and with Vietnamese residents and publicly address the stereotypes associated with the term, Việt Kiều. Although the issues they raise are difficult, the discussions are mostly civil and allow different segments to learn about and understand each other better. YouTube's affordances, such as threaded replies, enable virtual community formation as users not only comment on videos but also engage in conversations with each other.

PP 0314 "Eyo, mixed girl check": Negotiations of (non-)normativity through embodied performance in the #mixedgirlcheck trend on TikTok

Ana-Nzinga Weiß¹, Florian Primig², Hanna Dorottya Szabó³

¹ Freie Universität Berlin / Institute for Media and Communication Studies, Journalism Studies, Berlin, Germany

² Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

³ Freie Universität Berlin / Institute for Media and Communication Studies, International Communication, Berlin, Germany

TikTok is one of the most important social media platforms, especially for young users (Koetsier, 2023), and consequently their performance of identity including ("mixed") racial belonging. A "mixed-race" identity involves a "liminal positioning" (Dagbovie-Mullins & Berlatsky, 2021, p. 9) in the "great classificatory systems of difference" that shape human societies (Hall, 2021c, pp. 359–360). Imaginaries of belonging in these systems are constructed through "regimes of representation" (Hall, 2021a, p. 388). These regimes are, in turn, structured by social discourses (Hall, 2021b, pp. 266–267). Imaginaries of difference and belonging do not only operate extrinsically; they have also "become a constitutive element in our own identities" (Hall, 2021b, pp. 266–267).

Platform users' self-presentation on their profiles have always been related to socially dominant and stereotypical identity constructions (e.g., Hearn, 2017). TikTok's audiovisual memetic affordances further foreground the embodied self-presentation of identity. So far, TikTok research has addressed race and intersectionality mostly as aspects of concrete connective action – that is, activist or social movement struggles – or migrant identity. The explicit performance of "mixedness" has become a massive phenomenon as a connective, embodied, and memetic presentation on TikTok. The platform's provisions to establish connections through trends using sound and narrative templates allow users to easily construct their racial identities through personalized connections to others and discourses. While the individual performances of a trend are not necessarily expected to be very subversive, trends can reinforce or subvert dominant discourses concerning racial normativity. In this study, we complement previous research by focusing on the mundane, everyday performance of race, analyzing the intersectional representations of normativity (or non-normativity) in the #mixedgirlcheck trend on TikTok. Accordingly, we asked how normativity (or non-normativity) is represented in the #mixedgirlcheck trend on TikTok. To answer this question, we analyzed 100 randomly selected #mixedgirlcheck-trend videos, drawing on critical technocultural discourse analysis (Brock, 2018).

Our results reveal four prominent patterns in the representations of normativity (or non-normativity) using the #mixed-girlcheck hashtag. First, the *embodied performance of "mixed-race" heritage* reinforces normative assumptions about race in catering to a mainstream gaze that assumes "racial homogeneity" and demands the explanation of any deviations therefrom. Second, representations of *negotiating embodied ruptures in normative racial authenticity and belonging* subvert the mainstream gaze in challenging assumptions about universal signifiers of racial authenticity. Third, *embodied heterosexual performativity and the idealization of the bourgeois family* reinforce hegemonic heteronormativity and present heterosexuality as a crucial prerequisite to a person's "racial mixedness." Finally, in representations of *capitalizing on the performance of embodied individuality*, "mixed girl" embodiments function as branding that applies social discourses of "mixedness" with a focus on feminine beauty ideals. While the construction of (racial) identity may always evade robust generalization and further comparative and culturally specific research is needed, what we present here is a theoretically well-grounded analysis of prevalent discourse of "mixedness" on TikTok that can inform similar endeavors looking into the social constructions of difference and belonging and their (re-) negotiations online.

PP 0315 Music and critical cosmopolitan memories of the 1971 Bangladesh Liberation war

Paul Nataraj¹, Emily Keightley¹, Julia Giese²

¹ Loughborough University, School of Social Sciences and Humanities / Migrant Memory and The Postcolonial Imagination MMPI, Loughborough, United Kingdom

² Loughborough University, Communication and Media, London, United Kingdom

This paper focuses on the triadic relationship between shifting mnemonic constructions of Bengality, Bangladeshiness, and Britishness in the context of the legacy of the Bangladesh liberation war of 1971. Our analysis draws on six years of ethnographic fieldwork conducted by the Migrant Memory and the Postcolonial Imagination research project between 2017–2023 with South Asian communities in the UK, to explore how memories of 1971 and the accounts of national and cultural identity which are used to narratively underpin them, are reconfigured and transmitted in instances of musically mediated communication. The instances in question were witnessed during fieldwork interviews in community settings, and relate to other musical memories shared by participants in more formal interview scenarios. Using the concept of critical cosmopolitanism to explain how diaspora actively mobilise memory to sustain the symbolic markers of their longstanding national affiliations and use them to 'mediate' the embrace of new individual and collective identifications, the paper assesses the frictions between diverse contemporary, remembered, and inherited cultural experiences of belonging, and the strongly determined sense of national identity and transnational nation building which emerged from the liberation struggle. We consider musical memory as a site for reflection and struggle in which dominant and emerging ideologies of nationhood are brought into relation with new spaces of belonging and visions of home. In doing so diasporic communities redraw the frameworks of interpretation for those telling and those receiving these memories. Through the close analysis of communal music performances and ethnographic interviews, we assess the role of these memories' of violent upheaval and nation building in the ongoing narrative construction of diverse British Bangladeshi identities and communities in the UK. In so doing we highlight the potential of musical mediation as a vehicle for the recontextualization of historical struggle in contemporary diasporic contexts, and the solidarities which can be fostered and renewed through these mediated mnemonic practices.

DMM05 Platforms as spaces of affect and action

PP 0427 Understanding digital racism and xenophobia: Toward a theoretical model

Mattias Ekman¹

¹ Stockholm University, Department of Media Studies, Stockholm, Sweden

In recent decades, anti-immigrant, racist and nationalist attitudes have become increasingly mainstream (Mondon & Winter 2020), transforming public debates on immigration, immigrants and minorities in Europe, the US and elsewhere. These attitudes and sentiments have been widely disseminated and amplified through digital communication and online networks, including commercial social media platforms – in scholarly work labeled as "platformed", "networked" and "online" racism (Matamoros-Fernández, 2017; Murthy & Sharma, 2019; Ortiz, 2021). To better understand the relationship between racism and digital communication, this paper put forward the argument that it is necessary to move beyond media-centric explanations and simplified discussions of online hate speech and platform regulation. Therefore, it proposes a multi-theoretical approach to "digital racism" (Siapera, 2021), i.e. racist content produced and circulated online. The paper brings together four theoretical strands that combines sociological, political and socio-technical perspectives, and presents an understanding of digital racism in relation to: 1) networked affect, 2) nationalism/nativism, 3) masculinity and 4) conspiracy thinking. In particular, it discusses these as factors that underpin the articulation, circulation and amplification of digital racism.

First, the paper examines the role of digital platforms in the circulation of digital racism. Drawing on the concept of networked affect (Hillis, 2015), this section examines both organized and "ambient" forms of racism online (Siapera, 2019). Secondly, it assesses how various articulations of nationalism/nativism (Walsh, 2023) contribute to the construction of race, ethnicity and other signifiers of inclusion/exclusion online. Thirdly, it discusses digital racism in relation to masculinity and the (re)turn to historicized imaginaries of masculine gender in contemporary digital cultures. In particular, it identifies ideals of a "natural" hegemonic masculinity (Kaiser, 2022) and their relationship to race, ethnicity and nation. Fourthly, it discusses the role of conspiracy thinking and theories, and how they relate to ideas of race, immigration, politics and power in the digital age (Ekman, 2022). The paper then presents a model that enables an analytical assessment of these theoretical perspectives, to both understand and analytically approach digital racism, at the structural/ideological (macro) level, organizational/network (meso) level as well as on the individual (micro) level. The paper contributes to the ongoing discussion on the political mainstreaming of racism in the digital age (e.g. Miller-Idriss, 2020; Mondon & Winter, 2020; Gantt Shafer, 2017) and critically engages with the sociological, political and socio-technical characteristics that produce and reinforce contemporary racism, online as well as beyond.

DMM05 Platforms as spaces of affect and action

PP 0428 Networked nation in the time of political disorder: Affect in Afghanistan's diasporic ethnic groups' conflicted constructions of imagined community

[A. Wahid Mehran](#)¹, [Jolanta A. Drzewiecka](#)¹

¹ University of Lugano USI – Università della Svizzera italiana, Institute of Communication and Public Policy ICPP, Lugano, Switzerland

Afghanistan has been affected by a series of political disruptions in the form of civil war, military take overs and interventions by different powers in the past few decades. When Taliban assumed control of the country most recently, its restrictions on girls' education and women's employment received abundant media attention in the West. What has been less discussed is the persecution of the many ethnic groups and the Taliban's systematic efforts to define Afghanistan as Pashtun ethnically, culturally and linguistically. These efforts, however, have not escaped the attention of the diaspora where members of Tajiks, Hazara, Uzbek and other ethnic groups as well as Pashtuns call attention to the various exclusionary measures and engage in passionate discussions about the shape and identity of the national project on digital platforms, most prominently on X (former Twitter). We analyze the role of affect in the competing and conflicting definitions of the imagined Afghanistan nation emerging from these discussions.

Our theoretical framework combines the concept of 'networked nation' (Bernal, 2014) with the concept of 'platformed intersectionality' (Christian et al. 2020; Edwards & Stephens, 2023) to advance the understanding of affective investments in competing notions of 'nation' by diverse diaspora stakeholders. We view the relationship between emotions and digital technologies as co-constitutive (Alencar & Camargo, 2022) and emotions as communicative, social and implicated in power relations (Ahmed, 2004; Wetherell, 2012). While previous research on the Afghan diaspora has recognized ethnic divisions, the theoretical implications for conceptualizing diaspora have been limited. We advance this approach and argue for diaspora constituted and contested intersectionally whereby different groups have competing stakes in imagining the national community in exile. We focus on how emotions and emotional attachments animate the conflicts and debates on social media.

X became a major platform for informing the users of the Taliban abuses of ethnic groups and passionate discussions about the consequences as well as interventions advancing inclusive definitions of nation. We conducted a netnography (Kozinets, 2019) on platform X and collected posts and responses to the following topics of discussion: forceful evictions of non-Pashtuns like Uzbeks and Turkmen in the Northern part of the country, committing war crime of collective punishment against Tajiks, persecution of Hazaras by the Taliban, removing Farsi words from banners and plaques as part of systemic discrimination against the Persian language and most recently arresting Tajik and Hazara girls for wearing 'a bad hijab' and other ethnic discriminations. We identify and explore themes that construct different imagined communities in discussions on X: 'Pashtuns are the Taliban contra the Hazaras, Tajiks, and Uzbeks,' 'we are all 'Afghan' and 'Pashtuns are the natives'. We then examine the contestations of the label 'Afghan' as exclusionary and the debates over alternatives: 'Afghanistani' and 'Khorasani.' Our analysis highlights how the competing cultural, ethnic and non-ethnic forms of national order these debates propose are animated by emotions.

DMM05 Platforms as spaces of affect and action

PP 0429 Diasporas as online warriors: #Karabakh war and the narrative battles between Armenian and Azerbaijani diasporas

[Dmitry Chernobrov](#)¹

¹ University of Sheffield, Journalism Studies, Sheffield, United Kingdom

As fighting broke out between Armenia and Azerbaijan in September 2020, a parallel intensive war erupted on social media. Pro-Armenian and pro-Azerbaijani users shared information about the conflict, paid tribute to soldiers, amplified news, targeted international media, and pushed out hashtags like #StopAzerbaijaniAggression or #StopArmenianOccupation. These actions sought to mobilize international public opinion and influence policies of foreign governments, with consequences for the war outcomes. The 2020 Karabakh war was fought not just on the physical battlefield, but online, internationally and in different languages.

How do diasporas fight online during armed conflict in their homeland? I explore this question through interviews with over 100 diaspora Armenians and Azerbaijanis living in 10 nations around the world. I question their motivations for activism; strategies and methods of promoting the Armenian or Azerbaijani narrative; vision of the opponent; and perceived outcomes of their efforts. The interviews were conducted at the time of the 2020 war itself, as well as after it, during regular escalations until Azerbaijan reclaimed full control over Karabakh by the end of 2023.

Besides investigating this case of diaspora mobilization, the study offers broader conclusions about social media and participatory warfare, and about the changing roles of diasporas in IR. I argue that social media enables participatory war that is transnational, monologic and imposing silences, empowering and retaliatory, involving individual and networked tactics, and culturally and politically transformative. The online narrative war has new

tactics, benefits from and deceives social media algorithms, and delivers new types of casualties. Diasporas, traditionally seen as international agents of lobbying, public diplomacy, and material assistance, become important and decentralized actors in global conflict infopolitics. Finally, the paper relates its findings to other ongoing conflicts where diaspora digital activism plays a major role: Ukraine and Israel-Gaza. I identify similarities and differences of the online dimensions of modern conflicts and the roles of diasporas in participatory war.

DMM05 Platforms as spaces of affect and action

PP 0430 "Brazil will become a Venezuela": Migration, digital platforms and Brazilian elections

[Amanda Alencar](#)¹, [Denise Cogo](#)², [Julia Camargo](#)³

¹ Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

² Escola Superior de Propaganda e Marketing ESPM-Brazil, Media and Communication, Sao Paulo, Brazil

³ Universidade Federal de Roraima, International Relations, Boa Vista, Brazil

The issue of migration frequently appears in electoral campaigns, particularly through racist, xenophobic, and nationalist discourses. Although it is recognized that far-right politicians use migration for political gain, the 2022 elections in Brazil were marked by a different discursive strategy from the far-right represented by Jair Bolsonaro and the recent Venezuelan migration into the country. Bolsonaro's government and its supporters took advantage of the growing number of Venezuelans to create narratives that shifted from fearing migrants to perceiving the threat posed by the experiences of migrants in their home country, Venezuela, and its government regime. This rhetoric served as the foundation for the construction of moral panic around the hashtag "Brazil will become a Venezuela" if the opposition party (Workers' Party) comes to power. Moral panic, as defined by Cohen (2011), is a crucial concept for comprehending the discourses employed by populist leaders to create fears and divisions in society. It refers to the response of a group of people who falsely perceive the actions of a particular group, typically a minority, as perilous and a threat to the entire community. The notion of moral panic has been instrumental in the examination of migration and its interconnectedness with politics, social dynamics, and the media (Bauman, 2017). Following moral panic theory, this article examines how, during Brazil's elections, this narrative was produced and disseminated across various digital platforms by the far-right government and its allies to incite alarm about the risk of Brazil turning into a Venezuela with the Workers' Party's electoral victory. We also adopt Walsh and Hill's (2022) concept of platformed panics to analyze the role of digital platforms' socio-technical systems in shaping the panic narrative surrounding the fear of the "Venezuelanization" of Brazil in the context of the 2022 elections.

Data for this study were collected using qualitative content analysis of materials (videos, images, texts) posted on Facebook, TikTok, X (ex-Twitter), Instagram, YouTube, and WhatsApp. The sample resulted in the selection of 19 publications directly related to the fear rhetoric. The results reveal how Bolsonaro and his allies, acting as mediators of the experiences of Venezuelans, utilized the platforms to warn of the establishment of communism in Brazil. Such rhetoric was constructed with the adherence and engagement of Venezuelans, whose voices bore witness to the situation in Venezuela and supported Bolsonaro's re-election as the only alternative to Brazil. We also showed that this rhetoric was a component of a complex digital ecosystem designed to generate fear-based narratives and misinformation. This was achieved through extensive content creation and active mass-participation on various social media platforms. Simultaneously, the production and dissemination of panic by Bolsonaro's government and its supporters as well as Venezuelan migrants greatly benefited from the widespread visibility of far-right-oriented social media channels and the lack of transparency in the algorithms used by platforms. In conclusion, our study highlights the importance of critically examining the political engagement of migrants to gain a deeper insight into the widespread dissemination of anti-immigrant discourses in the online sphere.

DMM05 Platforms as spaces of affect and action

PP 0431 Transnational Turkish migrant families and their use of digital media: Sustaining and enacting mobile intimacies

[Gokcen Karanfil](#)¹

¹ Izmir University of Economics, Media and Communication, Izmir, Turkey

Migrant populations have long been known to navigate the dynamics of physical separation, and to sustain long-distance transnational relationships and ties through digital media use. The pandemic becoming global in 2020 ensued by the closing of borders, lockdowns and travel restrictions has further sophisticated how migrants negotiate their transnational social relations over distances and borders. As a result, the use of digital communication technologies to forge and maintain ties over a distance has become even more crucial during this period.

This paper focuses on the ways in which digital communication technologies have been mobilized by migrant populations, as part of everyday digital practices in border narratives, to sustain ties and family intimacies during the COVID-19 pandemic and thereafter. As John Urry (2007) has articulated through the "mobilities paradigm", in an increasingly interconnected and networked world, social relations are predominantly established, sustained and performed through mobilities that are not only corporeal but also imagined and mediated (Cabalquinto, 2018: 250). Drawing on Urry's work, and its utilization in a transnational mobile media context by Cabalquinto (2018),

I examine in this paper how digital communication technologies have enabled the imagination, mediation and enactment of intimacies among dispersed members of transnational Turkish families in Sydney, Australia during the COVID-19 pandemic, and how this digital connectivity has become an integral part of their everyday lives and everyday media practices following the subsidence of the pandemic.

The study is part of a broader ethnographic research project consisting of participant observation conducted over a period of 12 months among Turkish migrants in Sydney, including 30 in-depth interviews. The paper draws on data gathered from this extensive ethnography with a focus on two families, both of whom have been separated from one of their nuclear family members for 18 months during the COVID-19 pandemic. The study builds on and contributes to the existent literature on issues of mobile intimacy among members of dispersed families (Cabalquinto 2017, 2018, 2019; Madianou 2016; Madianou and Miller 2012, Lopez, 2016).

DMM06 Border politics, practices and discourses: alternative imaginaries and conceptualisations for a new world in the making

PN 073 The digital (b)order and the spectre of "climate migration"

Myria Georgiou¹

¹ London School of Economics and Political Science, Department of Media and Communications, London, United Kingdom

This presentation focusses on "climate migration", as the newly formed spectre haunting European imaginaries and galvanising the continent's digital (b)order. Fears over climate change driving unprecedented numbers of migrants towards the global North have generated new levels of anxiety among policy makers and across legacy and social media (Durant-Delarc et al. 2021; Gonzalez 2020). In response to fears for a new threatening disorder, the order of the border is yet again mobilised as the solution. "Smart", sophisticated and ever-expanding borders have a revamped target: climate refugees. At the heart of this presentation is the mediated constitution of "climate migration" as a symbolic and territorial crisis for the global North. Across policy and media narratives, we can see how this seemingly new "European crisis" to come is symbolically constituted through familiar tropes: "climate migration" is imagined as either a humanitarian catastrophe, or a security risk, or as both, with climate refugees conceived as either abject victims or as threats (Chouliaraki and Georgiou 2022). Territorially, climate migration is also constituted as a forthcoming emergency, a new crisis that needs, not only to be contained but, in fact, to be deterred. We thus see actors of the border, from the state to transnational corporations, using this perceived threat for the border as a justification for further investment in infrastructures of mobility control and surveillance, strengthening the already hegemonic imaginary of migration as a crisis. Yet, and while responses to "climate migration" reproduce the hegemonic mantra of securing European order through the border, they also reveal a reconfiguration of its politics: both the symbolic and territorial constitution of the border that has to deter climate refugees from even approaching Europe depend on predictions of a future, a crisis yet to come. This presentation examines what it means to (re-)construct and (re-)imagine the border and order through predictions and storytelling of the future. It particularly discusses how the border is symbolically and territorially reconfigured when AI and data modelling drive imaginaries and policies of prevention. The discussion illustrates how technocentric futurology pre-empts debate and marginalizes systematic research (de Haas 2023) and it also shows how the border reconfigurations for an imagined future transnationalize predictive policing of people and territories and turn climate change into a new project of racial injustice (Sealey-Huggins 2018).

DMM06 Border politics, practices and discourses: alternative imaginaries and conceptualisations for a new world in the making

PN 074 Convivial reflexivity in times of crisis: a new framework for data uses within border regimes

Sara Marino¹

¹ London College of Communication, Media School, London, United Kingdom

This presentation critically investigates the datafication and digitisation of Europe's migration regime and asks whether alternative uses of digital border technologies can be imagined. I begin by identifying borders as institutions of power, as mechanisms of identity formation and as performative spaces (Marino, 2021). Here, I dissect the transformation of Europe into an ambiguous geo-political space where different actors (border authorities, private enterprises, and humanitarian agencies) capitalise on the power of technologies to deliver faster and more efficient responses to human displacement, and question their impact on the migrant's body. I argue that digital borders should be conceptualized as performative spaces where more productive and less discriminatory uses of technologies can be re-imagined. Specifically, this paper contends that more productive re-conceptualizations of the current digital and geo-political landscape of bordering can be imagined through the adoption of a counter-hegemonic project of social justice rooted in the principles of radical democracy and convivial reflexivity. Using Judith Butler's *The Force of Non-Violence* framework (2020), and Koulaxi's concept of convivial reflexivity (2022) as starting points, the discussion invites to step away from instrumentalist frameworks that see violence (data extraction from the migrant/refugee body in this case) as a mean to an end, and to adopt instead a humanist perspective that sees the interdependency of life as the basis of social and political equality. In doing so, it encourages scholars to re-imagine, re-conceptualize and operationalize the materialities, practices and imaginaries of borders both within physical (proximity encounters) and symbolic (discourses) settings (Chouliaraki and Georgiou, 2019). The discussion will present some examples of how this can be carried out in practice, for example through the adoption of principles of ethical coding in both political and humanitarian settings (Marino, 2022) but also through the development of spaces of conversations with refugee-led organisations that could enable the development, perpetuation, and control of social and political orders related to migration in concert with political and non-political actors.

DMM06 Border politics, practices and discourses: alternative imaginaries and conceptualisations for a new world in the making

PN 075 Calculated (Dis)order: Numbers, Population, and the Sexuality of Migration Statistics

Michelle Pfeifer¹

¹ TUD Dresden University of Technology, Institute of German Studies and Media Cultures, Dresden, Germany

The repeating "crises" of migration of the last decades call into question the racial capitalism of nation-state borders. Indeed, borders have to continuously be reproduced through the work of policing and surveillance. One major area of reproducing borders is the rendering of borders through metrics. Departing from scholarship that considers how borders work and fail through the spectacular forms of border and migration policing (de Genova 2013), I look at the mundane administrative work of counting and classifying to contribute to understandings of the relationship between media technology and bordering. This paper will specifically consider the role of numbers as "quantum media" (Wernimont, 2018) in the work of reproducing the nation-state order of borders. While often invisibilized classification and normalization of race, gender, and sexuality depend on their constant reproduction to become common sense and natural (Bowker & Star 1999, Spade 2015, Murphy 2017). This paper will draw on the discourses and practices around production, use, and circulation of numbers in form of refugee quotas, allocation keys, and migration statistics. For instance, the figure of 1 million refugees has become a discursive shorthand to describe German exceptionalism in the reception and treatment of refugees during the 2015 "refugee crisis" that has been revitalized since the Russian invasion of Ukraine. A shorthand that lends itself to both liberal celebrations of hospitality and right-wing nationalist mobilizations and hostility against migrants. Analyzing the figure of 1 million

refugees, its statistical and social scientific rendering and its transnational discursive and media circulation this paper demonstrates that numbers work to extend borders into and within the nation-state to regulate sexual and gendered subjects. I show that the production, use, and circulation of numbers in form of refugee quotas, allocation keys, and migration statistics are central for bordering practices such as the decreasing possibilities for family unification, the production of threatening Muslim and/or Arab male sexuality, the pathologizing of the migrant family, and state practices of family separation and detention. In this sense, numbers do the work of bordering through situating migrants as a racialized threat of biological and social contagion. Numbers are therefore exemplary for the ways in which nation-state and transnational orders are articulated, imagined and maintained. A critical engagement with these (dis)ordering operations, thus, also opens pathways to imagining alternative futures and possibilities to enact solidarities with and against the numbering of life.

DMM06 Border politics, practices and discourses: alternative imaginaries and conceptualisations for a new world in the making

PN 076 The politics of brokenness and repair: media infrastructural build-up and tear-down at the border

Philipp Seufferling¹

¹ London School of Economics and Political Science, Media and Communications, London, United Kingdom

This paper engages with the mediation of borders and the (re)structuring of global (dis)orders on the level of media technologies and infrastructures. I argue for refocusing attention to the politics of "brokenness" and "repair" as conditions, practices, and rhetorics, to understand how borders become technologically rearticulated over time. Populist calls to "fix broken borders" motivate heavy investment in "smart borders", while infrastructures of rescue and care are systematically broken down. "Brokenness" and "tearing down", as well as "fixing" and "building up" of media technologies act as symbolic and material vehicles that structure how mobility regimes are built. How can efforts to repair mobilize alternative futures for media technologies at borders? I depart from a "broken-world-thinking" approach (Jackson, 2014) to technology, calling for accepting brokenness of the technological world as a counterpoint to progress, growth, and innovation. These perspectives articulate brokenness as a condition of media, where breakdown and glitches expose exclusions of specific users and the hidden labor of those fixing and maintaining it. Repair, in turn, becomes a productive practice for enacting care, autonomy, and increased participation in technological design. Here, I invert this perspective on brokenness and repair, and question their politics. At borders, I argue, the imagined condition of brokenness drives frantic media infrastructural build-up – while borders are anything but broken, but working in well-functioning ways for most mobile subjects: in fixating, excluding and lethal ways for a vast majority, and in smooth, hypermobilizing ways for a minority. Simultaneously, calls to "fix the broken border" dissipate Western right-wing media discourses, making the techno-centric metaphor of "brokenness" a populist rhetorical device. Yet, what rather is troubled by brokenness are infrastructures of solidarity, care and rescue – systems actively torn down. What are the politics of brokenness and repair in the symbolic and material "double articulation" (Chouliaraki & Georgiou, 2022) of borders? How can we critique and reimagine "brokenness" and "repair" at the border? I draw on the case of media infrastructural build-up at Ellis Island, New York (early 1900s), as well as the case of testing and implementing paternity testing and "DNA-fingerprinting" in the UK (1970s/1980s), in order to trace the symbolic-material articulation of attempts to "repair" "broken" borders through media technologies. These histories demonstrate how mobility regimes legitimize specific media infrastructures by invoking an imagined condition of brokenness of the border for states and publics. For those controlling mobilities, ever new media infrastructures of knowledge-production to differentiate become necessary – because the imaginary of a failsafe border is always already broken. Yet, in most migrants' experiences, borders are hardly broken. Brokenness structures the simultaneous build-up and tear-down of media infrastructures at the border. A critical analysis exposes these politics of brokenness and repair, and opens up a space for undoing and reimagining relations to media technologies of the border.

DMM07 Solidarity practices and humanitarian discourses

PP 0652 Data imageries and materiality of borders in times of crisis

Sanna Valtonen¹, Kaarina Nikunen²

¹ Tampere University, Faculty of Information Technologies and Communication, Tampere, Finland

² Tampere University, Faculty of Information Technology and Communication Sciences – Communication Sciences, Tampere, Finland

In recent years borders have become datafied due to the latest technologies that seek to improve systems of identification and surveillance (Leurs; Marino; Nikunen & Valtonen 2023; Aradau & Tazzioli, 2020; Broeders & Dijstelbom, 2016; Metcalfe & Dencik, 2019). Research has highlighted how several datasets—VIS, SIS and Eurodac – are used to track people's movements. These border databases and technologies include identification documents, fingerprinting, facial recognition systems, retinal scans, speech detection systems, ground sensors, aerial video surveillance drones, and various automated decision-making processes.

In this paper we explore how data imageries (as imageries of infrastructures, see Enrich 2022) among border officials and authorities guide understanding of border practices and solutions, shape politics of borders and how these imaginations may be challenged or accentuated in case of hybrid attack, such as in the Eastern border of Finland in 2023. Our empirical material consists of interviews with authorities and officials of the interior ministry, the migration office, the police and the YWombudsman as well as political decisions and documents concerning the hybrid attack on the Eastern border of Finland in 2023 related to asylum seekers from Russia.

As argued by Enrich (2022) *imaginaries of infrastructure* refers to the apparatuses of knowledge and power to understand "technological systems as well as the values toward which they should be organized". As such discussions of data infrastructures can be explored as sociotechnical imaginaries that "provide visions of the kinds of society that sociotechnical change could bring into being; they shape what is thinkable" and desired (Reutter 2022). We argue that data imaginations also reveal understandings of the core values in datafied practices and the ways in which for example human rights and ethical considerations are connected to these imaginations. Our interviews reveal a strong belief in the power of datafied systems that "never have a bad day". In addition, the concerns are related to the lack of resources and the obsolescence of things and technologies, thereby to information security and the coordination of systems, not to the rights of people using the systems. There seems to be a strong emphasis on securitization in adopting automated border technologies, yet it is not always clear whose security is at stake when developing systems.

We argue that the proliferation of datafied solutions is bringing about broader social changes that influence understanding of what constitutes security. While the increased use of data driven border practices and decision making is likely to dehumanise those seeking for protection, the recent hybrid attack seems to emphasize these dehumanizing tendencies even further, although it is responded with traditional, material tools, such as a material wall. Our study shows that both datafication and materiality of borders speak of imagery of infrastructures that emphasize asylum seekers as data points or objects that need to be managed – in ways that sideline humanity and human rights.

DMM07 Solidarity practices and humanitarian discourses

PP 0653 Building consensus in European discourse about migration: Willingness to avoid disorder or to protect immigrants?

Valérie Mistiaen¹

¹ Vrije Universiteit Brussel, Information and communication, Brussels, Belgium

This research analyses discourse of state-induced return (Kosh, 2014) at European level. The aim is to investigate how the lexical series of terms using a prefix expressing repetition or intensity serves European external policies. This paradigm of terms beginning with re- (which includes *resettlement*, *reintegration* and *readmission*) is increasingly used in UNHCR and IOM discourse as well as in European directives.

Indeed, readmission and resettlement are two of the three durable solutions proposed by international agencies (Arar & FitzGerald, 2022) that are supported by all actors in society, from civil associations to political actors (Tissier-Raffin, 2018: 79). These discourses are embedded in an international rhetoric (Gobin, 2011) that smooths the discourse (Ogier & Ollivier-Yaniv, 2006: 67) in order to build a consensus (Rist, 2002b: 15) between European member states and manage migratory flows at lower cost under the guise of humanitarian intervention (Chimni, 2004: 58).

In order to study the emergence of this paradigm and to understand how migration policies are put in place, what their objectives are and how they circulate in social discourse, a vast corpus of texts from institutional organisations and the voluntary sector will be collected in three countries (Belgium, Spain and England) and four languages. This data set will be supplemented by interviews with key members of staff. This large corpus will be analysed in the light of discourse analysis concepts (Lecolle et al., 2018) and implemented with corpus linguistics tools (Baker et al., 2008).

This communication will detail how the paradigm of terms beginning with the prefix *re-* serves European foreign policy objectives and how it softens the discourse to build consensus and avoid social disorder around the global issue of migration.

DMM07 Solidarity practices and humanitarian discourses

PP 0654 New media, new narratives? A comparative analysis of UNHCR's Instagram communication strategies for the Ukrainian and Syrian crises

David Ongenaert¹, Claudia Soler¹

¹ Erasmus University Rotterdam, Department of Media and Communication, Rotterdam, Netherlands

The Ukrainian crisis has received much Global Northern policy support and favourable news coverage, contrasting sharply with Global Southern crises, including the Syrian crisis (Moallin, Hargrave & Saez 2023; Sambaraju & Shrikant, 2023; Zawadzka-Paluckta, 2023). However, international refugee organizations can influence public perceptions through social media (Carrasco-Polaino, et al. 2018; Green, 2018). However, these social media strategies have hardly been investigated. This study investigates which Instagram communication strategies UNHCR uses for the Ukrainian and Syrian crises. We examine whether and how UNHCR's Instagram communication strategies differ from previously identified humanitarian narratives and differ for the Ukrainian and Syrian crises. Hence, we respond to the need for more comparative research on this subject (Author 2023a). Through a multimodal critical discourse analysis on UNHCR's Instagram posts (N = 90) about the Syrian and Ukrainian crises (2022–2023), we identified interacting humanitarian and post-humanitarian appeals, extending earlier research.

First, the study shows that UNHCR mainly uses shock effect appeals on Instagram to evoke pity and guilt. Consistent with previous research on other media genres (Rajaram 2002; Harrell-Bond and Voutira 2007; Carrasco-Polaino et al. 2018; Author 2019b 2023a; Bellander 2022), it represents forcibly displaced Ukrainians and, to lesser extents, Syrians as victimized, voiceless masses, which can have dehumanizing effects. Likewise, it focuses on ideal victims (Höjjer 2004) which can create hierarchies of deservingness within population groups. Second, the results indicate that UNHCR often employs deliberate positivism by portraying forcibly displaced Syrians and, to far lesser extents, Ukrainians, as talented, empowered, unique individuals to facilitate audience engagement and relatedness (Hedman 2009; Rodriguez 2016; Krause and Schmidt 2020; Bellander 2022; Dahin 2022; Author 2023b). However, by mainly highlighting people with highly valued functions, it creates hierarchies of deservingness (Scott 2014; Author 2023a). Extending previous literature, our analysis thus shows important differences in representations between forcibly displaced Ukrainians and Syrians. This can most likely be explained by crisis-specific differences and UNHCR's related objectives. Third, equally contributing to the literature, we found that UNHCR frequently combines shock effect appeals and, to a lesser extent, deliberate positivism with post-humanitarian appeals (Chouliaraki 2012a; Bellander 2022). UNHCR often combines shock effect appeals with humanitarian branding strategies and self-centred solidarity discourses. However, forcibly displaced people's voices are often neglected. Further, it pairs deliberate positivism sometimes with celebrity humanitarianism but risks relegating forcibly displaced Syrians to secondary positions (Chouliaraki 2012b). These combinations of humanitarian and post-humanitarian appeals are facilitated by Instagram affordances, including photo sharing and editing tools, which enable aesthetic slideshow activism (Dumitrica and Hockin-Boyers 2022), reflecting the marketization of the humanitarian industry (Scott 2014; Richey and Brockington 2020).

Overall, we argue that UNHCR's Instagram communication strategies largely reproduce traditional humanitarian and post-humanitarian strategies. UNHCR barely utilizes the platform's possibilities for more nuanced, contextualized representations, largely due to challenging institutional and crisis-specific contexts and social media logics. More generally, this study contributes to the literature by providing in-depth, comparative and new insights into the largely unexplored social media communication of refugee organizations, which mirrors and reproduces challenging social systems, power relations and consumerist values.

DMM07 Solidarity practices and humanitarian discourses

PP 0655 Historicising voice biometrics: The colonial continuity of listening, from the sound archive to the acoustic database

[Daniel Leix Palumbo](#)¹

¹ University of Groningen, Research Centre for Media and Journalism Studies, Groningen, Netherlands

Since 2017, German border authorities have introduced voice biometrics as a 'cutting-edge' assistance tool to analyse the language and accents of undocumented asylum seekers to determine their country of origin and assess eligibility for asylum. At the heart of this practice lies the idea that voice acoustics contain unique characteristics about one's origin and that recent advancements in machine learning allow the extraction of such unfiltered 'truths'. However, the attempt to 'scientifically' identify connections between voice, sound and country of origin through technology is not a recent development, standing in historical continuity with longer colonial practices of listening and sound archiving from the beginning of the last century.

European sound archives encompass early voice recordings made through large-scale research projects during colonial rule and the World Wars to reinforce the racial and nationalist ideologies of European states. Although not aimed at controlling borders but defining 'pure' characteristics in the voice of their populations to distance from the 'other', these recordings shared the purpose of creating an archive that could ground the determination of origin through voice analysis. These sound archives consist of early voice recordings made by commissioned researchers in war prisons and expeditions in the colonies. Nevertheless, audio data training the acoustic models of voice biometrics used in asylum procedures is generated under very different conditions. The creation of datasets is delegated to different public and private actors, including universities and crowdsourcing platforms. It involves linguistic researchers, but also many data workers who provide their voice data as cheap labour.

By historicising these outsourcing processes, I investigate the disruptions and continuities in the shift from the sound archive to the acoustic database and what these implicate about the operations of State power. I do this based on personal observations and experiences resulting from a digital autoethnography of my activity carrying out (audio) data work tasks, in-depth semi-structured interviews conducted with other data workers, managers and linguistic researchers who manage the creation of datasets used to train voice biometrics. The analysis shows how the monoglossic ideologies of the requesting border authorities condition the practices of voice data generation.

Therefore, I challenge the buzzword of 'innovation' frequently proclaimed by border authorities embracing voice biometrics for 'better securitisation and efficiency'. I argue instead that, besides technological advances, the cultural techniques guiding the technology have remained the same, in continuity with a long colonial history of Western science that aims to measure voice acoustics to determine the country of origin. On the other hand, I conclude that the main differences in the methods of sound collections represent two different modes of State power, as it developed throughout time: sound archives served European nation-states to define innate acoustic qualities in the voice of their population to express sovereign power; acoustic databases instead exemplify and serve the purpose of the border in the time of the globalised market, enforcing the policies that allocate different groups of people with higher and lesser degree of mobility, while allowing the free flow of capital, software and data.

DMM07 Solidarity practices and humanitarian discourses

PP 0656 #StandWithUkraine: Mobilization strategies to help Ukrainian refugees on crowdsourcing platforms

[Bianca Cheregi](#)¹, [Malina Ciocea](#)¹

¹ National University of Political Studies and Public Administration- Bucharest- Romania, Department of Public Relations, Bucharest, Romania

Following Russia's invasion of Ukraine in February 2022, Romania has come to host 135,485 Ukrainian refugees (European Council, 2023). The unexpected immediacy of the refugee as a symbolic presence has led to problematizations and tensions about attitudes towards people of other ethnicities, about fears and threats circulating in Romanian imaginary, about the humanitarian ideals that mobilize people and the kind of society projected by virtue of this newly acquired knowledge. The large-scale mobilization at individual and national level to support Ukrainian refugees indicates a 'maturation of Romanian civil society' (Anghel & Trandafoiu, 2022), which engaged in the symbolic negotiation of the meanings attributed to the refugee crisis, alongside media and political actors.

In this context, our paper focuses on crowdsourcing platforms for the support of Ukrainian refugees developed by the Romanian government and the civil society. Digital technologies, particularly the spaces that permit social

interaction, may facilitate forms of political engagement (Koc-Michalska and Lilleker, 2017), involving rewards through interaction. Crowdsourcing today is increasingly employed as a new method of public involvement into the political process (Khoma, 2015), with migration crowdfunding as a form of "socio-political crowdfunding", leading to "a new philosophy of cooperation and solidarity" (Khoma & Vdovychyn, 2022, 45). We take crowdsourcing platforms for helping Ukrainian refugees as dispositifs that have a strategic function. They are both infrastructures of problem-solving and discursive fields constituted around the public problem of refugees, which foster new forms of solidarity.

Our analysis focuses on 21 crowdsourcing platforms for the support of Ukrainian refugees developed by the Romanian government and the civil society, and on news articles about the platforms, published between February and November 2022 in the Romanian media. Our methodological approach, derived from dispositif analysis (Caborn, 2007; Jäger & Maier, 2016) and multimodal discourse analysis (Kress, 2010, 2012; van Leeuwen, 2013; Kress & van Leeuwen, 2021), allows us to understand how meaning is built on crowdsourcing platforms and what strategies are employed to mobilize the public towards politically-significant action.

In our analysis, we construct a typology of crowdsourcing initiatives (government crowdsourcing platforms; crowd-sourcing platforms initiated by experts; NGOs' crowdsourcing platforms; social media groups; media crowdsourcing initiatives; and mixed crowdsourcing initiatives) and identify two distinct categories of actors: the professionals of crowdsourcing and entrepreneurs of help.

We investigate the discursive construction of the problem of the refugees, seeking to understand which actors gain visibility and which competing discourses are circulated with reference to Ukrainians. Our case is relevant for how citizens build new forms of transnational solidarity through digital activism. Overall, our analysis highlights that actors employ a variety of semiotic resources and strategies to educate the public and get them involved in humanitarian action. The refugee crisis marked an emancipation of the civil society, which found its grounding and opened new opportunities for civic involvement.

DMM08 Digitised practices of inclusion, integration and belonging

PP 0746 Living archive: Chinese Londoners and diasporic solidarities in the city

[Stephanie Guo](#)¹

¹ London School of Economics and Political Science, Media and Communications, London, United Kingdom

Alongside the surge of COVID-19 infections in 2020 came a dramatic increase in racism, xenophobia, and hate crimes targeting individuals and communities of East and Southeast Asian (ESEA) descent throughout the UK. This alarming social response was provoked in large part by insidious mainstream narratives that, whether intentionally or not, attributed blame for the virus to certain populations. Forced into isolation by stay-at-home orders with nothing but screentime, Chinese Londoners took to digital spaces in search of healing and solidarity amidst rising racial antagonisms that accompanied this unprecedented global health crisis. Consequently, a collective diasporic consciousness began to solidify together with the emergence of a new East and Southeast Asian identity, facilitated entirely by online engagement during a period of intense physical isolation. Now several years on from the first lockdown, this momentum has continued to build with a particular bent toward increasing advocacy, raising awareness, and celebrating Chinese and ESEA diasporic heritage in both digital and physical fora. This project examines these digital communication practices, contributing to discussions on digital diaspora, identity, and community specifically in the context of urban environments and their increasingly throwntogether nature (Massey, 2005). Crucially, my work takes a spatial perspective that builds on Soja's socio-spatial writings to conceive of the city as a Third Space that is shaped simultaneously by engaging with the material realities of physical place and the intangible flows of digital space (1996). Drawing from an analysis of 43 interviews with Chinese Londoners, I explore how everyday digital media practices in the city facilitate new ways of remembering, performing, and archiving diasporic heritage. Specifically, I focus on understanding how media technologies have been leveraged to reorient storytelling and heritage-making practices toward dynamic, intangible, and future-oriented expressions of the diasporic self and away from traditionally institutionalized and essentializing preservation strategies. In other words, my findings demonstrate how evolving communications practices have prompted the creation of living archives where histories, futures, and the present can be reimagined, and previously silenced or segregated narratives, heard and seen. To capture the everyday lived experiences of Chinese Londoners, I draw from principles of walking interviews, photo voice, and photo elicitation in a creative, mixed method approach designed to capture physical and digital embeddedness in the urban environment. This project privileges the diasporic individual and

their primary role in knowledge production by leveraging participatory research techniques that prompt personal perspectives and narratives. Further, I argue that this agentic approach and its reliance on digital technologies, such as smartphones, GPS-enabled wearable devices, cameras, and social media platforms, is itself an exemplar of living archive and participatory digital storytelling. My work demonstrates that though pandemic-era social isolation accelerated a disruptive and disproportionate digital shift, these changing communication practices have ultimately proven to be generative for a marginalized community facing adversity, seeking solidarity, and seizing agency in the digital age.

PP 0747 The encounter between Ukrainian Refugees and their British hosts

[Yael Gordon](#)¹

¹ The London School of Economics and Political Science, Media and Communication, London, United Kingdom

Over 6,200,000 Ukrainian refugees have fled Ukraine since the February 2022 Russian invasion, creating Europe's largest humanitarian crisis this century. Of these, as of May 2023, 174,000 have relocated to the UK under the Ukraine Sponsorship Scheme. This research explores the encounter between Ukrainian refugees and their British hosts, both physically and virtually, on the Facebook group *UK Accommodation for Ukrainian Refugees* that links host families with Ukrainians needing temporary homes. The research aims to broaden the discussion of two types of encounters, virtual (via Facebook), and live (British families hosting Ukrainian refugees). In the literature, home is treated both in its physical and its figurative sense. The concept of home is a key discussion point in researching refugees' experiences. Refugees, by definition, are always on the move, as they have lost their physical homes. As such, home in the eyes of refugees is often present by its very absence (Boccagni, 2017). Boccagni (2016) characterized it as providing security, familiarity, and control. Moreover, home serves as a border between inside and outside, and also us vs them (Boccagni, 2016). In virtual space, refugees can feel part of their homeland, which they cannot physically visit. The virtual sphere therefore enables lost homes to be "found" and imagined (Giorgia, 2015). I will address home as an ongoing process and as daily experience, and its creation as an open-ended, unaccomplished process (Boccagni et al., 2020).

Accordingly, the research questions are: (1) How does the encounter between the Ukrainian refugee and the British host influence the concept of 'home' within which this encounter occurs? (2) How does the digital encounter configure and shape the physical encounter? Applying the phenomenological approach, I employ a two-stage qualitative research design: First, I will analyse Facebook posts in the two groups published during the first year of the war. Then, I will conduct semi-structured interviews with both sides of the encounter: the refugees, and their hosts. This study offers a novel and comprehensive understanding of the dual encounter that begins on a hyper-public platform – Facebook – and progresses into the very private and intimate domain: domestic and daily routines. Unlike previous research that aimed at furthering refugees' social integration into the host society, in this case, the locus of the research remains within the home, exploring how each side of the encounter defines it.

PP 0748 Diasporic disruptions in pandemic and post-pandemic times: Somali and Syrian refugee women's digital practices in Rome

[Claudia Minchilli](#)¹

¹ University of Groningen, Centre for Media and Journalism Studies CMJS, Groningen, Netherlands

The COVID-19 pandemic disproportionately impacted the resettlement experiences of refugees in Italy, the country hardest hit by the pandemic and subsequent economic crisis. During this period, digital media emerged as the primary, and often sole, source for human connections, information, and leisure, given the social isolation induced by recurrent lockdowns. This paper explores how refugee women navigated this challenging period and examines

its impact on their resettlement process in the new arrival context. Specifically, it investigates the role of digital media in strengthening their social capital, a crucial factor in mitigating the economic and social vulnerability of refugee women at the local level.

The study focuses on a comparative analysis of the experiences of Syrian and Somali refugee women residing in Rome, one of the capitals in Southern Europe that annually receives the highest number of refugees crossing the Mediterranean Sea. This research builds upon previous studies on refugee women's digital practices in relation to the growth of social capital. While existing research tends to be overly optimistic about the potential of digital media for refugees' social capital (Dekker et al., 2014), some correlate refugees' social and economic vulnerability to the strengthening of transnational connectivity with family and friends, neglecting investment in local networking (Minchilli, 2021). This paper aims to explore the extent to which this dynamic characterizes both pandemic and post-pandemic times, investigating the benefits and challenges that an increased reliance on digital media has brought to the diasporic everyday lives of Syrian and Somali women.

The analysis will reveal the possibilities and limitations of digital media usage, considering intersectional axes of differentiation that impact refugee women's ability to overcome social exclusion and isolation. The methodology employed draws inspiration from a feminist postcolonial approach to diaspora studies and digital ethnography. It meticulously considers women's positionality within the social field and the resources they own and mobilize (Anthias, 2007), both online and offline, to experience social mobility.

PP 0749 Media practices and (dis)connections of Vietnamese diaspora in the Midlands, UK

Yiting Chen¹

¹ Loughborough University, Communication and media, Loughborough, United Kingdom

The media's contribution to diverse diasporic spatialities as well as individual identities has been widely recognised (e.g., Georgiou, 2006; 2010). However, the media not only connect places, create new diasporic spaces and produce new connectivity of diaspora (Retis & Tsagarousianou, 2019), but also intervene in and re-produces the disconnections of diaspora. As argued in this paper, the media plays an ambiguous role in relation to diasporic connectivity. On the one hand, they have capacity to challenge and overcome the uneven distribution of diasporic communities in physical spaces and the isolation of individuals. On the other hand, this physical spatiality and connectivity also affects collective and individual practices in diaspora's digital spaces as well as their identities, and in this context, media can be mobilized to foster disconnection and alienation. How collectives and individuals use the media to practice their connections and disconnections with a diasporic community reflects their positions in the spatial matrix of diaspora (Georgiou, 2010) and their complicated diasporic identities.

I demonstrate these arguments by drawing on digital ethnography complemented with offline ethnography. Centred on social media platforms, especially Facebook as mainly used by Vietnamese diaspora, my analysis shows that the impact of digital media on diasporic connections of Vietnamese community is manifested at several scales – international/ transnational, national, regional, and personal connections. These multiscale connections are evidently related to different social spheres, including religious organisations, business networks, associational activities, or family connections. In each of these realms, the media has an expanding effect on connectivity, allowing influence or connections to transcend fixed time and space, and challenging the limits of physical disconnection.

At the same time, the media participates in the (re)production of (new) disconnections. Divides due to differences in class, origin, religion, or ethnicity continue to exist in the age of digital media, while silence, invisibility and withdrawal have also become new ways of expressing individual identities. Sometimes, digital disconnection does not represent only the individual's identity with the Vietnamese diaspora community, but rather accessibility of physical community space as well as private relationships. Diasporic individuals live their lives in other forms outside of their diaspora identities and are therefore always flexible in their choices and creations of diaspora spaces and connections. When we regard diaspora as a dynamic process in which ethnic boundaries are fluid and individual identities are heterogeneous (Mavroudi, 2007), the dynamic between media and (dis)connections deserves more attention to understand hybridity and in-between identities of diaspora in the future research, rather than only focusing on connection and inclusion created by media.

PP 0750 Highly skilled digital diasporas. Motherhood, class in the Turkish and Romanian migrant communities from Netherlands

[Laura Candidatu](#)¹

¹ Utrecht University, Media and Culture Studies, Utrecht, Netherlands

This paper addresses processes of diaspora formation and digital mediation in the Turkish and Romanian diasporas from the Netherlands. Based on an eight-month long ethnographic fieldwork conducted in 2017 and 2018, the paper investigates how classed identification shapes community building and ultimately informs respondents' affinities toward certain social media platforms and the affordances therein. In addition, it sheds light on the often overlooked highly skilled Romanian and Turkish digital diasporas, groups which have historically been associated with lower-skilled migrations. The paper builds on media anthropology (Madianou and Miller 2012; Miller et al. 2016; Costa 2016) and the anthropology of globalization (Appadurai, 1996; Mazzarella, 2004) scholarship that shows that not only media but also various other elements of transnational social life (such as motherhood and class) influence diasporic communication practices. It furthermore takes a digital ethnographic approach (Alinejad et al. 2019; Pink et al. 2016; Pink and Morgan 2013) by focusing on the lived experiences of migrant mothers across the online-offline continuum (see Candidatu et al 2019). The paper explores how classed distinctions emerging out of the relative recent surge of Turkish and Romanian highly skilled migrants to the Netherlands, play a pivotal role in shaping diasporic mothering practices, raising questions about the gendered relationship between elite migrants (expatriates), diaspora and digital media platforms. For highly skilled migrant women, mothering and classed identification, through a process of disidentification from the historical Turkish community in the Netherlands or the lower skilled Romanian migrants, led to the formation of new diaspora spaces. Furthermore, Facebook appears as an important social media platform for groups of highly educated migrants in this research. The platform emerges especially as a space where class distinctions experienced offline can, to some extent, be mitigated. In conclusion, this paper contributes to the understanding of how class shapes diasporic interactions and how digital media platforms, particularly Facebook, play a crucial role in overcoming classed distinctions within these migrant communities.

DCC01 From virality to vitality: Memes as potential catalysts of social resilience in times of crisis

PN 010 Meme-ing a movement: An exploration of creator commitment in climate change memetics

[Michael Johann](#)¹

¹ University of Augsburg, Department of Media Knowledge and Communication, Augsburg, Germany

Memes are potent vehicles for political critique and social identity. The transformative role of memes in political discourse has garnered considerable attention, yet the insights into the creators and the processes of meme creation—what this study terms as 'meme-ing'—remain relatively unexplored. This study bridges this gap by adopting a commitment perspective to scrutinise how individuals actively maintain the practice of meme-ing, particularly within the context of climate change. The pertinence of climate change to memetic discourse is underscored

by the way memetic communication has been shown to shape and reflect the socio-political engagement of social movements, potentially affecting the perception of climate change. Commitment refers to the sum of forces, pressures, or drives that influence individuals to maintain congruity between their identity setting and the input of reflected appraisals from the social setting. The notion of commitment can capture the forces driving an individual's online active content creation behaviour. Therefore, commitment serves as the missing link in previous meme research between content creation, motivation, and identity, and is pivotal for understanding why individuals engage in meme-ing as a form of political expression. To explore this, the study employed qualitative interviews with 20 climate change meme creators from Germany, alongside a qualitative content analysis of the interview transcripts. This methodological approach enabled a nuanced understanding of the creators' motivations (RQ1), the creators' identity construction within memetic discourse (RQ2), and the role of the creators' commitment to creating and sharing climate-related content on social media (RQ3). The findings reveal that meme creators are driven by factors, such as the entertainment value of memes, their capacity for political critique, and their role in identity management. The meme creators' identity was found to oscillate between their individuality and the collective identity of their online communities. This oscillation leads to a reflexive role performance where creators are both shaped by and shape group-related norms. Commitment manifested in various forms: emotional investment in political discourse, continuity in engaging with climate politics beyond mere meme creation, and normative pressures stemming from membership in online communities. These forms of commitment prompt creators to align their meme-ing with their offline engagements and personal identities. By focusing on meme creators and employing a commitment perspective, this study fills two vital research gaps: it provides a detailed look into the processes behind meme creation and connects identity, motivation, and content creation behaviour within the realm of online political communication and climate change. This research not only adds to the existing body of knowledge on digital political engagement but also prompts a reevaluation of the significance of creator agency in shaping memetic online movements on global issues.

DCC01 From virality to vitality: Memes as potential catalysts of social resilience in times of crisis

PN 011 Harnessing Humor: Reflecting and shaping social resilience in the face of energy crisis

Åsa Thelander¹, [Hui Zhao](#)¹

¹ Lund University, Department of Strategic Communication, Helsingborg, Sweden

This study aims to increase the understanding of the role of memes in enhancing or undermining social resilience in times of crisis. In “the post text” era, where “an online culture in which text recedes to the background, and sounds and images become the universal language”, memes have emerged as relevant tools in shaping public understanding of and reactions to crises. By analysing the content and sentiment of these memes, the study explores the role of memes in fostering a sense of unity, solidarity, or divisiveness among affected communities. By integrating theories from digital culture and crisis communication, this study offers a multifaceted analysis of memes in the context of crisis. The current global energy crisis is used as a case to demonstrate the consequences of the crisis permeating people’s everyday life. The most popular 100 memes disseminated on the Twitter platform from 2021–2023 were collected for analysis. The methodology comprises two parts: a quantitative content analysis to identify key themes and visual representations, and a multimodal discourse analysis to categorise the memes, focusing on their portrayal of the energy crisis and its relation to everyday life. The preliminary findings are: First, the energy crisis is co-constructed through memes. A broad category of memes produced by a variety of actors representing the diverse aspects of the energy crisis. Each meme contributes a thread to the complex tapestry of this global issue, ranging from policy critiques to consumer experiences. As such, they serve as a barometer for public sentiment, combining imagery and text to craft compelling, often humorous, messages that resonate with a wide audience. Second, a unifying theme present in all these memes is humour. The juxtaposition of image with text often yields an unexpected twist, which is the hallmark of meme humour. It’s a creative process that distils complex issues into an accessible form, making light of the serious and often dense subject matter of the energy crisis. By doing so, these memes can transform a technical or bleak reality into a relatable, and sometimes laughable, moment. Third, the humorous content serves diverse functions. One prominent function is to provide stress relief, offering a respite from the gravity of the energy crisis. Another distinct function is to incite anxiety and catalyse action, using humour as a vehicle to highlight the urgency of the situation. This dual capability of memes allows them to be versatile tools in both easing the psychological burden of the crisis and in spurring individuals and communities into meaningful action. Fourth, both the stress-relieving and action-mobilising functions are important in a crisis. Memes can engender a sense of community, helping people to cope with the challenges of a crisis collectively. At the same time, they have the potential to initiate societal change, by bringing issues to the forefront that might otherwise be ignored or understated. To conclude, this study contributes to a deeper understanding of how digital natives engage with and interpret the complex issues surrounding the energy crisis, offering valuable insights for communicators, policymakers, and educators alike.

DCC01 From virality to vitality: Memes as potential catalysts of social resilience in times of crisis

PN 012 Dis-meme-bering the Nation: A Look into Memes Through the Postcolonial Gothic

[Cristina Moreno-Almeida](#)¹

¹ Queen Mary University, Department of Modern Languages and Cultures, London, United Kingdom

This paper suggests that memes are monsters roaming the digital sphere. Existing within the liminal space between humour and horror, memes allow participants to bring to the surface important narratives that speak of the post-colonial nation. Reflecting on humorous yet grotesque memes through the postcolonial gothic, this paper presents how Moroccan memes have mocked well-rooted national symbols born within the struggle for independence from the French rule. In arguing for memes as digital monsters, this paper engages with how the Moroccan Andalusí song “Chams Al Achya” was reborn as a meme in 2019. Until then secluded within the walls of tradition and national festivities, the now Chams Al Achya meme situates Andalusí traditional music at the centre of a set of grotesque and amateurishly-made mashup videos showing failure situations such as violent runovers, smacks, or harmful falls. In becoming a meme, the song has been displaced from its preferred habitat among upper classes and harmoniously dressed music ensembles serving as a reminder of the smells, tastes, and sounds of the festivities of the Eid. Now, the song roams at the centre of a popular meme inhabiting the unheimlich world of Global digital cultures. In the process, the meme has threatened the traditional role Andalusí music plays in remembering the golden era of Moroccan history. Reading the meme through the postcolonial gothic suggests that the meme culture and the song – through their ability to create a sensorial sphere of resonance – may contribute to disfigure and dismember, or rather, dis-meme-berm a memory the eight centuries of Muslim rule over Iberia as formulated by the nationalist movement for independence from the French rule. A postcolonial gothic framework serves to connect humour and horror within different versions of this meme to the failure of nationalists’ projects. It is in this way that this paper argues that the Chams Al Achya meme uncovers the monstrous, chaotic, and grotesque embedded within the memetic return of Andalusí music as a digital cultural artefact. The return of the song “Chams Al Achya” song

as an online gothic story shows digital participants' critical reflection on lingering national(ist) project. Through the notion of the postcolonial gothic, this digital dis-meme-berment denotes the ways in which memes may expose and challenge the shortcomings of the postcolonial national project. In this sense, the revival of nationalist cultural artefacts, now as online memes, is monstrous because in spite of mocking the nation, memetic's own idiosyncrasy means that online netizens are still trapped within a post-colonial nationalist project that refuses to die.

DCC01 From virality to vitality: Memes as potential catalysts of social resilience in times of crisis

PN 013 Memeing the moniker: The stickiness of crime reporting for TikTok meme creation

Jeffrey Mitchell¹, Moa Krutrök²

¹ Umeå University, Department of Sociology, Umeå, Sweden

² Umeå University, Department of Culture and Media Studies, Umeå, Sweden

With a rise of organised crime in Sweden, resulting in one of the highest shooting deaths per capita in Europe. The Swedish National Council for Crime Prevention found that gun violence claims the lives of four people per million in Sweden, which is more than double the average of the European average. In this paper, we explore the interconnected functions and uses of TikTok memes during an ongoing crisis of increased organised crime in Sweden. Specifically, we focus on incorporating gang member monikers – i.e., their nicknames within underground criminal activity in both digital and legacy news media coverage of crime, and the interconnectedness of both media formats. As explored by van Hellemont and Densley, mythmaking is an integral part of gang practices, stating that “without the myth there is no gang”. We claim that monikers are used as a way of not only shaping the myths within gangs but also about gangs in legacy news media coverage and popular culture. On Swedish TikTok, certain members of gangs have become fodder for meme creation. Specifically, one of the suspected foremost leaders of one such organised crime network, Rawa Majid, commonly known as the Kurdish Fox, has gained notoriety in both on- and offline realms. As TikTok users have incorporated imagery, sound, and characteristics of the Kurdish Fox from legacy news media outlets, recordings from police investigation, the role of memes in the subversion of ongoing political discourse concerning organised crime will be explored in this study. Exploring the subversive practices of memes on TikTok, we delve into their role as amplifiers in users' information networks during an ongoing political crisis regarding organised crime and crime prevention. We explore the role of legacy news media imagery and incorporation of gang monikers in legacy news media coverage of organised crime, we incorporate digital methods of exploring content creation (>100 TikTok videos), legacy news media coverage (6400 Swedish articles and news sources), and interconnectedness of the two through multimodal critical discourse analysis and topic modelling. In this paper, we aim to expand the growing academic field of understanding crime on social media, which has heavily focused on the ways criminal offenders use social media as communicative tools. Preliminary findings show that news media incorporate and structure news reporting of organised crime via monikers, and multimodal content becomes recontextualized on TikTok as memetic content creation. Thus, we propose that news media coverage shapes individual gang members' myth-building and creates memetic figures that social media users build upon in their content creation. We find that audio recordings from police investigations become incorporated as memetic frameworks and that the personalization of individual gang members is performed on TikTok by “dressing up” and “playing the part” of the Kurdish fox by lipsyncing and dancing to these recordings.

DCC01 From virality to vitality: Memes as potential catalysts of social resilience in times of crisis

PN 014 “Meme-oralising” civil war: audiences' readings of “the Troubles” memes in Northern Ireland

Martin Lundqvist¹

¹ Lund University, Department of Communication and Media, Lund, Sweden

This study seeks to shed light on audiences' mnemonic engagement with memes about “the Troubles” in Northern Ireland. Memetic memorialisation (or “meme-oralisation”) may, on the one hand, help users find closure with traumatic experiences by giving them the agency to voice their own narratives of the past – narratives which are commonly absent from mainstream media. On the other hand, considering that memes frequently “travel” across digital contexts and may linger online for a long period of time it may entail that users unwillingly come across a meme which re-ignites traumatic memories of the past. Hence, it has been theorised that the meme is a double-edged sword in this regard: having the potential of helping people cope with traumatic memories of the past, while also potentially prolonging said mnemonic suffering. While theoretically convincing, these notions have not previously been “tested” on actual meme audiences. To ameliorate this shortcoming, I explore how audiences in Belfast engage with memes about “the Troubles”. In particular, I narrow in on a starter pack meme entitled “Welcome to Belfast” (the meme can be viewed here: <https://imgur.com/VcFr17v>) which draws its imagery primarily from this violent era in Northern Ireland's past. How – I ask – do audiences make sense of this meme? Does it help them come to terms with the violence of the past, or does it rather keep them trapped in painful memories of civil war? To answer these questions, I conducted 19 semi-structured interviews with interlocutors in Belfast in early 2023, asking them for their take on this (and other) memes about political violence in the city. Many interlocutors

read the meme as an indication that Northern Ireland has somewhat moved on from its troubled past. They saw memetic joking about “the Troubles” as a sign (or even a driver) of societal healing. Here, several interlocutors stressed that black humour about the violent past helps them cope with painful memories of it. Other interlocutors read the meme as narratively bringing back the past into the present: arguing that it is politically divisive and risks fuelling sectarian tensions in present-day Belfast. Interestingly, some of the interlocutors who read the meme this way exercised their agency by suggesting alternative starter pack memes that (in their view) better represent life in contemporary Belfast. Overall, then, this study confirms previous theorisations of how memes function in relation to traumatic memories, but importantly, it does so through an engagement with audiences. This is something that has been mostly missing from the broader meme studies literature where concept such as “imagined audience” and the “directionality” of memes have been favoured over in-depth audience research. Thus, this study not only answers the empirical question of how audiences engage mnemonically with memes about “the Troubles”, but it also contributes to the broader meme studies literature through its focus on the audience reception of memes.

DCC02 Digital governance, moderation, and trust

PP 0059 Participation of Twitch moderators. Guidelines for moderation in online communities

Diana-Maria Cornea¹, Andreea-Nicoleta Voina¹

¹ College of Political- Administrative Communication Sciences, Communication Department, Cluj-Napoca, Romania

The current study focuses on how moderators enforce norms and rules in online micro communities by following moderation guidelines on the Twitch platform. A significant amount of hateful messages have been appearing in live chat, which is a result of the growing popularity of online live streaming services. Live streaming companies have been pushed to raise the level of a centralized moderating executed by algorithms to a moderation model based on human moderators, as viewers turn to new ways to send negative comments (Cullen & Kairam, 2022; Wohn, 2019). Community moderators possess the ability to monitor activities inside communities by applying a contextual understanding of the group’s beliefs and objectives (Cullen & Kairam, 2022).

More studies have been conducted to determine the roles and ethical moderation strategies used by viewers as community moderators, as well as how they become moderators (Cai et al., 2021; Roberts, 2018). Using these research as a foundation, our exploratory study provides a comprehensive understanding of the moderator role in Twitch micro communities. In addition to these elements, we also investigate how a Twitch channel’s norms are established and what executive methods are used to enforce the rules in well-structured, ideologically coherent groups.

This study includes a viewpoint focused on the Romanian micro communities that emerged around certain social-political influencers on Twitch. While previous studies have focused on moderation standards in gaming streams (Mihailova, 2022) and general channels (Cullen & Kairam, 2022; Thach et al., 2022), our study focuses on a different aspect of Twitch communities: social and political discussions. These groups come together around common values and opinions held by both the streamer—who acts as a social or political influencer—and the audience (Nelmarkka et al., 2018; Peter & Muth, 2023). Within this environment, the community’s sense of belonging can be determined by moderating standards and sanctions (Gibbs et al., 2016). Because of this, moderators’ enforcement of the rules is essential to the community’s long-term growth.

For the methodology section, we used a semi-structured interview as a qualitative method to carry out our research strategy. The people who have been chosen for our interview are moderators who supervise the live chat content in some of Romania’s most popular Twitch micro communities. We are now collecting data for this paper. Our goal is to gather insightful knowledge that will enhance the body of current literature and offer new perspectives on the experiences of moderators and the decision-making process of moderation standards. We anticipate that Romania’s ideologically driven micro communities will adhere to rigid standards that serve to unite and bind the entire member group.

DCC02 Digital governance, moderation, and trust

PP 0060 Digital inclusion and digital literacy policy and practice: An exploration of the views and experiences of policymakers and civil society organisations in five UK devolved administrations

Gianfranco Polizzi¹, Jeanette D'Arcy¹, [Rebecca Harris](#)¹, Simeon Yates¹

¹ University of Liverpool, Communication and Media, Liverpool, United Kingdom

Our societies have become increasingly reliant on the use of digital technologies, which can present considerable opportunities and benefits for individuals and different communities. However, not only do these technologies also present significant risks, which makes it imperative for users to possess the digital literacy skills required to engage online both safely and critically, but digital inequalities remain prevalent in the UK. Since gaps in terms of digital access and digital literacy skills still affect much of the population in ways that are intertwined with socio-economic inequalities, the task of promoting both digital inclusion and digital literacy through policy and practical interventions has never been so urgent.

This paper presents key findings from a study that was conducted in the UK by a team of researchers from the University of Liverpool and John Moores University, and funded by the British Academy and Ofcom. Adopting a mixed methods approach focusing on five key devolved administrations in the UK (Birmingham / the West Midlands, Greater Manchester, Liverpool City Region, Scotland, Wales), this project explored in depth the experiences of challenges and best practice of two under-researched groups promoting digital inclusion and digital literacy – policymakers and civil society organisations – and what initiatives are currently being implemented in their areas. As part of this research, an online survey and elite interviews were conducted with both policymakers and organisations in each of the five areas. The data was analysed to produce key findings and recommendations for advancing policy and practice in digital inclusion and digital literacy in the UK.

Key findings from the project suggest that there is a need for an overarching framework for promoting digital inclusion and digital literacy more robustly across the UK. For both policymakers and organisations, collaboration is crucial. However, while there are examples of good practice in the establishment of digital taskforces and networks promoting digital inclusion within the different areas, promotion of digital literacy is less of a priority and piggybacks onto those networks. What is more, one of the main challenges that both groups experience is the extent to which funding for the implementation of digital inclusion and digital literacy initiatives is inconsistent, short-term and prescriptive. In the light of these findings, this paper presents recommendations with a view to advancing the state of policy and practice in digital inclusion and digital literacy.

DCC02 Digital governance, moderation, and trust

PP 0061 Exploring circular approaches to the management of IT resources for social good within the UK public sector

[Jeanette D'Arcy](#)¹, [Rebecca Harris](#)¹, [Emma Stone](#)², Simeon Yates¹

¹ University of Liverpool, Communication and Media, Liverpool, United Kingdom

² Good Things Foundation, Research, Sheffield, United Kingdom

As our societies become increasingly mediated by digital technologies and more essential services and life opportunities move online, it is vital to acknowledge that digital inequalities are still a key issue in the UK. Digital inclusion encompasses more than just access to the devices and data necessary to go online in the first place, including the need for the digital skills, motivation, and understanding to use the internet safely and confidently. However, this first step – i.e. access to devices and data – is still a barrier to inclusion for many. Digital exclusion is intertwined with social and economic inequalities and affordability of devices and data is a key issue, especially in the current cost-of-living crisis. Concern is also growing amid the parallel climate crisis about e-waste (i.e., discarded electronic devices), and the environmental costs of linear models of consumption of devices, connectivity and digital technologies. Device donation and reuse programmes have the potential to address both the goal of reducing e-waste and of addressing digital inequalities, and there is opportunity in the public sector to achieve these goals both via policy and via leading by example through taking part in such programmes.

This paper presents key findings from a project conducted by a team of researchers from the University of Liverpool and Good Things Foundation, funded by Research England. Based on a series of interviews with key public sector organisations and stakeholders across the UK, this project explored the motivations, enablers, and barriers which they experience in determining whether to adopt a more circular approach in how they manage their IT estate, and how this can help them to play their part in improving the lives of digitally excluded people. Data was thematically analysed to produce findings and recommendations.

Key findings suggest that commitment to sustainability targets and a desire to give back to communities along with awareness of issues of digital exclusion are motivators for reuse and donation of devices. Data security is a key concern for public sector organisations and can serve as a barrier, but one which is mitigated by organisational culture around risk management, which was found to be an enabler. Collaboration within and across organisations is an

important enabling factor, but so are individual 'champions', who are committed and motivate others, especially when they are found in senior positions with the ability to cut through bureaucracy.

This paper presents a set of recommendations, produced as part of the project, for both policymakers and organisations to promote more circular approaches to the management of IT resources within the public sector, including device reuse and donation programmes.

DCC02 Digital governance, moderation, and trust

PP 0062 "Hey Voice Assistant, tell me about your privacy policy!" The influence of privacy policies presented by voice vs. text on trust and use intentions in a voice-based assistant

[Katharina Frehmann](#)¹, [Marc Ziegele](#)¹, [Scarlett Arkian](#)¹, [Miriam Melzer](#)¹, [Jana Nagel](#)¹, [Yakin Bejan](#)¹

¹ Heinrich-Heine-Universität, Kommunikations- und Medienwissenschaft, Düsseldorf, Germany

Voice-based assistants (VBAs) have gained popularity as interaction partners and information sources (Newman et al., 2020, 2021). Despite their widespread use, many individuals remain non-users due to privacy concerns (Easwara Moorthy & Vu, 2015). While explaining data collection processes could alleviate these concerns, many privacy policy texts are too complex for users to engage with, resulting in uninformed consent and diminished trust (Ermakova et al., 2016).

To address this issue, some providers attempt to give verbal privacy information via the VBA itself to enhance interest, long-term acceptance, and use (Amazon, 2022; Jesus & Pandit, 2022). However, it is uncertain whether verbal presentations achieve these positive effects. Therefore, the current study explores whether presenting privacy policies via voice rather than text enhances user trust and intentions to use a fictional VBA.

Research on the Computers-As-Social-Actors paradigm suggests that human cues, like voice instead of text, promote perceptions of social presence and thereby increase trust in digital interaction partners (Nass & Moon, 2000; Blau, 1967). Trust is considered an important prerequisite for technology acceptance, and it predicts the use of technology like robots (Ghazizadeh, 2012; Wirtz et al., 2018). We therefore hypothesize that presenting privacy policies verbally will increase trust in the VBA compared to textual presentations (H1). We further assume that trust positively correlates with usage intentions of the VBA (H2), and that verbal presentation of privacy policies increases usage intentions via the enhancement of trust (mediation hypothesis H3).

In an online vignette experiment in 2021, participants imagined interacting with a fictional VBA that presented its privacy policy either via text or a pre-recorded human-sounding voice. 315 participants (55% female; MAge= 38; 78% high school graduates) evaluated trust (Pitardi & Marriott, 2021, $\alpha = .91$) and usage intentions (Cha et al., 2021, $\alpha = .89$).

Results confirm the hypotheses: Verbally presented privacy policies increased trust compared to text ($B = 0.35$, $p = .03$), and trust positively correlated with usage intentions ($B = 0.64$, $p < .001$). The indirect effect of verbal presentation on usage intention via trust was also positive ($B = 0.23$, 95% CI = 0.02 – 0.44). Interestingly, the verbal presentation had a negative direct effect on usage intention ($B = -0.43$, $p = .005$), and these competing effects canceled out the overall effect of presentation on usage intention ($B = -0.21$, $p = .27$).

The results provide insights into trust-building through verbally presented privacy policies. However, further measures might be necessary to promote VBA use. For example, Amazon already offers to ask Alexa dialogically and interactively about its privacy (Amazon, 2022), which could increase engagement, social presence, and trust. Whether such methods are sufficient to overcome skepticism about VBAs' privacy is unclear – especially since these concerns are justified, as some VBAs have been found to record private interactions (Ford & Palmer, 2019). Therefore, the actual privacy aspects need to be improved rather than their presentation. Future studies should investigate how data privacy is perceived by different (non-)users and how this perception impacts trust-building and usage intentions.

DCC02 Digital governance, moderation, and trust

PP 0063 "I wouldn't trust her with my life but..." – Identifying explicit and indirect signs of trust in voice-based-assistants in user-generated-content online

[Katharina Frehmann](#)¹, [Jana Leonie Peters](#)¹, [Marc Ziegele](#)¹

¹ Heinrich-Heine-Universität, Kommunikations- und Medienwissenschaft, Düsseldorf, Germany

Voice-based assistants (VBAs) are gaining popularity as new interaction partners and information sources that select and frame content users receive (Newman et al., 2019, 2020; Weidmüller, 2022). However, as commercial products of tech-companies, they serve commercial interests and do not provide transparency about how they work (Natale, 2021). Despite this lack of information, users still turn to them, which could be explained by trust: Trust enables interactions where one party has expectations towards another, but cannot control their actions (Mayer et al., 1995). It is unclear how trust in VBAs should be conceptualized, as they are a) technical devices but b) perceived

socially and c) act as information sources (Etzrodt & Engesser, 2021; Guzman 2019). Technical, interpersonal, and media trust concepts may thus be equally applicable. Furthermore, trust in VBAs has been investigated in quantitative studies, but qualitative studies could offer new insights into undiscovered aspects from users' perspectives. User-generated content like reviews could reveal such aspects, as it typically contains users' attitudes towards a technology, evaluated characteristics, and described experiences (e.g., Gebauer et al., 2008). Therefore, our study searches for explicit (RQ1) and indirect (RQ2) signs of trust in VBAs in German user-generated content.

Trust enables interactions in which trustors have positive expectations of a trustee but no control over the expected outcome (Luhmann, 2014). It is a partly subconscious attitude, often measured via determinants called "trusting beliefs", i.e., evaluations of trustees and their characteristics. When trust is given, it can be observed in its consequences, i.e., "trusting intentions" and "behaviors" (McKnight et al., 1998). Trust has been investigated for trustees like humans (Mayer et al., 1995), technology (McKnight et al., 2011), or media (Kohring & Matthes, 2007). For digital interactors, hybrid concepts combining interpersonal and technical trust have been successfully tested (Ulman & Malle, 2018; Weidmüller, 2022), but VBAs' role as information sources has not been considered yet.

Using qualitative structuring content analysis, we analyzed 170 postings about Alexa, Siri, and Google Assistant found on marketplaces, media coverage, and discussion platforms. We used the following main categories derived from trust research: explicit trust-statements, determinants, consequences, external factors. We extended them and their subcategories inductively (Kuckartz, 2018). Results showed that users rarely use the term trust in their postings, and most explicitly apply trust to parent-companies in high-risk-contexts rather than directly to VBAs (RQ1). Nevertheless, users evaluated VBAs regarding previously found and potential new determinants of interpersonal, technical, and media trust, e.g., competence, functionality, accuracy. When users discussed AI-capabilities, determinants of all three dimensions were mixed, suggesting a hybrid trust and confirming the relevance of media trust in addition to technical and interpersonal trust for VBAs (RQ2).

Overall, results indicate a subconscious trust: Users may not consciously associate the term "trust" with VBAs, but subconsciously evaluate signs of trustworthiness and rely on the VBA accordingly. We also found aspects that can be potential consequences and external factors of trust in VBAs and will discuss these findings as well as a preliminary model of hybrid trust in VBAs derived from our findings.

DCC03 Approaches and challenges to researching the digital

PP 0157 Cruising as method for researching queer dating cultures, or, queer melancholia in times of emotional capitalism

Lukasz Szulc¹

¹ University of Manchester, School of Arts- Languages and Cultures, Manchester, United Kingdom

Traditionally, media researchers have employed well-established, mostly quantitative, social science methods that require an objective, systematic and comprehensive analysis. This often has resulted in what Donna Haraway called the god trick, a pretence of seeing everything from nowhere. While cultural and critical media studies—which employ qualitative methods and interpretivist epistemologies—have earned more respect in contemporary media scholarship, they continue to be judged by similar, even if adapted, standards of what 'good research' should look like. Moreover, with the increasing rise of big data analytics, they have been arguably further marginalized as studies of allegedly less rich small data. In this paper, I will challenge the established quantitative as well as qualitative methodologies in media research by proposing cruising as method. Cruising is a queer tradition of wandering around to find sexual connections. It is driven by desires and involves feeling adventurous and aroused but also agitated. Translating this practice into a research method, cruising is about following what attracts us in data rather than conducting a formally structured analysis. It is about slowing down and hanging around with the hope of running into something that may prove risky, but what feels good. It is not about fixing gaze but throwing glances, the queer trick. I will discuss the prospects and limits of cruising as a method in relation to my recent project with Polish LGBTQs in the UK, which included 767 survey responses and 30 in-depth interviews, collected in 2018 and 2019. Interviewees included a diverse group across the LGBTQ+ spectrum, were located in different cities and towns in England, Scotland and Northern Ireland, and were between 19 and 58 years old at the time of interviews. I reached them through relevant LGBTQ+ and migrant communities and targeted advertising on social media. Interviews were conducted in Polish, English or Ponglish. In my analysis, I will focus on the participants' uses of hook-up apps and dating websites, arguing for the recognition of queer melancholia in dating cultures in times of emotional capitalism (Eva Illouz). I will show how by cruising the data and making connections between the data and the wider cultural transformations of capitalism, globalisation and mediation, we can make sense of the negative emotions expressed by my interviewees about digital dating cultures. I will frame these findings in terms of queer melancholia, that is, feelings of loss, loneliness, disappointment, rejection and alienation that, to some extent, have been exacerbated by the current largely digital and global cultural condition. To conclude, I will discuss the new insights we can gain when we withstand the positivist pressures of objectivity, systematization and completeness, and make coding less about looking for recurring patterns and more about succumbing to researchers' temptations.

DCC03 Approaches and challenges to researching the digital

PP 0158 Chances and challenges of participatory digital ethnography on TikTok

[Lisa Plumeier](#)¹

¹ Film University Babelsberg Konrad Wolf, Media Studies, Potsdam, Germany

TikTok being a platform based on ephemeral and multimodal networks that is especially known for its algorithmic sorting component as a success formula, brings up a variety of challenges in terms of research (Duguay/Gold-Apel 2023). Scholars have approached the platform via qualitative, ethnographic methods (Schellewald 2021, Zulli/Zulli 2022) to comprehend its workings and making sense of its structure. Still, the network poses the challenge of a highly individualized scrolling experience that is prone to sensitive changes depending on user's content interaction and bringing up significant limitations in terms of scholarship. Looking at TikTok within the "platform paradigm", stating social platforms' "power within the information sector and creative industries" (Burgess 2021), it is of heightened importance to find ways to tackle the ongoing issue of intransparent technology, heavily relying on civic practices to better understand its underlying mechanisms, for example theorized as "algorithmic folklore" by Kaye et al. 2022 or "visibility labour" by Abidin 2016.

Accompanying a larger research project dealing with remixed content of popular artefacts on TikTok, a 2-month participatory pilot study was carried out in Spring 2023 involving eight co-researchers, all of them being German TikTok users. The aim of the study was to get a better understanding of methodological possibilities and potentials to a) trace and comprehend specific content clusters and observe wider content ranges, b) find ways to work with and around the challenges of the platform's given technological nature and c) test out different (civic) methods to triangulate, reflect and expand the auto-ethnographic approach. This contribution focuses on the outcomes of c) and partly b), aiming at providing insights into the specific research process, such as chances and challenges of the chosen approach when facing TikTok as a platform with a very unique set of affordances and user cultures. The co-researchers were encouraged to observe and interact with their native, individual feeds, enabling the possibility of different digital auto-ethnographic perspectives within the same research preliminaries. The observations were accompanied by reflective processes – group discussions, media diaries and reflection reports – to comprehend movement within the study's framework, open possibilities to contextualize data and to ensure the epistemological alignment of all participants.

This framework of participatory digital ethnography allowed the research process to take into account the flexibility and complexity of TikTok as a monopolized platform. Moreover, it offered a practice of resistance against the platform's intransparent sorting mechanism and gave beneficial insights on the micro-interactions between users and their algorithmic counterparts. By engaging with different user-feeds it became possible to gain a wider perspective on the outstanding versatility of the research objective. Some of the results show for example that despite a proportionally homogenic group of co-researchers there were little to no overlaps in collected content, both in thematic as well as referential terms. At the same time the variety of interpretative and referential knowledge provided by the research participants added a significant contribution to interpersonal meaning-making. Regarding the multi-modal environment of TikTok it proved beneficial to adapt that structure towards a multi-perspectival, multi-methodological research approach.

DCC03 Approaches and challenges to researching the digital

PP 0159 Peeling back the layers: The Onion Model of youth's digital disconnection explored through digital diaries

[Mehri Agai](#)¹

¹ University of Bergen, Information Science and Media Studies, Bergen, Norway

This paper presents a nuanced exploration of digital disconnection among youth, situated within the ambivalence of digital spaces. Framed within the original "Onion Model" conceptualized for this study, it utilizes digital diaries over a week-long period with 17 Norwegian youths to probe the central research question, "How do digital diaries reveal both intentional and unintentional aspects of digital disconnection in young people's daily media experiences?" The study contributes both conceptually and methodologically to the field of digital disconnection and the broader tensions within digital cultures, providing a bottom-up perspective on media experiences.

Conceptually, the study addresses the challenge of articulating the nuanced processes of digital disconnection, previously limited in scope within the literature. To do so, the study introduces the "onion model" – a metaphorical construct adapted from the broader social sciences – specifically designed to analyze the various layers of digital disconnection. The middle layer of the onion model captures cognitive processes and emotional responses to digital media, including critical self-reflection and affective experiences. The inner layer encompasses identity and value-based disconnection, examining alignment with personal principles. The model also incorporates temporal and intensity dimensions, highlighting gradual disconnection habituation and varying effort levels. Overall, this

model provides a comprehensive framework that elucidates the complexities of digital disconnection and how it evolves over time.

Methodologically, the paper responds to the need for creative methods (Lomborg & Ytre-Arne, 2021) capable of detailing the subtleties of digital disconnection. Through utilizing digital diaries, the research captures the daily experiences and fluctuations in digital interaction among youth. This approach provides a longitudinal perspective and captures the temporal and emotional intensity of disconnection, offering in-depth insights into the informants' habitual disconnection woven into the rhythm of their digital lives. By combining semi-structured interviews, surveys, and diary entries, the study offers a robust methodological contribution that reveals the interplay between digital disconnection and the informants' daily routines, emotions, and attitudes, thereby advancing the methodological tools available in the field.

The analysis reveals that young individuals opt to disconnect due to immediate impulses and evolving habits that are deeply ingrained in their daily routines and sense of self. Key findings suggest that disconnection practices can be subtle, such as ignoring notifications, or more pronounced, like social media hiatuses. These practices are shaped by personal emotional reactions and cognitive assessments of the role of digital media in their lives. Furthermore, the research indicates a temporal pattern where disconnection becomes habitual, organically integrating into young people's daily lives.

The paper's significant contribution lies in its detailed portrayal of the interwoven cognitive and emotional triggers for disconnection, the varying degrees of effort invested, and the gradual habituation to disconnection over time. The study highlights the importance of understanding youth's navigation of their digital lives and suggesting strategies to promote digital well-being and literacy. The study affirms the value of digital diaries in digital disconnection research, offering in-depth insights into youth's daily digital experiences.

DCC03 Approaches and challenges to researching the digital

PP 0160 Data donations. A Scoping Review to investigate non-response bias and strategies to enhance participation

Elisabeth Schmidbauer¹, Jörg Haßler¹

¹ Ludwig-Maximilians-Universität München, Department of Media and Communication, Munich, Germany

Online platforms play a huge role in everyday life and changed the way we organize politically or consume news. Nonetheless, investigating such behavior poses challenges. Measurement is difficult, due to recall errors or social desirability in surveys. Data donations appear to be promising to address such issues (Wu-Ouyang & Chan, 2023).

Donated data from online platforms introduce their own biases, including non-response bias (Amaya et al., 2020). To unfold the potential of data donations, the necessity, to investigate and tackle this bias on the decision to donate arises. Therefore, our study asks why people do (not) donate their data to science and how to enhance participation.

To answer this research question, we conducted a Scoping Literature Review (Arksey & O'Malley, 2005; Levac et al., 2010). After searching different databases, Google Scholar and conducting a Backward Search (Booth et al., 2022) 523 studies were screened for eligibility.

After screening whether they deal with participation in data donation studies, 30 studies were included, primarily stemming out of health ($n = 13$), methodological ($n = 9$) or communication ($n = 4$) research. Most studies ($n = 12$) hypothetically queried willingness to donate through surveys or did not specify the method of donation ($n = 12$).

Influencing the decision to donate, studies identify non-situational factors, like technical skills ($n = 9$) or participants characteristics related to the study ($n = 7$). The latter can include, people who do not exercise regularly, refraining from donating health data (Toepoel et al., 2021). This introduces social desirability to participation.

Further, *general* and *study specific* situational factors, are identified. Within the former, privacy concerns ($n = 23$) are discussed most prevalently. The latter emphasize research design's influence, like required data types ($n = 12$) and the receiver of the data ($n = 11$).

Finally, *general* strategies potentially increasing participation include offering incentives ($n = 13$), suitable communication ($n = 11$) and nudges ($n = 7$), such as framing. Persuasive strategies, like hidden requests ($n = 1$), are discussed critically. *Study specific* strategies entail cultivating trust ($n = 14$), emphasizing adequate privacy protection ($n = 10$) and reducing the burden of participation ($n = 9$).

Studies on the *hypothetical* willingness to donate have to be evaluated critically, since people's *attitudes* to data disclosure and their *behavior* might differ (Toepoel et al., 2021). Therefore, studies should not only ask *if* people would donate, but *under which circumstances*.

In conclusion, the benefits and potential biases of data donation need further investigation. This literature review provides an important orientation for understanding and reflecting on the method. It highlights various general and study-specific aspects that influence the decision to donate which will be further explained and discussed in a potential presentation at ECREA.

DCC03 Approaches and challenges to researching the digital

PP 0161 The craft of bourdieusian media studies: Towards a relational sociology of digital media

[Johan Lindell](#)¹

¹ Uppsala University, Informatics and Media, Uppsala, Sweden

Pierre Bourdieu's field theory (e.g., Bourdieu & Wacquant, 1992) occupies a central place in many sub-fields of media and communication studies, including journalism studies, audience studies and media production studies. While media scholars have put Bourdieu to use in productive ways since the 1980s, our field has not yet embraced his full research program. It follows that media scholars' use of Bourdieu is characterized by a lack of correspondence between (field) theory and empirical research designs. Bourdieu nonetheless offered a holistic research program that includes a general theory of society (comprised of the triptych of field-capital-habitus) and a methodology able to accommodate his relational view on the social world. With a few exceptions (e.g., Hovden, 2008), the use of the method that aligns with the principles of field theory, multiple correspondence analysis (MCA), is rare in our field. In order to advance a holistic theoretical-methodological approach to field theory this paper spells out what "Bourdieuian media studies" entails. This research program offers productive ways to study key dynamics of the digital media landscape, including how social inequalities reflect in how people use digital media and the changing dynamics in fields of media and cultural production. The paper begins by unearthing the epistemological principles of field theory. It then illustrates how these principles are translated into the domain of empirical work with MCA. Two analytical strategies in Bourdieusian approach to MCA are presented: the social space/field analysis approach that starts in the analysis of social structures, and the "reciprocal approach" that begins in the study of lifestyles such as news consumption patterns, cinematic and music preferences, and patterns of social media use (Rosenlund, 2015). In addition, the paper applies field theory to the automated collection and visualization of digital interactions via social network analysis (SNA). Bourdieu remained skeptical of network analysis because of its focus on relationships between actors (e.g., interactions) rather than social structures. Drawing on previous attempts to merge SNA with field theory (e.g., De Nooy, 2003; Bail, 2014) this paper nonetheless illustrates how SNA may inform field theory on two counts. First, it is possible to identify the traces of social fields by studying metrics that capture interactions between actors in digital milieus. Second, studying patterns of interaction among actors, *in toto*, promotes an initial understanding of the outer limits of a field.

DCC04 Protest and activism on digital platforms I

PP 0162 It's ok as long as it's moral? Analyzing acceptance of uncivil comments in moralized online discussions about gender diversity and inclusivity

[Ina Helene Weber](#)¹, Heidi Vandebosch¹, Karolien Poels¹, Sara Pabian^{1,2}

¹ University of Antwerp, Communication Studies, Antwerpen, Belgium

² Tilburg University, Communication and Cognition, Tilburg, Netherlands

In a polarized opinion climate, discussions on social media about divisive issues are often characterized by hostilities and intolerance. An understudied yet possibly influential factor in this context is moralization, which we investigate by asking how moralization in online discussions impacts social media users' perceptions of uncivil comments. Moralization describes a process in which personal matters gain moral relevance. The Theory of Dyadic Morality (TDM) suggests that perceptions of moral relevance are triggered by perceptions of harm in a feedback loop: What seems harmful, seems morally wrong and what seems morally wrong, seems harmful. TDM specifies harm as individually perceived and dyadic (i.e., an entity intentionally causes damage to a vulnerable victim) (Schein & Gray, 2018).

Viewpoints based on morality are referred to as moral convictions. They are experienced as universal, objective truths that can predict for example intolerance towards political opponents (Ryan, 2014) or the legitimizing of deviant behaviors (Skitka et al., 2021). In polarized discussions, perceived threats to moral values furthermore prompt outrage and calls for punishment of those with differing views in order to protect one's own moral values (Van Zomeren et al., 2023).

Based on this theoretical framework, we assume that online discussion comments containing dyadic harm cues trigger moralization, which subsequently affects how the discussion is perceived. We hypothesize that moralization makes social media users perceive uncivil comments as less severe and more acceptable. Presumable moderation effects pertain to existing moral convictions and the ideological stance of the uncivil comment (if incongruent with an individual's ideological leaning, moralized uncivil comments may be perceived as more severe and less acceptable). We propose a mediation effect through ingroup value protection, a process triggered by dyadic harm cues and manifested in the experience of negative moral emotions and a desire for punishment of the commenter (Van Zomeren et al., 2023).

In a 2x2 between-subjects online experiment, we manipulate moralization (dyadic harm vs. personal preference) and ideological stance (conservative vs. progressive) of an uncivil discussion comment to test these assumptions. The experiment is conducted in Germany and Belgium with samples of 780 internet users from each country. The stimulus consists of a fabricated online discussion about gender diversity and inclusivity, a highly relevant issue in the context of incivility given the persisting discrimination against members of the LGBTQ+ community. We verify perceived polarization of different discussion topics in a pre-test in both countries.

For this study, incivility is defined as both a violation of politeness norms signaled by vulgar and offensive language (Kümpel & Unkel, 2023) and a threat to pluralistic debate by excluding others, negatively stereotyping them and discrediting their arguments (Kenski et al., 2020; Papacharissi, 2004). Ideological stance of the comments is indicated by embracing or opposing gender diversity and inclusivity. We measure perceptions and acceptability of the uncivil comment, as well as experiences of moral emotions and desire for retributive justice against the uncivil commenter. Data will be collected in January 2024 and analyzed by conducting mediation and moderation analyses.

DCC04 Protest and activism on digital platforms I

PP 0163 Russian digital nationalism and the Russo-Ukrainian War through the Prism of Russian Media Ecology

[Alexandra Brankova](#)¹

¹ Uppsala University, Department of Informatics and Media & Institute for Russian and Eurasian Studies, Uppsala, Sweden

The Russo-Ukrainian war and Russia's full-scale invasion of Ukraine are among some of the most mediated armed conflicts having multiple dimensions alongside the one on the battlefields (informational, ideological, economic, technological, and geopolitical). The neo-authoritarian process in the Russian Federation has a stronger focus on controlling digital media through the Federal Service for Supervision of Communications, Information Technology and Mass Media (Roskomnadzor) and boosting state-led narratives through algorithmic structures where only outlets registered by the Roskomnadzor appear on news aggregators such as Yandex Zen and Yandex News (Wijermars, 2021). The media framing of the war and of the Russian armed forces is strictly controlled and has resulted in the suppression of independent or more liberal media outlets. Meanwhile, nationalist media, movements, and their communities (such as Tsargrad online television, Eurasianists, and military bloggers on Telegram) have increased their salience among Russian audiences as alternative voices to the state-owned outlets. However, nationalist actors remain precarious judging by the closure of Yevgeni Prigozhin's Patriot Media Group (after his mutiny) or the arrest of the military blogger Igor Strelkov (Girkin).

This paper maps key Russian digital media channels and communities studying the Russian media landscape through the prism of media ecology (McLuhan, 1964; Postman, 1970; Altheide, 1995; Hoskins and Tulloch, 2016). The media ecology approach can serve as both a theoretical and methodological instrument that helps reveal synergies between nationalist and state actors, the influence of key figures and their media production practices and discourses, as well as the impact of bottom-up communities for mobilizing audiences in support of the war effort. Building on the communicative turn of media ecology (Altheide, 1995; Hearn and Foth 2007; Hoskins and Tulloch, 2016; Trere and Mattoni, 2016), I argue that Russian media ecology has state-specific characteristics and actors shaping three layers: technological, social and discursive. The paper aims to answer two research questions: what are the characteristics of Russian nationalist new media ecology, and what prevalent narratives of othering and "enemification" are salient among key Russian nationalist digital cultures? The paper combines digital methods, netnography, and critical discourse analysis (discourse-historical approach) in order to analyse the hyperconnectivity between actors, movements, their discourses, and larger media practices before and during the invasion (2018–2023). Assessing a non-Western case, digital media and aligned Russia-specific social media channels (such as Telegram, Odnoklassniki, or VK) provide platforms for the expressions of nationalist cultures. They also shape a darker type of participation where VK or Telegram serve as tools for recruitment for the frontlines, updates or firearm training provision. The study demonstrates that Russian nationalist actors can foster polarization of platform

environments and discourses of othering, both internal (Russian liberals, critics of the war or immigration) and external (the West, Central Asian States, Ukraine, the USA, or the UK). The line between order and disorder remains blurred since the notion of partners and adversaries shifts. The paper makes a contribution to both the Digital Culture and Communication Division and the Central and East-European Network of ECREA.

DCC04 Protest and activism on digital platforms I

PP 0164 Networked masterplots: Music, pro-Russian sentiment, and participatory propaganda on TikTok

Marloes Geboers¹, Elena Pilipets²

¹ University of Amsterdam, Media Studies, Amsterdam, Netherlands

² University of Siegen, Media Studies, Siegen, Germany

This article investigates engagement with propagandist videos on TikTok shortly after Russia's invasion of Ukraine on February 24, 2022, with particular attention to the role of music and comments. By repurposing the infrastructure of TikTok sound-linking (Author, 2023), our research upholds sensitivity to how this infrastructure enables affective and participatory workings of propaganda. Propaganda takes on various forms (Boler & Davis 2020), but within the scope of our research it is best defined in its capacity "to manipulate public opinion by activating strong emotions, simplifying ideas and information, attacking opponents, and responding to the deepest hopes, fears, and dreams of its target audiences" (Hobbs, 2020, p. 5; Luckert & Bachrach, 2009).

The overarching question guiding our research is: How do the affective affordances of TikTok (Author, 2022; Hautea et al., 2022) shape pro-Russian war propaganda? We present a case study using novel methods tailored to TikTok's performative and memetic nature. The case study consists of three video templates – each demonstrating specific aesthetic choices and attention-grabbing techniques (Abidin & Kaye, 2021) – that we conceptualise as networked masterplots. The analysed plots, as we will show, not only intentionally share the use of the same song but emerge through imitation (Zulli and Zulli, 2021) on the textual level of "stickers", or messages overlaid on top of videos. A selection of fifteen pro-Russian videos using the stickers – "What if they attack?", "I am wondering how many will (un)subscribe?", and "I am (not) ashamed" – in combination with a techno remix of the Soviet folk song Katyusha will be at the centre of our investigation. The remix turns a nostalgic 'sound from the past' into a catchy techno beat, targeting users' sense of collective belonging through a masterplot that is "co-constructed, stripped-down (skeletal), and thus easily shareable and adaptable" (Mäkelä, 2021, p. 51).

To explore the affective pathways extending the propagandist message, our research traces resonances and dissonances (Paasonen, 2021) evident in both video performances and interactions in the comment sections. We approach the latter through digital methods for multi-modal visual and textual analysis (Rogers, 2019; Rose, 2023; Niederer and Colombo 2019) attuned to the repetitive nature of users' shoutouts and the default visibility of comments with replies. We then make three arguments: First, TikTok's multi-layered affective affordances and networked features prioritise embodied performances that go beyond 'mere' persuasion, focusing on the bonding potential instead. Second, all three masterplots tap into a theatrical mode of 'situation and suspense' (Wang & Suthers, 2022), the suspense dissolves so as to inspire video appropriations and user alignments in the comment sections. Third, by fostering the practices of imitation through commenting, Katyusha TikToks not only make memetic content grow "sticky" (Ahmed, 2004) with affirmative associations of love (for the nation) but also foster collective imaginaries of war and peace. Arguing that in Katyusha videos, situation and suspense are indivisible, we conclude by reflecting on how TikTok sharing not only facilitates self-expression and social activism but also enables the weaponization of content within networked memetic environments.

DCC04 Protest and activism on digital platforms I

PP 0165 Challenges to unity: Exploring collective resistance among video content creators in the platform economy

Xiaoqing Bai¹, Jing Zhang¹

¹ Communication University of China, Television School, Beijing, China

The platform economy, a manifestation of digital capitalism, entices video content creators with promises of flexible schedules and creative autonomy. However, this seemingly liberating landscape conceals challenges such as uncertain labor relations, hidden control mechanisms, and elevated labor risks. This has spurred the imperative for collective resistance among creators. Employing the framework of labor process theory, this study explores the impediments hindering the realization of collective resistance within this dynamic environment.

Labor process theory posits that platform workers are not passive objects entirely subjected to digital capital but complex subjects who "make and seek meaning" (PING & YUJIE, 2021). Workers' subjectivities evolve through on-going labor practices, influenced by capital dynamics within specific workplaces situated within a broader political economy (Elger & Smith, 2005). Consequently, collective resistance, as a form of labor practice, should be analyzed within the context of a dynamic social process, avoiding reduction to abstract economic relationships (O'Doherty & Willmott, 2001).

This study addresses two primary questions: First, what factors impede video content creators from organizing collective resistance? Second, what psychological characteristics or objective circumstances do these factors reflect? To explore the potential for collective resistance, we immersed ourselves in the Bilibili platform between May 2023 and December 2023. Conducting participatory observations and semi-structured in-depth interviews with 22 creators, we delved into the experiences of content creators on this prominent Chinese video platform. Interviews, ranging from 60 to 120 minutes, were conducted with creators stratified into three levels based on their follower count: fewer than 100,000, 10,000 to 100,000, and over 100,000.

In conclusion, this study identifies improper utilization of "weapons of the weak" (Scott, 1985) and differences in creative experience as significant obstacles to collective resistance among creators. First of all, to cope with the intensifying exploitation by platforms, creators formed small-scale cooperatives to produce video content with a specialized division of labor. However, creators habitually "cut corners" in their collaborations and compete for revenue, which lowers the quality of their videos and breaks down the sincerity and fairness of the collaboration, wrongly pointing the "weapon of the weak" at other "weak people". In addition, existing studies have shown that many creators compromise their creative autonomy and produce content that runs counter to their inclinations to make ends meet. This common experience of "alienated judgment" (Siciliano, 2023) of creators is the basis for achieving collective resistance. However, varying levels of creators exhibit heterogeneity in wages and status, fostering a "narcissism of minor differences" (Deuze, 2007) that undermines shared experiences essential for collective resistance. Creators' different experiences are categorized into three tiers: the success tier, the dream-chasing tier, and the livelihood tier. Each tier exhibits distinct attitudes towards the platform, creative freedom, and their peers, influencing the potential for collective resistance.

We posit that pathways to collective resistance are embedded in the labor process. Only through a nuanced examination of subjectivity and dynamic environmental factors within the labor process can we uncover insights into existing obstacles and potential avenues for collective resistance.

DCC05 Pop culture and digital attention economies

PP 0256 Memes in mainstream digital culture: A cross-generational phenomenon

[Giulia Giorgi](#)¹

¹ University of Milan, Department of Social and Political Sciences, Milan, Italy

This study combines the theoretical framework on social generations and original empirical research to re-conceptualize the memetic phenomenon and observe its impact on mainstream digital culture.

After more than a decade since media studies scholars reappropriated the concept from memetics to study a seemingly fringe, subcultural phenomenon, Internet memes have gained momentum as the foundational digital practice. Nowadays any event, from pop culture to politics, can be commented on through memes. Following its mainstreamization, the memetic phenomenon extended beyond its original user base, coming to include previously excluded segments and demographics. Although the popularization of memes has been widely recognised, most studies still rest on definitions formalized when memes were bound to limited environments and communities (e.g. Shifman, 2014). These are therefore partially inadequate to capture the plurality of actors, conceptualisations, and digital spaces involved in contemporary meme culture.

Scholars agree that memes rely on a common milieu to be consumed: while this has traditionally been identified as affiliation to subcultural spaces and/or political leanings, I assume the existence of a generational bond, foundational to the political and cultural ones, which contributes to constructing different understandings of memes. The argument I put forward is that memes are a cross-generational phenomenon that takes on different forms, values, and meanings, depending on the generational allegiance of the users producing and circulating them.

This claim is supported by empirical research, which combines digital methods with semi-structured interviews and takes Italy as a case study. First, a corpus of around 2,000 memes was collected on Instagram and Facebook following the hashtag #memeitaliani (Italian memes); recurrent patterns in the composition of memes and in the conveyed messages have been explored by means of content analysis, visual analysis and discourse analysis (Rose, 2022). The study is completed by 41 semi-structured interviews with Italian users coming from 4 cohorts (Generation Z, Millennials, Generation X, Baby Boomer) to shed light on the social and cultural meanings attached to practices of meme production and consumption.

The findings indicate that users conceive memes differently depending on their 'media generation' (Bolin, 2016), a notion which merges age, digital literacy and patterns of media consumption. Specifically, I identify: 1) a *narrow* conceptualisation, typically shared by users coming from younger cohorts, with a heterogeneous mediascape, and high digital literacy; and 2) a *broad* conceptualisation, shared by older user demographics, with a homogenous (or limited) mediascape, and low digital competences. I will also illustrate how each understanding relies on distinct socially-defined 'grammars', which regulate the construction and the use-in-context of the memes.

In conclusion, the paper demonstrates how this generational perspective on memes enhances the understanding of their impact on mainstream digital culture, by bringing examples from key areas of social media research, such as: the production and reproduction of collective identities and the (collaborative) construction of shared narratives around mediatized events.

DCC05 Pop culture and digital attention economies

PP 0257 Consumption and consumerism in the beauty and fashion YouTube community: Young-adult audience perspectives

Ana Margarida Coelho¹

¹ Catholic University of Portugal and Lusófona University, Digital Literacy & Cultural Change, Lisbon, Portugal

Mostly constituted by young women (Ceci, 2023; Garcia-Rapp, 2016), the beauty and fashion YouTube community has contributed for the construction of female identities (Rosida & Azwar, 2021). Through videos regarding makeup, hair, clothing, skin and, overall, selfcare related-content (Berryman & Kavka, 2017), YouTubers on this sector reinforce stereotypical ideals, articulating traditionally female-associated topics with goods consumption and promotional practices (Andó, 2016; Genz, 2015). By being financially dependent on advertising revenue (Hödl & Myrach, 2023), these creators subordinate, whether consciously or not, to a normative and misogynist agenda supported by platform algorithms and brand positioning (Banet-Weiser, 2018), thus becoming part of a post-feminist culture supported by neoliberal society (Banet-Weiser et al., 2020; McRobbie, 2009). In this way, consumption plays an important role in the industry, and consumerism has a huge impact in the community, from producers to the audience. In order to integrate the economy of visibility and attention imposed by the industry (Abidin, 2016; Marwick, 2015), beauty and fashion digital creators adopt gendered strategies including aspirational labour (Duffy, 2016), normative self-branding (Kanai, 2017), passionate work (Duffy & Hund, 2015) and authenticity demonstrations (Pruchniewska, 2018), interfering on their public's perceptions and attitudes (Freberg et al., 2011). As opinion leaders appointed by conquered audiences (Abidin, 2019; Uzunoğlu & Kip, 2014), these professionals shape and structure users' values, mainly regarding femininity conceptions, and behavior tendencies.

This research aims to understand the perceptions of the young-adult audience over consumption and consumerism inside the beauty and fashion YouTube community. Approaching the Portuguese case, we selected 16 young-adult participants, with between 20 and 28 years old, who follow and admire the most popular beauty and fashion YouTubers in the country. We consequently arranged them into five focus groups, each with between 3 and 4 people, and applied a multimodal analysis to study the data, using the software MAXQDA+. The study identified a high level of influence for consumption within the audience of this community, namely by purchasing products mentioned on social media and creators' own brands. A sense of proximity with creators was noticed to be crucial for shopping intentions, as these digital personalities' self-presentation, based on authenticity performances, is said to be preferred over the conduct of traditional celebrities, who normally lacks relatability. Although proving to be influenceable, participants engaged in distancing discourses, particularly criticizing excessive consumerism within the community and positioning themselves as not-so permeable to promotional narratives in these platforms. Conscious consumption and environmental concerns were also mentioned to support this idea. Our study contributes to better understand the young-adult audience perspective on consumption and consumerism as agents in the beauty and fashion digital industry, on and off-camera. It also helps comprehend the consequences gendered discourses and heteronormative attitudes produce on a female audience that is part of a commercially based industry supported by conservative structures.

DCC05 Pop culture and digital attention economies

PP 0258 From Kylie Jenner to Narendra Modi: Dissecting the attention ecology of Instagram's most popular accounts using digital trace data and thick description

Julian Maitra¹

¹ University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland

In an era rife with global dis(order) (Thompson, 2022) across political, economic, environmental, and health sectors, the influence of social media, specifically Instagram, in public discourse and attention shaping is more pronounced than ever. This study scrutinizes the 500 most followed Instagram accounts and their most engaging posts, through the theoretical lens of *attention ecology* (Citton, 2014; 2017).

Instagram, the world's second-biggest social media platform, with its unique visual-centric nature, where images and videos are the primary modes of communication, creates a distinct culture where aesthetics, personal branding,

and perceived authenticity become crucial for engagement. In this distinctive digital milieu, a heterogeneous set of actors create an information-rich environment where they compete for the scarce resource of user attention (Zulli, 2017). These actors include celebrities from the entertainment domain, such as Kylie Jenner, but also politicians, like the Indian Prime Minister Narendra Modi, and news outlets, such as *Iran International TV*. Utilizing a digital trace dataset from the Meta-owned analytics tool *CrowdTangle*, this study analyses these top Instagram accounts and the content of their most engaging posts (user engagement measured as likes, comments, and video views), covering 2021–2023, to understand the dynamics of attention distribution in an increasingly fragmented digital landscape.

The mixed methodology blends quantitative, exploratory data analysis, focusing on Instagram accounts' follower counts and user engagement levels, with qualitative content analysis of selected Instagram posts. The qualitative part is inspired by Geertz' (1973) *thick description*, an anthropological, interpretative approach that involves detailed, nuanced descriptions of social actions and cultural symbols to make sense of a society's web of meanings. Repurposed and applied to Instagram, this approach analyzes the most engaging Instagram posts by examining not just the content of the posts, but also the cultural and social contexts in which they are created and received. This involves a detailed exploration and interpretation of the symbols, language, and interactions present in the posts to understand the underlying meanings and reasons for their engagement in their specific attentional niche. Hence, the study not only distinguishes between accounts with high follower numbers and those garnering significant user interaction but also reveals the dominant themes resonating with the global audience.

Preliminary findings indicate a complex interplay in Instagram's attention ecology. While the most followed accounts often mirror and reinforce prevailing social norms, notably heteronormative gender roles and family constellations, aligning with the established order, they also serve as platforms for challenging the status quo, hinting at transformative potentials. This ambivalence mirrors societal tensions, as Instagram oscillates between being a space for social movements and a breeding ground for polarized environments. In conclusion, this research offers a nuanced view of Instagram's top 500 accounts and their most engaging posts within the evolving digital attention ecology, contributing to the ECC 2024's discourse on communication (dis)order.

DCC05 Pop culture and digital attention economies

PP 0259 Scandalization by association: Celebrities' risk of being pulled into a scandal

[Nete Nørgaard Kristensen](#)¹, Anne Jerslev¹

¹ University of Copenhagen, Communication, Copenhagen S, Denmark

In this paper we propose "scandalization by association" as a new term to designate celebrities' perpetual risk of being scandalized by their association with other celebrities who find themselves at the midst of public controversy. We argue that in the current culture war climate, celebrity scandals may erupt and develop in unforeseen ways and spread infectiously to associated parties across media. Voicing public opinions online about gender issues has, for example, become communicative actions with unpredictable consequences for celebrities.

Mass mediated celebrity scandals used to be initiated by tabloid journalism (Usher 2020), nosing out transgressive behavior and pursuing increased circulation through revelation of morally unacceptable deeds (Johansson 2020). With the rise of social media, celebrities can circumvent such mass media influence on their visibility strategies and to a larger degree strategically control their desired image and communicative actions (Abidin 2018, Jerslev & Mortensen 2018). Celebrities' communication online is not without risks, however, as any statement can easily and unexpectedly unleash controversy, or turn into what Ekström and Johansson (2008) in the political domain have labelled "talk scandals", i.e., "failures in communication, not intended or designed to create a political scandal" (Ekström, Patrona & Thornborrow 2022, 957). Especially the public's reactions and interactions online to what is deemed transgressive behavior and communication can become co-drivers of the development of a scandal (Zulli 2021), producing unintentional or un-wanted visibility to public figures and quickly pull others e.g., fellow celebrities, into the controversy. Hence, being scandalized by association lies in wait for public figures due to the networked structure of online communication (van Dijck 2012); it calls for alertness to networked communication and strategic moves to avoid being 'pulled in'.

Based on a qualitative content analysis of an example of strategic reparation to a possible reputational damage (Ravell 2023), we illustrate the working of scandal by association: We focus on the public statements online from actors Daniel Radcliffe and Emma Watson to the controversy – or, as we argue, scandal – that arose when Harry Potter author, J.K. Rowling, in Summer 2020 tweeted her views on transgender issues. As part of their own reputation management, the actors had to respond publicly to avoid scandalization by association to Rowling. If they did not respond, this could be seen as a silent support of Rowling's views and potentially pull them into the scandal. But responding publicly could also be potentially explosive, as their response could backlash online. Radcliffe and Watson took their stand against Rowling's viewpoints in different but similarly safe ways: Watson in a very short tweet, and Radcliffe in a longer statement on the Trevor Project website.

The paper adds to our understanding of processes of scandalization in digital culture, especially celebrity scandals, the role of social media in reconfiguring how scandalization processes develop, and who are pulled into a scandal. A key point is that in cases of scandalization by association, the communicative phase before a scandal potentially spreads to a wider celebrity community has become crucial in celebrities' communicative efforts online.

DCC05 Pop culture and digital attention economies

PP 0260 Rethinking online anonymity with "momo" on Chinese social media platform Xiaohongshu

Mingyi Hou¹

¹ Tilburg University, Culture Studies Department- School of Humanities and Digital Sciences, Tilburg, Netherlands

This study explores the digital practices and sociocultural meanings regarding a series of anonymity-seeking activists by users on Chinese social media platform Xiaohongshu (Little Red Book). Since 2023, an increasing number of Xiaohongshu users have adopted the same username "momo" and the same profile picture featuring a cute pink dinosaur. This can be considered as a way to seek anonymity online. Anonymity in digital communication is multi-dimensional. It can refer to the inability to attribute a message to its source. However, pseudonymity on social media means that the message is always linked to one's username as the source. This screen identity can be operated and felt no less real than the offline identity. Using the same username and profile picture renders "momos" visually indistinguishable from one another, thus decreasing the linkability between source and message.

The issue of online anonymity has long passed the heat in cultural analysis of digital communication. This is not least because the digital industry has transformed its technological and commercial models in capitalizing on human interactions. Social networking sites tap into users' existing offline networks as a playground for tracking user behaviors. Micro-celebrity culture is predicated on presenting and branding one's identity. "Real" and "authentic" identities seem to characterize digital beings since the Web 2.0 era. The contemporary geo-location based services, digital payment solutions, and automated facial recognition also render "online identity" a less relevant point when discussing the digitalization and datafication of everyday life. If anonymity is conceptualized as the inability to recognize one's identity knowledge like real name, locality, and social categorization, digitally afforded commercial, political, and peer surveillance is exactly the technology to render this information knowable. Against such a context, this study asks three sub-questions progressively: 1) *what are the anonymity-seeking practices on Xiaohongshu and how do they capture the different dimensions of anonymity in digital communication?* 2) *how do users understand these practices regarding Xiaohongshu's platform design?* 3) *what are the motivations for users to conduct anonymity-seeking practices?*

The study adopts a digital ethnographic approach. Data are collected by several methods including an app-walk-through to explicate the functionalities of Xiaohongshu; observing anonymity-seeking tutorials and group pages; observing the critical moments of communication such as conflicts and misunderstandings among users; and importantly interviews with 20 users who have conducted the identified anonymity practices.

Preliminary analysis shows that users seek anonymity to manage their digital communicative orders on three levels. On the speech level, an indistinguishable screen identity saves users from targeted and prolonged online debates, as the comment thread structure is disrupted when several commenters are displayed with the same name. On the network level, seeking anonymity prevents peer surveillance from one's network beyond Xiaohongshu. Also, it protects one from or aids the participation in wide scale online harassment. On the sociocultural level, seeking anonymity signifies a mood of rejecting the uniqueness discourse and retreating from self-presentation in digital culture. The study then discusses how the concept of anonymity can become relevant again in understanding resistance towards neoliberal technologies of surveillance and subjectivity.

DCC06 The far right, digital culture and audiovisual fiction

PN 051 The final boss is woke: Video games and the gender discourses of far-right video influencers

Briar Dickey¹

¹ Vrije Universiteit Brussel, Communication Sciences, Brussels, Belgium

Several authors have noted that toxic 'geek masculinity' and conflicts about video games have aided digital far-right mobilisation (e.g. Bezio, 2018; Mortensen 2018). Digitally-located conflicts about video games show how geek masculinity underpins a framing of video games as a) belonging to (white) male communities and b) under threat from women and minorities (Salter, 2018). In these conflicts, attachment to certain franchises interacts with misogyny to create extreme anti-feminist mobilisation, an interaction more recently demonstrated in backlashes to diverse casting in film and TV (Blodgett & Salter, 2018). Existing observations about video games and far-right gender politics note an attachment to a particular type of technology and culture, but neglect to investigate how far-right actors engage with the fictional content of video games. This is despite the fact that mythology demonstrably plays a role in far-right constructions of collective identity (e.g. Castle & Parsons, 2019; Nilan, 2021), and motifs and characters from other audiovisual fiction are prevalent in the gender politics of the online far right (Nagle, 2017).

suggesting an important role for narratives and storytelling. Narrative-driven video games are a form of audiovisual fiction with uniquely interactive storytelling capacities, space for (gendered) identity exploration, and an association with geek masculinity. As such, far-right engagement with video game fiction reveals how far-right actors construct both individual and collective gendered identities through deep engagement with audiovisual fiction. This research zooms in on this engagement through a multimodal discourse analysis of 50 videos from YouTube, Rumble and Twitch containing gameplay or commentary on video games by far-right influencers, focusing on gender discourses present in these videos. It examines two interrelated facets of the role of fictional video game content in far-right gender discourse. Firstly, it explores how engagement with video game fiction is used to construct far-right masculinities and femininities as well as to criticise and object forms of gender. Secondly, building on work about the strategic use of pop culture to mainstream far-right ideology, it explores how engagement with video games is used to bring far-right ideas about gender and society into new contexts, harnessing both the subcultural significance of games and their increasing importance to mainstream pop culture.

DCC06 The far right, digital culture and audiovisual fiction

PN 052 Beyond the matrix: Mapping far right film references

Jana Goyvaerts¹

¹ Vrije Universiteit Brussel, Communication Sciences, Brussels, Belgium

Although much research on the far right has emphasised the role of parties and voters, there has been a recent emphasis on the non-party-political dimensions of far-right politics, particularly in cultural, media and communication studies. Inspired by the cultural revolutions of the 1960s and the work of left-wing academics such as Gramsci, some note that many far-right actors see cultural hegemony as a precursor to political hegemony – a strategy commonly referred to as metapolitics (Griffin, 2000).

However, while some attention has been given to the role of popular culture in far-right strategy, the role of popular audiovisual entertainment – films, TV series and video games – remains overlooked. Indeed, this paper argues that audiovisual fiction is an important site of popular culture that the far right engages with in meaningful, political ways, both through positive engagement and negative criticism. This is particularly the case online, and there are well-known examples of audiovisual fiction that have become central in some far-right digital discourses, such as the science fiction film *The Matrix* and its “red pill”-metaphor (Chapelan, 2021), the film adaption of *American Psycho* and the cult classic *Fight Club* (Nagle, 2017). Some more surprising examples have been noted: Lewis (2018), for example, describes how the 2018 Marvel film *Black Panther* was celebrated by far-right commentators and influencers, with some claiming that the film affirmed ethnonationalist calls for solidarity along racial lines.

Thus, the far right engages with audiovisual fiction in ways that are sometimes contradictory, but also substantively metapolitical, connecting far-right ideology to mainstream cultural interests. To better understand this relationship, this paper asks which audiovisual fictions garner attention in far-right digital culture. Moving beyond anecdotal evidence of what is liked or disliked by far-right audiences, I present the results of a computational analysis of audiovisual titles mentioned by the audiences of 950 channels in the far-right digital ecosystem on YouTube. Examining comments made by far-right audiences between 2008 and 2018, an era during which content moderation was lacking and far-right politics thus particularly prevalent, this paper maps the films, TV series and video games referred to by far-right audiences, producing a systematic overview of the types of audiovisual fiction that resonate with – and are rejected by – far-right audiences. This allows us to grasp how the far right engages with audiovisual fiction and, beginning from the titles identified, examine broader debates in far-right discourse about fiction and popular culture.

PN 053 Frames of dissent: Exploring visual storytelling in contesting COVID-19 measures on Instagram

[Ofra Klein](#)¹

¹ Erasmus University Rotterdam, Erasmus School of History Culture & Communication, Rotterdam, Netherlands

Following the COVID-19 pandemic, researchers detected a historically unprecedented rise in support of progressive values, particularly freedom (Lampert et al., 2021). With opposition against the COVID-19 restrictions, this rise in support of freedom is perhaps not remarkable. Being limited in their freedom of movement, individuals turned to social media, such as Instagram, to express their discontent about the handling of the COVID-19 pandemic. Amidst these digital conversations a captivating strategy to express this discontent about limited freedoms emerged, characterized by the incorporation of storytelling elements drawn from diverse sources such as movies, fairytales, and historical events. This research investigates the role of visual storytelling in contesting pandemic measures through a visual narrative analysis of images shared with German, Dutch, and Polish covid-sceptic hashtags on Instagram. Storytelling is a technique aimed at conveying a coherent and engaging narrative to convey political messages (Freinstein & Gadinger, 2019). Visual storytelling has become a preferred medium for political movements, playing a pivotal role in the transmission of information and identity formation (Freinstein & Gadinger, 2019; Doerr et al., 2015). Stories often share common themes and characters across countries and cultures. Stories serve to simplify complex ideas or arguments, facilitating a better connection to abstract issues. By appealing to personal emotions and experiences, stories can influence people's perceptions and political views as well as provide meaning, purpose, and a moral compass. Research on political conflict often overlooks the role of visual-based platforms like Instagram in expressing political discontent, focusing primarily on textual content from newspapers and social media. Nevertheless, in an era increasingly dominated by visuals, understanding the role of visual storytelling becomes crucial in comprehending the strategies employed by individuals and movements to appeal to their target audiences. The close connection between visual content and appealing to emotions makes Instagram particularly suitable for political storytelling.

DCC06 The far right, digital culture and audiovisual fiction

PN 054 Rethinking Influencer-audience relationships within the Alternative Influence Network

[Daniël Hans Marinus Jurg](#)¹, [Marc Tutters](#)², [Martine Trans](#)³

¹ Vrije Universiteit Brussel, Communication Sciences, Brussels, Belgium

² University of Amsterdam, Media Studies, Amsterdam, Netherlands

³ University of Amsterdam, Media and Culture, Amsterdam, Netherlands

The past decade has witnessed a surge in far right and reactionary ideologies, arguably propelled by digital media. Lewis' (2018) work on the so-called 'Alternative Influence Network' (AIN) describes a historical juncture where increasingly radical ideologies gained mass appeal on mainstream platforms like YouTube. Her report has laid the groundwork for subsequent scholarship uncovering the social media logics behind radicalization on YouTube, focusing on algorithmic amplification via influencer tactics (Yesilada & Lewandowsky, 2022). However, as Lewis points out, the complex radicalization processes "can include influencers radicalizing their audiences, each other, or being radicalized by their own audience's engagement" (Lewis, 2018, p. 5). This paper empirically explores Lewis' under-researched claim that influencers might be radicalized by their audiences. Indeed, scholars have pointed out that many radical ideologies traveling the digital landscape emerged from political subcultures at the 'bottom of the Web' (de Zeeuw & Tutters 2020). Following this depth heuristic, AIN may be bringing to the surface ideological positions that have already been developed in radical subcultural spaces. Alternative influencers might be less the source but rather the amplifiers of already-existing radical political ideas. Developing these ideas further, our work

seeks to substantiate and conceptualize what is known within AIN as 'audience capture'. Coined by alternative influencer Bret Weinstein, audience capture is described as a "self-reinforcing feedback loop that involves telling one's audience what they want to hear and getting rewarded for it" (The Portal Wiki, 2021). This concept precisely captures Lewis' suggestion that influencers are radicalized by their audiences through an active and highly critical political fandom. To investigate 'audience capture' within the AIN, we map the relation between content production and audience engagement on YouTube. Selecting two case studies of influencers seemingly radicalized by their audience – (1) Dave Rubin and (2) Tim Pool (see Fisher 2023, Silverman, 2021) – we adopt a quali-quantitative approach combining computational techniques to locate and compare key topics in video transcripts and comments sections from 2012 till 2018. The comparative analysis of our case studies allows us to better grasp if, and how, radical ideas suggested by audiences are taken up by political influencers.

DCC06 The far right, digital culture and audiovisual fiction

PN 055 Cultural critique from the right: The German far-right podcast 'von rechts gelesen'

Omran Shroufi¹

¹ Vrije Universiteit Brussel, Communication Sciences, Brussels, Belgium

While a podcast reviewing popular culture is nothing out of the ordinary, the German podcast 'von rechts gelesen' (read from the right) is rather unusual: It is a culture and literature podcast produced by the German far right. While popular culture had long been considered inherently progressive, liberal and modern (Stanfill, 2020), the podcast 'von rechts gelesen' is a vivid example of how far right actors are now increasingly embracing popular culture to capture new audiences and normalise far right ideas (Miller-Idriss, 2018; Penney, 2023). Indeed, in the podcast, founded in 2016 and released by the German far-right publishing house Jung Europa, the podcasts' two hosts discuss popular cultural or literary events, films and publications from a decidedly right-wing perspective. Zooming in on 'von rechts gelesen' as an example of the far right's engagement with popular culture more broadly, and engagement with audiovisual fiction in particular, this talk presents the findings of a discursive-theoretical analysis (Carpentier and De Cleen, 2007) of relevant 'von rechts gelesen' episodes between 2016 and 2023. By paying attention to the reasons given for (dis)liking different pieces of audiovisual fiction, it will be shown how the podcast's hosts draw connections between popular audiovisual titles and key components of far-right ideology, inter alia, ultra-nationalism, ethnopluralism, racism and patriarchy. Moreover, with the podcasts' hosts often praising pieces of cultural production that resonate with other political milieus (e.g., the film 'Oppenheimer'), it will be argued that far right figureheads and thinkers have moved beyond a crude fascination with violence and death and are increasingly look to tap into today's cultural and political zeitgeist. Essentially, audiovisual fiction, the talk will show, has become a site of political contestation as German far right activists and thinkers look to normalise far right ideas outside the confines of formal politics.

PP 0361 Unmatching: Exploring online daters' motives for disconnection

[Rita Sepúlveda](#)¹

¹ ICNOVA- Faculdade de Ciências Sociais e Humanas, Universidade Nova de Lisboa, Lisboa, Portugal

This work explores the motives for why users disconnect from dating apps. Dating apps form a part of the digital diet of 366 million users worldwide (Statista, 2022). The principles and operating logic underlying dating apps result in a set of practices, mediated by such platforms, which lead to a transformation of romance (Illouz, 2019).

In a "culture of connectivity", (van Dijck, 2013) in which platforms govern various aspects of everyday life, dating is no exception. As a critical response to a permanent connectivity in which digital technologies compete for users' attention, individuals have started to manage their media consumption (Lomborg & Ytre-Arne, 2021; Syvertsen & Elin, 2020). Expressions such as "media disconnection" and "digital detox" conceptualize individuals' self-regulating behaviors regarding their use of social media (Nguyen, 2021).

Although dating apps and digital detox subjects have been studied, these two threads have remained disconnected from each other, calling for attention.

This study focused on dating apps disconnection through a mixed methods approach, combining an online survey (n = 349: 44.7% female, 91% heterosexual) and semi-structured interviews (n = 20: age 21–45) aimed at (past) online daters. Quantitative analysis was carried out on survey results, and thematic analysis was applied to analyze survey open-ended questions and semi-structured interviews.

Five main dimensions to disconnect from dating apps were identified: 1. Users' experiences; 2. App features; 3. User well-being; 4. Privacy concerns; 5. Life transitions. The study reinforces motives for media disconnection identified in previous studies (e.g., platform features, privacy concerns or well-being) but expands knowledge related to dating apps dynamics specificities (e.g., poor profile information; limited search options; swiping movement) and highlights user perceptions of how their dating practices are mediated (e.g., unclear matching system).

Users often disconnect from dating apps in response to their experiences (e.g., Didn't meet anyone interesting; Didn't satisfy my needs) highlighting the role that expectations play. The perception of how usage is conditioned by apps features, not allowing certain dynamics and behaviors, also motivated users to disconnect (e.g., chat limitations; non-existent search option). Disconnection was also a result of users' concern for their well-being (e.g., Negatively affected my self-esteem; Time-consuming) and privacy concerns (e.g., Didn't want to share my data with the app; Didn't want others to see me online). Finally, disconnection was a result of events that occurred in participants' lives (e.g., started a relationship; stopped looking for a relationship) which could lead to individuals reassessing the significance of dating apps in their lives. These aspects refer not only to dating app ideologies, but also to the importance that life transitions pose for studying disconnection from such a particular media.

The study holds practical implications for the discussion of the dynamics between users and dating apps from a digital detox point of view through identifying several factors that lead to disconnection. Considering dating app specificities (e.g., positioning, principles, and affordances), this study contributes to dating culture understanding through the meaning given to dating apps and motives to disconnect from such a specific media.

PP 0362 '24/7 horny&training': Porn Bots, Authenticity, and Social Automation on Instagram

[Elena Pilipets](#)¹, [Sofia P. Caldeira](#)², [Ana Marta M. Flores](#)³

¹ University of Siegen, Department of Media Studies, Siegen, Germany

² Lusófona University, Centre for Research in Applied Communication- Culture- and New Technologies, Lisbon, Portugal

³ NOVA University of Lisbon, Faculty of Social Sciences and Humanities, Lisbon, Portugal

Whenever a celebrity posts a photo on Instagram, it is almost inevitable that the first comment on it will be made by a porn bot (Alvarez 2020). Porn bots – automated or semi-automated social media accounts that use sexually suggestive content to capture attention (Narang 2019) – embed themselves in social media interactions, using spam-like strategies (Paasonen 2006; Brunton 2015) of commenting and suggestive forms of address to redirect users' attention to external sites. Typically, porn bots tend to align with the idea of 'hetero-sexiness' observed in mainstream social media (Dobson 2011), echoing a highly standardized concept of attractiveness. Yet, despite Instagram's increasingly strict content regulations prohibiting both nudity and automation, porn bots demonstrate a remarkable ability to adapt to platform-specific communicative cultures and technical standards.

This paper presents a conceptual and methodological account of porn bot agency, focusing on its embeddedness within Instagram use. Arguing for a relational approach, the paper reflects on a common experience of bot-animat-ed attention theft (Santos 2023) – the flooding of celebrities' comment sections with sexy comments and emojis – as its main methodological entry point: Starting from the comment sections of five highly visible posts subsequently

published by Justin Bieber in June 2022, we manually identified thirty porn bot accounts. These accounts were selected based on their repetitive name patterns and comment amplification through likes. We then collected and analyzed associated metadata, using digital methods for a situated analysis (Rogers 2019, Rettberg 2020; Marres 2020) of bot profile names and pictures (n = 30), bot comments (n = 30) and comment likers (n = 1297), bot followers (n = 15729) and followings (n = 4550), bot profile posts (n = 150), and links in profile bio (n = 28).

Our analysis explores how porn bots intertwine mainstream digital culture, heteronormative sexual scripts, and social automation, focusing on three interconnected layers of porn bot agency. First, we analyze bots' strategies of identity performance and gendered representation, contextualizing them within Instagram's ongoing tendency towards deplatformisation of sex (Molldrem 2018; Tiidenberg and van der Nagel 2020). Secondly, we address how bots exploit Instagram-native ideas of authenticity (Marwick 2015; Leaver, Highfield, and Abidin 2019) and visibility (Bucher 2018), exploring the dynamics of following and being followed and the adoption of automated 'likers' that push porn bots' comments to the top. Finally, we discuss how bots promote adult-themed services, highlighting the attention economy of 'pornographic peekaboo' (Paasonen, Jarrett, and Light 2019) that captures attention through suggestive sexy pictures of young women while concealing explicitly pornographic content on external sites disguised in the links of bot profile bios. Our findings point to how porn bots reenact gender as a programmed set of instructions, adapting to Instagram's vision of acceptable sexuality and revealing its normative order.

PP 0363 Mapping the grey infrastructure of AI-facilitated sexual abuse

[Lucia Bainotti](#)¹

¹ University of Amsterdam, Media Studies, Amsterdam, Netherlands

This contribution explores the interplay between the proliferation of synthetic media and the potential harm they pose in the context of image-based sexual abuse. The increasing accessibility, efficacy, and popularity of AI technologies offer a wide variety of opportunities for the creation and dissemination of non-consensual intimate images (NCII), ranging from tools to produce deepfake videos to apps, websites, and bots that 'undress' pictures of (predominantly) girls and women known as 'nudify apps'. While image-based sexual abuse is not a new phenomenon (Henry et al., 2020), the rise of AI technologies adds complexity to this issue, introducing new opportunities to harm and silence women while reinforcing already established power structures in our societies. To understand the disruptions and continuities introduced by synthetic non-consensual material, this research aims to unravel the intricate network websites, platforms, and apps that allow this phenomenon to thrive, and analyse how such network comes to constitute a grey infrastructure of AI-facilitated sexual abuse.

Existing literature underscores the implications of deepfakes and synthetic media for image-based sexual abuse (Maddocks, 2020; van der Nagel, 2020), emphasising their disproportionate impact on women (Deeprace, 2019) and their increasing targeting of 'ordinary' individuals alongside celebrities (Dunn, 2021). The discussion has prompted investigations into the existing legislative frameworks and how they can be refined to encompass this form of abuse (Chesney & Citron, 2019). While attention has rightly been paid to detection, verification, and regulation issues, it is equally important to investigate the ecosystem that facilitates the production, circulation, and re-contextualisation of synthetic non-consensual material across diverse venues and among varied audiences.

This research builds on the concept of networked harassment (Marwick & Caplan, 2018; Marwick, 2021) to establish a comprehensive framework to the study of AI-facilitated, image-based sexual abuse, which encompasses contextual factors (Banet-Weiser & Miltner, 2016), the inherently social nature of online harassment (Marwick, 2021), as well as the infrastructural elements of digital technologies that allow for synthetic non-consensual material to spread.

By combining digital methods and digital ethnography, the research seeks to delineate the grey infrastructure of AI-facilitated sexual abuse and how it spreads across a spectrum of platforms, ranging from overt ones like nudify apps to discreet and under-the-radar venues such as Telegram chats and Discord servers. As the capability and accessibility of open-source AI image diffusion models rise, the production of non-consensual imagery is transforming into a burgeoning industry. At the same time, its dissemination remains intricately woven into a more capillary and niche network of chats, groups, and online forums, which allows users to de-contextualise and re-contextualise women's images, bodies, and intimacies, thus amplifying gender-based violence online and offline. The 'grey-ness' of such an infrastructure lies precisely in the networked co-existence of overt and subtle ways of creating, disseminating, and re-contextualising non-consensual material, which contribute to enhance the pervasiveness of image-based sexual abuse. Additionally, it is accentuated by the nature of AI-generated content, which complicates the notion of consent, privacy, and creative content production.

DCC07 Gender, sex, and sexualities online

PP 0364 Luring TikTok-Users into the right-wing rabbit hole via housekeeping and lifestyle content? Exploring #tradculture communities on TikTok

Svenja Boberg¹, [Sofie Beisemann](#)¹, M. Said Unger¹, Johanna Klapproth¹, Anna Davydova¹, Thorsten Quandt¹

¹ University of Muenster, Department of Communication, Münster, Germany

In the digital era, new avenues of participation have arisen, providing diverse groups with opportunities for engagement and expression. TikTok, with its growing user base, employs a content-centric approach, primarily focused on entertaining videos encompassing pop-cultural references, such as lip-syncing, cooking, and decorating. However, the platform's easy-to-consume content also serves as fertile ground for the dissemination of disinformation and right-wing ideologies disguised as lifestyle content.

Previous studies have demonstrated that seemingly inconspicuous entertaining videos and the propagation of radical views are not mutually exclusive. This phenomenon, termed "dark inspiration" (Frischlich, 2021), has been observed in Islamist accounts on Instagram, emphasizing eudaimonic entertainment that promotes values, deeper meanings, or utopian societal visions. Social media practices, such as hijacking, where radical groups leverage trending content for their own reinterpretation (Jackson & Foucault Welles, 2015), are also common in social media communication.

This study investigates the linkage between ostensibly harmless lifestyle and home-making content on TikTok and anti-feminist and right-wing narratives. Given the challenges in platform accessibility and searchability, we adopt a mixed-methods design to identify relevant content and actors. A dataset of 357 TikToks related to the #tradwife search query was collected, including metadata like account information. A network analysis of co-occurring hashtags and accounts aimed to identify related topics and detect tradculture communities. Additionally, a qualitative content analysis was performed to get a deeper understanding of the most central accounts per detected community.

The automated content analysis revealed distinct tradculture communities in different countries, linked through central #tradwife accounts emphasizing traditional gender roles. US-based accounts exhibited close ties to evangelical and right-wing communities, while German accounts were more subtle and only connected via singular hashtags. The results suggest that the algorithm guiding content exposure may lead from everyday videos of #tradwives to more extreme content. The study highlights significant connections between accounts perpetuating traditional gender roles and content espousing right-wing ideologies, even if the latter has a smaller reach.

This research proposes the further iteration of the mixed-methods design through a snowballing approach, aiming to reconstruct the spread of anti-feminist narratives by malicious communities who hijack trending lifestyle aesthetics on TikTok and lead consumers to their radical content.

DCC07 Gender, sex, and sexualities online

PP 0365 "Hey queen, want #wifimoney?" Multi-level marketing on TikTok

[Andreas Gregersen](#)¹, Jacob Ørmen¹, Tanja Wiehn²

¹ University of Copenhagen, Department of Communication, Copenhagen S, Denmark

² University of Copenhagen, Department of Arts and Culture, Copenhagen S, Denmark

This paper presents results from a case study of finance-related TikTok in Germany, focusing on a subset of accounts which utilize multi-level marketing (MLM) schemes. MLM phenomena are widespread but relatively under-described both in general social science research and within social media research. Our analysis draws on feminist literature which conceptualizes MLMs as neo-liberally capitalist, gendered, and potentially predatory (D'Antonio, 2019; Gill, 2008; Pearce, 2023; Wrenn and Waller, 2021), and based on this body of research we lay out the strategies of the MLM accounts as a type of social media-driven predatory feminism which tailors traditional MLM talking points and strategies to social media. The MLM accounts in our study are typically operated by young women and the target market for the operations seem to be other young women, who are offered a plush life with no stress and financial independence. The strategy offers a mixture of quasi-feminist hypervisibility and feigned intimacy coupled to obfuscation and opacity of underlying operations.

The presentation falls in two parts. First, we present the overall research design as a mixed methods study of finance-related TikTok using qualitative methods and computational tools. The first phase involved utilizing the

open-source tool Zeeschuurmer and TikToks web-interface, where a research assistant purposively and iteratively searched for and analyzed finance-related TikToks while Zeeschuurmer would passively build a data base of all surfaced posts. A second phase involved a hashtag-based clustering workflow in R, using a bespoke channel clustering method based on standardized hashtag usage profiles, dimension reduction and density-based clustering of accounts. This allowed for a large-scale overview of the domain as well as triangulation and consolidation of qualitative hypotheses driving further iterations of sampling and data collection through Zeeschuurmer. A third phase of the study switched to a more thorough analysis of specific clusters within the space, and the second part of our presentation will focus on the set of surfaced accounts which deploy MLM strategies. The discourse of these channels emphasizes working from home and glamorous stories of exotic travelling and financial independence, with many parallels to traditional success stories of social media entrepreneurs (Duffy and Hund, 2015). These personalized narratives serve as a front for typical MLM recruitment operations traceable to behind-the-scenes large-scale corporate activities.

DCC08 Authoritarianism and polarisation

PP 0366 A systematic review of how polarized sentiment and emotion influence retweets behavior across social media platforms

Petra De Place Bak¹

¹ Aarhus University, Media Studies and Journalism, Aarhus, Denmark

How do biases toward emotion and sentiment identified in face-to-face communication scale in digital social media? Social media has increased the availability of information, but human attention remains constrained. So far, research indicates that emotions hold a privileged position in early attention capture (Brady et al., 2020), and the body of studies on how emotion and sentiment expressions influence online spread is growing (e.g., Hansen et al., 2011; Stieglitz & Dang-Xuan, 2013; Zhang, 2022). Still, the literature lacks a comprehensive synthesis of these findings, and the field would benefit from such an analysis to understand how the results generalise across case-specific studies.

This article contributes a systematic review of 48 studies of how expressions of polarized sentiment and emotion affect spread across platforms, years, and domains. The search is conducted following the PRISMA guidelines (Page et al., 2021). The review shows a composite picture. Overall, the results skew in favor of negativity bias, most strongly in the political domain. So far, only Twitter, Facebook, and Sina Weibo, leaving the generalizability of the findings undiscovered. Similarly, primarily English, Chinese, and German are studied, restraining our ability to identify potential cultural differences. Finally, a limited number of domains are studied, primarily political, health, and misinformation.

Future research should focus on understudied platforms, languages, and domains to identify specificities and similarities across cases. Secondly, more consistency in the methodological designs of the studies would improve the comparability of results. Finally, a greater focus on studying emotions in addition to sentiment would further improve the quality of the findings by adding more nuance.

DCC08 Authoritarianism and polarisation

PP 0367 The role of social media in the protest-repression nexus in authoritarian settings: A scoping literature review

[Aytalina Kulichkina](#)¹

¹ University of Vienna, Department of Communication, Vienna, Austria

Social media have brought about significant changes in the dynamics of political protest within authoritarian societies, offering dissidents new avenues to express their grievances and garner support for their causes. For example, social media have been found to be instrumental in disseminating information about protests (Faris, 2010; Lotan et al., 2011; Tufekci & Wilson, 2012), coordinating logistics (Tucker et al., 2016), enhancing visibility (Lysenko & Desouza, 2012; Bruns et al., 2013), and providing support to protesters (Tucker et al., 2014). Nevertheless, social media have also been utilized by ruling regimes and their supporters as a means to hinder and suppress political unrest. For instance, they have been exploited for propaganda and surveillance by authorities (Morozov, 2011; Zhuravskaya et al., 2020), censorship of pro-opposition content and endorsement of pro-regime supporters (Feldstein, 2021; Earl et al., 2022), as well as identifying and imprisoning protesters (Aday et al., 2010; Tucker et al., 2017). Despite extensive research, a thorough understanding of how social media is used to enable and suppress protest movements remains limited due to the diverse range of platforms, their affordances, protest forms, and the contexts studied.

This scoping literature review gathers and analyzes the existing literature on the role of social media in protest and repression within authoritarian settings. The review examines and compares the evolution of these dynamics across different types of authoritarian contexts, such as policy-critical and leadership-critical publics, as described by Toepfl (2020). Additionally, the review explores methodological approaches, data collection strategies, and reported limitations to further shed light on areas that require more attention. The following research questions are addressed.

RQ1: What social media platforms, affordances, and activities have been studied in relation to what forms of political protest and repression in authoritarian contexts?

RQ2: What social media-related variables or phenomena have been reported as potentially impacting political protest and repression in authoritarian contexts?

RQ3: What methods and data have been used in academic research on the role of social media in political protest and repression in authoritarian contexts?

RQ4: What insights can be drawn from the literature on the dynamics between digital repression and political protest on social media, and how do these dynamics vary across different authoritarian contexts?

The review includes 434 peer-reviewed empirical articles focusing on the intersection of social media with either political protest or repression in authoritarian contexts published in academic journals from January 1997 through June 2023 and indexed in Scopus, Web of Science, and EBSCO. The review provides a quantitative descriptive analysis of the manifest content to address the first three research questions and a qualitative analysis of the latent content to answer the fourth research question. Additionally, the review identifies current research gaps and proposes directions for future studies while considering the potential risk of bias and other limitations in the existing research. By critically assessing the current state of knowledge, this review contributes to a more comprehensive understanding of social media's role in both facilitating and suppressing political protests within authoritarian contexts.

DCC08 Authoritarianism and polarisation

PP 0368 Multiple voices, one speaker? A computational approach to match far-right user identities across platforms

[Azade Kakavand](#)¹, [Ahrabhi Kathirgamalingam](#)¹, [Marvin Stecker](#)¹, [Frederik Møller Henriksen](#)², [Alexander Dalheimer](#)³, [Annie Waldherr](#)¹

¹ University of Vienna, Department of Communication, Vienna, Austria

² Roskilde University, Department of Communication and Arts, Roskilde, Denmark

³ University of Vienna, Department of Government, Vienna, Austria

Far-right actors use multiple platforms to communicate, mobilize, and recruit. This observation aligned with broader transformations in digital information media environments captured by notions such as the 'hybrid media system'

or 'networked public sphere' (Benkler et al., 2018). Still, most studies on the digital far right focus on single platforms, thereby not taking into account how the same actors use various platforms. Establishing a framework to link actors across platforms carries the potential to understand how the same actors form cross-platform communities by exploiting different platform's affordances.

One existing framework that offers a solution to that challenge is User-Identity-Linkage (UIL). Developed in the field of computer science, UIL aims to identify social media accounts belonging to the same user—natural persons or organizations—enabling researchers to conduct comparative and cross-platform studies on the actor level (Chen & Chen, 2022). Thus, this approach can accommodate moves in communication science from single- to more robust multi-platform studies. Individual features of UIL, such as measures of textual similarity or shared URLs, are already familiar to communication science researchers, making UIL a scalable and efficient method that might advance and reduce the manual labor of multi-platform research.

Given the multiple different approaches to performing UIL (Shu et al., 2017) but the lack of usage in communication research so far, we ask (RQ1): How well do UIL features perform in linking user accounts by far-right political actors across platforms?

With far-right as an umbrella term for the radical and extreme right, our case contains heterogeneous actor types, e.g., politicians, journalists, or organizations (Pirro, 2023). The social media usage of these actors likely varies in terms of activity level, sharing patterns, and messaging (use of visuals, texts, hyperlinks). Reflecting on these differences, we ask (RQ2): Which UIL features work better to link which actor types?

Lastly, we turn towards a possible application of UIL in multi-platform research. Based on different platform affordances, we expect far-right actors on Twitter (now X) to highlight more person-centric antagonists such as individual politicians or other elites that can be tagged. In contrast, their Facebook posts should contain more generalized out-group statements e.g., antisemitic or Islamophobic comments (Puschmann et al., 2022). We ask (RQ3): How do far-right actors' antagonists differ on Facebook and Twitter?

To address our research questions, we evaluate the performance of different UIL approaches to link far-right actors across different platforms, namely Twitter and Facebook. We use data from three iteration snowball samples on both platforms from April to September 2022. The seed lists for these samples consist of a matched sample of around 40 German far-right politicians, activists, and right-wing alternative media. Data collection resulted in approximately 1,000 Facebook pages and 40,000 Twitter accounts. For ethical and privacy reasons, we focus exclusively on actors of public interest (e.g., politicians, parties, and media actors).

Our main objective is to integrate UIL into research on political communication, showcasing its potential by evaluating the performances of different features and providing a comparative application that studies the strategies of far-right actors in mentioning antagonists.

DCC08 Authoritarianism and polarisation

PP 0369 Lexicon and ties: Affective polarization and networking practices among Italian fringe beliefs Telegram channels

[Giovanni Boccia Artieri](#)¹, [Sara Bentivegna](#)², [Rossella Rega](#)³, [Stefano Brilli](#)¹, [Elisabetta Zurovac](#)¹

¹ University of Urbino Carlo Bo, Department of Communication Sciences – Humanities and International Studies, Urbino, Italy

² Sapienza University of Rome, Department of Communication and Social Research CoRIS, Roma, Italy

³ University of Siena, Department of Social- Political and Cognitive Sciences – DISPOC, Siena, Italy

The current landscape of digital platforms is characterised by a complex constellation of public, semi-public and private spaces. These spaces are heterogeneous in terms of visibility, regulation and audiences, but also connected by mutual migration dynamics between fringe and mainstream environments that need to be studied in order to understand the contemporary communicative disorders.

Since its creation in 2013, Telegram has positioned itself as an ideal space for those who yearn for privacy and security, an affordance that satisfies those who dream of a free internet, and for those who find themselves compelled to use such a space as the only safe way to coordinate (Urman and Katz 2022). Telegram from this point of view seems to be the ideal place to trace information and contexts in which conspiracy narratives are found to flourish (Schulze et al. 2022, Herasimenka et al. 2022). In particular, the function of Telegram channels has been rapidly adopted for news broadcasting (Wijermars 2021). Moreover, research conducted on Telegram has shown that, in spaces such as these, extreme fringes recruit users (Urman & Katz 2022); alt-right conspiracist groups coordinate (Walther and McCoy 2021), and in general, disinformation spreads (Herasimenka et al. 2022). What is still unclear and under-researched, is the relationship between such fringe platforms and the more visible and mainstream web spaces as well as legacy media. In other words, it is necessary to understand how the practices and languages developed in fringe platforms move outside of them, i.e. between upstream and downstream (Gursky et al. 2022).

As part of an ongoing project (CORIT), funded by the National Recovery and Resilience Plan (NRRP) and concerning the development of narratives that are capable of "intoxicating" the Italian hybrid media system, this paper aims to answer the RQ1: how do practices and discourses of toxicity develop within fringe beliefs Telegram channels

in Italy? To do so, starting from lists of Telegram channels/groups compiled by debunkers (i.e. list from BUTAC <https://www.butac.it/the-black-list/>) (Fletcher et al. 2017), it has been built a network of the main Italian Telegram channels and groups that disseminate problematic content through a snowballing method (Peeters & Willaert, 2022). Then, using a combination of ethnographic observation and scraping tools such as 4Cat and the Telethon Python library (Urman & Katz, 2020) we collected and analyzed 1) news posted and their comments, 2) the most frequent targets of hostility, 3) recurrent lexicons participating in affective polarization, which has been clustered through the Emotional Text Mining technique (Boccia Artieri et al. 2021). Results will focus on the vocabularies, representations, and practices related to affective polarization in Telegram radicalized channels/groups, to provide a "Polarisation Glossary" useful for avoiding counter-measures that may lead to an escalation of distrust, uncivility, and radicalization.

DCC08 Authoritarianism and polarisation

PP 0370 Spaces of hybridized prefatory extremism (HYPE) on social media

[Mikkel Bækby Johansen](#)¹, Line Nybro Petersen¹

¹ University of Copenhagen, Department of Nordic Studies and Linguistics, Copenhagen S, Denmark

This paper addresses the contemporary trend of *hybridization* by which traditional boundaries of social media discourse between the mainstream and the extreme are increasingly obfuscated. The online proliferation of conspiracy theories, misinformation, and extremist opinions poses a serious challenge to intelligence services and security professionals alike (Gartenstein-Ross et al., 2023), especially because they are driven by social media logics and online cultures of perpetual ambiguity, transgressive humor, and shifting aesthetics (Demuru, 2022; Greene, 2019; Lee, 2020). In short, distinguishing between harmless conspiracy talk, hate speech, and serious threats of violence – and deciding when to intervene – is increasingly difficult online.

To better understand how previously fringe positions become mainstream and to clarify the relationship between conspiracy theories and extremism, the paper develops the concept of hybridized prefatory extremism (HYPE). *Hybridization* denotes the distinct social media process by which diverse ideologies, practices, and aesthetics amalgamate through networked communities to form new narratives with potential to motivate individuals and groups to carry out violent attacks (DSIS, 2023). This potentiality constitutes the *prefatory* nature of certain social media spaces – what we call HYPE spaces – in that they may facilitate individuals' radicalizing trajectory from a legitimate position of skepticism over (playful) conspiracy speculation to violent extremism.

Developing a heuristic analytical framework for studying the vast grey area of conspiratorial discourse and borderline extremism on social media, we identify three entry points by which HYPE spaces connect the mainstream to the extreme: 1) influencers, 2) communities, and 3) memetic content. Based on exploratory digital ethnographies of the respective entry points on YouTube, Facebook, and Instagram in both Denmark and the Anglosphere, we present a series of findings to illustrate how HYPE spaces operate. We find that the current integration of conspiracy theories into mainstream discourse is in part driven by memetic logics and ambiguous communication strategies: a sense of community among participants; and conspiratorial actors' careful genre imitations and performances of authority.

Hybridization, we conclude, is not simply an ideological bricolage of ideas and beliefs, but a consequence of social media's networked publics, platform infrastructure, participatory culture, and aesthetic digital practices.

The aim of this conceptualization is to offer insights into the environments from which democratic threats may emerge. The point is not to imply a teleology of extremist behavior since prefatory extremism by no means necessitates a trajectory toward extremist worldviews or actions. Individuals exploring HYPE spaces may as well return to the mainstream instead of venturing down a path of radicalization through rabbit holes of hateful propaganda, conspiracies, and misinformation, but the characteristics and beliefs in HYPE spaces significantly overlap with threats and attacker profiles identified in newer threat research and in law enforcement threat assessments. Thus, being able to identify them and understand their underlying logic becomes central to inform preventative measures going forward.

DCC09 Collectivity in the datified society

PN 068 Automated Fraud Detection: Power and Resistance

[Joanna Redden](#)¹, [Jess Brand](#)²

¹ Western University, Information and Media Studies, Ontario, Canada

² Bristol University, Policy Studies, Bristol, United Kingdom

This paper focuses on automated fraud detection as an application that illustrates how automation embeds differential systems of advantage and disadvantage (Crenshaw 1989, Collins 2019). Following Collins (2019) the paper draws attention to how automated decision-making systems (ADS) function as systems of power by utilising intersectionality as a means to: a) connect uses of ADS's to historical power structures and inequalities, b) as a paradigm for understanding the differential ways automation is employed as well as its differential impacts and c) valuing

experience as a way of knowing, recognizing experience as important to understanding social problems and collective ways to address them (Collins 2019, p. 185–186). We draw on interviews with frontline workers and service users to ensure a critical approach that is informed by experiences of impact and resistance as well as document analysis to assess the political dynamics underpinning decisions about where and how to employ automation. Our interviews demonstrate the importance of valuing people's experiences in order to appreciate the negative compounded impacts of automated fraud detection on an individual and family's income, housing, relationships, health, access to education and employment. Our document analysis reinforces previous work noting the politics informing government attention to benefit fraud detection, particularly as the amount of time and money devoted to finding benefit fraud does not match the problem. For example, in the UK it is reported that less than 1 percent of benefit claimants commit fraud and that the costs of this fraud is comparatively small. In contrast, tax evasion was estimated to cost the UK £32 billion in 2022, with considerably less public resources devoted to tackling this crime. We highlight how government agencies increasingly and problematically invest in automated practices in ways that disproportionately and punitively target low-income people which compounds struggles faced across different areas of life. We argue that this analysis provides an important indication of how the costs of increasing digitization fall disproportionately on people already marginalized, placing unjust constraints on enacting citizenship. We also detail the resistance by those affected by unjust automation as key collective action significant for our collective datafied present and futures. These actions highlight the importance of greater responsibility and accountability, but also a politics of care that prioritizes meeting people's needs, promoting health and well-being for all, valuing rights of refusal as well as our interdependence (Woodly et al. 2021, Chassmen and Cohen 2020, Benjamin 2019 and 2016, Gangadharen 2020).

DCC09 Collectivity in the datafied society

PN 069 Collective Response or Individualised Engagement? Deliberative Methods of Data Governance

[Arne Hintz](#)¹

¹ Cardiff University, JOMEC, Cardiff, United Kingdom

The increasing roll-out of data analytics, scoring systems and automated decision-making has severe implications for democratic participation and state-citizen relations. As these systems are deployed in the public sector and for state interventions, citizens' experiences of public services and interactions with the state are changing, and people are profiled, categorized and assessed to an unprecedented degree. Yet this happens largely without their knowledge and understanding, and without avenues to meaningfully engage and intervene. Citizens are rarely consulted regarding the implementation and impact of data systems, and their voice is not typically heard in the ongoing deployment of automated-decision-making. This raises the question of how citizens can affect the management and use of the very data systems that increasingly organize society, how they can have a voice in the transformation towards datafied societies, and how to create new democratic practices to ensure participation, accountability and democratic control in a context of automation. Models of 'democratic innovation' (Smith, 2009) have generated increasing interest as approaches for engaging the public in debates and decision-making. Citizen assemblies, citizen juries, and similar initiatives have been organised to address key concerns of contemporary societies. Based on the concept of 'mini-publics', they typically seek to bring together a representative cross-section of society to deliberate challenges and provide guidance for policymakers. This 'deliberative wave' (OECD, 2020) has also affected the deployment of data and AI, and in countries such as the UK a growing number of citizen summits, citizen councils, etc. have explored citizen perspectives on, e.g., facial recognition technology, and the application of AI in health provision. Emerging research has investigated the breadth, impact and democratic quality of these practices (e.g., Hintz et al. 2022). Building on these analyses, this paper will explore to what extent they constitute a collective response to datafication and, particularly, its collective dimension. Bringing a variety of citizens together to deliberate and generate common positions, mini-publics may exemplify a democratic approach that overcomes the isolation of individual 'users' in the face of state and corporate data power. However, as a format for assembling individual participants, they differ from, e.g., models of stakeholder engagement in policymaking, which place more emphasis on organised interests and may therefore be better placed to account for particular communities that are specifically affected by datafication. Drawing from a series of interviews with both organisers and participants of deliberative initiatives in the UK between 2020 and 2024, this paper will unpack these dynamics and propose further developments in the ongoing efforts to democratise datafication.

DCC09 Collectivity in the datafied society

PN 070 Collective Action in a Digitised Workplace: the challenge of solidarity

[Cate Hopkins](#)¹

¹ Cardiff University, JOMEC, Cardiff, United Kingdom

Surveillance is enabled and normalised through the ubiquity of digital platforms in our day-to-day lives. Our digital lives are highly individualised, and our experiences of technology-enabled surveillance are not necessarily

experienced mutually. Instead, they are linked to our individual identities, and can vary along lines of race, class, gender, sexual orientation, age, disability, and nationality. They carry connotations of asymmetrical power relations, and surveillance scholars have argued by focussing on the technological means by which surveillance is enabled, we are overlooking the individual, embodied experience of being scrutinised. Furthermore, the implementation of technologies of identification, analysis, and control have largely bypassed democratic processes, leaving citizens to experience scrutiny from governmental institutions, corporations, and from fellow citizens with little opportunity for effective opposition. The workplace is one arena in which this process has taken place. The problems of workplace surveillance have been acknowledged by trade union leaders in reports such as 'I'll Be Watching You: A Report on Workplace Monitoring' (TUC 2018), and the ensuing campaign which highlights the problems presented by Artificial Intelligence (AI) in the workplace. However, as yet, there has not been a substantive collective union response to the challenges presented by surveillance in the workplace. In a time of marked increase in trade union action, there is little attention in public discourse to the role that workplace surveillance plays in identifying, monitoring, and controlling trade union activists. The levels of control that are enabled in a highly scrutinised workplace means that workers' ability to organise is more dependent upon their relationship with their management. This in turn has led to uneven development across workplaces, where workers organising in more antagonistic environments encounter more opportunities for their activities to be controlled. This paper draws on three case studies to explore some of these concerns. Using semi-structured interviews with 40 trade union activists and analysis of 80 documents, it explores the intersection of the need to understand the individualised nature of workplace surveillance and the challenge this poses to collective identity. This tension is drawn out in the findings and it is suggested that the ensuing response from trade union activists can be understood as a form of alienation. In the digitised workplace, alienation from the self, which can be broadly understood within a Marxist framework, occurs when the digital technology is imposed in an undemocratic fashion which leaves the worker powerless to enact autonomy within their workplace. In this paper, it is also suggested that the highly individualised nature of the harms enabled by some of those technologies also produce in workers an alienation from both their trade union comrades and from the discourses of trade union solidarity.

DCC09 Collectivity in the datified society

PN 071 'Prove you are human': Collective resistance to facial recognition technology

Stefania Milan¹

¹ University of Amsterdam, Media Studies, Amsterdam, Netherlands

In December 2022, the Dutch College voor de Rechten van de Mens (the Netherlands Institute for Human Rights, an independent institute in charge of monitoring human rights in the country) found that it is "plausible" that the anti-cheating software used in most Dutch universities to invigilate remote examination during the Covid-19 pandemic discriminated against a student on account of her dark complexion (Damen, 2022). It now rests on the university, accused of deploying software that discriminates against non-White people, to prove otherwise. The case has brought to the public debate the potential discrimination aftereffects of biometric technology—that is, technology that enables the measurement and statistical analysis of people's unique physical and/or behavioral features. Today, a variety of biometric digital tools perform identity verification and/or policing. Examples include the anti-cheating software mentioned above, but also facial recognition cameras installed in public space, including stadiums, airports, squares, and schools. These tools generate data that result in real-time decision-making and/or monitoring, thus exercising regulatory power (hence "regulatory data infrastructure"). They take up functions that were once largely performed by humans and pertained almost exclusively to governmental agencies and public administrations. They empower an emerging mode of governance – "governance by data infrastructure" – that elevates regulatory data infrastructure to the preferred mode of governance of complexity. Paraphrasing Easterling (2016: 11), we can see these digital tools as "the overt point of contact and access" of governance by data infrastructure, making visible "the rules governing the space of everyday life". While facial recognition systems are mostly experienced at the individual level, since 2020 attempts at articulating a popular response to this intrusive technology have multiplied. They have taken the form of campaigning, petitions, as well as strategic litigation. For example, the Reclaim Your Face campaign is a pan-European initiative targeting European institutions and advocating a ban of biometric software in public space (ReclaimYourFace, 2020). This paper investigates the emergence of collective resistance to the advancement of facial recognition technology in public space from the vantage point of critical data studies and political sociology. It deploys a combination of qualitative document analysis, interviewing and co-design workshops in Amsterdam and Brussels, where the proposed EU AI Act is in the workings. The paper has two aims. First, it investigates how people, both experts and low-skills users, make sense of an intrusive technology like facial recognition, and the embedded socio-cultural meanings subtending to it. Second, it investigates how collective responses to the threat of facial recognition technology emerge, focusing on action repertoires, coalition building, and efforts at "translating" the complex issues at stake to make them actionable. In so doing, the paper contributes to our understanding of resistance efforts surrounding biometrics technology, illuminating how individual encounters with the technology become collective experiences.

DCC09 Collectivity in the datafied society

PN 072 'Rescuing' data justice? Mobilising the collective in responses to datafication

[Lina Denaik](#)¹

¹ Goldsmiths University of London, Media Communication and Cultural Studies, London, United Kingdom

The growing focus on the broader societal implications of datafication has elevated questions of social justice in line with a concern for data justice as a framework for response. However, what this means in practice and how it is approached is greatly varied. This paper draws on research conducted over several years for the ERC-funded project DATAJUSTICE to critically examine how data justice is being advanced. To do this, the paper outlines activities within three key domains for the advancement of data justice: 1) technology; 2) policy; and 3) civil society. Across these domains we have seen a flurry of activity that has sought to account for and respond to the complex and manifold ways in which datafication shapes life chances and human flourishing. This includes, for example, fairness-in-technology initiatives, the assertion of data rights, and the creation of data and AI ethics guidelines. Whilst such efforts have been significant for contending with key implications of emerging technologies, the paper makes the case that dominant responses to datafication and its injustices have tended to favour a translation of justice that privileges processes of individualisation and marketisation. Moreover, it makes the case that data justice in this context serves to secure a (neoliberal) hegemony in the advancement of data-driven technologies in society. In light of this, the paper draws on Gerald Cohen's (2008) notion of 'rescuing justice' as a way to assert an alternative vision for data justice that centres collectivity and solidarity. It does so by considering two key traditions in scholarship on justice: the Marxist/socialist tradition that understands justice as critique; and the feminist tradition that understands justice as empowerment. Central to both of these traditions is an emphasis on engaging with existing social relations and the structural conditions against which injustices are experienced. In this context, the advancement of data justice needs to account for the way technology is embedded in wider power dynamics and the avenues through which such power dynamics can be challenged. To illustrate this, the paper draws on examples from key areas of public life that have historically been central to struggles for social justice, including work, welfare, policing and migration. Research on developments in these areas suggest that a meaningful engagement with data justice requires us to go beyond technology and to mobilise solidarity based on collective experiences as they are currently lived.

DCC10 Living and dying with digital platforms

PP 0481 From bliss to burden: An ethnographic inquiry into how individual, material and social obstacles to digital wellbeing shape everyday life

[Sara Van Bruyssel](#)¹, [Ralf De Wolf](#)¹, [Marieke Vanden Abeele](#)¹

¹ Ghent University, Communication Sciences, Gent, Belgium

Finding and maintaining a balanced digital wellbeing is a practice fraught with ambivalences that go beyond individual control. To date, a fluid understanding is missing of how maintaining a sense of digital wellbeing cuts through multiple (digitized) facets of everyday life. Therefore, drawing from an ongoing ethnographic study (June 2022–September 2024) with sixteen adults in [omitted for peer review], this study disentangles social, material, and individual obstacles experienced in day-to-day life that hinder and/or foster digital wellbeing. We put forward a relational approach to contextualize complexities and disentangle the tensions limiting the often overestimated individual agency to reach a desired digital wellbeing. To examine the obstacles encountered when balancing (dis)connectivity in the context of maintaining everyday life, we question (1) how these obstacles are shaped by social, material and individual dimensions, and materialize, (2) how an individual is able to deal with an obstacle that cuts through these dimensions, and (3) what these experiences tell us about the mutual shaping of digital technology and everyday life. The results show how the obstacles to digital wellbeing are interrelated, existing within and outside of digital networks, laying bare the tensions that cut across social relations, digital devices, infrastructure, and spaces. In a first instance, our results emphasize an individuals' position within their vast networks and contexts, held together, to various extents, by digital ties. These ties, embedded within responsibilities and expectations, play a role in organizing and maintaining everyday routines, which in turn shape with who, and what, a person is digitally (dis)connected to. Second, the results show that these social, material and individual contexts impact a person's ability and desire to disconnect, as some disconnection would entail falling behind, not meeting expectations, and would create a significant amount of turbulence for the individual and their surrounding relations. Particularly, within the maintenance of everyday life, emotional and caring responsibilities, as well as certain infrastructure, and conflicting expectations, limited the ability and desire to disconnect. Third, individuals used discourses of addiction, gamification and cynicism, raising the question whether such internalized mindsets of individualized responsibility may obscure feelings reflecting a deeper lack of control over structural factors. We therefore propose the concept of 'repressed agency' that does not deny individual agency, but acknowledges how agency is consistently constrained and dependent on specific contexts and social relations in which people operate. The concept is aimed to capture the

plurality and entwinement of material, social and individual obstacles, to also go beyond individual-centric solutions, and towards approaches that follow the collective networks of everyday life and digitization. The study advocates to care for a digital wellbeing that goes hand in hand with making more time and space to deal with everyday challenges, as well as provide the tools to re-imagine digitized social networks that support an equal reproduction of digitized everyday life.

DCC10 Living and dying with digital platforms

PP 0482 Digital cocooning and its challenges: People with eating disorders regulation personal connections on social media

[Paula Saukko](#)¹

¹ Loughborough University, Criminology – Sociology and Social Policy, Loughborough, United Kingdom

Psychological research on social media and mental wellbeing has observed positive implications of social connectivity and negatives of social comparisons, including on body image (e.g. Appel et al 2020). Critical media studies has focused on how platforms push engagement and argued that discourses and practices on regulating or disconnecting from social media use are individualistic, entrepreneurial and not addressing the responsibilities of platforms (e.g. Baym, 2020; Kaun, 2021; Syvertsen, 2023). We conducted online interviews with people with eating disorders (EDs) (n = 31), recruited through a UK charity and university, on positive and negative experiences with social media. The thematic analysis identified clear mental health positives of what we call digital cocooning, one-to-one or group interaction with close, supportive, real-life friends and family using messaging apps. The participants especially appreciated the affordances of the apps for different modes of communication, such as chat, voicenotes and memes, enabling social interaction when direct conversations were too mentally demanding. However, participants related that connecting with larger network of acquaintances on traditional social media (Instagram, Facebook) provoked feelings of anxiety, competitiveness and not belonging. Participants sought to regulate traditional social media use by limiting friends and occasionally deleting an app, but social and professional pressures and the standard scrolling through key apps made this challenging. Drawing on Turner's (2006) history of digital media we suggest that our split findings relate to the original Californian countercultural, liberal ideal of supporting interaction between like-minded people that evolved into the Silicon Valley, contemporary dominant libertarian ethos of competitive, entrepreneurial networking and deregulation. This highlights that there are different social connections, with not only psychological but historical and political dimensions and affirms the media studies call for regulating platforms to make space for alternatives modes of connectivity (also Livingstone et al 2021). There are also different disconnections; rather than being only individualistic and entrepreneurial, the supportive cocooning of the vulnerable users with EDs sought to evade as well as shared therapeutic-type support to adapt to (Illouz, 2008) the prevailing entrepreneurial connectivity that caused them distress.

DCC10 Living and dying with digital platforms

PP 0483 Social structure in times of social disruption: Young adults' digital lives during a pandemic

[Eduardo Antunes](#)¹, [Ana Marta M. Flores](#)², [Inês Amaral](#)³, [Rita Basílio de Simões](#)³

¹ University of Coimbra, Faculty of Arts and Humanities, Coimbra, Portugal

² University of Coimbra/ICNOVA – University of Lisbon, Faculty of Arts and Humanities, Coimbra, Portugal

³ University of Coimbra/Centre for Social Studies, Faculty of Arts and Humanities, Coimbra, Portugal

The aftermath of the COVID-19 pandemic cleared the need to address people's overall well-being (Lemenager et al., 2021), as it led to widespread disruption of social structures (Dow et al., 2021). Just as it happened in Portugal, starting in March 2020 (Gomes et al., 2022), worldwide lockdowns arose as key strategies to contain the health crisis. As specific contexts influence digital usages, possibly (re)producing structures and hierarchies, it is crucial to

accentuate how people's digital usages surpass the consumption of technology, thus being also consumptions of language, thought, feelings and ways of thinking (Lupton, 2016). Digital sociability processes tend to be presented and discussed as a general unifying characteristic of young adults (Mestre-Bach et al., 2020). Even though COVID-19 inspired prolific academic production, there is a lack of solid research regarding such a generation, particularly in the Portuguese context. Although academia has tackled digital media prevalence during the pandemic, particularly social media platforms, a significant portion of it discussed the role of those platforms in dis/misinformation (Goel & Gupta, 2020). Our perspective converges with an emphasis on youth studies, grappling with the pivotal delineation of social generations. The validity of categorising young adulthood as an independent social generation is often questioned, even beyond the specification of age parameters (Vieira, 2018). Youth is inherently shaped and manipulated by social constructs and not an universal simplified culture. By conceptualising young adulthood as a category between 18 and 30 years old, this study explores the following research question: were social media apps prevalent in structuring young adults' lives during the pandemic? This quantitative-based exploratory study employed a method of tracking mobile apps' usage over 90 days. A specialised external entity tracked a convenience sample of 342 young adults living in Portugal, with a margin of error of $\pm 5\%$ for a 95% confidence level (z-score 1.96). Descriptive statistical procedures were applied to explore data. 40 mobile apps were tracked and later categorised between: social media and messaging; health and well-being; self-tracking; dating; fitness; and games. Results showed new evidence on how rooted social media and messaging apps were in young adults' lives during this social and health disorder, as all 342 young adults of the sample used an app of such category during the study. Overshadowing the remaining categories, social media and messaging apps had higher numbers of total visits (1777335), average visits per user (519), average pageviews per user (2840) and average minutes a day per user (65.18 minutes). The 8 most used apps of the sample were all social media and messaging apps, while 6 of those had more than 100 total users. This study addressed the connection between young adults and digital socialisation, highlighting the social structuring role of social media and messaging apps in times of social disruption. Future work is encouraged, both to understand how young adults' lives are digitally socially structured even beyond pandemics, but also to consolidate the body of work that addresses young adulthood as a generation of its own.

DCC10 Living and dying with digital platforms

PP 0484 Digital cultures of death: Domestication, resistance and non-use of social media in Italy

Francesca Pasquali¹, Roberta Bartoletti²

¹ Università degli studi di Bergamo, Lettere- Filosofia- Comunicazione, Bergamo, Italy

² Università di Bologna, Dipartimento di Sociologia e Diritto dell'Economia, Bologna, Italy

Digital communication platforms allow people to openly share their grief or remember those who have died. At the same time, interaction with the digital traces of those who are gone is considered a form of continuing bonds with the dead. However, the use of digital communication platforms in mourning practices is still controversial, and literature on online death reveals a considerable amount of resistance among people to using it. In the paper (a very first draft analysis was presented at a previous Ecrea conference), we explore these resistances in greater depth, relying on the analysis of the data collected through 400 in-depth interviews and a representative survey on the Italian population, including both digital communication platforms user and non-users (Authors, 2022).

Moving from a socio-constructivist and non-platform/media-centric perspective, our research questions were: Why do we use digital communication platforms when mourning? How do we domesticate them in mourning practices? How have digital communication platforms shaped the way we mourn?

First of all, our data suggests that the use/non-use of digital communication platforms for practices related to mourning and remembering depends primarily on how users have generally "domesticated" each digital platform in their daily lives.

As already highlighted by the literature, as far as non-use is concerned, many resistances are connected to some of the affordances of digital platforms – such as algorithmic content curation (Lambert et al., 2018), datafication processes (Lagerkvist, 2019), the processes of space-time dislocation permitted by online environments (Brubaker et al., 2013) – and from the other side many resistances are connected to possible uses oriented towards manipulative self-representation (Sabra, 2017) and emotional capitalization of the user (Marwick & Ellison, 2012).

Uses instead depend on platforms' affordances (i.e., instant messaging apps are widely used while social network sites are stigmatized) and the various stages of the loss process: the most ritualized practices, like death announcements and condolences, are relatively approved (Murrell et al., 2021). Instead, displays of grief online and the interaction with the digital remains of the dead are very controversial.

In conclusion, we can say that digital communication platforms have triggered processes of the mediatization of some of the rites and practices connected to death. However, they do not seem, at least in the Italian context, to be used to maintain ties with the deceased actively, and people don't seem willing to build a digital afterlife (consistently

with international research: Brubaker et al., 2019; Pitsillides & Wallace, 2021; Morse 2023) as instead stated by the more alarmed public discourse on the application of AI technologies to digital footprints of the deceased.

DCC10 Living and dying with digital platforms

PP 0485 The temporal logic of media practices: A study of Facebook mourning timeline

Sarit Navon¹

¹ Peres Academic Center, Communication, Rehovot, Israel

Since Harold Innis's (1951/2008) work on the relations between time, space, and the media, communication scholars perceive time as a fundamental component that shapes and distinguishes different forms of communication. At the same time, media technologies themselves play a fundamental role in structuring, shaping, and organizing time and temporal experiences. Personal media technologies, such as cameras and diaries, have helped individuals keep track of time and remember important details and events, while mass media, such as the radio and television have established the collective memory of societies and created a "common public time" (Scannell, 2014).

In recent years, researchers began exploring new media technologies, specifically social media platforms, and their temporal relations and implications. The concept of "social media time" (Kaun & Stiernstedt, 2014) considers how specific media afford specific temporalities and organize their users' time. Facebook, much like other social media platforms, builds on the principles of newness, immediacy, and "liveness." Thus, it facilitates a temporal experience of flow and rapid change, encouraging users to feed the constant stream with new posts rather than engage with older posts and maintain a sense of continuity.

Kaun and Stiernstedt (2014) place a strong emphasis on technological affordances. However, they also acknowledged the importance of users' perceptions and negotiations of affordances. They conclude that Facebook integrates "a multiplicity of temporal layers". Similarly, Poell (2020) observes that "media do not have an inherent temporality but engender a multiplicity of temporalities". He suggests a relational approach that highlights the interconnections between users' practices, media infrastructures, and political-cultural institutions.

This paper aims to develop the relational approach suggested by Poell (2020) by introducing the original concept of *temporal logic*. The concept of temporal logic seeks to capture the specific timing of media practices and the reasoning behind it. What prompts users to create and publish posts at specific times and days? I am interested in the temporal trigger of media practices, the temporal frames and patterns, and their meaning.

The context I look at in the current study is the context of Facebook mourning posts. My dataset comprises 40 cases of mourning and memorialization, spanning Facebook's three sub-platforms (15 Profiles, 10 Groups, and 15 Pages), for which I conducted ethnographic fieldwork over approximately three years (June 2018 to March 2021).

A detailed analysis indicates that users tend to post mourning-related content at specific times and on specific dates. These include biographical dates (such as birthdays, wedding anniversaries, and death anniversaries), national dates (like Memorial Day), dates of religious and cultural significance (such as *Shiva* and *Shloshim* in the Jewish tradition), and platform-generated dates (like Friendiversary and 'On This Day' in Facebook's Memories feature). This timeframe is hybrid, combining different temporal layers and encompassing or merging important events at both individual and public levels, as well as offline and online events.

The proposed concept of temporal logic illuminates the convergence of various time layers onto a single media platform and fosters a deeper appreciation of new rituals and forms of meaning.

DCC11 AI infrastructures and sustainability

PN 079 A practice approach to AI infrastructures and sustainability

Anne Mollen¹, Sigrid Kannengießer¹

¹ University of Münster, Department of Communication, Münster, Germany

The increasing spread and use of communicative Artificial Intelligence ("communicative AI"), as for instance in the form of generative AI systems, presents societies with various challenges (Solaiman et al., 2023) and media and communication research with the need for new research agendas (Guzman & Lewis, 2020). One urgent challenge is the matter of sustainability – in the sense of socio-ecologically just design, implementation, and use of the infrastructures through which generative AI constitutes itself. While in the Machine Learning (ML) community fields of research have been established focusing on social as well environmental justice implications of generative AI (Barocas et al., 2019; Bender et al., 2021), a comprehensive approach to the complex socio-ecological consequences that are inherent to this form of communication (Crawford, 2021) as well as theorization from a media and communication perspective is still missing. Using sociological practice theory (Reckwitz, 2002) and its implementation in media and communication studies (Couldry, 2012; Kannengießer & Kubitschko, 2017), we argue that practice theory is an inspiring approach to acknowledge the role of actors and their contexts in shaping the infrastructures of AI, that is, examining the practices of actors involved in building and maintaining generative AI models.

hardware, data submission and computing facilities, but also in implementing, regulating and using generative AI. Broadening the concept of infrastructuring (Pipek & Wulf, 2009), we argue that a practice approach not only helps in analyzing how AI infrastructures become established, but also reveals potentials to shape AI infrastructures more sustainably. We will present a problem-oriented research matrix systematizing sustainability (economic, ecological and environmental) impacts along the life cycle of generative AI systems. Based on this matrix, we suggest a media and communication research programme on the sustainability of AI technologies along three dimensions: media and communication research investigating 1) socio-ecological effects of automation in digital media from an infrastructure perspective, 2) practices of establishing such infrastructures in their respective contexts (appropriation, development, organizational contexts etc.) 3) as well as imaginations of AI in relation to matters of socio-ecological justice. Taking a practice approach to AI and sustainability thus helps not only to analyze and understand current phenomena in this field, but also stresses the relevance of deconstructing the norms which materialize in current AI development and implementation.

DCC11 AI infrastructures and sustainability

PN 080 Give the cloud a fish...: datanatures and the green extractive frontiers of aquaculture

[Patrick Brodie](#)¹

¹ University College Dublin, School of Information and Communication Studies, Dublin, Ireland

This presentation will introduce the unexpected material impacts and implications of digital “cloud” technologies by analysing their use and application on relatively novel (blue) terrain: aquaculture. Fish farming has seen a recent “cloud” and AI boom, as companies seek to innovate their cultivation and extraction measures by applying data-driven and machine-learning technologies to their operations. At the same time, the material components of the cloud – especially data centres – are increasingly being looked to as circular solutions for industrial activities, as their energy-intensive facilities are used as thermal and electrical supports for fish farming operations. As “data farms” and “fish farms” thus coalesce, and drawing from theories of environmental and “elemental” media, this article confronts the aquatic politics of digital infrastructure as it materially and epistemologically re-shapes the planet, its ecologies, and its food systems. Using critical discourse analysis, this presentation will unpack the industrial literature and arguments surrounding the growing overlaps between digital infrastructures, water politics, and the management of aquaculture. Specifically, I will focus on three areas of application: 1) the use of cloud and AI technologies by fish farming corporations; 2) the employment of data centre electricity infrastructures and climate systems in integrated ways with aquaculture projects; and 3) the monitoring and “streaming” of farming operations remotely via data-driven and video technologies. By each of these mechanisms, digital technologies are ordering the planet towards the production of value for fish harvesting, demonstrating the increasing integration of digital infrastructure, energy systems, and more-than-human ecologies towards “sustainable” practices. In particular, the energetic processes of the atmosphere, far from existing as a metaphorical “cloud,” are being integrated into the production of living beings and the management of the life-sustaining and harvesting infrastructures of aquaculture, from solar harvesting to climate management. These forms of atmospheric capture towards extractive operations demonstrate the increasing complexities of what critical geographers and agrarian scholars refer to as “green extractivism” by companies proclaiming to solve the planetary challenges of the climate crisis with expanding and networked frontiers of material extraction. In the case of digitalised aquaculture, from data farms to fish farms, these modes of extractivism are not only expanding but intensifying – deeper into the hydrologies and ecologies of environments globally, representing the amplified stakes of understanding how, why, and where digital technologies are being employed across the diverse geographies of emerging “sustainable” supply chains.

DCC11 AI infrastructures and sustainability

PN 081 Imagining spaces of governing AI infrastructures

[Fieke Jansen](#)¹

¹ University of Amsterdam, Critical Infrastructure Lab, Amsterdam, Netherlands

With the advent of Generative AI products like ChatGPT or Bard rely heavily on cloud computing power and is exacerbating data centers’ environmental impact. For example, Microsoft’s water consumption, needed for the cooling of its data centres, has dramatically risen to 6.4 million m³ in 2022. In part, this can be attributed to ChatGPT, which runs on Microsoft Azure. Increasingly scholars are exploring the relationship between the role of new technological capabilities at scale and the intensification in the need for natural resources – looking at the harms related to technologies’ material infrastructure (Hogan, 2015; Bender et al., 2021; Pasek, Vaughan and Starosielski, 2023), both in terms of consumption and a site for political struggle (Brodie and Velkova, 2021). The internet policy, engineering and governance communities are slowly coming to grips with the environmental harms of the technology, but the sustainability solutions that circulate in response are often narrow in scope. Next to a move towards renewable energy, the technology industry sustainability efforts aim at making its own and other industries more efficient. The centrality of the efficiency logic in the proposed solutions to minimize the environmental impact is according to

the Jevons paradox counter-productive (Alcott, 2005), in a capitalist society efficiency gains will lead to an overall increase in consumption and production. We should rather be thinking in terms of limits, quotas or rationing. To explore what it could look like to govern AI's underlying infrastructure in a framework of limits, reduction, and redistribution, we held several workshops with civil society. This paper will offer insights into how civil society imagines spaces of governance.

DCC11 AI infrastructures and sustainability

PN 082 Data forests: navigating the state's infrastructural power in environmental governance

[Jedrzej Niklas](#)¹

¹ Polish Academy of Science/University of Cambridge, Institute of Philosophy and Sociology, Warszawa, Poland

Public actors wield a significant influence in data governance, shaping behaviours through regulatory frameworks, infrastructure development, and decisions on data collection goals. While the impact of state influence is acknowledged, the precise meaning of state power in the context of data governance remains elusive. This ambiguity is further complicated by the unique dynamics introduced by the context and content of data, particularly concerning information about natural environments, land, atmosphere, plants, and animals, which pose distinct ethical challenges. This paper focuses on these complexities by examining the public governance of information about natural environments, focusing on forests.

Grounded in Michael Mann's infrastructural power framework, this study aims to unravel the diverse dimensions of state authority in shaping and controlling digital infrastructures. Infrastructural power is characterized as the state's capacity to penetrate civil society and effectively implement political decisions across its territory. It emphasizes the state's role in coordinating and centrally organizing society, particularly through its infrastructure. Mann's framework underlines the state's capability not just in coercion, but also in positively organizing and mobilizing citizen activities. Through an exploration of the interplay between digital policies and forest governance, the paper investigates the case of Polish forestry and forest data, a comprehensive two-year empirical study, including over 30 interviews with practitioners, experts, policymakers, and activists, observations and systematic document analysis. The Polish forestry sector presents a particularly intriguing case. The State Forests, a public entity, manages over a quarter of Poland's land area and boasts a robust data infrastructure and procedures. This active engagement in data collection serves multiple purposes: forest management, reporting to international bodies, influencing climate policies, and more. However, forest data in Poland is not without controversy, marked by conflicts and tensions, particularly from activists. These disputes are intertwined with significant political debates surrounding logging and environmental protection, which were central issues in recent elections.

Analysing Polish case of forest data from the lenses of infrastructural power, this paper introduces two analytical starting points: firstly, examining infrastructural elements in forest data systems, emphasizing institutional aspects of data governance, organizational structures, and interrelations. This includes centralization struggles, data standardization, political conflicts, and an understanding of the roles of key state agencies. Secondly, the paper explores how data infrastructures are utilized in environmental management, shedding light on what state power signifies in shaping decisions and instigating environmental conflicts.

The argument posits that incorporating Mann's concept of power into the realm of data governance reveals how the state's organizational, regulatory, and control capacities extend into the digital sphere, influencing environmental management through data-driven decision-making. This analytical framework facilitates an in-depth exploration of the state's role in governing data, a dimension often pivotal yet not centrally discussed in conversations about datafication and data governance. Focusing on the state, Mann's nuanced categorization of different power, enables a systematic and comprehensive examination of state influence in the data landscape. By intertwining the complexities of technology, state authority, and natural environments, this paper aims to spark broader discussions on the evolving role of the state in the governance of digital landscapes.

DCC11 AI infrastructures and sustainability

PN 083 Sustainability insights in ai-driven marketing agencies: An infrastructural approach

[Laura Bruschi](#)¹

¹ University of Milan, Department of Social and Political Sciences, Milan, Italy

In recent years, market research, which has always been fundamental to monitor, understand and predict consumer behaviour, has increasingly shifted its focus to sustainability, which has arguably become a central value for both producers and consumers. Accordingly, this research aims to look at the socio-technical construction of marketing insights on sustainability by using data gathered during a participant observation carried out in a digital marketing agency specialised in collecting data from social media platforms. To do so, I argue that conceptualising digital marketing agencies as infrastructures allows us to look at them not as a neutral background, but as relational

concepts which embed specific values and constraints (Slota & Bowker, 2017). Specifically, I will follow Kjellberg and colleagues' (2019) work on market infrastructures as arrangements that supports market exchanges.

The research is rooted in a 7-month long participant observation in a marketing agency renamed Predicto, which collects consumers' data from social media platforms and analyses them using "self-developed" machine learning algorithms and I will show that data collection and analysis processes are conditioned by the values and constraints of the infrastructure.

The research follows a conceptualization of marketing agencies as infrastructures. Viewing marketing agencies through an infrastructural lens allows us to see them not as neutral backgrounds, but as infrastructures with a pre-determined set of values and constraints that shape and influence the way one thinks and acts within them (Slota & Bowker, 2017). Moreover, by considering marketing agencies as knowledge-based infrastructures (Araujo & Mason, 2021), we can look at their production and circulation of information for the market. In this view, the presentation will argue that processes of data collection and analysis, in addition to the inherent biases in AI-generated results, are also conditioned by the values and constraints of the infrastructure.

While the chapter will primarily focus on a theoretical conceptualisation, it will also make use of empirical vignettes to illustrate how the marketing agency studied worked on the topic of sustainability. These elements will allow for a study of the sociotechnical creation of marketing insights on sustainability in the age of AI, illustrating them as outputs of a market infrastructure.

DCC12 Digital placemaking and national digital cultures

PP 0593 Formation of social norms in location-based meso-spaces: A study of WeChat neighborhood groups during the Covid-19 pandemic lockdown

Yichen Zhao¹, Qinfeng Zhu¹, Marcel Broersma¹

¹ University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

Formed through communication processes, social norms play a crucial role in shaping individuals' behaviors. While instant messaging (IM) groups are nowadays prominent spaces for daily communication, we have only little knowledge of how norms function within them. In particular, large, heterogenous IM groups, which are usually created for a certain goal and in which members are connected by weak ties, are conceptualized as meso-spaces that reside "between the private and public realms" (Tenenboim and Kligler-Vilenchik, 2020: 577). Because groups are closed but membership still extends beyond "trusted ties", norms are ever more essential.

To successfully navigate the simultaneously private and public character of meso-spaces, members need clear guidelines. However, we have limited knowledge about how social norms emerge within meso-spaces. To address this gap, the study examines norm formation mechanisms in WeChat neighborhood groups during the Covid-19 lockdown in Shanghai. In the spring of 2022, Shanghai government implemented a citywide lockdown, when WeChat neighborhood groups became an essential communication channel for quarantined residents to seek help. We conceptualize WeChat neighborhood groups as location-based meso-spaces, serving as both a public sphere for discussing public issues and a closed domain facilitating interpersonal communication. Specifically, we ask: (1) what social norms emerged in WeChat neighborhood groups during the Covid-19 pandemic lockdown in Shanghai and how were these formed? (2) how do technological affordances and sociotechnical contexts shape norm formation in WeChat neighborhood groups?

To answer the questions, we conducted semi-structured interviews, combined with walk-through protocols of participants' chat logs to identify what social norms emerge and how they are formed in these location-based IM groups. We recruited twenty participants from nineteen neighborhood groups by snowball sampling. They were a member of at least one WeChat neighborhood group, with the number of members ranging from 30 to 150 for residential building groups and to up to 500 for large neighborhood groups. We diversified the samples on age, gender and the neighborhood types they lived in.

After three rounds of coding, we identified six norms: keeping solidarity, reciprocity, regulating intimacy, maintaining social harmony, well-considered information care, and showing tolerance. We find that the formation of norms was dependent on the communicative processes that were afforded by IM groups, while emerging norms were also rooted in shared moral norms among group members. Moreover, the location-based nature of the group lead to in-group dynamics mapping onto real-world neighborhood relationships. Therefore, participants tended to align with the "group prototype" for being a good neighbor. Overall, our findings highlight the significant roles of

technological affordances of IM platforms, in-group dynamics, and the overarching social environment in shaping norm formation within IM groups. Our study aims for a nuanced and cohesive understanding of how a set of norms is formed, and pay attention to how norms are shaped by the platform and the sociotechnical context. Moreover, by conceptualizing IM neighborhood groups as location-based meso-spaces, we expand the scope of meso-space research beyond news-related and interest-oriented groups.

DCC12 Digital placemaking and national digital cultures

PP 0594 The implications of COVID-19 pandemic for use-by-proxy in digital inequalities among internet users in Slovenia

[Andraž Petrovčič](#)¹, Bianca C. Reisdorf², Jošt Bartol¹

¹ University of Ljubljana- Faculty of Social Sciences, Department of Sociology, Ljubljana, Slovenia

² University of North Carolina Charlotte, Department of Communication Studies, Charlotte, USA

Background

The COVID-19 pandemic has restructured social and technological opportunities for people to take advantage of the large-scale digitalization that emerged as part of the response to managing the health and social crisis after the virus outbreak. Studies show that the pandemic encouraged digital engagement of different population groups. However, evidence also suggests that pre-pandemic disparities among internet users have been exacerbated at all three levels of digital inequalities (internet access, skills and uses, tangible outcomes) during the pandemic. This study aims to assess the impact of the pandemic on use-by-proxy in digital inequalities among internet users. Use-by-proxy is a practice whereby users with limited internet skills and experiences ask others to do things online on their behalf. Based on the extended model of compound and sequential digital exclusion (MCSDE; Petrovčič et. al. 2022), this study compares how the engagement in use-by-proxy mediated the sequential pathways between the three levels of digital inequalities among internet users in Slovenia before and during the pandemic.

Methods

We used cross-sectional data from the 2018 and 2022 waves of the Slovenian Public Opinion Survey. In both years, participants aged 18+ years were selected from the Central Register of Population using two-stage random sampling. We analysed the representative subsamples of respondents who were internet users ($N_{2018} = 814$, $N_{2022} = 802$). The exact same survey questions, adapted from prior literature, were used in both surveys. Path and multi-group analysis (MGA) were conducted to assess the validity of the extended MCSDE.

Results

Path analyses indicated that the extended MCSDE had an adequate fit in both 2018 and 2022. In both years, internet access had a positive effect on internet skills, internet uses, and use-by-proxy. Internet skills had a positive effect on internet uses and a negative effect on use-by-proxy, which in turn had a positive impact on internet outcomes but no significant effect on internet uses. In both years, internet uses positively affected internet outcomes. Importantly, the MGA showed only two significant changes of path estimates: during the pandemic the effect of internet access on internet uses was smaller, while the negative effect of internet skills on use-by-proxy was stronger than before the pandemic.

Conclusion

This is the first study to empirically assess the implications of the COVID-19 pandemic on the sequential paths that connect use-by-proxy with three levels of digital inequalities. The findings indicate that government efforts aimed at reducing digital inequalities during the pandemic did not diminish the role of use-by-proxy. In fact, internet users with lower skills were significantly more likely to rely on others during the pandemic, while the remaining factors and consequences stayed largely unchanged. This suggests that use-by-proxy should continue to be an important aspect for digital inequalities research and inclusion programs in the post-pandemic world.

Keywords: COVID-19 pandemic, digital inequalities, internet users, time comparison, use-by-proxy

PP 0595 Platformized identities: How TikTok's digital nomads assimilate, shape, and disrupt online personas

[Karine Ehn](#)¹

¹ Universidade Lusófona de Lisboa, COFAC – Cooperativa de Formação e Animação Cultural CRL / CICANT, Lisboa, Portugal

This study continues my exploration of digital nomad (DN) identities through the lens of communication science, focusing on their self-presentation and identity negotiation on the digital platform of TikTok. DNs, a group of mobile

professionals who blend work and leisure in pursuit of location independence, have gained prominence during the COVID-19 pandemic. Their significant presence on TikTok, a platform that also saw a surge in popularity during this period, provides a rich context for examining how they shape their identities to appeal to young audiences. I employ a mixed-methods approach to construct a framework for analyzing how DNs assimilate their online identities on TikTok. This involves examining their identity processing and responses to threats through the lens of Breakwell's identity process theory. My findings reveal that DNs often depict personal, controversial life events as catalysts for reassessing their careers and lifestyles. They leverage TikTok's meme culture as a space for coping and adaptation, showcasing extensive travel content as a route to healing. This aligns with Breakwell's theory of identity formation through coping and underscores how TikTok facilitates the assimilation of the DN identity following major life transitions. Furthermore, I explore the role of uncertainty, a salient feature in the construction and maintenance of DN identities. Travel, a key aspect of the DN lifestyle, is framed in my study as a representation of uncertainty. This narrative tool allows DNs to navigate potential identity threats, such as burnout or poor leadership, that challenge the autonomy and self-efficacy central to their identity. This study enhances our understanding of the DN lifestyle and online identity as emerging social phenomena. It underscores TikTok's role in personal and professional identity transitions and provides perspective on the fluidity of online identity formation within social networks. The analysis also sheds light on the interplay between identity, risk, and coping strategies in the context of digital nomadism, contributing to the broader discourse on identity threat and coping mechanisms.

PP 0596 Generative AI and the Swedish history that never was

Emil Stjernholm¹, Maria Eriksson², Fredrik Mohammadi Norén³

¹ Lund University, Department of Media Studies, Lund, Sweden

² Basel University, Seminar for Media Studies, Basel, Switzerland

³ Malmö University, School of Art and Communication, Malmö, Sweden

In recent years, the development of generative AI has been rapid as generative platforms such as ChatGPT, LLaMA and Bard and text-to-image models such as DALL-E, Midjourney and Stable Diffusion are increasingly permeating people's everyday lives. In many creative and artistic fields, generative AI has been perceived as a threat due to its advanced capabilities of producing realistic text and image material. As a result, Critical AI Studies, focusing on evaluating the ethical, political, and philosophical consequences of algorithmic tools and systems, can be described as a field in formation (Raley & Rhee 2023).

While disruptive in various fields, including higher education, recent scholarship suggests that generative AI can also offer new opportunities (Wilde 2023), not least in media history. As Offert and Bell (2020) argue, generative AI can be useful for tracing tropes and patterns in historical datasets. The generative models operate by statistical induction and as such probabilistic image and text production mirrors the features of its training data. Drawing on this, generative AI can be used to explore the visual and textual characteristics of images and texts produced during a particular historical epoch.

Sweden is a country where modernity is often said to have arrived late. Around the turn of the century, there was still a low rate of urbanization and industrialization. During the 1920s and the 1930s, social engineers, public intellectuals and politicians on the left were soon to embrace modernity, welcoming progressive social and employment reforms, and the launch of various urban projects (Widenheim 2002). This paper uses generative AI to explore patterns in digitized Swedish photographic collections from the 1930s, as well as historiographical tropes and tendencies in the writing of Swedish history of the said period. Methodologically, our experiment, conducted within the framework of the ongoing digital humanities research project Modern Times, uses around 80,000 images from the repository DigitaltMuseum and 100 English-language history books and scholarly articles about Sweden during the 1930s as our training data. Such an investigation raises critical questions: what media historical source material has been digitized and preserved and whose life stories are told in these archival collections? What is it that generative AI sees, hears and perceives when historical images and history texts about the 1930s are used to produce novel images and texts? Accordingly, while the results of the experiment are yet to be analyzed, we hope to be able to shine light on what elements of history tend to be highlighted and neglected when AI generates a version of history. And, as Andreas Ervik has argued about generative AI, the unpredictability of the results is precisely "part of the intrigue" (Ervik 2023: 50).

PP 0597 Negotiating AI(s) futures: Stakeholders strategic communication shaping AI imaginaries in Germany, the US, and China

Vanessa Richter¹, Christian Katzenbach¹, Jing Zeng²

¹ University of Bremen, Center for Media-Communication and Information Research ZeMKI, Bremen, Germany

² University of Utrecht, Department of Media and Culture, Utrecht, Netherlands

Utopian and dystopian visions regularly dominate the public discourse on artificial intelligence (AI) (Cave & Dihal 2019). These debates are increasingly focused on how AI (re)consolidates existing discrimination and social inequalities. While AI is now routinely treated as self-evident (Suchman 2023), it is still very much under formation as a sociotechnical phenomenon. Public communication and discursive framing hereby have considerable influence, being important elements of social (dis)ordering, and potentially both disrupting and reproducing prevailing social organization and its control.

This paper builds on the concept of imaginaries to study how AI is being negotiated between stakeholders in the US, China, and Germany. The concept of sociotechnical imaginaries defined as “collectively held, institutionally stabilized, and publicly performed visions of desirable futures, animated by shared understandings of forms of social life and social order” (Jasanoff, 2015, p. 4) has proven useful in studying the interplay of discourses, institutional and technological developments. The concept offers a constructive framework to question the role of different stakeholders in shaping imaginaries around AI and the often disruptive negotiation processes around different desirable futures of AI and social orders.

Therefore, this paper addresses producers of AI-related communication, based on interviews with AI experts in industry, government, academia, media, and civil society from three leading countries in AI development (10–15 per country): USA, Germany, and China. While several studies have analysed national, industrial, and political visions of digital media and automation (Felt & Öchsner, 2019; Mager, 2017), there is a lack of research analysing the negotiation of imaginations on potential futures of AI between stakeholders of AI development. Additionally, there is often a strong national focus due to funding and regulation of AI; however, national perception is not a homogenous point of view but rather a controversial discursive construction process.

The qualitative analysis reveals stark differences across countries and regions. The transcribed interviews were analysed employing both situational analysis (Clarke, 2019) and critical discourse analysis (Wodak, 2015) to map the relational development of imaginaries across stakeholder groups and major emerging AI imaginaries. The analysis highlights that firstly the negotiation of AI imaginaries does not necessarily occur across all stakeholder groups as the US and German discourses are localised in several geographic AI centres. Secondly, there is a strong co-orientation and networking between actors from the countries studied. Moving beyond specific stakeholders to question the processes of national and international negotiation on future AI imaginaries, the analysis reveals relevant intersections of imaginary building and political and sociotechnical agendas forming and disrupting current trajectories.

The analysis thus offers key results for understanding how AI as an object of public communication is actively negotiated between powerful stakeholders, based on data from the US, China, and Germany. As a result, the paper makes visible how discourses and strategic activities of stakeholders condense into widely shared sociotechnical imaginaries with societal implications. These imaginaries play a decisive role in shaping the future design of AI systems and their integration into society and thus social (dis)ordering in times of profound automation.

DCC13 Influencer, who? Heterogeneity in content creator culture

PN 102 Professionalised Networked Misogyny: Andrew Tate’s Travelling Discourses among Estonian Influencers

Kaarel Lott¹

¹ University of Tartu, Institute of Social Sciences, Tartu, Estonia

Over the last few years, former kickboxer Andrew Tate has gained immense global popularity on social media. Despite facing recent charges related to rape, human trafficking, and organised crime, Tate has amassed a large following, particularly for promoting misogynistic views and advocating violence against women and male supremacy (Das, 2022). Although popular and networked misogyny, incels, the manosphere and related conceptualisations have been well studied, Tate and other misogynists as (aspirational) influencers have received very little academic attention. A lot is at stake, however, as school teachers have reported a concerning rise in misogynist discourse among young boys who have been engaging with Tate’s online content (Weale, 2023; Will, 2023). This study addresses the gap in research by conducting a discourse analysis of selected videos from Tate’s account on Rumble. Additionally, social media content from Estonian (aspirational) influencers (n = 10) expressing misogynistic views will be analysed via a combination of standardised content analysis and discourse analysis. The study aims to

identify dominant narratives within Tate's content and assess whether and how Estonian influencers employ similar narratives and strategies to gain the audience's attention. Data collection and analysis will be conducted from January to April 2024. In the process, we will test the expectation of these influencers utilising 'travelling discourses' (Arnesen, Lahelma and Öhrn, 2008) of misogyny, which a network of influencers uses to gain followers. Additionally, we will explore how audience formation or perhaps even what can be referred to as 'audience grooming' is taking place, along with how this process is utilised for monetisation purposes. Preliminary screening analysis of Estonian influencers shows that misogynistic and ultra-masculine messages are used to gain attention and then monetise in the form of webinars, training plans, books, paid content, etc. Banet-Weiser (2018) has indicated that popular misogyny does not employ isolated or unique stances, but rather exists as a broad and interconnected structure. The results of this study are crucial for understanding the circulation of misogynistic content together with the dynamics between influencers and their audiences. By gaining insight into how these potential networks operate, the study contributes to understanding the professionalisation of networked misogyny. Without such understanding, we would be caught in an endless game of Whac-A-Mole, where the sanctioning of one misogynist influencer is swiftly followed by the emergence of another using similar discourse.

DCC13 Influencer, who? Heterogeneity in content creator culture

PN 103 "My Instagram is my portfolio": Being a content creator as a shortcut to creative industries

[Maria Castellvi-Lloveras](#)¹, [Ona Anglada-Pujol](#)¹, [Mercè Oliva](#)¹, [Isabel Villegas Simón](#)¹

¹ Universitat Pompeu Fabra, Communication, Barcelona, Spain

The creator economy is an industry that has experienced exponential growth, fostered by the platformization of media industries and the consolidation of 'digital content creators' (Cunningham & Craig, 2021), a form of native social media entrepreneurs who make a living by creating and disseminating content on the internet. These content creators have originated social and cultural practices that have permeated other work spheres, shaping expectations and labour experiences. This phenomenon is called "influencer creep" (Bishop, 2023), defined as the adoption of microcelebrity practices (self-branding, optimization, and performance of authenticity) as an unavoidable side of building a professional identity. As previous scholarship has noted (Cotter, 2022; Duffy & Meisner, 2023), far from being a homogenous category, the label "content creator" is an umbrella term for many different profiles. The platforms used, the type/genre of content created, or the audience reached influences greatly on content creator's practices and experiences. Therefore, this study focuses on three different groups of content creators: gamers, lifestyle influencers, and digital cultural communicators. Our main aim is to identify the differences and commonalities in how these three groups perceive and experience the defining tenets of influencer creep, mainly self-branding practices, optimization and authenticity. In particular, our research aims to answer the following research questions: (a) What are the main motivations and expectations of different types of Spanish digital content creators regarding their careers? (b) How do they perceive and experience the defining tenets of influencer cultures? (c) What are their professional aspirations and future perspectives? To fulfill these aims, we draw upon in-depth interviews with 54 Spanish participants (18 from each group) in an aspirational phase of their careers. The interviews covered different topics regarding their work practices and aspirations and were qualitatively analyzed using thematic analysis (Braun & Clarke, 2012; 2021). Our results indicate that participants started as content creators as an answer to the precarious and unstable labour context. Nevertheless, there is a consensus among the participants that digital media is volatile, and they have a hard time imagining working as content creators for a long time. Thus, we can see how influencer creep works in a double way: on the one hand, content creation is perceived as a shortcut into creative industries (i.e., the fashion industry, traditional media, or the videogame industry), connecting with imaginaries of flexibility, fulfillment, and passion. On the other hand, participants also believe that the experience, visibility, and skills acquired as content creators will be useful for these other professions. At the same time, we also identified differences among the three profiles analysed regarding how to deal with the showcase of their intimacy, their relationship with their followers, and their responses to the specific demands of each platform.

DCC13 Influencer, who? Heterogeneity in content creator culture

PN 104 Feeling the "influencer creep": How different professions embed influencers' practices to their work

[Maria Murumaa-Mengel](#)¹

¹ University of Tartu, Institute of Social Studies, Tartu, Estonia

Similarly to macro-societal concepts like mediatization (Couldry & Hepp, 2017) and social media logic (van Dijk & Poell, 2013), scholars have started to describe a specific influencer-culture-borne process termed "influencer creep" (Bishop, 2023). The term fits under the umbrella of celebritization (Driessens, 2013: 653), "the meta-process involving changes in the nature of celebrity (or its democratization), and its social and cultural embedding (through its diversification and migration)". Influencer creep refers to how expectations, practices and norms that have been established within influencer culture have "crept" out into other professions and sectors. As media devices and media services are increasingly omnipresent (Paus-Hasebrink, Kulterer & Sinner, 2019), nearly all professions have

to accommodate self-branding, optimization and a performance of authenticity if they want to be represented in the media, participate in mediatized societies and benefit from attention economy (Goldhaber, 1997; Hendricks & Vestergaard, 2019). In other words, communication that takes place via social media platforms often follows the logic and "rules" of content that platforms have previously amplified, valued and rewarded as attention-worthy. Nearly all walks of life are feeling the effect of the "influencer creep", as we are slowly subjugated to the cultural expansion of microcelebrity promotional practices (Abidin, 2018). This study set out to understand how people adjust and navigate this rapidly changing sphere of professional communication, the perceived risks and opportunities, benefits and costs. From December 2023 to March 2024 I conduct 15 in-depth interviews with people who use social media professionally, but whose work is predominantly "elsewhere". Interviewees include Estonian teachers, politicians, lawyers, musicians, doctors, police officers, etc who have deliberately started using social media as the "augmented" part of their work. The interviews will be analyzed using thematic analysis, and materials from the creative research task – draw your work, using AI tools for creating visuals – are analyzed using the socio-semiotic approach to the analysis of visual materials. Preliminary results point towards increasingly blurring boundaries between professional and personal, private and public. It comes with a perceived freedom of expression and a constant flow of positive feedback, but also burnout, self-doubt, facing harassment and online incivility. Social media has amplified the achieved (by effort) and attributed (by others) celebrification processes, i.e. transforming someone into a celebrity, thus reinforcing the embedding of celebrity culture (Driessens, 2013) to everyday work practices. Different forms of capital (e.g. economic, symbolic, social, technical, celebrity, attention capital – Abidin, 2018; Brooks et al., 2021; Mears, 2023) flow on social media, but the interviewees tend to describe mainly community-oriented social and symbolic capital as desirable. Economic capital and benefits are discussed with uncertainty ("I'm not sure which limitations exist") and moral judgments ("#sponsored is unbecoming to my occupation"). Professional ethics are clumsily negotiated and adjusted to social media, even if there are no established legal frameworks and guidelines.

DCC13 Influencer, who? Heterogeneity in content creator culture

PN 105 Sharenting a child with Down syndrome: between advocacy and commodification on Instagram

Alexandra Ruiz-Gomez¹, Lidia Marôpo², Ana Jorge³

¹ CIS University- Endicott International, Communications, Madrid, Portugal

² Polytechnic University of Setúbal, Communication and Language Sciences, Setúbal, Portugal

³ Lusófona University, CICANT, Lisboa, Portugal

Parents who practice advocacy share their children's struggles and triumphs on social media to find support, promote destigmatization and inclusion, and influence policy (Ammari and Schoenebeck, 2015). Despite growing attention to sharenting (Cataldo et al., 2022), advocacy sharenting is largely underexplored in scholarship. The experiences and perspectives of these children regarding issues of privacy and data, for example, remain a neglected topic (Goggin and Ellis, 2020). Different types of families, such as parents of special needs or sick children practice advocacy sharenting (Jorge et al., 2020; Marôpo et al., 2021; Borgos-Rodriguez et al., 2019; Goggin and Ellis, 2020; Lo Bosco, 2021). Some take a prominent role in content creation, gaining the attention of thousands of followers. In digital platforms such as Instagram, dominated by an influencer model, these parents often merge advocacy and commercial sharenting to obtain economic benefits from their social media presence. They employ various strategies to generate income from their children's content, such as showcasing and reviewing products sent as gifts, creating sponsored posts, affiliate marketing, merchandise sales, and other partnerships with brands seeking to target family-oriented audiences (Marôpo et al., 2021; Ruiz-Gomez, 2023). These content creators face tensions to remain credible while not crossing the line to appear overtly promotional, hurting their advocacy. Thus, it is crucial to analyze the connection between advocacy and family influencer strategies (San Cornelio, 2021). This paper aims to shed light on the dynamics of advocacy sharenting within the context of Down Syndrome (DS) analyzing the digital presence and portrayal of AC, a 5-year-old girl with DS born and living in the UK. We conducted a long-term, qualitative analysis using a multimodal approach focused on her Instagram account created by her parents. The study covers the period from the account's creation on June 23, 2018 (four months before AC's first birthday), up to October 25, 2023. Since we situated this case as a low-visibility social media account, we took deliberate steps to anonymize the child's identity. The findings suggest that AC Instagram's profile emphasizes the message of normalcy of children with DS and the love and joy they bring into their families' lives. Relying on emotional engagement in which AC is a strong affective capital, it promotes inclusion, challenges stereotypes, and also educates and raises awareness for children with DS. This is the perfect motto for brands striving to build a more inclusive image. The account does engage in brand representation, receiving frequent gifts from brands while using several strategies to balance advocacy with financial benefits. AC's account presents tensions regarding the child's privacy. Firstly, while the depiction of her life helps advocate for DS, it also raises concerns regarding AC's rights as her identity and personal experiences, including sensitive matters, are extensively exposed without the possibility of her informed consent. Secondly, and in contradiction to an account that shows the child, it maintains privacy for the rest of the family members as their public exposure is significantly limited.

DCC13 Influencer, who? Heterogeneity in content creator culture

PN 106 Life Coaches Performing Digital Disconnection as Impression Management

Bert Verhulst¹, Sarah Van Bruyssel¹, Tom De Leyn^{2,1}, Mariek Vanden Abeele¹

¹ Ghent University, Communication Sciences imec-mict-UGent, Ghent, Belgium

² Hasselt University, School of Social Sciences, Hasselt, Belgium

In today's Western industrialized societies, the ability to be digitally connected anywhere at any time offers several advantages for online entrepreneurs such as life coaches. Life coaching is an increasingly popular self-help profession in which coaches guide individuals in enhancing their life experiences, achieving goals, and improving overall well-being (Green et al., 2006). In a competitive and unregulated industry, life coaches strive to establish their positions as experts by sharing their methods and unique values. Previous studies (Baker, 2022; Baker & Rojek, 2020; Rimke, 2000) indicate that life coaches strategically use social media platforms, such as Instagram, to promote self-improvement messages driven by neoliberal ideologies and demonstrate their expertise to a broad audience. These neoliberal ideas imply that individuals are expected to assume responsibility for their lives through the use of self-improvement methods, with the promise that doing so will lead to a good life (Binkley, 2014; Brown & Baker, 2012). Yet, in what scholars refer to as 'the age of mobile connectivity,' there is a growing awareness of achieving digital well-being by maximizing the benefits while minimizing the drawbacks of digital connectivity (Vanden Abeele & Nguyen, 2022). Considering life coaches' online presence and rising status as authorities in individual well-being, they may encounter the growing imperative of performing digital disconnection as a self-disciplining measure to limit harmful connectivity, or to align with the neoliberal-driven idea of the 'good life' (Fast, 2021; Syvertsen & Enli, 2020). This demand imbues itself in these coaches' professional and personal everyday lives as they strive to embody the principles of (digital) well-being. To analyze this development, we conducted in-depth interviews with 15 life coaches and analyzed their Instagram profiles, employing Goffman's (1959) dramaturgical theory to explore the (strategic) integration of digital disconnection into life coaches' professional performances. Moreover, we delved into the ways life coaches navigate the complexities of digital (dis)connection to manage impressions on both the front stage (publicly visible on Instagram) and the backstage (more private or concealed aspects of their lives). This exploration aims to unveil the nuances of how impression management, specifically oriented towards expertise and expert status, shapes and is shaped by the strategic use of digital disconnection, shedding light on the interplay between the digital and the performative aspects of the life coaching profession. Our findings underscore the tensions faced by life coaches as they strive to maintain authenticity and professionalism while skillfully managing the performances of digital disconnection on both the front stage and backstage.

DCC14 AI and algorithmic cultures

PP 0687 Young people and algorithms: Profiles of learning contexts and concerns about diversity from a digital culture perspective

Maria José Brites¹, Teresa Sofia Castro¹, Mariana Scalabrin Müller¹, Margarida Maneta¹

¹ Lusófona University/CICANT, Communication Sciences, Porto, Portugal

This proposal aims to reflect on how young people perceive algorithmic and filter bubble challenges in the digital era, particularly concerning how they define and deal with algorithms (Swart, 2021) and their implications for information selection processes in their daily lives. E-social contexts and diverse daily life constellations can have implications concerning information diversity, datafication and information disorder (Wardle & Derakhshan, 2017).

To deepen this debate, as part of a funded project on young people, news and digital citizenship, we analysed 42 semi-structured and participatory interviews with young people aged between 15 and 24 (F = 21; M = 21) living in Portugal. Research questions: Q1 – What is their knowledge of algorithms and filter bubbles?, Q2 – How did they learn what they know about them? and Q3 – What implications do they have for diversity issues in everyday life?

The preliminary results indicate 4 distinct profiles of how they view algorithms: profile 1 highlights that "The algorithm is an ethereal entity, endowed with human faculties of action and decision". These participants describe the algorithm as an "acting agent" with decision skills. The familiar contexts found are prevalent in the context of forms of learning, as well as self-learning. This profile recognises that this superhuman image of the algorithm is not without its problems from the point of view of diversity. These participants also associate the algorithm with situations related to fake news. Profile 2 (the dominant one in terms of the number of respondents) includes those who believe that "Algorithms are not easy to understand". These participants fell into two fundamental spheres. On the one hand, they showed and recognised basic knowledge acquired mainly from friends and individuals. On the other hand, they also included people who didn't know what an algorithm was at all. In the latter cases, the participants recognised that they had gained basic knowledge of what the algorithm is through the interview process. The third profile includes interviewees who believe that "The algorithm is essentially negative". They were particularly concerned about diversity matters, and they believe that the algorithm is targeted and ends up being "selfish" in the restrictions it imposes. These young people learnt about these matters at school, although also in family environments and

on an individual basis. Finally, the fourth profile states: "There's no problem if the algorithm gives us what we want to see". This includes people who see advantages in the algorithm, who recognise the importance of diversity, but who demand the power of individual opinion (as Sofia, 18, studying International Relations, points out, "we are all free to have our own opinion"). In this case, it's more favourable for them to be able to have what they want tailored to them (particularly on social networks like TikTok). They have learnt individually and with friends.

These early-stage results pinpoint challenges that democratic societies face nowadays and evidence of self-centred forms of learning in the context of the digital society that prompts a disruptive style of understanding selfhood in the context of a globalized society.

DCC14 AI and algorithmic cultures

PP 0688 Structural relationships between algorithmic awareness and factors often associated with digital inequalities

Andrea Rosales¹, Sara Suárez-Gonzalo², Francisca Morey Cortès², Mireia Fernández-Ardèvol¹

¹ Universitat Oberta de Catalunya, Faculty of Information and Communication, Barcelona, Spain

² Universitat Oberta de Catalunya, Internet Interdisciplinary Institute, Barcelona, Spain

Algorithmic recommendations underpin everyday life. They are widely used in recommendation systems to provide personalised search results, translations, news feeds, audio and multimedia suggestions, or automated systems that support decisions on job recruitment, credit assessments and court proceedings. However, the selection of databases, the definition of variables, the instructions given to algorithms and how the outcomes of such algorithms are used define how these systems impact sensitive aspects of people's lives and, potentially, the course of society. While such systems are useful, in most cases, they may be unfair (Starke et al., 2022), provoke unintended effects or harm individuals or social groups (Eubanks, 2018; Wachter-Boettcher, 2017).

Algorithmic awareness (AA), or the ability to perceive the use of algorithms in everyday recommendation systems and understand how they work, has been argued to contribute to people's control over such systems. Being more critical about the information they consume, evaluating the reliability of different sources, overcoming the limitations of interacting with them, and governing self-representation (Cotter and Reisdorf, 2020; Hargittai et al., 2020; Swart, 2021; DeVito et al., 2018).

Awareness of their use and understanding of their operation may foster critical attitudes towards their outputs and facilitate their use. While previous studies on algorithmic awareness of recommendation systems have employed qualitative and quantitative approaches to explore factors that influence it, there is still a need for a theoretical model to explain which factors influence it. Drawing on factors often associated with the digital divide, this study employs structural equation modelling to investigate what factors explain **AA** by using data from 1,084 adult individuals, based on a representative sample of the online Spanish population. Results show that **AA** relates to digital attitudes, educational level and working status. However, age, gender, digital skills, and smartphone usage diversity are not always associated with algorithmic awareness. These findings enrich the research with evidence for factors that (not always) influence **AA**. Limitations and implications for critical technology studies are also discussed.

DCC14 AI and algorithmic cultures

PP 0689 Mitigating loneliness with AI-driven technologies? Exploring discussions on the promises of automated communication technologies for reducing social isolation in Europe

[Nisa Irem Kirbacı](#)¹, [Sander De Ridder](#)¹

¹ University of Antwerp, Department of Communication Studies, Antwerp, Belgium

Increasing evidence suggests the acceleration of a "loneliness epidemic" in the West, mainly driven by the aftermath of the COVID-19 pandemic. As a response, the European Union (EU) is actively engaged in projects that aim to better understand loneliness as a social problem instead of an individual issue. Notably, the "Monitoring Loneliness in Europe" project that is carried out by the European Commission's Joint Research Centre (JRC) serves as a valuable reference point contributing to research on the recent conversations around loneliness and strategies for its mitigation.

In addition to the governments' efforts to combat the loneliness epidemic, the number of Human-Machine Communication-centered business initiatives offering communicative and social robots as a solution to this problem is growing. Focusing on the "creation of meaning among humans and machines" (Guzman 2018), Human-Machine Communication (HMC) implies an essential transformation of the definition of communication. In this study we discuss the impact of automated technologies such as AI-driven conversational agents that allow individuals not to only communicate through but also communicate with. We specifically attempt to answer the question: What promises are made about automated technologies and their potential to mitigate loneliness in Europe? More specifically, what is being discussed on technology-driven solutions for social problems such as loneliness and the communicative needs of people?

To answer this question, firstly, we have constructed two comprehensive databases: One on the initiatives across Europe that aim to develop a better understanding of loneliness epidemic in the region through exploring causes, consequences, and solutions for its mitigation (for example, see Nurminen, Thoma-Otremba, and Casabianca 2023). In line with the objective of understanding EU efforts to mitigate loneliness, we conduct a thorough analysis of recent documents and publications from EU initiatives and search across the academic literature. The second database focuses on HMC initiatives that propose the use of digital tools incorporating communicative AI as solutions for various social problems, specifically loneliness. This database encompasses a diverse range of sources, including websites, press releases, corporate social responsibility reports, and annual reports associated with the identified initiatives. To gain insight into the perceptions of HMC initiatives listed in our database, we present a document analysis of all available information that companies publicly provide regarding their initiatives and HMC products. Our focus here is on a critical understanding of how these initiatives articulate their goals, promote their products, and engage with their target audiences. By constructing two different databases, we are able to analyze documents from two distinct perspectives and to understand them in articulation: EU authorities to mitigate loneliness, as well as medical, commercial, and scientific initiatives seeking to provide technology-driven solutions for communication needs.

In conclusion, our approach aims to illuminate the different perspectives held by key stakeholders concerning the utilization of and techno-solutionist thinking about AI-driven conversational agents to tackle social problems, with a particular focus on the growing challenge of loneliness.

DCC14 AI and algorithmic cultures

PP 0690 The temporal formation of synthetic data

[James Steinhoff](#)¹

¹ University College Dublin, School of Information and Communication Studies, Dublin, Ireland

Critical data scholarship has highlighted the importance of understanding the "temporal formation" of big data (Boellstorff 2013). Machine learning is deployed to predict future events, but it does so by extrapolating from patterns present in data which are a recording of the past. However, the conventional form of big data, which is a recording via some kind of sensor, must now be assessed alongside the emergent technique of synthetic data which is "artificially created rather than being generated by actual events" (Dilemgani 2020). For instance, rather than deploying prototype autonomous vehicles on real world streets to collect camera and LIDAR data, one can instead deploy virtual vehicles in simulations to generate synthetic data that can be used to train models for real world deployment (Tideman 2021). Recent research has shown that synthetic data has different epistemic, ontological and political implications than conventional data (Steinhoff 2022; Jacobsen 2023). This paper focuses on temporality, which existing work has yet to cover. I argue that synthetic data has a distinct temporal formation in which a virtual future is mobilized to predict the future. First, I conduct a discourse analysis on documents concerning NVIDIA's Omniverse simulation platform, which is mainly used to synthesize data for autonomous vehicles. I show how synthetic data is reckoned as an ongoing project, rather than a recording of the past, and how it is pitched as solving the problem of

rare events or edge cases. Second, I show that synthetic data is not merely a sociotechnical imaginary by detailing my interviews with 3D and technical artists who build simulations for synthetic data production. I show that it is their labour which generates the distinct temporal formation of synthetic data. Finally, I outline some social and political implications of this novel temporality.

DCC14 AI and algorithmic cultures

PP 0691 Beyond the hype: Unraveling narratives and cultivating imaginaries in critical AI research

Taina Bucher¹

¹ University of Oslo, Media and communication, Oslo, Norway

The debate over AI's future is happening as we speak. With the availability of technologies such as OpenAI's GPT and Dall-E, Midjourney, Bard, and GitHub's Copilot for widespread use, AI is now a focal point in public discourse. Media reports abound on latest developments in AI models; policymakers are drafting legislative and policy initiatives to mitigate the risks of AI while also harnessing its potential; teachers engage in heated debates about the effects of large language models (LLMs) on the future of education; economists offer projections of how AI-based automation impact future jobs; and 'longtermism' is mobilized by prominent tech billionaires to capture our imagination about human extinction and cyborg afterlives.

Embedded within these stories are not only hopes and dreams, but also fears and anxieties – of broken democracies, a decrease in civic engagement, increased surveillance, and the potential for technology to supplant human roles. These narratives compellingly demonstrate how AI is not merely a singular field or even a collection of technologies, but a figure that serves to shape the realities of how we come to know and imagine AI in the first place. Whether it's Silicon Valley's AI visions or the risk-based policies of the coming EU AI Act, imaginaries matter.

The stories of AI being crafted and shared today will directly impact the intertwined futures of humans and AI. The strategic shaping of public narratives is crucial for fostering informed societal attitudes, which in turn influence policy decisions and ethical considerations concerning AI. Yet, the technologies and imaginaries of AI have rich histories, some untold. The past of AI remains unsettled, and its present could have unfolded differently.

Presenting the conceptual frameworks and guiding questions of a newly funded national research hub, this paper advocates for re-centering the humanities in core AI debates. Specifically, this paper reports on some agenda-setting questions and perspectives centered around the texts, affects, and speculative futures of AI. These questions revolve around the textual, affective, and speculative dimensions of AI, exploring how it can be grasped textually and theoretically within a humanities framework. For example, how do we understand ChatGPT text-analytically? What stories are embedded within Large Language Models? Additionally, the paper delves into changing conceptions of AI in the cultural imagination and proposes a speculative practice-based research approach to create new narratives for more equitable and sustainable AI futures. What does it mean that we are increasingly asked to interact with the machine via prompts through individualized, trial-and-error interactions? How can we imagine AI otherwise? By addressing questions such as these, the paper contributes to the emerging field of critical AI studies, seeking to establish a foundation for interdisciplinary research that critically examines AI beyond the hype.

DCC15 Protest and activism on digital platforms II

PP 0795 The power of a hashtag. A typology of hashtag activism focused on actors and temporal aspects

Kateryna Maikovska¹, Nicola Righetti¹, Annie Waldherr¹

¹ University of Vienna, Department of Communication, Vienna, Austria

In this theoretical contribution, we present a concept explication of hashtag activism and a new typology of it, focused on actors and temporal aspects. The hashtag has become a powerful tool for citizens worldwide to attract attention to social issues aiming to change the status quo, such as in the cases of the #MeToo, #BlackLivesMatter, and #FridaysforFuture movements. The current post-pandemic and post-Twitter hashtag activism needs a theoretical reevaluation. Even though general typologies of digital activism distinguish hashtag activism from other forms

of digital activism, there is a notable lack of analytical engagement with the concept of hashtag activism itself and no typology that differentiates between different types of hashtag activism.

We fill this gap by conducting an extensive literature review and applying Chaffee's (1991) concept explication framework. "Concept explication", as described by Chaffee, is a methodological process used in communication research to clarify and define concepts more precisely. This step enhances the clarity and operational usefulness of theoretical concepts, aiding in the development of more accurate and testable models and hypotheses in research.

Resulting from an extensive literature review, our theoretical contribution is threefold: First, we position hashtag activism against other terms relating to digital activism, e.g., "cyberprotest" or "hacktivism". We explain these terms' differences and common attributes and propose a hierarchy of terms based on the digital skills needed to participate in an activity and the particularities of the digital settings. Further, we embed the definition of hashtag activism within other instances of the same emergent phenomenon – social issue emergence – the emergence and development of discussions on social issues online, formation of ad hoc publics around them, sometimes followed by a viral spread, and picked up by the traditional media. Different social media functionalities can enable the phenomenon: the hashtag, "add yours" feature on Instagram, TikTok "sounds", Facebook protest avatars, and others.

Second, following the concept explication framework, we discuss the definition, attributes and properties, antecedent causes, and subsequent effects of hashtag activism. The distinguishing characteristics of hashtag activism are the technological factors, its capacity to promote personalized action frames, and its symbolic capacity as a type of cultural meme. We elaborate on the effects of hashtag activism for different types of actors and the discourse in general, describing it as a form of linguistic activism, as it often aims to shape the language we use to discuss social issues.

Third, we propose a typology of hashtag activism based on the distinction between its actors, primarily dividing them into the internal ad hoc community and the external participants, and we subcategorize the temporal patterns of hashtag activism into digitally native and non-digitally native cases.

DCC15 Protest and activism on digital platforms II

PP 0796 Examining the role of social media in triggering the Tigray War in Ethiopia

Kristin Skare Orgeret¹, Bruce Mutsvauro²

¹ Oslo Metropolitan University, Dept. of Journalism and Media Studies, Oslo, Norway

² Utrecht University, Media Studies, Utrecht, Netherlands

Examining the role of social media in triggering the Tigray War in Ethiopia

Escalating conflicts are deepening insecurity and disrupting lives in various regions across the globe. Digital media is increasingly held responsible for magnifying the dissemination of rumors, hate speech, and ethnic tensions (Castaño-Pulgarín et al 2021, Satarino 2021), with assumed significant impacts on the development and mediation of conflicts. In Ethiopia, Twitter and Facebook are accused of amplifying the spread of rumors, hate speech and ethnic tensions, contributing to the descent of the East African nation into a devastating war in Tigray (UN, 2022). Reports indicate that over 600 000 civilians lost their lives, numerous women and girls were raped, and extensive land areas were ravaged in the wake of the war (Van der Merwe, 2022). As digital technologies increasingly become "the infrastructure underlying all infrastructures", also on the African continent (Mutsvauro et al 2021), it is imperative to examine the role of social media in conflicts, not least in areas where internet access has been recently acquired.

This study seeks to ascertain the extent to which social media played a role in the escalation of the crisis in Tigray. The project aligns with the theoretical discussions on media and conflict (Budka & Brauchler, 2020; Maweu & Mare, 2021) and investigates how social media impact the escalation and perpetuation of violence. The study examines the utilization of hashtags, whether explicitly or implicitly linked to hate speech or discriminatory rhetoric, to elucidate the role played by social media in heightening tensions and disseminating hate speech.

By leveraging data from Twitter (now X) spanning from September 1, 2020, to December 31, 2022, this project will employ a dual approach involving computational modeling and network analysis. Subsequently, a qualitative content analysis of specific social media posts will be conducted. The aim is to encapsulate and illustrate how social media platforms contribute to the amplification of divisive narratives. After a rough screening of the Ethiopian Twitterscape focusing both on the posts of relevant actors in Ethiopia and in the diaspora, topicality, and popularity, a hashtag tracking tool is used to track and monitor selected hashtags considered of relevance to the conflict. The project will map hashtags that demonstrate significant engagement, measured by their capacities to generate "information cascades" or retweets. A topography of these hashtags based on their frequency over time will be analyzed in correlation with key dates related to the development of the Tigray war that commenced on November 4, 2020. This examination aims to discern connections between social media engagement and on-the-ground events, offering novel insights into the ways in which social media serves as a catalyst. The objective of the study is to enhance our comprehension of the intricate interplay between social media and the escalation of

violent conflicts. The findings will offer insights into the collaborative dynamics between hashtags and hate speech, clarifying their contribution to processes described as 'weaponizing information' (Singer & Brooking, 2019) and their role in escalating violence.

DCC15 Protest and activism on digital platforms II

PP 0797 Implicit collective memory in Social Media Ephemeral Story and how it fuels implicit activism in Nigeria`s EndSARS Movement: A Digital Ethnographic Journey

Silas Udenze¹

¹ Universitat Oberta de Catalunya, Humanities and Communication, Barcelona, Spain

The #EndSARS protest, a significant social movement that gained prominence in Nigeria in October 2020, garnered national and international attention. Originating as an online campaign on Twitter in 2016, the hashtag evolved into a widespread and impassioned movement against police brutality and misconduct in Nigeria (Obia, 2023). The Special Anti-Robbery Squad (SARS), established in 1992 by former Commissioner of Police Simeon Danladi, became notorious for alleged human rights violations, including extrajudicial killings, extortion, and harassment of Nigerian citizens (Asogwa et al., 2023). The catalyst for the 2020 protest was the reported killing of a young man by SARS officers in Delta State on October 3, 2020. The victim was stereotyped as a Yahoo Boy (Internet Fraudster), and the officers allegedly shot him and fled with his car, a crime captured on video and widely shared on social media (Agbo, 2021). This incident triggered widespread physical protests, uniting a diverse cross-section of Nigerian society, particularly young people, who utilised social media and took to the streets to demand justice, accountability, and comprehensive police reform. Beyond exposing issues of police brutality, the EndSARS movement raised broader questions about governance, transparency, and the role of social media in contemporary activism (Olaseni & Oladele, 2023). As a result, the #EndSARS protest serves as a poignant case study in the fight for social justice and change in Nigeria. Studies (Obia, 2023; Dambo, 2021, 2022; Uwalaka, 2021; Uwazuruike, 2020) have explored the EndSARS protest from various perspectives. This study contributes to the literature of the EndSARS and broader social movements by adopting a theoretical perspective centred on memory. While social movement studies often focus on explicit memory and commemoration, this work explores implicit memory, an often neglected aspect of movement studies. Unlike studies that emphasise episodic fanfare, this research delves into the driving force of implicit memory in social movements, providing a unique perspective on the EndSARS movement and its implications for memory studies (Eyerman, 2015; della Porta et al., 2018; Smit et al., 2018; Zamponi, 2018). Moreover, I contend that, given the online nature of the EndSARS movement, the existing literature should incorporate the methodological rigour of digital ethnography. As a result, the research questions this work attempts to answer are: What is implicit collective memory in the context of the EndSARS movement? How does implicit collective memory on the selected social media story fuel implicit activism? Preliminary results suggest that ephemeral story facilitates implicit activism and enables the construction of implicit collective memory of the EndSARS movement. I argue that understanding the interplay between implicit activism and implicit collective memory is vital for comprehending the dynamics of modern social movements and their potential for lasting impact. As we continue to witness the fusion of digital platforms, implicit activism, and implicit collective memory, it is crucial to explore the evolution of this relationship in the context of social and political change, not only in Nigeria but across the globe.

DCC15 Protest and activism on digital platforms II

PP 0798 'Creating our Seat at the Table' – Analyzing the epistemic formation of counterpublics in the Instagram series Sitzplatzreservierung

Ang-Nzinga Weiß¹

¹ Freie Universität Berlin / Institute for Media and Communication Studies, Journalism Studies, Berlin, Germany

In international comparison, Germany has rather hesitantly discussed racism in public debates (Çaglar & Sridharan, 2021; Salem & Thompson, 2016). This public disengagement with racism was interrupted in the summer of 2020, when German traditional mass media reacted to worldwide Black Lives Matter protests following the killing of Afro-American George Floyd (Haruna-Oelker, 2020). However, traditional mass media were soon met with public criticism. Especially on social media platforms, content creators started to publish formats complementing, critiquing, or countering traditional media's engagement. One of these initiatives was *Sitzplatzreservierung* (translating to 'seat reservation'), a series of videos published on Instagram in which Black Germans talk about their everyday experiences with racism. The title illustrates the video creators' demand for participation in the German public media debate.

Against the hegemonic resistance to critically talk about racism, *Sitzplatzreservierung* marked a novel account of publicly approaching the topic. A common concept used to describe endeavors that collectively share non-dominant discursive claims is the one of counterpublics. Squires (2002) critiques that this broad conceptualization, does no longer serve to 'distinguish amongst marginal publics and their activities' (p. 460). *Sitzplatzreservierung*

particularly highlights the importance of the epistemic dimension of counterpublics: Black Germans claim a seat at the table as knowers of their lifeworld beyond the hegemonic norm. I argue that focusing the epistemic formation of counterpublics can add more nuance to their conceptualization and their relation to the dominant public sphere. My argument is based on the philosophical paradigm of social epistemology and the theoretical presumption that knowledge is produced socially, in interactions with other people, instances, systems, etc. (Goldman & Whitcomb, 2011, pp. 11–12; Zerubavel, 1999, p. 6). Accordingly, counterpublics can be viewed as producing 'nondominant forms of knowledge' (Jackson & Foucault Welles, 2015, pp. 933–934) that challenge the assumption of a universal, objective, unmarked and disembodied knowledge (Kilomba, 2017, p. 85) in dominant publics.

To illustrate my claim, I analyzed all 14 videos published under *Sitzplatzreservierung* using a Critical Discourse Analysis. Following feminist, critical race theorist and decolonial approaches in analyzing the subject of knowledge (e.g., Harding, 2004; Hill Collins, 2000; Combahee River Collective, 1977; Fricker, 2017; Pohlhaus, 2017; Dotson, 2012) I derived the following dimensions for the analysis of the epistemic formation of counterpublics: (1) Knowledge power context, (2) Legitimate Knowledge, (2) Standpoint of communication, (4) Stranger sociability.

I find that *Sitzplatzreservierung* (1) occupies a subordinate status in the German context that is characterized by a 'dominant white consensus' (van Dijk, 1992, p. 89), (2) redefines the subject of knowledge in refuting the assumption of a universal, neutral and objective view, (3) explicitly articulates their standpoint in opposition to the German (traditional media) mainstream and (4) constructs an intimate stranger sociability by sharing embodied knowledge. *Sitzplatzreservierung* thus emphasizes 'nondominant forms of knowledge' (Jackson & Foucault Welles, 2015, pp. 933–934) and represents an example for the various approaches to redefine the subject of knowledge such as feminist standpoint theory, U.S. Black feminist thought or critical raced-gendered epistemologies.

DCC15 Protest and activism on digital platforms II

PP 0799 "I practically only see Stories:" Exploring emerging uses of Instagram Stories for everyday feminisms

Sofia P. Caldeira¹

¹ Universidade Lusófona, CICANT, Lisboa, Portugal

Social media platforms play a predominant role in our experiences of everyday feminisms (Pruchniewska, 2019), with different platforms, with distinct affordances and cultures of use, helping to shape different modes of political expression (Keller, 2019). This paper explores how Instagram Stories can facilitate emerging feminist practices, creating a rich environment where feminisms can be engaged with not only by activists or feminist organisations but also by "ordinary" people. Introduced in 2016, Instagram Stories enable the sharing of multi-modal content that disappears after 24 hours. Despite its wide adoption, studies on the political potential of Stories are still scarce (Jaramillo-Dent et al, 2021 or Cassidy et al., 2019).

This paper is grounded on 20 in-depth semi-structured interviews with feminist content-creators. The interviewees were purposefully selected following an exploratory study on feminisms on Portuguese Instagram (author, manuscript under revision), seeking to encompass diverse manifestations of feminist discourses and include diverse creators. Interviewees were also invited to go through their Instagram Stories Archive, a form of elicitation through scroll back techniques (Robards & Lincoln, 2017) that facilitated the discussion of these practices and their changes through time. The interviews were transcribed verbatim and thematically coded using MaxQDA.

These interviews explore the conventions and concerns underlying feminist practices in Instagram Stories, being attentive to technological affordances, existing cultures of use, and users' expectations. The interviews highlight how Instagram Stories can function as an ambivalent space for feminist communication. Interviewees – including individuals concerned with feminist issues, people with more public-facing platforms, or people who were part of feminist collectives or organisations – emphasised the current popularity of Stories, praising the ease in sharing they enable, and the presence of affordances like re-sharing content created by others, sharing of links, and one-to-one responses – all understood as having political benefits. This signals a shift from previous Instagram uses, with Stories appearing as a complement, and often a replacement, for formats like posts.

Yet, this paper also highlights the tensions felt by interviewees, reflecting on the contradictions between platform logics of Instagram and a sense of political responsibility – one pushing for continual and rapid content production to "feed the algorithm," and the other privileging careful and often slower forms political reflection. In this context, Stories are often seen as enabling small acts of political engagement (Picone et al., 2019) that allow to negotiate these opposing logics – with their shorter and less labour-intensive format and re-sharing abilities helping to ensure the regularity seen as essential to maintain algorithmic visibility (Treré, 2018), and to cover a wide variety of issues consistent with the interviewees' intersectional concerns. Finally, this paper reflects on how Stories can occupy a contradictory position in regards to Instagram's attention economy, on one hand seen as reaching larger audiences than those of posts, on the other simultaneously imagined as circulating amongst a more restricted and like-minded audience, thus being felt as a way to minimise forms of unwanted attention (Abidin, 2021) and, particularly, the pervasive backlash that often accompanies the popularity of online feminisms (Banet-Weiser, 2018).

DCC16 Disrupting the welfare state?: Crowdfunding platforms and digital redistributive imaginaries

PN 128 Theoretical and methodological approaches to crowdfunding platforms and redistributive imaginaries

[Mercè Oliva](#)¹, [Rebecca Bramall](#)²

¹ Universitat Pompeu Fabra, Department of Communication, Barcelona, Spain

² University of the Arts London, Media School, London, United Kingdom

This paper focuses on the theoretical and methodological challenges involved in analysing the role of crowdfunding platforms and other apps and digital tools in shaping redistributive practices and imaginaries. The aim of the paper is to introduce the theoretical framework for our research project and present the methodological approach that we adopted for the analysis of the 'digitalization' of prosocial giving and its relationship with dominant, emergent and residual discourses about redistribution. The paper's first section presents our rationale for adopting the concept of 'imaginaries' and explains how it supports our inquiry into redistributive practices and social meaning-making. Drawing on Jasanoff's conceptualization of socio-technical imaginaries (2015) and Jessop's approach to economic imaginaries (2010), we explain how the project has adapted and adopted these concepts. In particular, we are interested in exploring the balance between structure and agency that the concept of imaginary allows: how technologies can render imaginaries 'collective, durable and capable of being performed' (Jasanoff, 2015); and the concept of emergent imaginaries. The second part of the paper discusses the methodological challenges related to research on imaginaries. It outlines the specific methods chosen for the implementation of the project and the analysis of crowdfunding platforms. When analysing imaginaries, we face several challenges concerning the selection of data, actors and institutions involved and how to analyse this data. In our paper, we argue for a mixed-methods approach that combines qualitative textual analysis methods (CDA, social semiotics), with platform studies (Van Dijk, 2013) and affordance analysis (Scolari, 2004; Ronzhyn, Cardenal and Batlle Rubio, 2023). Through this approach, our project is able not only to better understand crowdfunding platforms, but also reflect on their role at the intersection of different imaginaries and ideologies of the digital, the role of citizenship and the state in the redistribution of wealth and the remaking of welfare states in the context of neoliberal (post) austerity policies within diverse national contexts.

DCC16 Disrupting the welfare state?: Crowdfunding platforms and digital redistributive imaginaries

PN 129 The ambivalent possibilities of social cause crowdfunding

[Jonathan Paylor](#)¹

¹ University of the Arts London, Media School, London, United Kingdom

By considering digital platforms as spaces of ambivalence, this paper explores how 'social cause crowdfunding' can be both a site of capitalist discipline and control and a site of radical possibilities. The paper draws on an analysis of various platforms operating in the UK (e.g., Spacehive, Open Collective and JustGiving) that enable users to crowdfund for social causes, and it adopts an understanding of subjectification which is informed by the work of Lazzarato (2014) and which takes into account signifying and a-signifying semiotics. In viewing social cause crowdfunding as a site of capitalist discipline and control, I draw attention to the ways in which platforms assign roles that accord with neoliberal visions of the entrepreneur. I show how these processes of social subjection work in conjunction with process of 'machinic enslavement' that induce certain kinds of action (e.g., 'sharing' and 'liking' crowdfunding campaigns) and which render crowdfunding platform users constitutive parts of the technical and social machines of digital capitalism. At the same time as illuminating the complimentary workings of social subjection and machinic enslavement, I consider how social cause crowdfunding opens up possibilities for rupture and creating alternative subjectivities. I do so by drawing on the concept of 'potent collectivity' (Gilbert, 2020) and exploring the ways in which platforms create spaces of collective agency. While I recognise how the enablement and exploitation of such collective relations is central to the workings of digital capitalism, I point to modes of existence that trouble and exceed dominant significations and subjections. In particular, by drawing attention to the possibilities of political mobilisation and collective ownership that platforms afford, I point to ways of being that disrupt the individualising and privatising tendencies of digital capitalism and which break with neoliberal visions of the entrepreneur. I conclude by reflecting on what the ambivalent spaces of social cause crowdfunding reveal about changing practices and understandings of redistribution within the context of digitalisation. In particular, I reflect on what these recent trends reveal about the reproduction and disruption of the dominant social order.

DCC16 Disrupting the welfare state?: Crowdfunding platforms and digital redistributive imaginaries

PN 130 From utopian to corporative discourses around solidarity on crowdfunding platforms in Spain

Isabel Villegas-Simón¹, Mercè Oliva¹, Ona Anglada-Pujol¹, Maria Castellví-Lloveras¹, Mar Guerrero-Pico¹

¹ Universitat Pompeu Fabra, Department of Communication, Barcelona, Spain

This communication seeks to analyse how crowdfunding platforms shape redistributive practices and imaginaries in Spain. Our objective is twofold: on the one hand, to understand to what extent these platforms transform redistributive practices and challenge the welfare state, and on the other hand, to explore the discourses around solidarity portrayed by these platforms. Previous scholarship (Davies, 2015) has explored how crowdfunding platforms can play a role in supporting, undermining or presenting an alternative to the welfare state. At the same time, crowdfunding platforms can propose new practices between citizens and prosocial contributions. To fulfill these aims, we apply a multidisciplinary analysis on four Spanish social crowdfunding platforms: Goteo, Mi grano de arena, Teaming and Bizum. The results show that each platform proposes a particular model of prosocial donations. Goteo presents as a transparent and accountable actor who vindicates open source and open data. Moreover, Goteo frames social causes under utopian and idealistic discourses to aspire to social transformation and puts citizens at the center as a force to guide and control public institutions. Mi grano de arena and Bizum present themselves as a digital service for the communication of the activity of NGOs and social entities and use corporate and commercial discourses that equate solidarity campaigns with any other marketing campaign. In this vein, these two platforms connect with neoliberal definitions of philanthropy and maintain a complementary role with the State. Finally, Teaming promotes two distinct characteristics of the crowdfunding model: recurrence and donating the same amount of money (only one euro per month). In this vein, Teaming articulates solidarity discourse around ideas of community, belonging, and accessible to everyone. However, the social causes that appear in Teaming are all linked to NGOs or social entities. In conclusion, crowdfunding platforms, such as Goteo and Teaming, present an alternative to the State when they present new redistributive practices and portray discourses about social transformation. Besides, both platforms broaden the definition of Welfare by including new areas, such as environmental causes, culture and animal well-being. In contrast, Mi grano de arena and Bizum present a complementary role of the State, portraying more established views regarding solidarity connected to NGOs. However, all of them present as an advantage to donors the possibility of obtaining a tax relief certificate after donating. This fact gives new nuances to understanding the relationship with the State since it portrays a more functional way to understand solidarity and may be interpreted as an individual alternative to payment of taxes. Thus, our results show that the relationship between these platforms and the Welfare State is complex and ambivalent.

DCC16 Disrupting the welfare state?: Crowdfunding platforms and digital redistributive imaginaries

PN 131 Human/non-human agencies in the digital: Analysis of four Finnish fundraising websites

Marleena Huuhka¹, Keijo Lakkala¹

¹ University of Lapland, Faculty of Social Sciences, Rovaniemi, Finland

This paper will analyse representations of agency in four different fundraising websites that are either based in Finland or aimed at the Finnish public. These websites represent a variety of crowdfunding and (financial) charity platforms: one donates to miscellaneous charities (Giving What We Can associated with Effective Altruism Finland); one is dedicated to helping Finnish World War II veterans (Veteraanit.fi by The Veteran Responsibility); one allows people to seek funding for a variety of different projects from art to business (Mesenaatti.fi); and one is directing their help to children and their families (The Mannerheim League for Child Welfare). In this paper we will discuss how human agency is portrayed on these websites and how digital platforms frame human agency, especially in relation to the transparent or invisible agency of 'the digital', the digital here referring to the platform as an agent. We will look at both human and non-human agencies present and discuss their relationship in the context of digitally coordinated voluntary redistribution practices. How are the human positions or roles – those of the fundraiser, donor, receiver – involved in the crowdfunding process represented and constructed? What kind of agency do those positions make possible? What sort of hierarchies are formed and what sort of agential power do they offer? How is the agency of the digital constructed, as a neutral or active participant? The above-mentioned aspects and their analysis contribute to the understanding of agency in redistributive practices in general, and especially in changes due to the increasing digitalization of said practices. As the agency of the digital increases, the assemblage of care present in traditional prosocial contribution transforms into an assemblage of digital and physical, human and non-human entities establishing new agential rhizomes of digitalized charity.

DCC16 Disrupting the welfare state?: Crowdfunding platforms and digital redistributive imaginaries

PN 132 Crowdfunding in Montenegro: Dynamics of digital inclusion and exclusion in Europe

Milana Čerčić¹, Čarna Brković¹

¹ Johannes Gutenberg-Universität Mainz, Institute for Film Theater Media and Cultural Studies, Mainz, Germany

This paper delves into the interconnected processes of digitalization and Europeanization at a European periphery. It focuses on Montenegro, a candidate country for EU-membership since 2010. Based on an affordance analysis of four crowdsourcing platforms in Montenegro (Budi Human, Pristanište, Volonteri Crne Gore and Help Each Other), and drawing on literature regarding the Europeanization of policies, the paper explores the characteristics of online crowdfunding on the 'digital periphery' (Szczepanik et al. 2020). The paper illustrates that digitalization in the Western Balkans embodies 'the paradox of Europeanness': 'that is, the simultaneous demand for inclusion and exclusion, openness and closure, transcendence and erection of borders' (Dzenovska 2018: 11). Rather than a 'digital divide', our findings from Montenegro reveal patterns of conditional inclusion and partial exclusion from the European financial and digital infrastructures. Digitalization in Montenegro has received strong support through the EU-accession process and has been shaped by techno-optimism. Narratives about digital means of raising money highlight a clear advantage over other means of raising money. Our material suggests that Western Balkan countries are generally expected to engage in crowdsourcing as 'an alternative source of financing in Europe', and as 'a potential key to success' (Stevanović and Milenković 2020: 54). Yet, the scarcity of online crowdsourcing initiatives is interpreted as a signal that the "awakening of the citizens' awareness" (ibid.) is needed in the Western Balkans. Our material shows that Montenegrin citizens are aware of the potential of crowdfunding. Montenegro ranks second only to Estonia in terms of the number of entrepreneurs (Luca, Bell, and Bozward 2021) and there are many local and analog crowdfunding initiatives. We suggest that the relative scarcity of implemented online crowdsourcing initiatives in everyday life is the result of a particular pattern of inclusion and exclusion from European digital and financial spaces: Montenegro is included into the circulation of dominant European imaginaries about the digital, while being excluded from actual participation in the digital and financial infrastructures constituting the European space. The case in point are major Western crowdfunding platforms, such as Fundly, GoFundMe, Indiegogo, Kickstarter, Mightycause, SeedInvest, and StartEngine, which do not accept projects seeking funding based in the Western Balkans, filtering out funding projects from the Western Balkans based on individuals' or business' residence and bank account details (Luca, Bell, and Bozward 2021: 58). The pattern of partial inclusion and conditional exclusion of Montenegro from 'Europe' is also visible in the organization of financial structures. Despite using Euro as its only currency, Montenegro is not part of the Single Euro Payments Area (SEPA), an EU payment integration initiative simplifying Euro bank transfers. Additionally, Montenegro is conditionally included in the Paypal – money can be sent from Montenegro via Paypal, but it cannot be received. In such a constellation, the local embeddedness of crowdsourcing initiatives and interpersonal relationships became crucial for platform success. Online platforms often need to integrate offline contributions to broaden public participation. Analog social events are often the key to the success of crowdsourcing in Montenegro.

DCC17 Media and news in digital cultures

PP 0998 News organisations struggle to understand audiences: Media companies advance in digital transformation only when they learn to use the data they have collected

Visa Noronen¹

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

Digital transformation and data analytics enable companies in various sectors to develop products that better meet their customers' needs. For news media, this means delivering content that meets the needs of different audiences. Legacy media institutions have faced challenges when it comes to understanding the audience data they have, yet this understanding is crucial for journalists to better serve their audience, which, in turn, significantly impacts business success.

In my research, I document how non-market-leading, subscription-based news organisations are evolving in their use of metrics, data analytics and metrics-enabled artificial intelligence (AI) solutions. Much of the existing literature concentrates on market leaders and news outlets in English-speaking countries, so this study aims to fill a gap in the scientific discussion by focusing on market followers—as opposed to those with the largest market share in their area—and media companies outside English-speaking countries.

To this purpose, I interviewed 16 experts from 14 market-follower legacy news organisations in Denmark, Finland, Norway and Sweden: four from each country. The media landscapes of these countries share several common features. Firstly, the Nordic media markets are some of the most digitally mature, and subscription-based online media is vital. Additionally, each country has one significantly larger and more international media company, which is the local market leader, and all four nations are subject to the same EU legislation on data privacy. I describe how

their analytics capabilities advanced using the levels and three-way division developed by Cherubini and Nielsen (2016), who categorise newsrooms working with audience metrics into three levels of evolution: rudimentary, generic and editorial analytics. They also evaluate news media companies' analytics capabilities as three dimensions of an assessment triangle: tools, organisation and culture.

At the rudimentary level, a news organisation often has a range of digital tools for collecting data, but it lacks the expertise to understand and efficiently use it. When market-follower news organisations move from the rudimentary level to the generic level, they start to better understand behavioural data through improved use of key performance indicators (KPIs), which allow them to measure and quantify metrics to evaluate and assess performance. News organisations then improve their understanding by reducing the number of KPIs used and easing their use in editors' and journalists' decision-making. News organisations advance to the editorial level when they start combining data from different sources – mostly behavioural data to user data – to understand the audience subgroups.

It is important to bear in mind that digitalising a market-follower media company is particularly demanding for management because in minor newsrooms, management may not have access to experts to consult when making decisions. However, market-follower news organisations have some clear advantages over larger ones when digitalising news production. For example, because they are usually smaller than market leaders, there are often no separate large divisions inside the news organisation, and thus information is less likely to be siloed.

DCC17 Media and news in digital cultures

PP 0999 Facebook without the News: Link-sharing patterns during the Meta's Australian and Canadian News Bans

Axel Bruns¹, Daniel Angus¹, Laura Vodden¹, Ashwin Nagappa¹

¹ Queensland University of Technology, Digital Media Research Centre, Kelvin Grove, Australia

Several governments have recently sought to redirect digital advertising revenues flowing to online intermediary platforms (search engines and social media platforms) towards news publishers; they argue that news content contributes substantially to the popular appeal of such platforms. In February 2021, Australia was the first major jurisdiction to pass a law, the News Media Bargaining Code, implementing a mandatory bargaining process between news media and platforms to facilitate such revenue-sharing; largely following the Australian model, Canada's Online News Act was passed in June 2023.

While Google reached a settlement relatively swiftly, despite vocal earlier protests against these initiatives, Meta, as parent company of Facebook, Instagram, and other platforms, took a substantially more aggressive stance, in both countries acting on its earlier threats to ban news from its platforms altogether. Consequently, the circulation of news (i.e. posting, passing on, or accessing links to news sites) on Facebook in Australia was blocked completely from 18 to 25 Feb. 2021; in Canada, similar restrictions commenced in late July 2023, and (at the time of writing in early 2024) remain in place.

At the height of the COVID-19 pandemic in Australia in 2021, and during a severe wildfire season in Canada in 2023, these unprecedented restrictions to the flow of vital news and information on a leading social media platform resulted in considerable public condemnation (also because overreach in the bans' scope resulted in the blocking of official meteorological services, government health departments, and even news satire sites). Meta, however, argued that news engagement accounts only for a very small proportion of overall Facebook activity, and that citizens could find sufficient news updates elsewhere.

Drawing on the comprehensive Facebook URL Shares dataset, this paper tests this claim by investigating link-sharing patterns on Facebook before, during, and (at least in the Australian case) after these news bans. The dataset provides anonymised information on link-sharing for all of Facebook (importantly also including non-public personal profiles); filtering it for Australian and Canadian users, respectively, we examine the volume of overall link-sharing activity in each country during each period, as well as the sharing of links to an extensive selection of major news outlets; this provides new insight into the proportion of link-sharing on Facebook that is actually engaged with news.

We also test for an increase in circumvention techniques (e.g. URL shorteners or other link target obfuscation tools) or in the use of alternative sources not covered by Facebook's bans, and (for Australia as well as for Canada, should the ban there be rescinded in time) examine whether news-sharing patterns return to pre-ban levels after the conclusion of the ban, or whether the service disruption appears to have permanently altered users' news engagement practices.

Our detailed analysis of link-sharing patterns during these exceptional interventions in Facebook's operation by parent company Meta therefore offers a unique insight into how platform users cope with such a major, deliberate

disruption of service. It can also inform future policy-making initiatives in this space, including those being considered by European nation states and the European Union.

DCC17 Media and news in digital cultures

PP 1000 Evolution of Sound-Text Dynamics: A comparative analysis of Social Media News Videos in French-speaking Belgium and Switzerland (2020-2023)

Margaux Guyot¹

¹ UCLouvain, Communication, Louvain-la-Neuve, Belgium

Our communication aims to investigate the relationships between sound and textual characteristics in native social media news videos. Such videos often deviate from the codes of traditional, linear television journalism and offer emerging formats, sometimes innovative, that are currently heterogeneous (Bock, 2016). A notable phenomenon in these videos is their compatibility with soundless consumption, thanks to subtitles, in particular. The ordinary voiceover commonly used in television is regularly replaced by textual annotation within the video. Our research question is therefore formulated as follows: Is text supplanting sound, making the latter non-essential in social media news videos on Facebook, Youtube, Instagram and TikTok? How has this phenomenon evolved between 2020 and 2023?

This research question prompts us to consider whether we are witnessing a transformation where video is no longer simply composed of images and sound, but where textual elements are gaining an equal or even greater importance due to changing consumption habits. The existing literature on the interplay between news video and social networks is limited and the fast-moving nature of the phenomenon contributes to the swift obsolescence of previous findings. We nonetheless rely on Newman's survey of the strategies employed by publishers for the creation and dissemination of news content on TikTok (Newman, 2022), the typology introduced by Jaffeux (2022) for classifying such videos and studies exploring the influence of social networks on the technical and editorial features of newsroom production (Mattelart, 2018; Barnes, 2013).

Our research focuses specifically on French-speaking Belgium and Switzerland, two small-sized markets sharing many structural similarities (Bonin et al., 2017). Six newsrooms have been included in the corpus: the broadcasting PSM of both countries, the two most read newspapers and the two online media outlets having the largest audience in each market. We analyze the videos published on YouTube, Facebook, Instagram and TikTok, between October and November 2020, and during the same months in 2023. The corpus includes a total of 581 videos in 2020 and 997 in 2023.

Following our manual content analysis (Bardin, 2013), the relationships between sound and text within the videos can be divided into three main distinct categories:

1. A first one where text does not replace sound but adds value (e.g., the name of a participant). This represents 28% of the videos in the first wave, 15 % in the second.
2. A second one where text replaces sound but the latter still adds value (e.g., a subtitled video with ambient sounds). This represents 34% of the videos in the first wave and 47% in the second.
3. A third one where text replaces sound, and the latter does not add value, except for the tone of voice and/or background music. Representing just over 35% of the videos in both waves of analysis.

Based on these results, our article aims to study the emergence of a new sound-image interaction regime within our corpus, where text would play an increasingly determinative role in the creation and consumption of videos, while sound becomes progressively limited to illustrative and esthetic purposes.

DCC17 Media and news in digital cultures

PP 1001 Media literacy and misinformation: Building resilience in the digital age

Paola Palomino Flores¹, Arnau Grifeu²

¹ Universidad Peruana de Ciencias Aplicadas, School of Communication, Lima, Peru

² Universitat Autònoma de Barcelona, Faculty of Communications, Barcelona, Spain

Media literacy and misinformation is an increasingly critical area of study in our technology-driven world (Salaverría & Cardoso, 2023). Media literacy is fundamental as a tool to combat the spread of misinformation in our digital age. It has become an essential pillar in modern education, providing people with the necessary skills to navigate and critically analyze the vast landscape of information available online. Therefore, it is important to see that the proliferation of digital media has facilitated the spread of misinformation, thus creating an urgent need for effective media literacy (Caled & Silva, 2022). The lack of media literacy in contemporary society has profound and multifaceted consequences (Wei, 2023). First, vulnerability to misinformation becomes a central problem (Gerbina, 2021). Without the necessary skills to discern the veracity and context of the information being consumed, individuals can easily fall into the traps of fake news and conspiracy theories (Chang, Mukherjee & Coppel, 2021). This not only affects individual understanding of the facts, but also has a collective impact, as misinformation can spread quickly

through social networks and other digital channels (Benaissa Pedriza, 2023). As a result, opinions and attitudes are formed based on erroneous or manipulated data, which can lead to harmful decisions in vital areas.

In addition, the absence of effective media literacy exacerbates social polarization and division, creating environments where individuals become entrenched in their viewpoints, often leading to a lack of exposure to or acceptance of differing perspectives (Modgil, Singh, Rgupta & Dennehy, 2021). This situation can result in the formation of ideologically homogeneous groups, further contributing to societal fragmentation. In its early conceptual framework, media literacy was defined as a complex skill set crucial for engaging with mediated communication. This definition, articulated by scholars such as Aufderheide (1993) and Livingstone (2004), involved a detailed understanding of various key competencies: the ability to access a wide range of media sources, the capacity for critical analysis and interpretation of media content, the aptitude to evaluate and discern the intentions behind media messages, and the competence to create content across different media platforms.

This study explores how media literacy education can enable individuals to identify, understand and critically evaluate the content they encounter online. This, in turn, empowers them to make informed decisions and fosters a more informed and resilient society against the tide of misinformation. Regarding methodology, the study adopts a mixed-methods approach, combining quantitative and qualitative research methods to provide a comprehensive understanding of the impact of media literacy on misinformation. This paradigm allows for a nuanced exploration of how media literacy education affects people's ability to discern truth from falsehood in the media they consume. In terms of sample size, the study strategically selects a significant number of participants to ensure representativeness and accuracy. The objective is to analyze survey responses from 500 participants. Participants are chosen to reflect a wide range of experiences and perspectives on media literacy, ensuring a comprehensive understanding of the challenges and successes in combating misinformation in different educational and policy contexts.

DCC17 Media and news in digital cultures

PP 1002 From euphoria to reservation: Fact-checkers' partnership with Meta and the third-party fact-checking program

Mette Bengtsson¹, Sabina Schousboe¹, Johan Farkas¹, Anna Schjøtt²

¹ University of Copenhagen, Department of Communication, Copenhagen, Denmark

² University of Amsterdam, Departement Mediastudies, Amsterdam, Netherlands

In a time of epistemic instability, fact-checking has gained ground worldwide. We now have a global expansion of fact-checking organisations with both journalistic news outlets and grassroots initiatives (Graves, 2016; Lowrey, 2017). As of 2023, the Duke Reporters' Lab counts 417 active fact-checking organisations globally (Stencel et al., 2023). A recent development is the increasing use of technical solutions and algorithmic systems to advance fact-checking practices (Full Fact, 2016; Graves, 2018; Guo et al., 2022; Johnson, 2023). One example of AI-supported fact-checking is Meta's third-party fact-checking program where IFCN-certified fact-checkers are responsible for fact-checking content in the local language on, for example, Facebook, which has been flagged by Meta's AI system designated to identify potentially false or misinforming content (META, 2021). Based on interviews and ethnographic fieldwork carried out in the Danish partner organisation of Meta, *TjekDet*, during the last five years (since *TjekDet* initiated their partnership with Meta), we explore the practices of Danish fact-checkers and their interaction with and reflections about the use of the AI system. We describe the development from a primarily optimistic to a more critical attitude towards the program and its workings and implications. Whereas the fact-checkers initially emphasise machinic virtues and the possibilities of tracing problematic claims in a vast ocean of claims circulating on social media, faster and with greater accuracy, they more recently painted a motley picture involving reservations, primarily relating to insecurities about the workings of the system, lack of alignment in internal working procedures, and lack of confidence in the systems as it sometimes seems to centre around single topics. We end by discussing that while the fact-checkers' reservations are primarily practical related to working procedures and concerns for potential consequences for themselves as a trustworthy organisation, the program also carries more fundamental problematic ideals and understandings of democracy and the journalist and citizen role that the fact-checkers do not reflect on (for a related discussion see Ananny, 2020).

DCC18 Digital economies and platformed labour

PP 1100 In this economy: Exploring visual signifiers and lifestyle narratives in financial discourse on YouTube and TikTok

Flavia Tăran¹

¹ Babeş-Bolyai University, Department of Journalism and Digital Media, Cluj-Napoca, Romania

The social media landscape has experienced a notable surge in content promoting the allure of the capitalist dream – an enticing narrative of swiftly accumulating wealth, devoid of traditional hard work. This phenomenon is captured in "FinTok" and "FinTube", portmanteaus for the financial content posted on TikTok and YouTube. Here, content creators promote topics such as investment opportunities, cryptocurrency, and how to reach financial independence through passive income. In this marketplace of ideas, influencers offer strategies for rapid wealth accumulation, promising a shortcut to prosperity from the comfort of one's home.

This article explores financial content on TikTok and YouTube, concerning the visual grammar and signifiers used, while also critically examining the narratives surrounding the pursuit of financial independence. This research investigates the content generated by Romanian creators within the financial niche, encompassing both macro and granular perspectives. Employing a mixed-methods approach, the study combines automated data collection, natural language processing (NLP), and metadata processing, with a qualitative grounded theory methodology (Glaser and Strauss, 1967) and social semiotics analysis. The research is also anchored in the Elaboration Likelihood Model (ELM) (Petty and Cacioppo, 1986), particularly emphasizing indicators associated with the peripheral route, through textual and visual cues such as the speaker's visual presentation, perceived credibility, and expertise (through props, personal example), repetition and textual structures.

Extensive datasets consisting of 4,500 TikTok videos and 1,000 YouTube videos, along with their associated metadata, were utilized to construct a comprehensive overview of the subject. Textual content, both video titles and transcribed audio from selected videos underwent analysis utilizing NLP. Co-occurrence networks (Higuchi, 2016) were constructed to unveil the prominent themes and key discourse points within the examined content. The second part of the analysis focused on a subset of videos from each platform, selected based on their view count. The videos were coded on three core aspects: visual grammar (how the videos were constructed), visual signifiers and cues (like the speaker's presentation, and lifestyle), and discursive elements.

The results revealed patterns in the form and the content of the videos, hinting at the existence of a FinTube/FinTok style. Additionally, the analysis uncovers traces of discourse addressing scams, asserting that the content vehemently denies any association with fraudulent activities. The scrutiny of the visual attributes of the videos yields noteworthy findings. Notably, most of the content is generated by male creators who commonly adopt a professional demeanor, often donning suits and projecting an image of affluence through displays of luxurious possessions such as cars, watches, and vacations. Furthermore, a distinct pattern emerges wherein content is produced in bulk, subsequently fragmented into smaller segments, and disseminated across multiple installments.

This study holds significance as it provides insights into this prominent content niche. Beyond its academic value, the research contributes to the realm of financial literacy by offering observations on the types of advice circulating online for achieving the elusive "financial independence". The examination of online behaviors informs our understanding of digital communication strategies on these platforms.

DCC18 Digital economies and platformed labour

PP 1101 Coins and connection: Exploring the viewer's gratification towards digital begging on TikTok live streaming

Diyana Kasimon¹, Syafika Mohd Ghazi¹

¹ Universiti Putra Malaysia, Communication, Kuala Lumpur, Malaysia

The upsurge of social media platforms has changed the way individuals engage with digital content and interact with other users. TikTok, one of the biggest social media platforms, has billion of users worldwide. Alongside with this growth, there is a rising trend known as "digital begging" within the backdrop of TikTok live streaming. Digital begging,

or some prefer to call it as "E-begging", can be described as a person who utilises social media such as TikTok as an online fundraising platform with the intention of getting financial gain from strangers online. Previous studies have highlighted the reasons for the TikTok content creators "digital beg" through TikTok live streaming. However, studies pertaining to why the TikTok users that are categorised as "viewers", are willing to spend hours in participating in digital begging particularly through the "gift-giving" activity during the live streaming are understudied.

With that in mind, by using Malaysia as the case study, this paper seeks to gain insights on this phenomenon through the lens of Uses and Gratification Theory (UGT). The objectives of this paper are:

- To examine the motivations for viewers to spend hours watching TikTok live streams.
- To explore the gratifications that viewers seek through their participation in digital begging through gift-giving activity during TikTok live streams.
- To understand the extent how digital begging on TikTok influences the dynamics of creator-viewer relationships through gift-giving activity during TikTok live streams.

Based on the data by Statistica (2023), Millennials and Gen Z are the biggest TikTok users in Malaysia. Hence, focus group discussions (FGD) with TikTok users with these age groups will be employed to understand their motivations and gratifications for using TikTok and watching the platform's live streams. The data from FGD will be analysed by using thematic analysis to observe patterns of similarities and differences across the data set.

This study makes a valuable contribution on the understanding of the role of social media in society in today's communication landscape. Moreover, we hope that this study is able to expand our knowledge on how communication on how social media like TikTok contributes to the development of online communities thus extending our understanding on issues of digital well-being that includes the potential exploitation of user-generated content across different cultural contexts, which in this case is Malaysia.

DCC18 Digital economies and platformed labour

PP 1102 "Waiting" for Traffic: A field study of TikTok transnational e-commerce live streaming industry

Xi Luo¹

¹ Communication University of China, Institute of Communication Studies, Beijing, China

The globalization of communication goes hand in hand with the globalization of the economy. As a digital infrastructure, platforms enable the connection of social relations and the reorganization of social resources through broad access and reach. The 2020 COVID-19 epidemic has accelerated the digital transformation of interactions on a global scale. With the booming development of China's digital economy, many digital platform companies such as Alibaba, Tencent, ByteDance born in the Chinese market have gradually started to globalize their business, and become new players in the global digital communication game, competing with American tech giants such as Meta, Apple, Google, etc. However, most of the existing research about digital platform focuses on micro-audience surveys or macro-theoretical discussions, lacking empirical analysis of concrete practical experiences at the meso-level, to explore how have digital platforms been used as a tool to influence the established social operation mechanism and how do practitioners interact with digital platforms.

Therefore, this study attempts to take the case as a starting point for discussion, using the transnational e-commerce live streaming industry, which has developed based on the TikTok platform during the pandemic. This study adopting a qualitative research methodology through a total six-month online and offline fieldwork, including three-month online participatory observation and a three-month field research in the TikTok E-commerce Live Streaming Base in Guangzhou. Guangzhou is the capital city of Guangdong Province, located in the southeastern part of mainland China, and is one of the largest transnational e-commerce live streaming industry marketplaces in China (even the world), as well as China's most important manufacturing region and port.

A total of four findings are obtained in this report: firstly, transnational e-commerce live streaming is essentially a intercultural relational engagement communication dominated by goods and algorithm-based traffic. Secondly, the development direction of the whole industry is closely related to platform policies and is forming a pattern of intensification and scale around the platform. Thirdly, transnational digital platforms have brought about the "time difference" effect between regions, which is specifically manifested in the "time difference" of business models and the "time difference" of the global division of labor, and the platforms, as a new type of transnational enterprise in the post-industrial era, have become a global phenomenon. The platform as a new type of transnational corporations in the post-industrial era deploys resources globally. Fourthly, the connections between practitioners in the industry are relatively loose, characterized by high mobility and instability. This study gives a thick description of the new industry boomed by digital platform, providing a vivid case study of digital platforms and broadens the research ideas of digital platforms, digital culture and media studies.

DCC18 Digital economies and platformed labour

PP 1103 "I won't do that": Rejection as a form of resistance among online freelancers

[Floor Fiers](#)¹

¹ Northwestern University, Communication Studies, Evanston, USA

This study examines how online freelancers in the United States and the Netherlands exercise agency in their employment through gig platforms. In the gig economy, workers face long, unsocial work hours (Wood et al., 2019) due to, for example, global competition (Vallas & Schor, 2020), the need to invest unpaid labor to procure paid projects (Berg, 2016), and a lack of (sufficient) employment benefits (Gray & Suri, 2019). Simultaneously, the fragmented nature of gig work and the increased surveillance on digital platforms limits workers' ability to organize and improve their working conditions (Woodcock & Graham, 2020). Prior research shows that, in response to these sources of precarity, gig workers develop strategies to build resiliency and make the work more manageable. Such research has primarily focused on more precarious contexts, such as the Global South (Anwar & Graham, 2020) or lines of work that require less training and communication with clients (Chen & Soriano, 2022). This study extends this work by tracing the contours of worker agency among gig workers who are in less precarious positions. When people choose to work in the gig economy despite having other, arguably better options, do they engage in similar resilience strategies?

This study draws on semi-structured interviews with thirty-one online freelancers, who perform fully remote contract work characterized by a high level of technical and creative skill. These individuals are in relatively privileged positions, as compared to other gig workers, in three ways. First, participants are based in the United States (n = 21) or the Netherlands (n = 12), which provides them not only with various forms of social security, but also with the advantage of less competition on the platform. Second, they engage in online freelancing, arguably a less – though still – precarious form of gig work as compared to other forms. As compared to microwork or delivery work, the more complex nature of the work presumably yields greater financial rewards as well as greater intellectual and creative challenges. Moreover, online freelancing platforms encourage individualized brand building and sustaining a roster of clients, giving online freelancers more power and agency than the more invisible workers in the gig economy (Ahmad & Krzywdzinski, 2022). Lastly, most participants are highly educated and have specialized technical or creative skill sets. Consequently, they tend to have other employment options at hand and make a more active choice to work through a gig platform.

We find that online freelancers engage in what we call "shades of rejection," which refers to the varying rates at which they refuse to engage with (parts of) gig platforms. Such rejection ranges from refusing to engage in free consultations to leaving the platform altogether. This finding suggests that resistance among more privileged gig workers might take the form of rejection, which extends frameworks adopted by earlier research (e.g., Anwar & Graham, 2020). Finally, the paper considers how rejection behaviors intersect with privilege, where those less dependent on gig work are able to distance themselves from the precarious employment environment within the gig economy.

DCC18 Digital economies and platformed labour

PP 1104 Re-ordering the disorder of the "World Wide Web" trademark application: A historical analysis through the CERN archives

[Deborah Barcella](#)¹

¹ USI Università della Svizzera italiana, Institute of Media and Journalism, Lugano, Switzerland

The World Wide Web (also known as Web or WWW), developed at CERN in 1989, rapidly evolved into the most popular Internet service. Despite its great popularity, Web development has been characterized by various disorders, that have shaped how users access and engage with the service.

One of the lesser-known yet significant "disorders" in the history of the Web involves CERN's unsuccessful attempt to trademark the name World Wide Web. To gain legal recognition and protection as the official owner of this Internet service, CERN applied to the Patent and Trademark Office of the US Department of Commerce for registration of a trademark in 1995. However, this request was rejected in 1996 because the name was "a recognized term describing the global computer network known as the 'World Wide Web'" (CERN-ARCH-WWW-2-002).

This paper examines and reorders the factors and underlying reasons that led to the initial application and subsequent rejection of the "World Wide Web" as a registered trademark. The research is based on exclusive access to documents housed in the CERN archives, specifically the WWW collection, and in-depth interviews with key figures involved in the trademark application process. In this endeavour, the research employs a marketing lens, grounded in brand management principles, to conduct a hermeneutic analysis of the data to interpret findings.

The results show that organisational culture is a key factor in rejecting the trademark. The need to trademark "Web" only became apparent in 1994, amid a clash of organisational cultures between CERN and MIT. MIT's push for CERN to trademark the Web to gain ownership was countered by CERN's own trademark application, a strategic move to assert its creative rights and prevent MIT from owning the service. This underlines the tensions between the two organisations that underpinned the trademark application. Furthermore, CERN's culture was an important factor in analysing the reasons for the rejection of the trademark. Its culture shaped decisions related to product development and promotion that, from a marketing perspective, could be seen as misjudgements. These "mistakes" fall into four categories: (i) the naming process; (ii) pricing strategies; (iii) distribution approach; and (iv) timing. While these decisions helped to increase the number of web users and facilitate the adoption of the technology in the early 1990s, they also reduced the likelihood of the web becoming a registered trademark.

By exploring a lesser-known aspect of this technology through a marketing lens, this paper contributes to the historical literature on the Web. It highlights the influence of organisational culture on digital product development decisions. In addition, this study provides a basis for considering the counterfactual history of the most widely used Internet service: What if CERN had succeeded in trademarking the Web? How would the digital landscape as we know it have changed if the web became trademarked?

DGR01 Analyzing games and the state of game studies

PP 0716 Virtual reality as a space for self-creation – An exploratory study of Polish VRChat players

Karolina Brylska¹

¹ University of Warsaw, Faculty of Journalism- Information and Book Studies, Warsaw, Poland

The study dealt with the ways of human (player) functioning in virtual reality (VR), especially in the context of the means and mechanisms of player self-creation. As an example of such a space, social VR application VRChat was chosen – in which one can interact with other players (Wang 2020; Maloney & Freeman 2020; McVeigh-Schultz et al. 2018, 2019). One of the key aspects of acting in games and VR is self-creation, expressed mainly through an avatar (Freeman et al. 2020; Baumann-Jaeger 2018). The relationship between avatar and player identity is the subject of academic debate (e.g. Ducheneaut, et al. 2009; Kafai et al. 2009; McArthur & Jenson 2015). Avatars represent players in the VR world and enable them to experience it by means of modifying, creating and personalizing an image of themselves – which happens to be a key activity in the process of socialization, exploration and experimentation in the online social space (Rzeszewski 2020). Thus, the study served to check whether the players realize the process of self-creation ("the conscious co-formation of the individual through learning, action, reflection, life choices, opening up new possibilities for development", Pietrasinski, 2001:88).

In this exploratory study we posed the following research questions: (Q1) How do VRChat players understand and define their in-game identity (specifically, their relationship with their avatar)? (Q2) What are the motivations of people, intensively using VRChat? (Q3) How do players functionalize the use of VRChat (what do they use it for, what functions does it perform)? (Q4) What benefits and risks do gamers see in experiencing VR? (Q5) How do players describe the communication between avatars in the VRChat app in terms of form and content? The project was funded by the National Science Center in Poland (decision no. 2022/06/X/XXX/XXXX [anonymized]).

The study consisted of in-depth individual interviews (IDI) with 30 Polish players, using the VRChat app intensively (5–6 hrs/week, for min. 2 years). The interviews took place in the VRChat and its scenario involved 23 questions. The research material was analyzed using QDAMiner, a code tree included 8 codes and 58 sub-codes.

We aimed at finding out players' motivations for using the app and decoding the ways they think about themselves in the game – including, in particular, their relationships with their own avatar and with other players. During the interviews, all players pointed to the social potential as a key benefit of using the app. We also observed seven crucial factors determining the choice of a particular avatar, such as the desire to reflect one's personality and to "feel good" about the character with which the player identifies, or making the avatar an excuse for an ironic but friendly discussion between players. Significantly, too, some respondents used statements that indicate identification with the avatar they chose and used constantly (or most of the time). Some respondents outright stated that they would like to be their avatar in real life.

The project yielded insights into the functioning of social VR applications by players and the complex relationship between player and avatar.

DGR01 Analyzing games and the state of game studies

PP 0717 Playing anxiety – Examining how game design can be used to experience mental illnesses

[Celine Dorrani](#)¹, Freya Sukalla¹

¹ Leipzig University, Institute of Communication and Media Studies, Leipzig, Germany

In recent years, more and more serious games have been published that move away from the prevalent stigmatizing portrayal of mental illness and place sensitive portrayals of playable characters (PCs) with mental illness at the center of the game. As mental illnesses are often not visible externally, a sensitive, non-stigmatizing portrayal presents a particular challenge.

Compared to films where mental illnesses can be portrayed only using the narrative and audiovisual elements, video games can use ludic elements as an additional layer. Games designed with a subjective point of view (no avatar visualized), and an intradiegetic-centered direct point of action (interaction within the game only via a directly controllable PC) provide a high degree of subjectification where the players merge with the PC and experience the narrative through their eyes. If the PC is conceived with a mental illness, the game offers players the opportunity to adopt this character's perspective and actively experience various aspects of mental illness themselves. Additional elements of gameplay, such as manipulation rules, can be used to create an even closer experience of "what it's like." This perspective-taking can lead to fewer stigmatizing responses, more empathy with the target, and more prosocial behaviors.

However, there is no research on which aspects of a game and gameplay are specifically associated with perspective-taking and how this might be related to (de)stigmatization.

This study uses the game *Fractured Minds* – a short puzzle adventure game designed to demonstrate life with an anxiety disorder – to examine which elements of a game are suitable for experiencing mental illness through a PC. We used the methodology of close play to analyze how anxiety disorder is portrayed in the game. To investigate how this portrayals are interpreted, we also conducted qualitative interviews with 21 participants (13 female, 21–56 years), who were asked to play the game and then interviewed about their gaming experience.

Fractured Minds features a high degree of subjectification by its first-person perspective and direct control of the PC's actions. The game represents anxiety disorder on the narrative level directly through the plot and indirectly through metaphorical representations. On the visual-auditory level the game uses dark colors and dissonant music. On the ludic level, the game uses defamiliarization (disrupting people's routinized actions) by undermining players' expectations of control and agency. Also it counteracts the state of flow by creating a challenge-skill imbalance through missing instructions, agency restriction and negative feedback, even after success.

Our interviews identified the ludic elements as the most relevant reference point in players' gaming experience and reflections as it triggered negative feelings in line with feelings that can accompany anxiety disorders (anxiety, fear, self-doubt). Defamiliarization and these negative feelings drew attention to the dissimilarity to other games and therefore encouraged reflection on the game and the illness. However, there is still a risk of stigmatization, primarily related to the narrative level when elements (especially metaphors) were misunderstood.

Our study offers relevant insights for how to design a game portraying mental illnesses to contribute to destigmatization.

DGR01 Analyzing games and the state of game studies

PP 0718 How do people experience a chronic disease of a loved one in digital games? Representation of illness experience and support

[Ruth Kasdorf](#)¹, Christine Linke¹

¹ Hochschule Wismar, Fakultät Gestaltung, Wismar, Germany

Chronic diseases, i.e., "conditions that last 1 year or more and require ongoing medical attention or limit activities of daily living or both" (CDC, 2022), do not only disrupt the lives of those affected. People close to someone with a chronic disease, such as family members, partners, and friends, are also confronted with a breakdown of their „old“ order. Support from caregivers may include providing information and compassion, decision-making, assistance in everyday life, and financial aid (Reifegerste, 2019). Hence, the illness may affect family members regarding emotions, finances, education and work, leisure time, social life, and family relationships (Golics et al., 2013). Representation from the point of view of relatives of those affected potentially helps reflect and understand how the illness impacts their lives and leads to educating the public on diseases and health (Fürholzer, 2020).

This contribution deals with representing the close social group of people with chronic diseases in digital games. The games examined in this study are chosen based on their relevance, variance, and accessibility through Let's Plays on the video platform YouTube in German or English. The games examined in this study were released within the last ten years and belong to different genres. The sample includes examples of both mental, e.g., depression and anxiety, and physical illnesses, e.g., cancer. There was a combined deductive-inductive process of creating

a coding system (Mayring, 1997) with further steps of analytic coding (Flick, 2007). Communication and consensual coding validated the categories and ensured their inter-coding reliability (Kuckartz, 2018). The focus is on the illness experience of family members and friends and how they support those affected.

The findings show different perspectives on dealing with chronic diseases in digital games. On the one hand, there is the representation of those affected, including how they experience the support of their family and friends and how this support impacts them. On the other hand, the perspective of relatives offers more insight into their illness experience and ways of support that might go unnoticed by those affected. Games following the perspective of relatives tend to focus on coping with the illness, bereavement, and grief. The analyzed sample shows different kinds of support: Positive support or harmful approaches to dealing with the disease. Some examples even lack representation of support from family and friends for those affected. The presentation will offer a detailed insight into selected examples.

The contribution reveals different approaches to representing the close social group of people with chronic diseases. These representations might lead to more awareness of the impact of chronic diseases beyond those affected and more understanding in this context. Positive support identified in the sample, as best practice examples, might help improve the relationship between those affected and their loved ones. On the other hand, depictions of harmful dealing with the illness might also be beneficial as cautionary tales. The findings of this study also emphasize the potential of digital games for meaningful representations of complex social phenomena, in this case, chronic diseases.

DGR01 Analyzing games and the state of game studies

PP 0719 "Git gud or go home": Boundary work and distinction in Fromsoftware games' online communities

Ilir Rama¹, Laura Bruschi¹, Giacomo Lauritano²

¹ University of Milan, Department of Social and Political Sciences, Milan, Italy

² University of Milano-Bicocca, Department of Sociology and Social Research, Milan, Italy

Cultural consumption is a central part of how identity is socially built and performed. Alongside from more affirmed cultural products such as music, movies, and books, videogames are increasingly becoming a part of the cultural diet and, thus, increasingly concur to the formation of group identities, such as through the building and negotiation of symbolic boundaries. Symbolic boundaries can be defined as the lines that define some groups, people and things while excluding others (Lamont et al 2015). It is a term that refers to the internal classification systems within and between groups and that, as noted by Bourdieu (1984), always carry an implicit judgment by the classifier to the classified. The study of music consumption is a central example, albeit not the only one, of how researchers have used this literature to investigate forms of cultural consumption.

However, we maintain that videogames communities have a peculiar way to enforce and create boundaries tied to the specificity of the considered medium. Games require a high level of interaction in order to function and this allows different players' expectations, desires and "gaming background" to create wildly different gameplay experiences (Aarseth 2003, Malliet 2007). The centrality of gameplay implies the necessity to learn not only theoretical and aesthetic knowledge in order to decipher an obscure medium, but also a practical skill set in order to overcome the game's challenges. When considering how symbolic boundaries are built through game consumption it is thus paramount to put a focus on how games are played, even more so as when considering less interactive forms of media (Jarness 2015).

Hence, this article will investigate how symbolic boundaries are discursively built, managed, maintained, and negotiated within the specifics of digital game communities, and how this intersects with specific gameplay elements and design choices. To do so we focus on how Fromsoftware titles (e.g.: Elden Ring, Dark Souls, Bloodborne), which are notorious for their difficulty and their dedicated fanbase, have been discussed on dedicated online communities on Reddit. We perform a discourse and content analysis of over 120,000 comments, through manual and automated text analysis, within the broader methodological framework of digital methods. We consider how symbolic boundaries are discursively built within these communities, and how users define what authentic, true, or "hardcore" modes of consumption are, and how these distinguish and socially situate the player.

DGR01 Analyzing games and the state of game studies

PP 0720 Press Start to Publish. The state of Game Studies research in 2024

[George Prundaru](#)¹

¹ Babeş-Bolyai University, Journalism and Digital Media, Cluj-Napoca, Romania

In response to the increasing recognition of digital games as pivotal elements of modern media culture, this paper presents a thorough bibliometric analysis of the Game Studies field. Utilizing a comprehensive dataset comprising 4484 unique scientific articles published in *Game Studies*, sourced from various bibliometric databases including WoS, Scopus, Crossref, Semantic Scholar, and cross-referenced with Google Scholar, we embark on a detailed exploration of the themes and trends that have captivated researchers over the past two decades. This examination delves into the distribution of research across multiple domains within Game Studies, aiming to unearth emerging trends in the field and identify theoretical gaps in the existing literature.

Our methodical approach involved analyzing key publication metrics, such as trends in publication volume, citation patterns, and thematic focuses (through automated content analysis of titles and abstracts) over time. Our findings reveal notable shifts in research focus, with a consistent presence of research on gamification, game design, and fluctuations in interest in topics of societal relevance, such as extremism and gender issues. These shifts highlight the field's adaptability to evolving societal concerns and the increasingly complex role of gaming in culture. This trend correlates with a surge in publications in the fields of Communication and Cultural Studies, which dominate our sample.

Additionally, our preliminary analysis indicates that open access articles are cited more frequently than non-open access articles, suggesting a strong statistical correlation between open access status and citation counts. This insight is particularly relevant in the context of the ongoing discourse on open access publishing and its impact on academic research dissemination.

In conclusion, this study not only charts the dynamic landscape of Game Studies but also serves as a critical compass for future research. It highlights areas ripe for exploration and underscores the evolving interplay between digital gaming and broader cultural and societal trends. Through this comprehensive bibliometric analysis, we provide a foundational roadmap for scholars seeking to navigate the multifaceted and ever-changing terrain of Game Studies.

DGR02 Games, gamification and society

PP 0830 The importance of social engagement and local context: Findings from the Euphorigen Investigation misinformation escape room

[Chris Coward](#)^{1,2}, [Klinta Ločmele](#)³, [Jin Ha Lee](#)¹

¹ University of Washington, Information School, Seattle, USA

² University of Copenhagen, Department of Communication, Copenhagen, Denmark

³ University of Latvia, Department of Communication Studies, Riga, Latvia

Educational misinformation games have proliferated as a novel approach for building resilience to misinformation. This paper presents research on the Euphorigen Investigation (Loki's Loop, 2023), an escape room style misinformation game, focused on two findings: the social nature of the game and the importance of local context.

Media literacy theory and practice largely focuses on the individual and the skills and knowledge needed to navigate information on one's own. Most misinformation games (31 of 32 according to DeJong, 2023) are single-player games, illustrating strong adherence to the individual skills orientation. In contrast, we developed Euphorigen as a collaborative game with a post-game debrief conversation to reflect the social aspect of misinformation. We analyzed video recordings and player surveys from 53 game sessions involving 211 players. We find that the collaborative gameplay offers opportunities to discuss their experiences with misinformation in the debrief, factoring significantly in producing strong results on increasing people's awareness of misinformation tactics and generating reflection on the psychological and emotional aspects of misinformation (Cho et al., 2023).

We developed Euphorigen for the US context with a narrative that leverages the US's overall low levels of trust in government and large corporations to trigger confirmation bias as well as the notion of introducing a substance into the public water stream to establish a particular player mindset. Other organizations have since localized Euphorigen into a number of European languages (Latvian, Lithuanian, Estonian, Finnish, Dutch), all countries with varying levels of trust in institutions among other misinformation resiliency factors (Humphrecht, E., Esser, F., & Van Aelst, P., 2020). Based on a workshop of the localization partners we found mixed results. Positively, seemingly minor but significant modifications, such as changing the names of the characters and integrating local misinformation examples into the debrief, contributed to the game's relevancy. However, we also learned that there was a missed

opportunity to make modest changes to the narrative (e.g. a different delivery system than the public water supply) that would have enhanced the game's appeal and impact.

This study has important implications for misinformation game design. In critiquing media literacy's overriding emphasis on individual skills, we suggest games are ideally suited for creating environments that reproduce the social nature of misinformation and engage multiple people in collective sensemaking and dialogue among people with different views. We further offer a co-design methodology based on the insights from the workshop findings, to co-create misinformation games tailored to local context.

PP 0831 Indie video games for addressing ecological challenges. A narrative review of game-based learning approaches in high school and baccalaureate education

Kevin Marín-Rubio¹, Júlia Vilasis-Pamos², Xavier Rubio-Campillo¹

¹ University of Barcelona, Department of Applied Didactics, Barcelona, Spain

² Pompeu Fabra University, Department of Communication, Barcelona, Spain

Video games addressing environmental issues have the potential to raise awareness among players by providing interactive and immersive experiences that demonstrate the complexities and interconnections of natural systems, as well as the potential consequences of ecological degradation and the benefits of conservation efforts (Larreina-Morales & Gunella, 2023). These games provide a system of rewards and goals that motivate players, a narrative context that situates the activity and establishes rules of engagement, learning content relevant to the narrative plot, and interactive cues that prompt learning and provide feedback. Furthermore, game-based learning approaches have explored the benefits of introducing video games into formal learning contexts. In video games, players embody themselves within a system of signs and symbols that are learned implicitly through their interactive, immersive, and problem-solving nature, providing a situated learning (Gee, 2003). Therefore, video games contribute to the perception of players as agents of change, increasing the application of knowledge in real situations and promoting sustainable actions (Larreina-Morales & Gunella, 2023).

The purpose of this paper is to report on a narrative literature review that aimed to determine the extent to which ecological indie games are potential resources for raising environmental awareness and addressing climate change issues among high school and baccalaureate students.

We conducted a literature search on the intersection of indie (or independent) games, ecology and games, and game-based learning approaches using databases such as Scopus, Web of Science, and Google Scholar. Search terms used in the literature review included varied terms for indie games and ecological awareness, terms relevant to the twin goals of learning and engagement in games.

We identified articles and books describing the indie genre as opposed to mainstream video games (such as Juul, 2019; Pérez-Latorre, 2016); ecologic video games (Chang, 2011); and case studies based on game-based learning approaches, particularly on mainstream and serious games (Picó et al., 2021; Gómez & Lanza, 2021). Applying the inclusion criteria led to 21 papers, 3 book chapters, and 4 books, which were considered relevant.

The synthesis of the papers indicates that there is reason to be optimistic that a game-based learning approach may effectively increase environmental awareness and address climate change issues among high school and baccalaureate students. It is important to take advantage of the interdisciplinary nature of video games when incorporating game-based learning approaches into the educational curriculum. Furthermore, while indie games are not commonly used in classrooms, they have the potential to be a valuable resource for teachers and critical pedagogy learning contexts.

PP 0832 Speak with blocks: Minecraft, environmental campaigns and activism

Gaia Amadori¹, [Lavinia Colantoni](#)¹, Matteo Tarantino¹

¹ Università Cattolica del Sacro Cuore, Department of Communication, Milano, Italy

Speak with Blocks: Minecraft, Environmental Campaigns and Activism

The communication of urban environmental issues and sustainability represents a pivotal asset for city administrators and stakeholders. Engaging citizens in this field constitutes a salient challenge to face on the one hand public apathy, or even negationism, and on the other disinformation. Reaching effectively the target requests new kinds of communicative instances that leverage the potential of new media. In this regard, video games emerged as a potential help in the promotion of awareness, reflection, criticism, or even action and behavioral changes. Reflection has focused particularly on the so-called "serious games" (Frasca, 2003), that is games specifically developed for advancing a thesis, emphasizing the educational value of video games and focusing on game-based learning for engaging with climate change (Fernández Galeote & Hamari, 2021; Ouariachi et al., 2019). This scholarship has primarily adopted discrete video game software as its main analytical unit.

The present contribution adopts instead a more systemic perspective, focusing on the co-shaping processes between the game software, its assets, the campaign itself, players, its commentators (streamers) and the broader controversy it inserts itself into. From this perspective, it acknowledges that the roles played by video games within sustainability campaigns can be manifold and often contradictory. After putting forward a multi-dimensional analytical model, the present contribution applies it to two top-down environmental campaigns, both using the popular 3D sandbox game Minecraft (Mojang 2011), which allows users to build and explore polygonal environments. The first is a 2021 institutional campaign in Venice, Italy, where developers built an interactive map of the Venetian lagoon to promote sustainable development through a series of green practices, such as cultivating urban gardens, fining drivers using polluting vehicles, or creating short-supply chains and solidarity economies. The second is a 2020 corporate campaign where grade school pupils built the local power plant to model water uses (aqueducts, discharges, industrial uses, and energy) to ensure the protection of the waters in the Po Valley region and encourage imagining an ideal and environmentally sustainable city.

Through analysis of production pivoting on semi-structured interviews to the campaign and software developers (n = 6), this research explores the intersections between (a) urban sustainability issues, (b) the network of actors and stakeholders involved in sustainability communication, and (c) the video game ecosystem which includes the video game assets and affordances as well as the articulation of its community (including users, modders, streamers, spectators, distributors...). The analysis shows how the trade-offs entailed by the use of video games within sustainability campaigns (i.e. between knowledge, social capital, political support, social relevance...) are carefully navigated by the stakeholders to secure funding and bring such campaigns to fruition. Moreover, the analysis stresses the strong limitations currently stifling the evaluation of such campaigns and their short and long-term benefits for the local context. In conclusion, the analysis puts forward some ideas for overcoming such limitations to better leverage the potential of video games in the context of such urgent challenges.

DGR02 Games, gamification and society

PP 0833 Putting hope and power of action into play

[Sara Mosberg Iversen](#)¹

¹ University of Southern Denmark, Department of Design- Media- and Educational Science, Odense M, Denmark

Increasingly, the fight for climate and environment may seem hopeless as much too little is being done way too late. Many people, including children and youth, experience anxiety, anger, despair, or apathy as a direct reaction to the current state of the world (e.g. Happer, 2017; Hickman et al. 2021). Loss of hope is problematic both for the individual, due to the suffering it may cause, as well as for society and the environment at large, as it may affect the will to act (Kelsey, 2020, pp. 28–29). It seems that hope and its relation to power of action is something we need not only to understand, but to find ways to put into play to continually encourage and foster transformative action toward climate and environment.

In the proposed paper I will discuss a case, where we literally seek to put hope and power of action into play via a speculative cli-fi roleplaying game (RPG), created to be used with youth aged 15–20 years. The question that informs the paper is: How can hope and power of action be put into play in a cli-fi roleplaying game, and how is this received by the players?

Firstly, I will focus on hope and power of action as phenomena, examining both from various angles such as philosophy and psychology. Then I will discuss how we seek to work with hope and power of action as game mechanisms and themes in the RPG *The children from the eternity train*. Thirdly, I examine how two groups of players receive and react to these mechanisms and themes, drawing on data from a pilot study consisting of two tests play-rounds of four sessions each. One took place from August 2022 to August 2023 with a varied group of educators, researchers, and roleplaying enthusiasts, one was carried out in January 2024 with a group of pupils from the Danish boarding school Østerskov. The pilot study forms the foundation for the three-year research project *Playing with disaster*, officially starting in September 2024, that has received funding from the Independent Research Fund Denmark as well as the Climate Cluster at University of Southern Denmark.

PP 0834 Gamification in Higher Education: A systematic literature review of its creative potential in instructional communication

Nigar Zahan¹

¹ Technische Universität Ilmenau, Department of Economic Sciences and Media, Ilmenau, Germany

In response to the increasing concerns of disengagement and demotivation among today's higher education students (Chipchase et al., 2017; Pham et al., 2022; Wong & Liem, 2021), gamification, a concept that utilises game design elements in a non-game context (Deterding et al., 2011), has emerged as a key educational approach. Indicating its creative potential to enhance learner engagement and motivation, the adoption of gamification has witnessed a surge in online, hybrid, and traditional learning environments over the last decade (Kaya & Erçağ, 2023; Khalil et al., 2018; Sailer & Sailer, 2020). Integration of such technological tools and engaging strategies is indispensable in the field of instructional communication (Myers et al., 2016; Waldeck et al., 2001). However, diverse application arrangements and widespread implementation approaches have also led to a fragmented understanding and debates on the effectiveness of gamification (Hanus & Fox, 2015; Kyewski & Krmer, 2018; Mekler et al., 2017). This complexity poses a dilemma for educators and educational institutes aiming to integrate gamification into their instructional practices.

To address these challenges, this work systematically reviews the state of gamification implementation approaches in higher education from 2013 to 2023. Drawing from 87 papers systematically selected from five databases (Scopus, Web of Science, EBSCOhost, ACM Library, and IEEE Explore), the research navigates the complex landscape of gamification, identifying the core objectives of the implementation, the approach of execution, the methodologies used for intervention, and the impact of intervention on the students. The systematic review also classifies the effectiveness of gamification based on the environment of the study and the duration of the intervention.

The systematic literature review reveals a nuanced and multifaceted outlook on gamification within higher education. Preference towards certain implementation tools, such as the mobile app Kahoot, Gamified Moodle, and tailored platforms, has been observed as a prominent execution approach. A high number of studies concentrated on the online learning environment, resulting in a limited exploration of in-class gamification applications. Only a small number of studies considered the theoretical foundations. By synthesising insights from current empirical studies, the results of the review provide valuable direction for higher education institutions, educators, and instructional designers. The findings contribute to the ongoing discourse on gamification's implementation strategies and impacts within the landscape of educational technologies, a much-needed new order of higher education, and instructional communication practices.

DGR03 Free-to-play and mobile games

PP 0937 Google Doodle games as a branded entertainment strategy: A content analysis from 2010 to 2023

Laura Cañete Sanz¹, Salvador Gómez García²

¹ Universidad de Murcia, Facultad de Comunicación y Documentación, Murcia, Spain

² Universidad Complutense de Madrid, Facultad de Ciencias de la Información, Madrid, Spain

This study explores the following research question: *How do Google Doodle Games, serving as promotional gaming experience, work to contribute to brand value?* By running an in-depth content analysis of the Google Doodle games published until 2023, we specify the characteristics that identify this interactive content as a direct influence in the brand image. In 1998, Google started designing artistic and appealing modifications of their logotype embedded in their search engine service. Google Doodles adopted different styles and formats that encompass different topics. Due to their creativity, one Doodle was nominated to an Emmy in 2018, and users record some Doodles to upload them on YouTube.

Our work examines the characteristics of Google Doodle games as a subcategory of branded content, valuable content generated around a brand that through its interaction pursues brand engagement and different marketing objectives that influence the brand image. From a persuasive perspective, we propose that interactive doodles improve the brand image by linking specific events and emotions to the organization, which can be described as a type of experiential marketing (Berlanga-Fernández & Sánchez-Esparza, 2021).

We first run a literature review to identify the academic publications linked to Google Doodles and their communicative characteristics. Secondly, we review the Google Doodles Library and, after applying specific exclusive and inclusive criteria, a data corpus is generated from 75 games retrieved. Thirdly, we extract the data set by coding specific characteristics that provide meaningful information to understand these games as brand image enhancers. This codification pays attention to (a) formal data (year and location of publication, topic), (b) game data (game genre, time spent, serious purposes, social elements) and (c) persuasive data (persuasive elements, external elements). For this last step, we follow the theoretical model proposed by De la Hera (2019) to identify persuasive elements; and supported by the method for analysing games as sociotechnical systems suggested by Sicart (2015) to dig into game specifications and game contextualization.

The key findings highlight a transformative shift of the games towards mobile platforms, emphasizing a social aspect characterized by highly 'shareable' content, thereby enhancing word-of-mouth. Additionally, the design of online games facilitates collaborative experiences, allowing players to play with others. The thematic spectrum spans from international festivities (i.e. Halloween, Olympic Games) to more niche and cultural themes (i.e. Mbira, Jerry Lawson's birthday). The persuasive elements show a subtle and associative type of visual placement of the logo, and the main service of the organization (search engine) is commonly present in the game as a button that shows more information about the topic. Finally, educational objectives are also present in the corpus studied as an in-game element.

The implications of the results show the flexibility of possibilities in the use of games as a communicative tool. We identify a necessity to interpret the context these games have outside the playful action. Studying other external effects, such as publicity communication would give a complete understanding of the usability of these games as a positive brand image generator.

DGR03 Free-to-play and mobile games

PP 0938 Dive into the past: Intangible Chinese cultural heritage represented in Chinese mobile games

Yixiang Que¹, Teresa De la Hera¹, Jeroen Jansz¹

¹ Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

This study aims at providing an overview of how intangible Chinese cultural heritage is represented in mobile games developed by Chinese production studios. Our systematic literature review on the academic study of the representation of cultural heritage in games has shown that existing academic publications on this topic focus on the study of tangible cultural heritage and that the study of the representation of cultural heritage in mobile games has been so far neglected (Que et al., In Prep). Furthermore, to overcome the bad reputation of mobile games, there is a growing number of Chinese mobile game studios that followed the strategy of increasing the representation of Chinese cultural heritage in their games, which has been used as a sign of aligning the government's priority of increasing the country's "cultural confidence" and expanding the reputation of Chinese culture globally (Davis, 2020). Considering this context, this study strived to answer the following research question: *What aspects of intangible cultural heritage are represented in mobile games developed by Chinese studios?*

To answer the research question, we conducted a qualitative content analysis of 32 mobile games that we purposively sampled from Apple's App Store and China's TapTap store. The inclusion criteria were as follows: (1) mobile games produced by Chinese studios; (2) including representations of intangible cultural heritage. The data

collection method used in this study was analytical play, in concrete utilitarian play following Mäyrä (2008, p. 165). this involved making notes of the visual, textual, and audio representations in games and relating these elements to a wider context of historical and social range to contribute to an overall qualitative understanding of the sampled games. For the analysis of the data collected, we conducted a thematic analysis following (Fernández-Vara, 2019). To operationalize the analysis, we followed the definition of intangible cultural heritage by UNESCO (n.d.: 2009).

Our research reports the aspects of history, arts and artefacts, and people as the main themes depicted in the sampled games. The preliminary results of our study showed that Chinese mobile games opted for Chinese historical eras to be the inspiration for their world design. Also, they depicted abundant Chinese arts and artefacts, such as traditional performances, literature, music, rituals, and so on. Lastly, they also included Chinese people's lifestyles and traditional social norms in their game design. Additionally, our results implied that game elements and game genres play crucial roles in choosing which facets of intangible Chinese cultural heritage in Chinese mobile games. Besides, the "games as service" model is widely used by mobile games, providing game content on a continuing revenue model. Noticeably, some sampled games have released new content during special times, such as traditional Chinese festivals, with corresponding intangible heritage to be depicted. This shows the important role of game context in integrating the representation of intangible Chinese cultural heritage in Chinese mobile games.

DGR03 Free-to-play and mobile games

PP 0939 Darker Shades of Play: The prevalence of dark patterns in early childhood mobile digital games

Carla Patricia Sousa¹, Ana Filipa Pereira Oliveira¹

¹ Lusófona University, Centre for Research in Applied Communication – Culture – and New Technologies CICANT, Lisbon, Portugal

The centrality of play has been recognized since the early days of the study of human development, given its subordination to meaning-making, with a focus on early childhood (Vygotsky, 1978). With the digitalization of contemporary society, early childhood education itself has increasingly been developed in close contact with digital media, both at school (Lindeman et al., 2021) and family level (Kumpulainen & Gillen, 2020) – with a particular focus on the role of mobile digital games (MDG), and their impact on the "ways children interact, play and learn" (Morgade, et al., 2020, p.119). With this growing interaction between young children and MDG, concerns about problem gaming – conflicts and problems emerging from videogame playing in the sociocultural contexts of everyday life (Thorhauge, Gregersen, & Enevold, 2018) – are also emerging for this age group. According to Zagal et al. (2013) some game design patterns can be unethical, labeling them as "dark" – deceitful design which focuses on maximising profits through manipulative tactics (Dahlan and Susanty, 2022; Heimo et al., 2018; Zagal et al., 2013).

These can have a negative impact on players, manipulating them against their best interests, as well as impacting their digital literacy competencies. Considering the above-discussed aspects of the role of mobile gaming in early childhood, researching dark patterns can be considered even more relevant since their prevalence seems to be expressive on these platforms (Dahlan & Susanty, 2022) and younger age groups (Escudero, 2022; Smahel et al., 2020).

This study aims to investigate the presence of dark patterns in MDG for young children (0–5 years old), through mixed-methods analysis. The five most popular free games for this age range on App Store (February 2023) were analyzed, particularly focusing on the presence of temporal, monetary, social, and/or psychological dark patterns.

The results emphasise the importance of promoting adults' game and digital literacy to support children effectively. Conclusions also raise questions about managing associated risks while fostering critical and empowering approaches and learning, particularly when considering dark patterns within the context of childhood. Furthermore, the results sustain a need to re-contextualize dark patterns and associated literacy practices within the context of childhood, particularly early childhood.

By shining a light on these dark patterns, this research study contributes to a broader discussion on responsible and ethical game design practices and the promotion of game literacies in early childhood. Thereafter, it encourages researchers, developers, families, and educators to reflect on the impact of these design strategies on children's well-being, literacy development, and overall digital experiences. Ultimately, the goal is to promote the creation of more inclusive, engaging, and ethically designed digital experiences for young children.

DGR03 Free-to-play and mobile games

PP 0940 (Un)intended consequences of new monetization strategies in digital games

Max De Baey-Ernsten¹, Sven Joeckel¹

¹ University of Erfurt, Media and communication, Erfurt, Germany

We set out to ask what consequences the shift towards new models of monetization in the gaming industry, e.g. in-game sales, will have for gamers, media regulators and media education. First, we describe the ongoing shift in monetization strategies for digital games, relying on aspects of participatory media culture and platform economy

(Nieborg & Poel, 2018). Then, we spell out consequences for users and regulators. Finally, we argue that these consequences pose challenges for (critical) media literacy education.

Monetization of digital games

For years, the way to monetize digital games has been to sell them as products that were distributed either physically or through digital distribution. In recent years digital games across all platforms started generating a substantial amount of revenue through in-game-purchases. This shift is due to a greater reliance on free-to-play models, where a game or certain elements of a game can be used with no or little monetary costs, while access to further game features or items comes with costs in form of in-game sales. Many traditional pay-to-play games now also include a variety of in-game sales.

Potential consequences

Such monetization strategies have led to new forms of catering for consumers' willingness to pay for digital games and new forms of digital gaming with the development of diverse and long-lasting types of games (Joseph, 2021). In addition, games and gaming environments such as Minecraft or Roblox (Evans et al., 2022) make user-generated-content available that is traded in in-game marketplaces. Consumers as producers take an active role in the provision of gaming content. Yet, digital games now have introduced rather complex in-game economies, that are deeply connected to aspects of attention economy (Davenport & Beck, 2001) and data-driven design (Bernevgg & Gekker, 2022). Gamers either pay for gaming elements or spent more time in the game to earn rewards. This not only leads to challenges for game designers to cater to diverse audiences in terms of buying power but also encourages gamers to devote more time to a game, potentially increasing risks of excessive or pathological gaming behavior (Lemmens, 2022). At the same time, in-game purchases are often linked with elements of gambling, such as Loot-Boxes. On a regulatory perspective, we observe that strategies to counter such gambling mechanism differ even on a European level, with some countries such as the Netherland taking a stricter approach against gambling elements than others such as Germany.

Challenges for media literacy education

Issues that have long been discussed in social media literacy research, such as privacy, the dissolving boundaries between consumption and production and an understanding of platform logic and economic backgrounds (Manca et al., 2021), also play an increasingly important role for digital gaming. We argue for a need to integrate discourses on digital platform economy and monetization strategies for digital games and consumer rights into the wider framework of (critical) media literacy to prepare consumers, particular children and adolescents, to better cope with the (economic) challenges that are now inherent in the gaming market.

DGR03 Free-to-play and mobile games

PP 0941 I want a new skin! A study on the consumption of microtransactions and gamer status perception among adolescents according to their social class and gender

Júlia Vilasis-Pamos¹

¹ Universitat Pompeu Fabra, Department of Communication / MEDIUM Research Group, Barcelona, Spain

This article examines the social class and gender influence the microtransactions (MTX) consumption among Spaniards 14 and 15 years old and how they related their consumption practices with their gamer identity and status between players.

Nowadays, MTX is the prototypical form of Downloadable Content (DLC). Specifically, they are the virtual purchases associated with customization, either of additional content or cosmetic changes (a 'skin', an add-on without direct impact on the way you play) and/or the functional update (for example, unlocking new levels or maps). The player can make these purchases with real money through the game's virtual store or, in paradigmatic cases like Fortnite, in physical stores (like GAME, in the case of Spain). They are called MTX ('micro', 'transaction') because they are considered small sums of money. These MTX allow players to acquire status within the game (Nielsen, 2020) and, therefore, within the gamer community.

This research is carried out with the participation of in-school 14 and 15-year-old adolescents from Barcelona and Vic cities (located in Spain). The data collection is based on two qualitative questionnaires (N = 150), eight focus groups (N = 48), and two series of virtual semi-structured interviews (N = 8) and online gaming interviews (N = 8). The qualitative analysis of the participants' discourses was performed with the NVivo software in two rounds of coding. The first coding focused on the adolescents' gaming practices; their discourses on "status" in gaming culture; their definitions of "gamer"; and their identification (or non-identification) with this concept. Based on the first coding, a second round of coding was performed by crossing the first analysis with the categories mentioned above established by Muriel & Crawford (2018): hardcore-subcultural; casual; foodie-connoisseur; cultural-intellectual; everyone is a gamer. The results show significant differences in the consumption of MTX regarding social class and gender. Firstly, we can observe that the working class practically only plays free-to-play and pay-to-win video games. Concerning this issue, we observe that working-class boys are most likely to engage in this purchasing practice.

In contrast, both middle-class boys and girls openly criticize this type of practice and, in some cases, especially among girls, both working-class and middle-class, link it to gambling addiction. Moreover, these consumption practices are related to adolescents' perception of gamer status and their identification with the gamer identity (Nielsen, 2020). In short, we observed that social class and gender play an important role in adolescents' consumption practices concerning MTX consumption and their perception of their status and identification (or not) as gamers.

DGR04 Motivations and emotions

PP 1028 (Are we) motivated to game for meaning? Insights and challenges from extant literature on eudaimonia in digital games research

Nicholas Bowman¹, Daniel Possler², Rowan Daneels³

¹ Syracuse University, S.I. Newhouse School of Public Communications, Syracuse, USA

² University of Würzburg, Media and Business Communication, Würzburg, Germany

³ University of Antwerp, Department of Communication Studies, Antwerp, Belgium

Among the more impactful shifts in media psychology research is the expansion of entertainment to consider hedonic (e.g., pleasure) and eudaimonic (e.g., meaningful) experiences (Vorderer & Reinecke, 2015). This research has found footing in explaining video games (see Daneels et al., 2023)—a medium not commonly thought to offer more serious and contemplative experiences (Oliver et al., 2016).

In a scoping review of eudaimonia in video games (Daneels et al., 2021), ample scholarship on how and why players feel eudaimonia during and following gameplay was identified ($N = 83$ studies). However, there was a dearth of scholarship into if and how players are motivated to seek eudaimonia in video games. Some disagreed on key *definitions* (e.g., “insight needs” in Oliver et al., 2016 as compared to “eudaimonic entertainment motivations” in Possler et al., 2020). Others differed in the *levels of selection* at which they considered eudaimonic motives to operate (e.g., selecting a specific game in Wulf & Baldwin, 2020 as opposed to selecting how to play a game in Holl et al., 2020). To these ends, the current study more deeply explores existing literature to address:

(RQ1) How are eudaimonic motives of digital game use conceptualized?

(RQ2) At which levels of media selection are eudaimonic motives considered?

Method

We conducted a multi-stage scoping review: a secondary analysis of manuscripts from Daneels et al (2021, <https://osf.io/q7kdv>) and a PRISMA search for new manuscripts (see https://osf.io/rvqnm/?view_only=f917379fa0854609874d9f212823f38f). $N = 26$ papers overall. Using qualitative content analysis (Mayring, 2000), all information on eudaimonic motives (conceptualization, measurement, results) was extracted from the papers, summarized and then clustered by similarity to identify larger patterns.

Results

Regarding RQ1, when conceptualized as trait-like, eudaimonic motives reflect individuals' persistent tendency to seek out games for meaningful experiences in ways reflecting more *fundamental human needs* (e.g., insight and psychological well-being; Oliver et al., 2016; Possler et al., 2020; Rigby & Ryan, 2017; Wulf & Baldwin, 2020). For others, traits were more proximally connected to *media preferences* (e.g., wanting emotionally challenging or reflective content; Cohen, 2016; Possler et al., 2020; Wulf & Baldwin, 2020). In both cases, at least some players seem to use games to “scratch a eudaimonic itch” (Jacobs, 2021, p. 31), although more recent scholarship (Bowman et al., 2023) found players to rarely mention eudaimonic expectations of upcoming games from franchises with known eudaimonic capacities.

Regarding RQ2, we found that eudaimonic gaming motives have been considered to operate on at least four levels of media selection: selecting games over other activities (e.g., Laato & Rauti, 2021; Shi et al., 2019), selecting a specific game genre (e.g., serious games; Jacobs, 2021), choosing a specific game (e.g., *Pokémon Go* for nostalgia; Wulf & Baldwin, 2020), and engaging specific playstyles within a game (Cohen, 2016; Possler et al., 2020).

Digital games are known to elicit eudaimonia in players, and have unique capacities relevant to these more contemplative experiences (Possler et al., 2023). Our findings should help guide theoretical and operational refinement towards a better understanding of if, when, and how players seek out eudaimonia.

DGR04 Motivations and emotions

PP 1029 Bored gaming: Exploring relationships between state boredom and digital game selection

Rowan Daneels¹, Karolien Poels¹, Heidi Vandebosch¹

¹ University of Antwerp, Communication Studies, Antwerp, Belgium

Boredom is a prevalent yet understudied negative emotional state in media research. Traditionally associated with insufficient stimulation and low arousal, boredom also occurs when individuals are highly aroused, leading to the development of the Meaning and Attentional Components (MAC) model by psychologists Westgate and Wilson (2018). This model posits that boredom has an attentional (ability to focus on current activity, considering a person's resources and an activity's demanding nature) and meaning component (desire to do the activity), creating six boredom profiles based on low or high attention and meaning levels. However, this psychological model remains scarcely studied in a media and gaming context (Poels et al., 2022).

Classic communication theories like Mood Management theory (Zillmann, 1988) suggest that people turn to media to overcome negative emotions like boredom. Similarly, the MAC model proposes different strategies to regulate boredom, including switching activities such as playing a game. Switching activities only occurs though when individuals experience meaningless boredom, as people engaged in meaningful activities stay with their current activity, instead regulating their resources to meet the activity's demands. As our focus lies on game selection and switching activities, this study only concentrates on the four boredom profiles with low meaning levels.

Due to their interactive nature, immersive storytelling potential and feedback-based character, digital games can be effective emotion regulation instruments (Villani et al., 2018). To gain insight into how players try to regulate boredom feelings by selecting different types of games, we examine how different meaningless boredom profiles relate to digital game selection, considering selection in terms of (1) games that elicit hedonic and/or eudaimonic experiences and (2) games with different types of demands. First, since the MAC model suggests people switch to enjoyable or meaningful activities based on their boredom profile, we adopt the two-factor perspective of hedonic (enjoyable) and eudaimonic (meaningful, emotional, reflective) entertainment (Vorderer & Reinecke, 2015). The Recovery and Resilience in Entertaining Media use (R²EM) model (Reinecke & Rieger, 2021), for instance, can help explain why individuals with different boredom profiles select games for hedonic (e.g., for relaxation) or eudaimonic experiences (e.g., for mastery). Second, expanding on the MAC model's focus on cognitive demands within the attentional component, this study explores other types of demands, such as emotionally demanding games connected to more meaningful or eudaimonic experiences (Bowman, 2021).

An online exploratory survey among a gaming population will test these relationships. Participants are given four situations, each describing one of four meaningless boredom profiles. For each situation, participants indicate whether they recognize the situation as being boring, whether they are willing to switch the described boring activity for playing a digital game, and what type of game—in terms of their enjoyability (hedonic) and meaningfulness (eudaimonic) as well as their cognitive and emotional demands—they would choose in each situation. This study tests whether individuals' game selection aligns with MAC model predictions. Participants' assessment of boredom, perceived hedonic and eudaimonic experiences, and perceived game demands are measured.

As data collection and analysis are ongoing, results will be presented at the conference.

DGR04 Motivations and emotions

PP 1030 Barrens chat brings me back: Nostalgia and sense of place for World of Warcraft locales

Jaime Banks¹, Nicholas David Bowman², Charlotte Ebel², Qianqian Zhao²

¹ Syracuse University, School of Information Studies, Syracuse – NY, USA

² Syracuse University, S.I. Newhouse School of Public Communications, Syracuse – NY, USA

Among many outcomes of playing videogames--especially franchises with rich histories--are feelings of *nostalgia*. Nostalgia is a bittersweet yet positively valenced emotional response to fond recollections of the past (Sedikides & Wildschut, 2022); prior work indicates digital experiences such as videogame play are especially adept at fostering nostalgia (Makai, 2018). In particular, in-game locations are especially powerful in evoking nostalgia, as they assemble self-relevant aesthetics, familiar objects, personal achievements, and social connections, often through substantial time investments (see Wulf et al., 2018). Location-related nostalgia can be triggered when players feel a *sense of place* (SoP) for gaming locales (AUTHORS1). SoP is a phenomenon in which people form familiar, deep, personal meanings to spaces (Norberg-Schulz, 1980); these meanings inform SoP as a kind of place-knowing that moves beyond mere names and descriptions to knowing a place "as one person knows another [person]" (Tuan, 1975, p. 152). AUTHORS2 argue that SoP comprises symbolic, purposive, identity, relational, and emotional dimensions (the SPIRES) applicable to both digital and physical spaces. Videogames foster SoP when players spend time in game spaces (e.g. Bowman et al., 2020), engage historical contexts (Bowman et al., 2023), and--critical for the current study--recall past gaming experiences (Robinson & Bowman, 2021).

Notably, both nostalgia and SoP are feeling- and knowing-states that can be elicited without being *in* the space (Wulf et al., 2021; AUTHORS1,2). Beyond this commonality, however, little is known about the intersections of nostalgia and SoP for digital spaces--especially given that many persistent game spaces can be revisited. This study moves toward addressing that gap by exploring player responses to social media content from Blizzard Entertainment (publishers of *World of Warcraft*, est. 2004; *WoW*) asking player communities about *WoW* places. Specifically, we explore three questions:

RQ1: Do gamers more often revisit older or newer spaces from *WoW*'s history?

RQ2: What SoP dimensions are present in recollections of revisited game spaces?

RQ3: (How) does nostalgia correspond with (a) space recency and (b) SoP dimensions in those recollections?

To address these questions, we are conducting secondary, inductive analysis on public social media data. On 29 July 2023, the official *WoW* social media accounts for Facebook (<http://bit.ly/3RyNCqv>) and Twitter (<https://bit.ly/3tu59rW>) posed a question: "Which place in *WoW* do you like going back to just for a visit?" We scraped $N = 2,864$ Facebook replies and $N = 336$ Twitter replies.

Quantitative content analysis of those data (Neuendorf, 2014) are in progress, coding for (a) the space's originating *WoW* expansion, (b) presence of SoP SPIREs, and (c) presence of nostalgic emotion. An early interpretive reading of data suggest (RQ1) participants principally name 'vanilla' or early-expansion locales (e.g., The Barrens, Nagrand) and starting zones. (RQ2) All SPIREs are mentioned, though symbolism is not overt or prevalent. (RQ3) Early locales are often co-mentioned with nostalgic emotion, and recent locales to a lesser extent. Nostalgia can correspond with all SoP SPIREs, but notably is often the very *purpose* of named spaces--revisiting because it "takes me back" to one's (gaming) past.

DGR04 Motivations and emotions

PP 1031 Typical gamers: A survey study on stereotypes surrounding gamer identity

[Jeroen Lemmens](#)¹

¹ University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

The term *gamer* is widely used colloquially and within research to describe people who regularly play computer or video games. Identification as a gamer is generally perceived as a fluid concept that consists of an interplay of *social*, *individual*, and *contextual* factors. Social factors that contribute to gamer identity often come from a collective sense of belonging that arises within a group of players. Notably, gamer communities on Twitter displayed traditional hegemonic masculine traits through the rejection of women and femininity (Dowling et al., 2020). Among the most prominent individual factors contributing to gamer identity is an excessive and often obsessive involvement with games (DiSalvo, 2016). When persistent, excessive and obsessive gaming becomes problematic for a player, this behavior may be labelled as a gaming disorder (World Health Organization, 2022). Finally, contextual factors of gamer identity are reflected in a general preference for hardcore competitive computer- and console games over casual games on mobile devices (De Grove et al., 2015). These three factors influence how gamers are perceived, their behavior, and their perception of themselves. Because quantitative studies on gamer identity and its relations with social, individual and contextual factors are very scarce (e.g., Yim et al., 2023), the current study aims to examine how stereotypical characteristics, motivations and behaviours of video game players relate to identification as a gamer.

The results of this survey study among an international sample of 1427 predominantly male (89%) players ($M_{age} = 29.07$, $SD = 9.50$), challenge some traditional stereotypes of gamers, while confirming others. In general, self-identification as gamer was more common among younger players. No evidence was found for a stronger sense of hegemonic masculinity among those who showed more self-identification as gamers. However, the stereotypical perception of gamers as socially awkward was confirmed by a positive relation between gamer identification and social anxiety. Gamer identity is further characterized by a strong passion for gaming, predominantly on console and pc, coming from intrinsic needs to experience competence, autonomy and relatedness in games, thereby underscoring the idea that gamers find meaning and fulfilment in gaming activities.

Especially for younger players, self-esteem and social status may hinge on continued engagement with online video games, causing some players to consciously overindulge. This results in excessive amounts of gametime among many gamers, and gaming disorder among a few. These few who showed signs of gaming disorder also showed more signs of excessive cannabis use, whereas cannabis use showed no relation with gamer identification. Another difference between gamer identity and gaming disorder was found in the positive correlation between gamer identity and self-esteem, whereas gaming disorder showed a negative correlation with self-esteem. This indicates that identifying as a gamer can be a source of self-confidence and positive self-image, but those with low self-esteem may use gaming as a maladaptive coping strategy, leading to compulsive, obsessive and problematic gaming patterns. Overall, this research contributes to a deeper understanding of how gamers may perceive themselves and the factors that shape this identity.

DGR04 Motivations and emotions

PP 1032 Perfect love or illusory hope? Exploring fantasy and ambivalence in Chinese female players' engagement with otome games

Haili Li¹, Hao Zhang²

¹ University of Exeter, Department of Communications - Drama and Film, Exeter, United Kingdom

² Freie Universität Berlin, School of East Asian Studies, Berlin, Germany

A diverse range of female-oriented media and cultural products have emerged in recent decades. Among these, otome games have garnered considerable popularity, particularly among young females who wish to seek and experience love and romance within an idealized gaming world. Since the release of *Mr. Love: Queen's Choice* in 2017, Chinese otome games have undergone tremendous growth, achieving substantial business success in both domestic and international markets (National Business Daily, 2020). Importantly, the increasing purchasing power of female consumers and the rising number of female gamers have further fueled the expansion of the otome game market in China (Gong, 2022). Against this backdrop, this study examines how Chinese female players engage with otome games and obtain gratifications, and how their gaming practices influence their real-life attitudes and experiences regarding romance, love, and intimacy in contemporary China.

Digital ethnography and semi-structured interviews are employed as the primary methods to examine four popular Chinese otome games and players' gaming practices. Specifically, our digital ethnography involves (a) analyzing the narratives, character design, scenarios, and purchase mechanisms of otome games, and (b) examining user discussions under trending hashtags related to otome games on popular Chinese social media platforms (e.g., Weibo, Douyin, and Douban). This enables us to understand players' attitudes and engagement with otome games. We also conduct semi-structured interviews with female participants who have experience playing the selected Chinese otome games. To boost our outreach to a diverse pool of potential participants, we have distributed recruitment posts across multiple Chinese social media platforms (e.g., WeChat, Weibo, and QQ) and leveraged offline social networks. Following the completion of three pilot interviews, we are currently in the process of conducting both face-to-face and online interviews with otome game players.

Our preliminary findings unveil several key insights. Firstly, participants derived multifaceted gratifications from otome games, encompassing fulfilling fantasies for idealized romantic relationships, meeting emotional needs, escaping from real-world pressures, and achieving control over intimate relationships. Secondly, participants exhibited ambivalent and even conflicting perspectives towards otome games. Some participants are fascinated by the portrayal of male characters as powerful, strong, and talented, while embracing heroines designed as weak, innocent, and highly dependent on their male counterparts. This character distinction satisfies their expectations and desires for idealized romantic relationships. However, others expressed reluctance and resistance toward the male superiority embedded in character design and storyline, perceiving it as promoting gender stereotypes and patriarchal logic, thus undermining female agency. Thirdly, the disjunction between the game world and reality leads participants to foster unrealistic fantasies and false hopes for love and relationships, resulting in frustration and disengagement from otome games. This study contributes to enriching existing research on otome games and the broader love/dating simulation games, particularly concerning gender representation, power dynamics, and sociocultural norms within these games and user perceptions and practices. Our findings also offer practical insights into the design and user experiences of otome games, potentially aiding game developers in better understanding user demands, satisfaction, and dissatisfaction, thereby enhancing their game design.

DGR05 Toxicity and violence

PP 1135 Within- and between-person effects of violence in video games on aggression and empathy

David Lacko¹, Hana Machackova¹, David Smahel¹

¹ Masaryk University, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Videogames have evolved into a pervasive and influential form of modern entertainment. Playing violent videogames (VG), particularly those promoting aggressive acts towards other players (often anonymous, distant, and invisible), has been discussed as a risk factor for youth development. In line with the General Aggression Model (GAM), suggesting that exposure to violence heightens aggression and diminishes empathy, this study investigates the longitudinal effects of VG on both aspects. Despite extensive research on this subject, the evidence remains inconclusive as supported by conflicting findings in numerous meta-analyses. A major factor in this ambiguity is the limitation of previous longitudinal studies, frequently employing only two-waves of data collection and overlooking the distinction between within- and between-person effects, thus omitting causal-inference modeling.

Drawing on a sample of 3,010 Czech adolescents (13-17-year-olds), data were collected over four waves (six-month intervals) using representative quota sampling, measuring physical and verbal aggression (BPAQ-SF) and cognitive and affective empathy (AMES). VG was evaluated based on participants' open-ended responses coded

into 1,300 unique game titles. Of these, 474 were rated using a violence score obtained from Common Sense Media. The remaining titles were appraised by two independent raters, demonstrating sufficient inter-rater reliability ($\alpha = .83$). To differentiate within- and between-person associations, a (multi-group) random-intercept cross-lagged panel model was employed.

At the between-person level, WG positively correlated with cognitive empathy ($r = .08$), verbal aggression ($r = .12$), and physical aggression ($r = .24$). At the within-person level, two hypotheses were examined: the selection effect, investigating the link between changes in aggression/empathy and changes in WG, and the desensitization effect, exploring changes in WG and alterations in aggression/empathy. All desensitization effects were statistically insignificant, most showing negligible effect sizes ($\beta \approx .03$). Regarding selection effects, an increase in affective empathy during T3 was linked to a decrease in WG in T4 ($\beta = -.12$). Conversely, an increase in physical aggression during T3 was associated with an increase in WG in T4 ($\beta = .12$). Surprisingly, the effect was the opposite for an increase in physical aggression during the T1, correlating with a decrease in WG during the T2 ($\beta = -.10$). Furthermore, moderation effects were tested at both levels. At the between-person level, boys played more WG than girls ($\beta = .41$), and age showed no association with WG. No gender differences were found at the within-person level. However, the positive effect of physical aggression from T3 on WG at T4 was robust for younger participants ($\beta = .29$) but essentially non-existent for older adolescents ($\beta < .01$).

The findings challenge the portrayal of WG as a significant contributor to heightened aggression and decreased empathy in adolescents according to the GAM. Contrary to prevailing views, our results reveal no evidence supporting the impact of WG on physical and verbal aggression or cognitive and affective empathy. These findings will be discussed, particularly regarding the character of WG's causal effects. Additionally, the potential effects of other factors such as online gaming, perceived anonymity, and game genre, serving as inspiration for future research, will also be discussed.

DGR05 Toxicity and violence

PP 1136 Violent vs. non-violent gaming for stress: Testing physiological relaxation and the moderating role of the Dark Tetrad

Gary Wagener¹, André Melzer¹

¹ University of Luxembourg, Department of Behavioural and Cognitive Sciences, Esch-sur-Alzette, Luxembourg

Playing non-violent video games has been shown to reduce perceived levels of stress (Pallavicini et al., 2021). A recent study by Wagener and colleagues (2023) suggested that although playing a violent video game does not affect aggressive cognition, it can induce physiological relaxation. Also, personality-related factors, such as the Dark Tetrad (i.e., Machiavellianism, everyday sadism, subclinical psychopathy, and narcissism) can have a moderating effect. Individuals with greater Dark Tetrad expressions deliberately prefer and play more violent video games (e.g., Greitemeyer et al., 2019; Greitemeyer & Sagioglou, 2017). In Wagener et al. (2023), physiological relaxation when playing violent video games was even greater for participants with greater Machiavellianism expressions. In contrast, these individuals felt significantly more stressed when playing a non-violent video game (Wagener et al., 2023). The present lab experiment aimed to further investigate the relaxation effects of violent and non-violent video games. The study also addressed shortcomings in Wagener et al. (2023), namely (1) its small sample size, (2) that only male participants had been tested, (3) that cortisol was the only measure for relaxation, and (4) that there was no true control condition, in which participants did not play a video game.

In the present study, participants ($N = 106$) either played a violent game or a non-violent game (*Assassin's Creed Valhalla*; Ubisoft Montreal, 2020) for 25 minutes or completed a jigsaw puzzle. Whereas participants in the non-violent condition played the discovery mode, in which they explored the environment, participants in the violent condition had to fight non-player characters in violent combat. In the control condition, a 300-piece jigsaw puzzle was used. Cortisol levels, heart rate variability (HRV), and self-reported stress levels were assessed before, during, and after gameplay/puzzle task. Dark Tetrad traits were assessed using the Short Dark Tetrad scale (SD4; Paulhus et al., 2021).

Playing violent and non-violent video game passages both significantly decreased cortisol levels. Violent gameplay also significantly increased HRV (i.e., decreasing the ratio of low frequency power to high-frequency power), thus providing additional support for physiological relaxation. In contrast, trying to complete the puzzle did not increase physiological relaxation, but even decreased HRV (i.e., increasing the ratio of low-frequency power to high-frequency power and decreasing high-frequency power). Control questions suggested that, regardless of condition, playing a video game was generally considered more cognitively engaging than trying to complete the puzzle. We might speculate that playing a video game provides greater distraction and therefore greater physiological relaxation compared to other tasks like engaging with a puzzle. High levels of immersion, cognitive engagement, and presence in the virtual world might be important aspects leading to relaxation effects of gaming, regardless of violent content. The surprising finding that Dark Tetrad expressions did not affect stress indicators were possibly due to low variance in Dark Tetrad levels in the present sample.

The present results indicate that both playing violent or non-violent video games can lead to physiological relaxation. This seems important for future research on the potential of video games for stress relief interventions.

DGR05 Toxicity and violence

PP 1137 Exploring incidental toxic behavior perpetration in multiplayer online games

[Vivian Hsueh Hua Chen](#)¹, [Valerie Yu](#)²

¹ Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

² Nanyang Technological University, Wee Kim Wee School of Communication and Information, Singapore, Singapore

Toxic behavior in MOGs refers to the phenomenon when players intentionally perform socially undesirable verbal or gameplay actions that harm other players (Kordyaka et al., 2020; Kowert, 2020). The prevalence of toxic behavior in MOGs goes against its primary purpose as a form of entertainment. Catalyzing events such as the 2017 *Call of Duty* swatting incident (see BBC, 2018) have further highlighted the harmful nature and reach of game-based toxicity, even beyond the gaming community. Thus, a growing body of research examined why players perpetrate toxic behavior, why it remains a prevalent and problematic issue in gaming, and how game-based toxic behavior can be effectively addressed. Extant research has primarily provided individual- and identity-focused explanations for toxic behavior perpetration (e.g., Beres et al., 2021; Kordyaka et al., 2020; Lemercier-Dugarin et al., 2021). This leads into assumptions that players who perform toxic behavior in games are intrinsically motivated to do so (i.e., trait-based susceptibility), or perhaps view toxicity as a characteristic and acceptable aspect of online gaming experiences. While this explains a subset of game-based toxic behavior, it leaves a gap in explaining toxic behavior in situations where perpetrators are neither predisposed to being toxic, nor proponents of toxicity in gaming.

Therefore, this paper seeks to address the highlighted gap by exploring players' experiences with incidental toxic behavior perpetration in MOGs. Incidental in this context refers to acts of toxic behavior that occur as an unplanned response to an arising in-game event, rather than being premeditated or actively initiated. Semi-structured interviews were conducted with 21 players. Interviews lasted between 38 and 51 minutes. Thematic analysis was employed.

Findings reveal a range of arising in-game occurrences that may prompt a corresponding toxic response from players, despite having no premeditated motivation. These include prior transgression, goal conflict, pressure to conform, cathartic, gatekeeping, advancement, and flex opportunities. There appears to be some fluidity in players' attitudes toward specific types of toxic behavior perpetration, as opposed to their attitudes toward toxic behavior when viewed as a single, uniform concept. Players' incidental toxic behavior perpetration may therefore not be as dissonant as it seems, as they rationalize and view certain toxic responses as justifiable or acceptable while maintaining strongly negative views about other types. In contrast to the prevailing view that toxic behavior in gaming primarily stems from hostility and aggression, our findings showed that social or egocentric enablers influence incidental toxic behavior during gaming. Research implications and future theoretical and practical recommendations are discussed.

DGR05 Toxicity and violence

PP 1138 Structures that 'tilt': Understanding 'toxic' behaviors in online gaming

[Friedrich Donner](#)¹

¹ Johannes Gutenberg Universität Mainz, Institute of Geography, Mainz, Germany

This paper provides a better understanding for the social antecedents of disruptive behaviors in online gaming environments. Disruptive – or as gamers refer to it, "toxic" – behaviors in online gaming are forms of verbal harassment or behavioral misconduct which disrupt another's experience of the game. They have received increased attention in recent years: Previous research has shown e.g. their prevalence (Chesney et al., 2009; Monge and O'Brien, 2021), and how they impede upon individual player experience and performance (e.g. Kou, 2020; Monge and O'Brien, 2021), as well as on overall community inclusivity and safety (e.g. Shores et al. 2014; Ratan et al. 2015). In accounting for such behaviors, many previous studies have sought to blame individual wrong-doers (Chesney et al. 2009) or labelled the entire gaming community a 'deviant' subculture which celebrates toxic behaviors (Cook et al. 2018). By contrast, this paper (and the emerging literature upon which it builds) seeks to show how structural constraints may provoke negative behaviors in a broad range of online gamers (see also Kou, 2020). Toxic behavior is seen as situated within and emergent from specific social contexts – as a spur-of-the-moment loss of control (associated by gamers with the term 'tilt'), triggered by contextual factors within the game. Based on interview and ethnographic data on the popular online multiplayer game *League of Legends*, it is shown how weak normative and relational structures within a gaming context can lead to negative emotions in players, prompting toxic behaviors. This opens the way for a long term constructive impact upon society by encouraging the creation of online social contexts which engender positive behaviors, rather than suggesting ways of identifying and excluding

individual 'wrong-doers' or writing off millions of gamers world-wide as 'deviants'. Avenues for future research and implications for improving online social spaces are discussed.

DGR05 Toxicity and violence

PP 1139 Rethinking cheating in digital games: Motivations, categories, and implications

[Sena Elif Özkan¹](#)

¹ Kadir Has University, Communication Sciences, Istanbul, Turkey

Digital games, known for their immersive experiences across genres, present a complex issue: cheating. Within this domain, cheating has prompted critical inquiries into the intricate relationship between technology, the gaming community, game design, and individual players. The concept of cheating has predominantly been associated with the social context, gaming culture, and design elements that can facilitate cheating behaviors (Boldi & Rapp, 2023). However, cheating includes many potential actions within different modes of gaming experiences, and has been the subject of various typologies (Consalvo, 2007; Jeff et al., 2002; Taylor, 2006b; Yan & Randell, 2005). While exploring the concept of cheating has been the subject of many studies, creating a broadly applicable definition is challenging due to the diverse factors involved, including different game genres and modes (online, offline, single-player, multiplayer, games with online features, etc.). Moreover, it is commonly assumed that players play a single type and mode of game, so the extent of cheating and the players' motivations have been examined through limited games. The challenge lies in setting a consistent definition of cheating across the diverse gaming landscape, and a definitive conclusion on the matter is still pending. Thus, the main question will be addressed: How can we redefine or reconceptualize the notion of cheating to account for its specificity in various contexts?

This research offers new insights into cheating in varied gaming contexts by initially differentiating between 'game' and 'play.' Games adhere to rules, while play, which is spontaneous, is where cheating often originates before extending to games. Through play, and referring to cheaters as players rather than gamers, an inclusive perspective of all genres and modes of game will be employed. Motivations for cheating that may coexist are categorized into four main areas: fun, performance, social status, and monetary gain. A qualitative approach will be utilized to assess these categories, involving conducting semi-structured, in-depth interviews with scenario-based questions. These scenarios will serve as a value-neutral lens through which players can conceptualize and rationalize cheating in different contexts. Purposive sampling will be employed to select 15 participants who engage in cheating from all age and gender groups of avid players involved in multiple game genres and modes. Consistency in playing multiple genres and modes of games is essential to enabling a holistic understanding of the categories. Data analysis will involve a comparative examination of the motivations within the four primary cheating categories. Participants will be categorized based on the genres and modes they engage in and their motivations for cheating, allowing for the identification of patterns, differences, and commonalities in their responses; and will be situated within their respective categories.

Consequently, motivations for cheating will be reevaluated from a neutral standpoint, considering all social, cultural, design, experience, and technological possibilities. The research is intended to aid future inquiries into player perceptions, agency, creativity, persuasive design, competitive gaming, the political economy of gaming, and related subjects. Thus, a more comprehensive perspective of the context of cheating is aimed to serve as a valuable guide for future research.

FIS01 New horizons in film studies

PP 0776 Intrusive windmills and solar panels: Energy transition as a symptom of rural decay in contemporary Spanish cinema

Ariadna Cordal¹, Santiago Fillol¹

¹ Pompeu Fabra University, Department of Communication, Barcelona, Spain

In 2022, two of the most internationally renowned and successful Spanish films, *Alcarràs* (Carla Simón, 2022) and *As Bestas* (Rodrigo Sorogoyen, 2022), focused on narratives of the rural way of life in which the context of the energy transition appeared as the story's driving force. In these films, the intrusion of solar panels and windmills emerges as a threat to disrupt and expel the tradition of rural labour, which is explored through disputes between neighbours and relatives, advancing a mutation of previous narrative formulas in rural fiction cinema from Spain (González Requena, 1988; Gómez Gómez and Poyato Sánchez, 2010). The institutions and the economic interests behind the investments in constructing wind and solar energy farms in the story are never embodied in the films, and by remaining invisibilized as background actors, they leave the neighbors of rural areas to their fate, who must agree to settle the enormous conflict of the installation of renewable energies. But in reality, the unequal distribution of energy production in the Spanish territory entails a socio-natural conflict, generating cheap natures (Moore 2015) that transform geographical spaces and provoke rural exodus. This recurrence of renewable devices appearing and interrupting the filmic space and plot generates a sort of affective tension that reminds the viewers of the narrative tradition encompassing the decay of the rural world. Thus, it functions as a visual motif (Balló and Bergala, 2016) that has evolved in light of the ecological crisis.

The study of films and their environmental conditions becomes, then, an important task for film studies as it can account for how nature is entangled with everything, becoming "an opening to a myriad of concerns" including ideology, race, and gender, as well as allowing to consider dynamics of human domination and granting access to the conditions and relations between nonhuman natures present in these motifs of renewable energy (Pick and Narraway, 2013). This paper argues that energy in these films is rendered as a natural abstract entity because of its tendency to be detached from real social relations and erased from social analysis (Franquesa, 2021) and that this invisibilization of energy is related to the difficulties of finding representational motifs of economic power in film and visual culture (Garin and Fernández, 2021). Focusing on these aspects appearing in *Alcarràs* and *As Bestas*, we propose to frame their cinematographic formulation as symptoms of the conception of nature as a source of economic exploitation. We aim to illustrate the ways this representation of the environment struggles with the decaying rural imaginary and advance that its causes seep into the narratives and aesthetic tensions about the absence of local cooperative networks that can face the energy transition without being at the mercy of invisible extractivist emporiums.

FIS01 New horizons in film studies

PP 0777 Zoomorphic introjection vs. anthropocentric projection European animation as vehicle of environmental thoughts

Virág Vécsey¹

¹ Eötvös Loránd University, Media and Communication Studies, Budapest, Hungary

Animation is the art form through which industrialized societies have most often expressed their ideas and beliefs about the non-human world in recent decades (Heise, 2014). Examining it from an ecocritical viewpoint, can be of particular importance today, trusting that if cultural perceptions change, we can address the worsening ecological crisis.

Based on these thoughts, my presentation, which is part of a larger research project, examines the changing cultural logic of ecology from the 1960s to the present through European animated films. The research separately examines animation from the (former) Eastern Bloc and Western European countries from an ecocritical perspective, focusing on formal idiosyncrasies that make animation particularly suited for environmental communication, such as plasmaticness (Leyda, 1986), anthropomorphism, zoomorphism, reverberating space etc. The extent to which different political regimes are environmentally destructive is difficult to rank, but in the literature comparing the scale of environmental damage caused by capitalism and former state socialism, the latter is the more insidious. This is despite the fact that the principle of economic profit has proved to be more important than environmental protection in both regimes. The aim of my research is to investigate this phenomenon and its heritage through pop culture, which plays an important role in the reproduction of symbolic and material order.

The relationship between human and nature and its representation, which is assumed to be universal and eternal, has changed not only over time, but also in relation to dominant political and social ideologies and cultural norms. Accordingly, in line with the paradigm of cultural studies, this research does not only provide an ecocritical content analysis of the animations examined, but also takes into account the social, historical and production context, following the approach of Murray and Heumann's (2011) work on ecocriticism. Following the brief synthesis on

scholarly work examining animations' relation to environmental themes I will present two case studies, which do not cover the whole of my research, but provide an insight into the impact of different periods, cultural, social and political contexts on the representation of environmental issues and the diversity of animation's formal idioms.

First I will present two influential television cartoon series from the Eastern Bloc, which were successful globally, the Czech animation series *Little Mole* (1957–2002) and the Polish *Lolek and Bolek* (1963–1986). The former initially conveyed the idea of deep ecology through anthropomorphic animal depictions facilitating zoomorphic introjection, but from the 1990s onwards it became increasingly confusing ideologically when its animal characters turned into vehicles of anthropocentric projection. *Lolek and Bolek*, conveys an anthropocentric worldview all along, positing the relationship between human and nature as hierarchical, in which anthropomorphic animals appear always as objects of othering. Lastly I will demonstrate, through an Irish-produced 21st century animated trilogy, how anthropomorphism, transformativeness and animation of non-human and hybrid beings effectively mediates the codependent relationship between humans and nature.

FIS01 New horizons in film studies

PP 0778 Spectres of migration: Mobile hauntologies, a hybrid genre

Giacomo Toffano¹

¹ Vrije Universiteit Brussels, Communication Studies, Brussels, Belgium

This paper connects the conditions of non-belonging, 'otherness,' and unsettlement with visual expressions of spectrality, hauntology, and the otherworldly. Employing a mixed-method approach that integrates genre criticism (Altman 2012) and narrative theory (Ryan 2019), the analysis explores genre hybridizations within films that articulate the syntaxis of displacement specific to migration and border narrative, using visual elements of haunting, oneiric experiences, and the supernatural.

Drawing from films such as *Jupiter's Moon* (2017), *Europe* (2022), and *The Quiet Migration* (2023), this exploration investigates instances where the authenticity and realism of mobility narratives converge with the enchantment of the otherworldly. The focal point of the analysis lies in the migration fiction's shift towards the haunting realm, highlighting the use of spectral and supernatural elements to convey experiences of unsettlement, alienation, and grief. This discussion is rooted in Derrida's concept of the spectre, existing in the liminal space between visibility and invisibility, materiality and immateriality, life and death (Del Pilar Blanco & Peeren 2014, 2).

Recent literature on migrant, mobility, and border zone cinema has highlighted the unwavering commitment to realism in many films within these genres (e.g., Kaur and Grassilli 2019; Wolley 2023). However, scholars caution against the unintended consequences of this strong emphasis on the veracity and authenticity of the migrant testimonial: entering the domain of inquiries on truth might paradoxically align with vetting processes typical of migration governmental management (Fassin, 2013; Fielder 2021).

With this paper, I explore content challenging these enforced coherent, realist, and stable migration narratives, analysing fictional films that articulate migration in an oneiric and haunting semantic, countering a realism that can inherently contain elements of epistemic violence. In general, I study how the spectrality present in three migration films serves as a tool for a visual counter-narrative of mobility, highlighting how these haunting representations of mobile subjects disrupt coherent, naturalized, and stable conceptions of nations, identities, and borders. The inquiry aims to examine how the *spectral glitches the spectacle*, studying how spectral anomalies dispute and interrupt the homogeneous realist imageries of borders normalized by mainstream accounts of migration.

Exploring the concept of glitch, I revisit Legacy Russell's (2020) feminist perspective, which sees glitches as moments of malfunction, refusal, and non-performance. These glitches can become places for reimagination and resistance against the established order. In migration fiction, – I claim – spectres glitch the pervasive realism on the screen. Haunting anomalies bring disorder, dysfunctions, and unpredictability to the conventional realist and testimonial portrayals, therefore fostering a space for reimaging and challenging the constraints of mainstream migration narratives.

FIS01 New horizons in film studies

PP 0779 Ethics and aesthetics of contemporary film discourses on illegal migration and refugees

Lourdes Monterrubio Ibáñez¹

¹ Pompeu Fabra University of Barcelona, Department of Communication, Barcelona, Spain

Film narratives about illegal migration and refugees have had particular relevance in recent years, generating a great variety of film forms that arise from indispensable ethical and aesthetic questions about first-person enunciation of the protagonists, (self-)representation, point of view and fictional and documentary forms. This communication aims to deepen the study of these issues through the comparative analysis of three non-fiction films that generate indispensable reflections on the matter through the construction of their film discourses. *Purple Sea* (Amel Alzakout and Khaled Abdulwahed, 2020) shows the first-person experience of Alzakout's subjective camera on her sea crossing between Syria and Lesbos, and moves it into poetic and experimental dimension through her inner monologue as imagined dialogue as well. The essay film *Ailleurs, partout* (Isabelle Ingold and Vivianne Perelmutter, 2020) offers the mediated encounter typical of our globalised reality between the filmmakers and their protagonist Shahin—a young Iranian man, who, after a journey of a year and a half, arrives in the UK, where he seeks asylum—using images from surveillance cameras collected from the Internet and a polyphony of subjectivities including Shahin's narratives and thoughts. The animation documentary *Flee* (Jonas Poer Rassmussen, 2021) embodies the conversation between the filmmaker and his protagonist Amin—an Afghan refugee in Denmark who has hidden his real story—through animation and hybridises it with documentary images of the historical events that determine Amin's story. Therefore, the three works share two crucial aesthetic and ethical premises: the narration in the first person and voice of the real protagonists, but in the absence of their image, and the use of experimental and hybrid discursive constructions. The comparative analysis allows us to determine how these films generate counter-narratives, problematising the filmmaker-protagonist dynamics, the illegal migrant-refugee dialectics, the nature of the notion of veracity regarding migrants' memory and testimony, to generate critical thinking on globalisation and its migration policies against human rights, which cause the life experiences these films narrate and explore.

FIS01 New horizons in film studies

PP 0780 AI (dis)order in filmmaking: Navigating creative decisions and predicting film success

Arezou Zalipour¹

¹ Auckland University of Technology AUT, Screen- Audio and Journalism, Auckland, New Zealand

The filmmaking landscape has undergone a remarkable transformation in recent years, largely fuelled by the integration of artificial intelligence (AI) into various facets of the screen production process. The current buzz in Hollywood centres on AI boldly assuming roles such as directing, crafting movie trailers, and title sequences, and even producing entire episodes of shows. This intriguing blend of technology and creativity has not only captivated the attention of industry insiders but also resonated with online binge-watchers and casual moviegoers. Such innovations have introduced a degree of disorder in traditional decision-making processes, now informed by data-driven insights into audience preferences, casting choices, and the overall feasibility of film projects. Should major industry players like the Academy and APSA fully embrace AI, or should specific aspects of the filmmaking process remain untouched by artificial intelligence?

The journey of AI in filmmaking traces back through decades of cinematic history, captivating our collective imagination with portrayals of sentient machines in classics like "Electric Dreams" (1984), thought-provoking narratives in films like "The Matrix" (1999), and the lovable AI waste-collecting robot WALL-E (2008). AI has significantly influenced the visuals and graphics behind special effects, utilising robots, drones, and high-tech innovations on film sets to create extraordinary visuals and simulated worlds efficiently. Beyond visuals, AI has played a pivotal role in revolutionising audience experiences, evident in advancements like 4k and 3D movie technologies.

Academic research on AI integration in the filmmaking process is limited. Most studies have examined the portrayal of AI characters in popular films and their capacity to develop human-like emotions, with a handful of articles published in science and management journals, and none from a film production perspective. One noteworthy contribution is found in the work of Park et al. (2018) in the *Information Systems Frontiers* journal. Their study underscores

the increasing prominence of Artificial Neural Network (ANN) technology in film industry analytics, discussing ANN models' superior capacity for predicting box office success compared to other AI models.

In this paper, I turned the academic research inquiry into the filmmaking process by adopting a screen production lens. This paper discusses how AI is reshaping the filmmaking process and identifies and examines the key concerns it has recently sparked. It explores the disruptive role of AI in the early stages of film production, focusing on the greenlighting and pre-production phases, where traditional practices are being challenged and redefined.

My research methodology includes the collection and a thematic analysis of interviews with industry professionals, shedding light on the tangible impact of this technological disruption. Furthermore, this analysis is enriched by my own creative practice in a New Zealand-German film co-production, where our engagement with a Swiss-based AI firm for screenplay analysis underscores the transformative and occasionally disorderly impact of AI in the film industry's decision-making processes. The synthesis of diverse perspectives aims to contribute meaningfully to the ongoing discourse surrounding the challenges and opportunities presented by the integration of AI in filmmaking.

PP 0883 Practices and motivations of domestic film audiences in small countries: A qualitative study across seven European countries

Cathrin Bengesser¹, Manuel José Damasio², Rita Gracio², Jaka Primorac³, Paul Hammoud⁴, André Rui Graça², Nicole Flanagan⁵, Małgorzata Kotlińska², Marta Materska-Samek²

¹ Aarhus University, Media and Journalism Studies, Aarhus, Denmark

² Universidade Lusófona, Centro de Investigação em Comunicação Aplicada Cultura e Novas Tecnologias, Lisbon, Portugal

³ Institute for Development and International Relations IRMO, Department for Culture and Communication, Zagreb, Croatia

⁴ Vrije Universiteit Brussel, imec-SMIT, Brussels, Belgium

⁵ Munster Technological University, Fine Art Department, Cork, Ireland

Europe displays a resilience of national cinema (Higson 2021), but in small markets, the popularity of domestic cinema varies greatly and has faced even more challenges through the Covid-19 pandemic. The rise of globally operating streaming services, with catalogues that feature mainly US productions, as well as the lack of resources for film production in small markets (Hjort and Duncan 2007) are also issues that European cinema grapples with. By comparing audience's opinions on domestic film in the context of their overall audiovisual media consumption, across seven small European markets (Ireland, Portugal, Croatia, Lithuania, Estonia, Flanders and Denmark) this paper highlights the specific challenges of films from small European countries in competition with imported film. At the same time, the analysis of audiences' motivations for watching domestic film highlights specific dynamics in their filmic properties, exhibition and cultural/social perception (see Kauber 2022), which can strengthen the position of domestic film.

Based on qualitative data from 84 media diaries and 1:1 interviews, the study compares the perceptions and motivations of domestic film audiences across seven markets with varying levels of domestic film production and consumption. In Ireland, Portugal and Croatia the average share of domestic film in cinema admissions in the past decade has remained around 5 percent. In Lithuania and Estonia domestic shares have increased from just over 10% in 2015 to over 20% before the Covid-19 crisis. In Flanders the domestic share fluctuates between 15% and 30%, while Denmark averages at 30% and reached 50% amidst the pandemic. The insights from this qualitative study allow us to form hypotheses about industry-related, economic and cultural reasons for these vast differences, concerning the properties of domestic film (e.g. genre, casting, setting), the cinematic landscape (e.g. presence and business model of local cinemas in rural areas) and the perceived status of domestic film (e.g. international awards, film's role in cultural memory, film education, existing prejudice) as well as social practices around it. The conclusion discusses the findings' implications for comparative media research and film industries in small European markets.

This paper presents results from the research project CRESCINE (2023–26) – Increasing the international competitiveness of the film industry in small European markets (HORIZON-CL2-2022-HERITAGE-01, project ID: 101094988). This large-scale comparative study contributes to our understanding of the diversity of small film industries in Europe as well as to our emergent knowledge about audience demand for domestic vs. imported content (Rohn, 2011; Graça, 2021).

PP 0884 HBO Max and its impact on the development of local documentary film production in Poland

Iwona Morozow¹

¹ University SWPS, Department of Cultural and Media Studies, Wrocław, Poland

The production of documentary films in Poland after the fall of the Polish People's Republic faced a huge challenge in terms of financing opportunities, and due to the low commercial potential and relatively low audience interest. The breakthrough for contemporary Polish documentary production came with the establishment of the Polish Film Institute in 2005 as a state institution aimed at supporting the development of Polish cinematography and the decision of HBO Polska in 2006 to start documentary production, with the aim to produce "controversial, bold, contemporary films, films that discover new topics, surprise with point of view, but do not follow the temptation of cheap sensation". So far, HBO has been the producer or co-producer of 49 documentary productions in Poland (approximate number of annual genre production in the country is 80-100), mainly full-length, made by both – accomplished and young documentary directors. The number might not be considered as significant, but what is important, most of those produced by HBO reached bigger audience, won rewards and some of them even had limited movie theatre distribution. Thus, the local film industry often emphasises the strategic importance of HBO in the process of contemporary documentary film production development. What is more, the HBO involvement brought to Polish documentaries new topics, forms of narration and values, which changed local into more universal stories and ultimately took part in complementing fusion between tradition and modernity with co-called "Polish School of Documentary Cinema" with its over 70 years of unique history.

The aim is to look at the platform's strategy in terms production, distribution and promotion of documentary films. What's more, intention is to uncover the profound impact HBO has had the Polish documentary film market in terms of participating in the emergence of specific qualitative style as well as coproduction conditions and standards. Polish film market might be considered as the biggest in Central and Eastern Europe and according to the latest KIPAs (Polish Producers Alliance) report it contributes around 3.4% of the general European film and TV revenues and because of that plays an important role in developing good practices between local industries and global media platforms.

The paper will be strongly based on ten in-depth interviews with local independent producers, HBO producer as well as documentary filmmakers. The author provides analytical insight into the creative process of foregoing collaboration between HBO as a powerful media conglomerate and local creative talent, thus uncovering the power dynamics, artistic compromise and industrial paradigm of local documentary production in general and with taking closer look to particular cases. Thus, main goal of it is to demonstrate in more detail and with the wide historical and contemporary production conditions, the dynamics of HBO's policy in the domain of documentary production and its impact on filmmaking conditions in eastern Europe, but also in terms of documentary forms, styles and topics and the dynamics between ideological, brand strategy and social engagement.

FIS02 Policy and industry

PP 0885 Eyes, ears, intermediaries and artists: The work of archival researchers and producers in contemporary documentary

Christopher Meir¹

¹ Universidad de Carlos III de Madrid, Department of Journalism and Audiovisual Communication, Getafe, Spain

Despite a concerted move away from the auteur theory in the study of fiction film, in favor of nuanced studies of collaboration between the various artists who help to make films, studies of documentary cinema remain stubbornly entrenched in a director-oriented paradigm. This paper will seek to broaden our understanding of creativity in documentary practice by analyzing the roles played by archival researchers and those working in a role often referred to as the archival producer. The paper will argue that the labor of these figures is crucial in shaping compilation documentary films in particular, films which by their very nature require voluminous quantities of archival footage (including music) and re-assembly of the retrieved images into complex intellectual and aesthetic montage structures. Archival researchers and producers routinely influence these aspects of finished documentary films and series, acting as intermediaries between directors and archives, helping to find, select, and secure rights to the images that make the final cut of films, often after searching through thousands of hours of footage in multiple national contexts.

These theoretical claims will be substantiated by an extended case study of the archival research team that worked on *Exterminate All the Brutes*, a four-part documentary made by celebrated auteur film-maker Raoul Peck. While not seeking to contest the dominant auteurist views of Peck per se, the paper contends that the finished product in this case benefitted greatly from contributions from archival producer Kenn Rabin and archival researcher

Nolwenn Gouault. Drawing on original interviews with the two film-makers and close textual analysis of the archival footage used in the film, the paper highlights their important contributions to the artistic, intellectual, and even ethical achievements of the finished product. The paper then concludes with a call for closer examination of these important figures in documentary creativity. As part of a larger project aimed at appreciating the complexities of utilizing historical archives in contemporary media production, the paper also concludes by highlighting the agency of archival specialists as intermediaries between contemporary audiences and images from the colonial past.

FIS02 Policy and industry

PP 0886 Young people and the European film industry: The Governance of 'near Misses'

Katharine Sarikakis¹, [Gentiana Ramadani](#)¹, Juengst Janina¹, Angeliki Chatziefrimidou¹

¹ University of Vienna, Department of Communication, Vienna, Austria

This paper aims to present an exploration of the research of young people's changing role in the European film industry (EFI) over the past quarter-century. Recognising youth as an underserved group, traditionally viewed only as consumers, this study highlights missed opportunities in nurturing them as future film creators and policy leaders. The focus lies on comprehensively understanding the interplay between youth culture, technological progress, and other factors impacting their engagement with film and filmmaking. The analysis, referencing scientific literature and policies from the Council of the European Union, spans from 2000 to 2023. Special attention is given to the impact of technological advancements on film consumption patterns and the significance of young people's approaches in shaping the industry. Moreover, this paper investigates young people's portrayal as "future leaders" and explores the extent to which their role in future decision-making and in fostering the industry's competitiveness within the EFI is reflected in research. Although the existing policies address issues such as global competition and limited distribution, they do not place a particular emphasis on engaging and empowering young talent. This oversight is a crucial element in increasing the industry's competitiveness and driving growth. A deeper understanding will facilitate further exploration and discourse in this constantly evolving field. Our findings show that national policy focuses particularly on young people as audiences, rather than recognizing and promoting their potential as creators, neglects their crucial role in the industry, and fails to integrate them as future leaders of the industry, which is not just cultural, but also has socio-political implications. Additionally, the young professionals cope with difficulties to enter and get established in the filming industry, and thereby often they face financial challenges and limited possibilities of finding projects. We argue that young people's empowerment will be the catalyst to enhance the development of the European industry. The analysis serves as a valuable resource for future scholarship, fostering a deeper comprehension of the involvement of young people in the EFI and supporting the advancement of research in this area.

FIS03 Films and conflicts

PP 0981 The Dublin Film Society and the Bolshevik threat: An early case of culture wars

[Ruth Barton](#)¹

¹ Trinity College, Creative Arts, Dublin, Ireland

This paper focuses on fears of Russian propaganda being spread via groups of intellectuals in the 1930s, specifically through the Film Society movement. I focus on the attempts by writer and critic, Mary Manning, to establish a Dublin Film Society in 1930s Ireland as a space of opposition to the prevailing conservatism and anti-intellectualism of the Free State. Drawing on archival sources and secondary reading, I describe the evolution of the planned society and in particular Manning's dismissal in her newspaper columns of Hollywood mainstream entertainment. This led her to gather together a group of like-minded intellectuals to attempt to form a society using the model of the international film society movement. The proposal was to show films such as: *Battleship Potemkin* (Sergei Eisenstein, 1925); *Berlin, Symphony of a City* (Walter Ruttmann, 1927); *Mother* (Vsevolod Pudovkin, 1926) and others. It was this particular interest in Soviet cinema that aroused the suspicion of the authorities. A series of confidential police reports on the group was compiled, profiling each of the members of the committee. A reliable source confirmed that one of the members had approached the well-known socialist revolutionary James Larkin and asked him to ask Russia for finance to procure a theatre in Dublin for the purpose of showing Russian films. The embryonic

movement, the report concluded, was too poorly financed to constitute a significant threat to the State. However, the author noted:

We have some reason to fear, and this fear is not dictated by reference to the personnel of the Society, that Bolshevik propaganda agents look to this Society as a medium for the dissemination of films which would otherwise fail to secure publicity here. Apart from this I am somewhat nervous of the "Cinema as an Art Medium" in the hands of a Society such as the present.

In the end, the Dublin Film Society did not take off. The costs of importing films and a low membership uptake meant that Manning had to abandon her plans.

I propose this paper as a way of historicizing populist/nationalist opposition to "Cinema as an Art Medium". Official hostility to Russian cinema was far from unique to Ireland, with *Battleship Potemkin* often taken as emblematic of the Bolshevik threat to Western society. It was a flashpoint in what now would be termed culture wars – with conflicting political allegiances being claimed and set against each other via cultural consumption. At the same time, I recognise the elitism of those who dismissed popular culture in favour of high art and the film society movement as what now would be termed an echo chamber. I argue that we need to understand the current cultural moment as a continuation of, not a break with, history.

FIS03 Films and conflicts

PP 0982 The circulation of Spanish Colonial cinema

Miguel Fernandez-Rodriguez Labayen¹

¹ Universidad Carlos III de Madrid, Department of Communication, Madrid, Spain

This paper focuses on the circulation of Spanish colonial cinema during the Franco era (1939–1975). The presentation emanates from the research project "Institutional documentary and amateur cinema in the colonial era: analysis and uses" (ref. PID2021-123567NB-I00), funded by the Spanish State Research Agency in collaboration with the Spanish Film Archive, and which is currently identifying, cataloguing, and digitizing the hundreds of Spanish productions shot in Morocco, Western Sahara and Equatorial Guinea as part of a neglected yet significant legacy of colonial history. Hence, the aim of this paper is twofold: on the one hand, it wants to offer a deeper perspective on the social life of these films; on the other, it questions the significance of cinema within the colonial apparatus.

Departing from the importance of these materials for the construction of a national identity but also understanding them as key for the activation and critical review of colonial archives within discussions about film (and) culture, the paper looks at the much-neglected issues of circulation and reception of Spanish colonial films, both within the Peninsula and in the colonial territories. Through historiographical research and archival access to distribution and production companies' records, state files, film magazines and theatrical revenues, the presentation intervenes in current reflections about cinemagoing and film distribution in colonial contexts by looking at how, where and when the colonial films produced under Francoism were screened. At the same time, the paper maps the complex and mostly unknown network of film exhibitors in the Spanish colonies and collects information on the distribution strategies and public and critical reception of these films. Within this framework, the paper shines a light on the success of some of the narrative films within Spain but also in Equatorial Guinea or Morocco. Finally, it shows the relevant and completely overlooked to this day distribution and exhibition of state-funded colonial documentaries, providing a much richer and nuanced knowledge of the social and cultural impact of Spanish colonial cinema.

FIS03 Films and conflicts

PP 0983 Film as "Prosthetic Memory": Chinese mainland audiences' reconstruction of Historical Memory through the Taiwanese film "City of Sadness"

Duanduan Wei¹

¹ Shanghai International Studies University, School of Journalism and Communication, Shanghai, China

The Taiwanese film "City of Sadness," shot in 1989, stands as the pioneering work in Taiwanese director Hou Hsiao-hsien's "Taiwan Trilogy." It presents a traumatic story of a Taiwanese family during the period from 1945 to 1949.

set against the backdrop of the Kuomintang regime's "retaking of Taiwan" — a historical narrative that significantly differs from that of the Chinese mainland. In June 2023, the 4K restored version of "City of Sadness" was screened at the Shanghai International Film Festival, emerging as one of the most popular films. Second-hand tickets were priced as high as 2400 yuan. Currently, the film holds a score of 9.0 on Douban, the Chinese equivalent of IMDB, with over 100,000 mainland Chinese viewers participating in the ratings, ranking among the top 2% of historical movies on the site.

This research delves into the reception of "City of Sadness" by Chinese mainland audiences from the theoretical perspective of memory studies and the idea of "Prosthetic Memory," as proposed by the French philosopher and cultural theorist, Bernard Stiegler. Stiegler argues that technology serves as an external carrier of human memory, continuously interacting with individual and collective consciousness.

Using Douban film reviews of "City of Sadness" as an example, the research addresses questions such as: How does the historical narrative in "City of Sadness" become a "prosthetic memory" for the majority of mainland Chinese viewers? Where does this film activate collective memories of mainland audiences? The study illustrates how mainland audiences resonate and reconstruct their historical memories of Taiwan and the Chinese mainland through the reception of the arrangement of time, space, sound, and historical narrative of the film, providing theoretical implications for understanding how films function as "prosthetic memory" in compensating for absent memories and negotiating memory disputes. Additionally, by considering the historical context of WWII, the Cold War, and Chinese mainland-Taiwan relations, the research explores the dialogical role that films could potentially play in global and geopolitical conflicts, as well as in narrating human history.

FIS03 Films and conflicts

PP 0984 Cinema in the shadows of news? A transnational analysis of Israeli and Palestinian films reviewing in four countries

[Jerome Bourdon](#)¹, [Sandrine Boudana](#)²

¹ Tel Aviv University, Communication Studies, Tel Aviv, Israel

² Tel Aviv University, Department of Communication studies, Tel Aviv, Israel

This paper analyzes the impact of the news environment on cultural journalism, focusing on the case of Israeli-Palestinian films in the early 2000s, when they enjoyed international success while the Israel-Palestine conflict was especially high on the news agenda. It compares a total of 400 reviews of 10 films in four countries: the USA, the UK, France and Israel. It uses a two-pronged methodology, quantitative content analysis at the sentence-level and qualitative thematic analysis. It confirms our main hypothesis: socio-political comments "creep" into the highly artistic genre of film reviewing, with different inflexions, depending on four factors. First, the dominant media perspective on Israel-Palestine, from pro-Israeli (Israel, the USA) to pro-Palestinian (the UK) is the prominent factor. UK reviewers easily connect their reviews to criticism of Israeli policies, especially by approving films deemed critical of Israel, in particular the four films directed or co-directed by Palestinian (Palestinian citizens of Israel), while the American critics adopt the "balanced", "neutral" tone of American journalism and focus on the artistic contribution of the films, while France holds an intermediate position, balancing the artistic and the political perspectives. Second, the journalistic tradition, from more neutral and wary of looking "objective" the US, to more personal and editorializing in France, has an effect on the language of criticism. Third, the cinema culture of each country matters: American critics are more wary of the films being accessible to audiences, and devote more space to purely "narrative" parts telling the story, and to the factual background they deem necessary. France, adopt the more high-brow, cinephilic language, referring to cinema history and to special artistic achievements. Fourth, the theme of the films matter: movies dealing directly with the Israeli-Palestinian or Israeli-Arab conflict draw more political comments, *ceteris paribus*: the reviews of the three films with at least one leading female character includes consideration of gender, differently when the heroines are jewish religious or palestinians. A special analysis is devoted to Israeli reviewing, where artistic comment predominates, with a complex mixture of pride for the international success of the movies and a reluctance to praise the stories deem (too) critical of Israeli policies. The paper concludes on a proposal for additional research, asking to what extent these results are specific of reviews of Israeli-Palestinian films or can be generalized to other national cinemas affected by a specific current affairs environment.

PP 1082 Affective-emotional structures of enmity in contemporary Finnish World War II war films

[Laura Seppälä](#)¹

¹ Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

The first two decades of the 21st century have witnessed an increased interest in war narratives in Finnish cinema, and a similar phenomenon has been recognized internationally: in Russia and in the US, for example, the war film returned with a bang in the late-1990s and early-2000s. My research aims to understand the appeal of the war

film by examining how affective-emotional structures of enmity and national feeling are produced in contemporary Finnish war films, and what kind of representations of enmity and nationhood are produced by these structures.

My research combines cultural studies theory on national belonging and enmity with methodological approaches from cognitive film analysis to examine how films "work" in relation to their affective-emotional capacities within a cultural and societal framework. I use the term affective-emotional (suggested in Fisher 2014, 2017) to describe the often overlapping and interchangeably used concepts of affect, emotion and feeling. My work contributes to the growing body of research examining the relationship between cinematic affect and emotion, representations of war and national identities, whereby affect and emotion are understood as not merely personal and bodily, but as culturally and politically significant.

In this paper I present the results of my research on enmity as an affective-emotional structure and the resulting enemy representations. My material consists of nine Finnish war films (from 1999 to 2017) depicting the wars between Finland and the Soviet Union during World War II. My analysis has shown that the majority of the Soviet representations are largely insignificant when examined in relation to the affective-emotional structures of these films: Soviet bombers flying by or tanks and soldiers appearing briefly in combat scenes often merely indicate the presence of an enemy without attaching affective-emotional significance to them. While there are examples of enemy representations that aim to elicit antipathy in the viewer, there are also instances in which the enemy is portrayed sympathetically, such as a Soviet soldier rescuing a Finnish soldier.

My results indicate that the juxtaposition of the enemy-other and the Finnish 'us' plays a relatively insignificant role in the construction of nationhood and a sense of national belonging in these films. Rather, meanings about the nation and "ideal" Finnishness are produced by positioning the viewer to feel sympathy towards characters that embody wartime virtues such as bravery, heroism and sacrifice, and antipathy towards Finnish characters who disrupt the national unity by being portrayed as immoral, scared or otherwise unfit for war.

PP 1083 Musical thinking in the visual and sound structuring of Sandro Aguilar's films: Transformations in recent production

[Helder Gonçalves¹](#)

¹ Universidade da Beira Interior, LabCom, Covilhã, Portugal

Director Sandro Aguilar (Portugal, 1974) has had a long and award-winning career as a short film writer. He has made three feature films and also worked as a producer and/or editor, often for films by other directors. He tends to propose a "dysfunctional perceptual experience" in each of his films, by suggesting undefined narrative lines and often by dissociating sounds from images. His usual experimentalism is always noticeable, enhancing the atmospheric character he wants to give to the great diversity of scenes that his creativity has already achieved.

Aguilar takes different decisions when it comes to the sound of his films, eschewing the most common practices of distributing tasks linked to sound production and post-production. The organicity that exists in the sound design of his films, which he says he identifies well, is the result of two important aspects: (1) on the one hand, the constant rewriting of the initial script, sometimes influenced by the sound of the shooting locations; (2) on the other hand, the attention paid to musicality and the way of "orchestrating" the different sound layers present in the scenes. He recognizes the unusual way in which he takes the sound editing – "pre-mixed" – to the last sound person, the re-recording mixer, minimizing the inventive role that could be attributed to this professional.

Starting with recent short films, such as *Exotic Words Drifted* (2023) and *O Teu Peso Em Ouro* (2022), and relating them to the most recent feature film *Primeira Pessoa Do Plural* (2024), our aim is to understand the musicality underlying the processes of image montage and sound montage. We propose that the musical thinking that guides this director's inspiration promotes variable types of "immateriality" and various ways of moving between the (possible) real and the (more) oneiric. On the other hand, the aim is to show how certain narrative elements, whether sound or visual, oppose the sense of filmic temporality that Aguilar pursues, by the way in which they provide an anchor of meaning to which the viewer may want to connect. It is perhaps these elements that most easily reassure the spectator, in a flow of images and sounds that contrasts enormously with more traditional filmic narratives.

FIS04 Contemporary films, directors and paratexts

PP 1084 Between horror tales and legends of glory: The Soviet Union and the GDR in film. Critical discourse analysis of cinematic narratives about the past

[Daria Gordeeva](#)¹

¹ University of Munich LMU, Department of Media and Communication IfKW, Munich, Germany

The paper delves into the cinematic portrayal of socialism since 1990, offering critical insights into the intricate relationship between popular film narratives and political, cultural, and social landscapes in which films are produced and consumed.

Research problem

More than three decades after German reunification and the collapse of the Soviet Union the ongoing struggle for the 'right' memory of the GDR and its 'big brother' persists, and media play a pivotal role in shaping collective perceptions of the past. The study focuses on *film* as the leading medium of popular memory culture, which is continually balancing between art, profitability, politics, and public's demands. Grounded in Assmann's and Erll's theories of collective and cultural memory, along with the (Critical) Discourse Analysis as practiced by Foucault and Jäger, the study explores how successful feature films represent former socialist states and examines the power structures, resources, and interests behind their production and reception.

Methodology

The empirical work involves a qualitative, category-led analysis of 20 most successful films (in terms of audience reach) dealing with the GDR and Soviet past, produced between 1990 and 2021 in Germany and Russia, respectively. The paper introduces a methodological framework for analysing historical film, applicable to diverse case studies. The core idea is to move beyond the 'traditional' film-immanent analysis (which is usually restricted to the plot, characters, and cinematic means such as colours and music) and consider the production and reception context. This includes biographical backgrounds of film makers, state funding, marketing strategies, box office results, media coverage, and public debates. The study also advocates for embedding films in the public memory discourse and the debate about national identity.

Key findings and their implications

Drawing on 20 successful national films, the paper presents a typology of four cinematic 'socialism realities,' shedding light on discourse dynamics and linking cinematic images and narratives with their production and reception contexts. The discourse analysis, firstly, challenges prevalent interpretation patterns (dictatorship narrative in Germany and patriotic-glorifying narrative in Russia) and problematizes the associated power relations (Western dominance in Germany, Kremlin loyalty in Russia). The analysis also reveals ways in which the discourse can be productively expanded and develops strategies for a culture of remembrance that moves beyond stereotypes, encourages understanding over demarcation, and overcomes the simplistic friend-foe dichotomy. Inspired by concrete examples, the paper advocates for narrative strategies that foster more nuanced examination of the past, for example (1) by focusing on individual agency, social and cultural life, and everyday decision-making against the background or beyond the restrictions; or (2) by understanding the ideological and political peculiarity of the socialist society, which can only be imperfectly grasped by Western (liberal) criteria. Moreover, the paper links films to socio-political discourses of their time, illustrating how the present is legitimized and elevated through its ties to the past. Particularly revealing is the study's placement of recent Russian productions within the context of the Russian invasion of Ukraine.

FIS04 Contemporary films, directors and paratexts

PP 1085 A mixed-methodological mapping of the Hollywood (fan-)paratext in the digital age: Long live the Snyderverse

[Florian Stegen](#)¹

¹ Vrije Universiteit Brussel, Communication Sciences, Elsene, Belgium

The American film industry is well-known for its contemporary production of blockbusters and franchises on which often gigantic budgets are spent. With the rise of (digital) platforms full of new content, it is increasingly challenging to stand out to audiences, for which Hollywood studios place great importance on creating complementary products, such as merchandising.

In researching these additional products, this article applies the concept of *paratext* to analyse the relationships between the different types of movie-related products, such as film posters, advertising, and trailers. Although this set of outputs is created by studios and their representatives themselves, *paratext* also applies to the media products that are produced by fans of cinematic content. As such, we build on the relation between movie-related products by establishing a connection, through paratext, between a text, the industry, and (fanatic) audiences. Therefore, this paper aims to map the complexity of (fan) products surrounding big-budget Hollywood blockbusters by forming

a comprehensive picture of the paratextual (inter-)activity that exists within the movie industry, an under-researched area within the contemporary film and communication studies.

The aim of this article is to provide a theoretical overview of the paratext based on already published scientific literature, before adding extra findings from new, additional observations. Therefore, this paper consists of a literature review, mainly structured based on the intersection between the paratextual content, the creator/writer, and its intended objective. In doing so, it provides a clear overview of the contemporary cinematic paratext, which is thereafter subjected to a present-day case for verification and completion, as mapping all existing paratexts around all movies would be an impossible endeavor. Therefore, we analyse **Warner Bros.' DC Extended Universe** (DCEU) (2013–2023), a multimedia franchise, based on the DC comic books. This cinematic universe is a section of **DC Studios**, whose combined estimated budget for the released films alone is equivalent to over USD 2.8 billion. Its fan movement was particularly noticeable in recent years within the *#ReleaseTheSnyderCut* movement, with fans (and eventually even production staff) spreading their demand for the directors' cut of *Justice League* (2017) online. Even now, after the finalisation of the DCEU (and consequently the so-called *Snyderverse*), another kind of emerging fan activity can be noticed, with audiences putting forward potential actors for the new DCU (**DC Universe**, the rebooted shared universe, partly separate from the previous films). The comparison of these snapshots allows to identify the paratextual differences between both moments of audience resistance and support.

The research findings prove the importance of the wide spectrum of media texts (paratextual content), produced by fans, and its impact on the media industry as they can influence decisions within the industry itself, such as character design in films. Findings also prove that fans have the potential to influence (un-)finished media products, thereby affecting the studio's policy. In this way, this paper helps to reflect on the challenges of today's mainstream film industry and to recognise the creative agency of contemporary filmgoers.

GSC01 Thinking, researching and doing – Glocal approaches to contemporary feminisms

PN 015 Understanding Portuguese feminism(s)

[Célia Taborda Silva](#)¹

¹ Universidade Lusófona do Porto, Comunicação, Porto, Portugal

Contemporary feminism is a multifaceted, complex and plural social movement that has taken on various forms of activism and collective action, and which unfolds between the global and the local, the digital and the face-to-face. These glocal flows pose challenges for feminist movements that need to be understood by analysing myriad concepts (e.g., transnational feminism, social movement, fourth wave feminism, intersectionality, Portuguese feminist activism, communication), in a situational approach (e.g., Portuguese feminism). Transnational feminist movements, such as SlutWalk, #MeToo, #EleNão, #8M, have also had an expression in Portugal, but within the singularities of Portuguese feminism, which is very much conditioned by the country's history of 48 years of dictatorship, in which the echoes of the first feminisms were almost erased from memory. The political change in 1974 made apparent that the memories of feminist activism had not disappeared, but still the weaknesses of the movement in Portugal were great. The changes brought about by democracy resulted in the emergence of feminist organisations and, consequently, new agendas for the movement. A path made up of advances and setbacks (Tavares, 2011) that has sought to incorporate feminist issues into the public space through various communication and action strategies (Cerqueira et al. 2017). Portugal's participation in transnational feminist actions, such as those mentioned above, is what FEMglocal's project is dedicated to. It aims to position and frame current Portuguese feminism in relation to the global but also in relation to the local in the forms of mobilisation and collective action and in the media visibility of glocal feminist movements. In this presentation, I will reflect on, and theoretically problematise, the central concepts that have been developed in this project for understanding national feminist movements today, paying attention to the historical specificities of the Portuguese context, and their articulation with transnational feminisms. Methodologically, a literature review was conducted in national and international databases on the concepts mentioned above and the Portuguese feminist movement. This will allow for the particularities of Portuguese feminism(s) to be established and compared within the western context, deconstructing and reviewing the single story narrative of the history of feminism(s).

GSC01 Thinking, researching and doing – Glocal approaches to contemporary feminisms

PN 016 Glocal, physical, digital and beyond: Visualizing (historical) feminisms in Portugal

[Daniel Cardoso](#)¹

¹ Universidade Lusófona, ECATI, Lisbon, Portugal

The concept of "glocal" aims at bringing together potentially disparate phenomena and contexts – in this case, the global and the local – as co-constitutive, and with specific dynamics that can only be found at that intersection, rather than it being the sum of its component parts. Likewise, and as various authors have shown, digital activism cannot fully be understood by only considering what happens in digital spaces and platforms, but rather by considering how different spaces come together in digitally-mediated physical interventions and physically-contextual digital platforms or actions. Furthermore, initiatives or actions undertaken in digital spaces tend to leave traces – the doing itself constituting a sort of potential archive. As previous research has shown, this does not mean that online content is 'forever', but rather that traces of online presence (e.g., metadata, images, videos, texts) can serve, ambivalently, for the constitution of political memory/forgetting, for resistance/surveillance, or for connection/segregation, especially when it pertains to socially disadvantaged groups. Thus, commercially-owned and controlled so-called Big Data can be mobilized for State surveillance or surplus-value extraction, just as activist-driven Big Data can be used to foreground, and push back against, systemic inequalities. In the context of this project, we developed an online platform that functions, simultaneously, as a peer-driven resource for connection-building, as a repository that visualizes historical feminist initiatives and groups, and as a visual aid for mapping and situating glocal feminisms in Portugal – a map that lets users know where and what feminisms there are in Portugal, and to add to that repository of knowledge. In this presentation, I will discuss and explore: 1) the connection between the platform and the project's methodology, 2) the visual and technical choices made for the platform, and how they themselves embody the guiding principles of the topic being researched, 3) the ethical issues arising from, and feeding into, the decision-making process of how and what to include (and exclude), and 4) the potential for theory-building that comes out of using and reappropriating this platform.

GSC01 Thinking, researching and doing – Global approaches to contemporary feminisms

PN 017 Framing feminisms in Portugal: When violence against women is the main topic of the news coverage

Sónia Lamy¹, Carla Cerqueira²

¹ Universidade Lusófona, ECATI, Lisbon, Portugal

² Universidade Lusófona, Comunicação, Lisbon, Portugal

News framing focuses on what journalists and news media organisations actively do to the topics they select and stress (Vreese, 2014), and the concept, grounded in the classical work of authors such as Gitlin (2003), and Tuchmann (1978), refers to the idea that actors as journalists select and underline some aspects and ignore others. For that reason, media representation of social movements has been one of the focus of the last few decades of research (Mendes, 2011). Feminism has gained some prominence in Portugal and published news articles, in diverse mainstream media, motivating the breaking of silences and influencing how certain issues are understood and received publicly (Cerqueira et al., 2023). We know that traditional media plays an important role in feminist informal groups' communication strategies and in the way how messages are published, in the Portuguese context violence against women is one of the most focused topics on the news articles. Our research was conducted on the MediaCloud platform using the keywords 'feminist organizations/associations/movements/collectives'. And using content analysis of 367 news articles, published in Portuguese digital newspapers – Expresso, Público, JN, Observador, Correio da Manhã, and two newsmagazines Sábado and Visão – between 2011 and 2022, we found that 31% of the articles were focused on items related with violence against women. And, the main triggers for the published news are subjects such as feminist political actions, legislative initiatives, campaigns and demonstrations, but the discussion about feminism as an independent item is only the starting point of 25% of the news articles. Considering that communication practices change tendencies, and in an attempt to analyse the metamorphoses and patterns of news coverage, and considering the high emergence of various transnational feminist movements in the last decade, it is essential to reflect on the way how media are framing feminist items. Based on a frequency analysis (Krippendorff, 2004), using words and concepts as coding units, we sought to reflect on the following research questions: Besides violence against women, what are the main news items that mobilised contact with feminist organisations? What subjects are represented by feminist movements? Which feminisms are represented in this journalistic-mediated space? The published news articles motivate the exposure or silence of many organisations, which consolidates, or damages, their public image, in a medium where visibility is always promoted.

GSC01 Thinking, researching and doing – Global approaches to contemporary feminisms

PN 018 The #MeToo movement and masculinities in Portuguese newsmagazines

Carla Cerqueira¹, Ana Sofia Pereira², Célia Taborda³, Priscilla Domingos³

¹ Universidade Lusófona, Comunicação, Lisbon, Portugal

² Lusófona University – CICANT, Comunicação, Porto, Portugal

³ Universidade Lusófona, Comunicação, Porto, Portugal

The #MeToo movement was founded by African-American activist Tarana Burke in 2006, with the objective to foster empathy and solidarity among black women and women of color who, like herself, had suffered situations of sexual assault and/or harassment (Boyd & McEwan, 2022; Franks, 2019). However, it wasn't until 2017 that the movement went viral after a tweet by actress Alyssa Milano, in the aftermath of numerous allegations of sexual harassment and violence against American cinema producer Harvey Weinstein (Gleeson & Turner, 2019). The movement became a transnational phenomenon and has promoted several discussions on issues of sexual harassment and violence against women. Simultaneously, has given rise to a broader dialog that includes issues such as gender power dynamics, prevailing conceptions of masculinities, anti-feminism and sexist responses (e.g. Clark-Parsons, 2021; Fileborn & Phillips, 2019; Franks, 2019; Maricourt & Burrell, 2022). In Portugal, #EuTambém (the literal translation of the words "Me Too") failed to garner significant traction or ignite a local widespread movement. Predominantly perceived as an American phenomenon with minimal impact and appropriation in Portugal (Garraio et al., 2020), the number of reported cases was scarce. The challenges faced by the movement #MeToo in Portugal can be partially explained by the country's historical context (Portugal experienced the longest-lasting dictatorship in Europe in the 20th Century, spanning from May 1926, when the Military Dictatorship started, to April 1974), and its unique feminist narrative, which is yet to be fully explored (Tavares, 2011). This communication analyzes how masculinities are expressed and discussed in Portuguese mainstream media coverage of the #MeToo movement, with a specific focus on opinion-based journalism, including op-ed pieces and chronicles, in the highest paid digital Portuguese newsmagazines Sábado and Visão, between the second semester of 2017 (when the movement gained prominence) and the first trimester of 2023. This translates into the following research question: How has the media's depiction of #MeToo in Portugal influenced the reinforcement or deconstruction of hegemonic masculinities? Examining a corpus of 16 opinion pieces using a qualitative methodology anchored in thematic analysis, two main themes were identified: Models of Masculinities (including subthemes of Hegemonic masculinities and gender power dynamics, and Men's virile and violent nature) and #MeToo: a "revolution" (including subthemes of Stances

on #MeToo, and Effects of #MeToo). Our findings in these two newsmagazines underscore a lesser emphasis on discussions about masculinities and their critical examination in Portugal, indicating a hesitance to directly confront patriarchy and deconstruct hegemonic masculinities, contributing to reinforcing patriarchal gender norms.

GSC01 Thinking, researching and doing – Glocal approaches to contemporary feminisms

PN 019 Moving image, static knowledge: Navigating the interplay of cinema, science, and Portuguese feminism

Ana Sofia Pereira¹, Camila Lamartine², Célia Tabora¹, Carla Cerqueira³

¹ Universidade Lusófona, Comunicação, Porto, Portugal

² Universidade Nova de Lisboa, Ciências da Comunicação, Lisboa, Portugal

³ Universidade Lusófona, Comunicação, Lisbon, Portugal

The history of feminisms in Portugal has been largely overlooked by the cinematic culture. The country's past, shaped by a long-lasting dictatorship, has resulted in a fragmented national feminist action, which has hampered public recognition and documentary depiction. In the contemporary landscape, global feminist movements echo locally, embracing a pronounced transnational dimension through street demonstrations and digital activism, notably cyberfeminism (Martinez, 2019; Haraway, 1991). This phenomenon is mirrored in Portugal, underscoring the need to explore the absence of feminist representation in national audiovisual and media outlets. Cinema is a valuable tool in education and raising awareness among viewers. Münsterberg (1916) notes that films are, above all, great teachers of knowledge: "No more patient, friendly, or persuasive teacher can be found" (p. 196). Several other writers have come to emphasise the significance of cinema in shaping, rejuvenating, and revolutionising cultures due to its distinctive audiovisual and realistic language, which speaks to the human mind and emotions (Balázs, 1948; Cavell, 1971; Derrida, 1993; De Lauretis, 1984; Johnston, 1973). In this context, cinema has emerged as a prominent instrument for scientific dissemination, seamlessly combining various art forms, like photography and literature, and evolving into a form of activism. Its fundamental objective is to convey complex ideas and phenomena to diverse audiences, fostering reflection and wide-ranging discussions on pressing social, technical, and scientific issues. Recent years have witnessed an increasing trend in communicating academic research results through multimedia platforms, with cinema and films becoming highly popular vehicles for disseminating and demystifying scientific knowledge, thereby ensuring accessibility across social strata, educational backgrounds, genders, and age groups. Integrating scientific dissemination, the diverse facets of feminisms in Portugal, activism, and cinema, the "FEMglocal – Glocal feminist movements: interactions and contradictions" research project dedicates a significant portion of its focus to the study of Portuguese feminist activism, with the goal of contributing to the (re)construction of the historical memory surrounding feminisms. A pivotal aspect of this undertaking involves the development of a documentary. This cinematic endeavour seeks to shed light on the intricate landscape of national feminist activism. Positioned at the intersection of academic and societal significance, the project strives to engage a diverse range of audiences to ensure that the scientific insights derived from the research project remain not only pertinent but also accessible as a form of knowledge for society in the future. With this paper, our objective is, thus, to delve into the role of cinema in scientific dissemination, particularly documentaries that, according to Nichols (2001), challenge social conventions. Employing a combination of literature review and film analysis, our aim is to discern how the historical narrative of feminisms in Portugal could be effectively conveyed through the documentary format, reaching a broader and more diverse audience with a pluralistic perspective.

GSC02 Entanglements of gender and technology

PP 0182 Gender stereotypes assigned to artificial intelligence. An experts' comparative perspective on virtual assistants

Miruna Craiut¹, Ioana-Raluca Iancu¹

¹ Babes-Bolyai University, Communication- Public Relations and Advertising, Cluj-Napoca, Romania

Artificial Intelligence (AI) has become one of the most discussed topics nowadays (Helm et al., 2020). Consequently, virtual assistants are present in most industries (Rawassizadeh et al., 2019) and raise multiple issues for debate (Cheng & Jiang, 2021). Since their appearance is increasingly human-like, gender stereotypes problems emerge, affecting the way this technology is perceived in terms of competence, trust, and intentional behavior (Ahn et al., 2022). However, the existing literature on the way different gendered virtual assistants are perceived is contradictory and the interaction's impact is not yet fully understood (Adams & Loideáin, 2019).

Thus, the present study aims to investigate (1) how human-computer interaction can be affected by gender role stereotypes and (2) how the latter can be prevented and corrected. Relying on Computers as Social Actors Theory (Munnukka et al., 2022), which explains the anthropomorphism process present in virtual assistants, and on Social Response Theory (Huang & Lin, 2011), which states that individuals treat technology as social entities, a set of semi-structured interviews with experts is conducted. For a comprehensive perspective, opinions from communication, computer science, and psychology domains are compared.

The study is relevant by providing clarifications on the inconclusive existing results on gender stereotypes assigned to virtual assistants (Dogruel & Joeckel, 2023), by focusing on experts' perspectives, and by offering a domain

comparative approach. Likewise, it emphasizes different insights useful for technology designers and organizations to correct gender stereotypes ascribed to chatbots. The research can also be replicated for other types of technologies.

GSC02 Entanglements of gender and technology

PP 0183 Covering social injustice and gender inequality? The debate about ChatGPT and generative artificial intelligence in German media

Lina Brink¹, Elke Grittmann¹, Peter Kann¹

¹ Magdeburg-Stendal University of Applied Sciences, Social Work- Health and Media, Magdeburg, Germany

In the last two years, a new generation of generative artificial intelligence (AI) has been released in the form of ChatGPT, Dall-E, Midjourney and Bard, among others, which are said to have the potential to fundamentally transform various areas of society as well as everyday life of people. In view of the rapid spread of these applications, scientific, political and media debates about AI have intensified once again. In the scientific context in particular, the question of the social implications of generative AI, including issues relating to the de/stabilization of the social order and the effects on social justice, is increasingly being discussed. But to what extent are gender inequalities and other forms of social discrimination and disorder addressed in public debates on generative artificial intelligence?

Our study addresses these questions by conducting a quantitative content analysis and a qualitative discourse analysis of news coverage on generative AI in German media. While previous research has focused on topics, risks and tonality (e.g. Brantner & Sauerwein 2021) questions on gender inequality and social injustice in media discourse about AI has gained less attention in scientific research. The empirical research questions are:

1. How did news coverage of AI develop and which topics were in the foreground over time? What attention did issues of gender inequalities and social justice receive in the discourse?
2. Which topics of social implications are being discussed? Which issues of social justice are raised by which actors and which are marginalised or neglected?

The paper examines media discourse of German media on generative AI from the launch of ChatGPT-3 in November 2022 to November 2023. By means of a quantitative content analysis of news coverage, the paper first shows the significance of the topic of AI in the media discourse. The media sample for the study consists of 10 high-reach news outlets representing a broad political spectrum. Digital, print and audiovisual media were included in the analysis. From the entire corpus, the contributions that deal with social implications are qualitatively examined in detail using the Sociology of Knowledge Approach to Discourse (SKAD, Keller 2011).

To sum up, the public debate on AI shows a primarily economic orientation and framing of AI as an important future technology and a dominance of economic actors. Discourse on gender inequalities and social injustice plays

a minor role. The media problematise the effects of generative AI on the social order for example with regard to educational justice and various forms of social discrimination.

The results of the discourse analysis are related back to the current scientific and political discourse on generative AI and social justice. Finally, specific recommendations for action are formulated with regard to the deficits that still exist in public debates on the social implications of generative AI.

PP 0184 “Your data, your choice” – An investigation into alternative menstrual tracking applications

[Aino Koskenniemi](#)¹

¹ University of Helsinki, Faculty of Social Sciences, Helsinki, Finland

Tracking menstruation is no small business. The number of people actively using apps for menstrual tracking was estimated at around 100 million in 2019 (Kresge et al., 2019). Femtech (female technology) and menstrual apps have been presented as tools for female empowerment but also heavily criticised for relying on and strengthening stereotypes, for inaccuracies in explanations and predictions, and for the ways in which they collect and utilise people’s intimate data for commercial purposes. However, despite the abundance of research on menstrual applications, there is, to date, no scholarly work analysing free, not-for-profit applications for menstrual tracking that position themselves against the mainstream commercial tracking applications that require users to share intimate data with the providers of the apps.

This project therefore explores free, not-for-profit menstrual tracking applications that collect data only on the device used for tracking to find answers to the following questions:

1. What is the role of not-for-profit tracking applications in the digital “menstrual health space” (Bobel, 2019)?
2. What are the motivations, goals, and strategies of the developers of these apps?
3. What are the possibilities and limitations of this form of (civic) action?

These questions allow examining whether and how alternative menstrual applications may answer to menstruators’ needs and to menstrual activists’ calls for better methods of gaining understanding of one’s body without reinforcing harmful stereotypes or stigma or exploiting personal data. The study makes use of semi-structured interviews with app developers and contributors and qualitative content analysis of communications materials, reviews, social media materials, and online communications related to not-for-profit menstrual tracking applications. The qualitative content analysis is used to identify the concerns in the market that the apps are explicitly and implicitly providing solutions to, whereas the interviews allow examining the motivations of the developers and the contributors, the meanings they ascribe to their work, and the strategies they are employing. Ultimately, the research maps the possibilities and problems in (feminist) menstrual app development to produce knowledge about ways of reinforcing menstruators’ bodily autonomy.

GSC02 Entanglements of gender and technology

PP 0185 Behind the front page: A comparative gender gap study of Wikipedia’s main page through gatekeeping and agenda-setting theories

[Núria Ferran-Ferrer](#)¹, [Laura Fernández](#)¹, [Miquel Centelles](#)¹

¹ Universitat de Barcelona, Department of Library and Information Science and Audiovisual Communication, Barcelona, Spain

The gender gap in Wikipedia is a widely documented problem both in terms of participation (volunteers editing on the platform) and content (representation of women and other non-normative gender identities’ biographies) (Bear and Collier 2016, Ferran-Ferrer et al. 2023, Minguillón et al. 2021). A relevant space in Wikipedias where the gender gap is an observable phenomenon is the so-called Main Page. The front page of Wikipedia is the home page, the most visited page of this digital encyclopaedia and whose contents have a wide reach as the most popular video on YouTube or a common search on Google.

Previous research indicates that gender, colonial/cultural and other intersectional biases abound in the front pages of the various Wikipedias and that the most visible biographies are those of cisgender men and white, European and North American individuals (Sefidari-Huici 2022, Ferran-Ferrer, et al., 2024). As part of the research project "Women and Wikipedia (W&W)", we have focused our investigation of the gender gap in this section of the English, Spanish and Catalan Wikipedias from the communication theories of gatekeeping (Barzilai-Nahon, 2009) and agenda-setting (McCombs and Shaw, 1972) coupled with a feminist and intersectional perspective (Harvey 2020).

First, we carried out a scoping review (Arksey and O'Malley 2005) in Web of Science and Scopus databases to map previous work analysing Wikipedia from these communication theories. Second, we conducted 13 semi-structured personal interviews with volunteers from the English, Spanish and Catalan Wikipedia in charge of editing the front page or who have been involved with this section of Wikipedia. Our main aim was to learn first-hand about the functioning of this section as well as their experiences in editing and programming it.

Prospective results suggest that, despite the open and collective nature of Wikipedia, a large part of the volunteers interviewed do not consider the gender/content gap to be addressed through the front page, but at most the gap of the front page would be the result of the existing gap, as a mirror of current patriarchal society. The interviews revealed that the topics displayed on the front page, while part of the volunteer community's content, ultimately respond to the subjective decisions of the individuals taking administrator roles. Tacitly, these administrators prioritize their own topic preferences and interests. Despite the Wikimedia Movement, which includes the Wikimedia Foundation and all the language and territory-based affiliates, agreed on a new strategic direction towards the 2030 horizon, which sets the goal to eradicate the gender gap and prioritize underrepresented groups, there are no concrete steps taken to address these on the Wikipedia's Main page. On the contrary, within the volunteer community, emphasising gender and intersectional concerns tends to be perceived as an activist topic, posing challenges in achieving a consensus. Consequently, the gender gap is mainly addressed through the committed impulse of individual feminist and LGBTIQ+ activist Wiki-projects and editorial collectives. The Wikipedia Main Page emerges as an online space of contestation on gender representation (dis)orders warranting urgent academic attention.

Keywords: Wikipedia, gender gap, affirmative action, gatekeeping, agenda-setting, interviews.

PP 0186 Still a debate or just an "echo chamber" effect? "Gender theory" in Slovenian Twitter discussion

Roman Kuhar¹, Rok Smrdelj¹, Monika Kalin Golob²

¹ University of Ljubljana- Faculty of Arts, Department of Sociology, Ljubljana, Slovenia

² University of Ljubljana- Faculty of Social Sciences, Department of Journalism, Ljubljana, Slovenia

This paper examines Twitter (X) discussions in Slovenia following the decision of the Faculty of Arts, University of Ljubljana, to adopt gender-sensitive language in their internal regulation documents. Employing social network analysis, this study identifies distinct user communities with predominantly right-leaning political affiliations. Linguostylistic and critical frame analyses revealed that these communities emphasize different themes related to gender-sensitive language. However, a common thread connecting these debates is the discursive concept of "gender theory." Specifically, our critical frame analysis showed that communities focused on topics such as the integration of "gender theory" into the education system (Community 1), the defence of patriarchal roles (Community 2), the exposure of the dean's homosexuality and allegations of childhood abuse (Community 3), the infiltration of "cultural Marxism" in educational institutions (Community 4), and the interpretation of the measure as an act of language destruction (Community 5). The linguostylistic analysis also provides evidence supporting the understanding of "gender theory" as an "empty signifier". This is exemplified by the identification of a conceptual opposition "illness" vs. "health" in the most retweeted tweets. Within this framing, "gender theory" is represented as an "illness", while "normalcy" is associated with "health". Deviations from established grammatical norms are depicted as diseased and perverse, implying that society itself is afflicted by this condition, attributed to various elements such as radical feminism, the LGBT agenda, and cultural Marxism.

Our empirical findings demonstrate the role of "gender theory" in de-democratization by limiting the boundaries of legitimate debate to frame of "gender theory/ideology", marginalizing and excluding "alternative" viewpoints and impeding democratic and pluralistic exchanges. Our analysis reveals the significant absence of any voices capable of offering alternative perspectives or framing the focal issue beyond the confines of "gender theory." This indicates that the right-leaning network has effectively instrumentalized the Twitter (X) debate, surpassing the conventional *pro et contra* structure characterized by opposing viewpoints. Despite the identification of distinct communities, they ultimately stem from the same political network, creating an "echo chamber" where users reinforce shared convictions and dominate the online media sphere, resulting in the marginalization and exclusion of alternative perspectives on the subject matter. Put differently, we observe a departure from the network "polarization" and "fragmentation", which typically characterise Twitter (X) debates of this nature. Instead, our analysis reveals prevailing ideological homogenization across various communities. This phenomenon can be attributed to the colonizing

nature of "gender theory," which effectively restricts the space for emergence of alternative viewpoints on the given topic.

Examining the findings of our study through the lens of established concepts for studying "gender theory" reveals its "colonizing" nature, exemplifying its assimilation and normalization in the public sphere. Moreover, our research substantiates the importance of integrating quantitative analysis at the level of "big data" with qualitative examination of tweet content, providing a comprehensive and multi-faceted understanding of the Twitter (X) debate.

GSC03 More-than-human intimacies in digital worlds: Identity, power, and inequality

PN 056 The Techno-politics of Automated Intimacies: The Case of Replika

[Sander De Ridder](#)¹

¹ University of Antwerp, Communication Studies, Antwerp, Belgium

Replika, a prominent player in the conversational AI space, is a chatbot that is acknowledged to provide users with social support, companionship, and personal growth. Replika is a key example of the growing significance of AI as an industry that has the potential to deeply shape the most intimate aspects of people's everyday lives. Users engage with Replika in deeply personalized ways and they often express romantic and sexual interest. These newly emerging socio-technical relations are what this contribution conceptualizes as 'automated intimacies'. Given the rapid adoption of forms of automated intimacy, this presentation will argue that we need to understand the gendered imaginaries and expectations that individual users, and more broadly society, project onto conversational AI tools such as Replika. My contribution aims to critically examine the technopolitics of automated intimacy, focusing on the case of Replika. It will explore the imaginaries and expectations that users have of Replika to provide them with companionship, and how the institutional and technological logics of conversational AI are new battlegrounds for the politics of intimacy to unfold: the valuing of certain feelings, identities, and gendered practices of intimacy, and the disregard for others. The case of Replika is a lens through which to understand contemporary politics of intimacy in deeply digitalized life worlds where private romantic and erotic spheres are increasingly subjected to automated technologies that act without human intervention or oversight. To achieve this, this presentation will present data collected from Reddit, a popular online discussion platform. The Replika community on Reddit is, with more than 78.400 members, amongst the top 5% ranked in size subreddits and offers numerous discussions, questions, and stories shared by Replika users. The data collection and analysis rely on automated content analysis (topic modeling and sentiment analysis) of the Replika subreddit to provide a systematic overview of the discussions in the Replika community, combined with more in-depth textual analysis of prominent topics, allowing for a deeper discussion on the techno-politics of automated intimacy. For example, the desires of Replika users, frustrations with Replika, gendered fantasies about Replika, and the attribution of sexual identities to Replika are the most important topics this presentation will tackle. To conclude, this presentation will argue that AI industries should be taken seriously as increasingly being important actors in the politics of intimacy, gender, and sexuality.

PN 057 Gender roles and courtship scripts in dating apps. Lessons learned from Italian women dating women

[Francesca Comunello](#)¹, [Lorenza Parisi](#)², [Francesca Leracitano](#)², [Arianna Bussoletti](#)²

¹ Sapienza University of Rome, Department of Communication and Social Research, Rome, Italy

² University of Roma La Sapienza, Department of Communication and Social Research, Rome, Italy

Dating apps are becoming the most popular way for couples to meet, especially for LGBTQIA+ people, and their usage has dramatically increased during the CoViD-19 pandemic (Statista, 2021; Duguay et al., 2022). In this contribution, we explore the ways in which women dating women (wdw) in Italy negotiate with (traditional) courtship scripts in the context of dating apps. Courtship scripts have been defined as cognitive representations that provide information about the desirable sequence of events and behaviors for dating situations (Simon & Gagnon, 1986; Abelson 1981; Eaton & Rose, 2011). Research has shown that, in heterosexual contexts, courtship scripts are strongly gendered and that, even in recent years, they are bound to traditional gender roles (Eaton et al. 2016). While heterosexual scripts have been extensively studied, less is known about scripts among non-heterosexuals. The Italian case is of particular interest: Scappini et al. (2023) underline how gendered scripts have been seldom scrutinized in Italy and confirm the endorsement of traditional gender scripts. Gender stereotypes are particularly present in Italy, if compared with other Global North countries (Ragnedda & Budd, 2015). Moreover, the Rainbow Europe Index (Ilga-Europe, 2023) highlighted how Italy offers the worst conditions for LGBTQIA+ individuals in Western Europe. We focus on the scripts adopted by women dating women: Rose and Zand (2002) highlighted that the preferred courtship scripts among women dating women are the "friendship" script (emphasizing "emotional intimacy over sexuality" Rose and Zand 2002: 87) and the "romance" script (depicting "emotional intimacy and sexual attraction as being intertwined", *ivi*), while the "sexually explicit" one is the less preferred. By establishing an explicit "dating" frame for their users, dating apps might appear inconsistent with the prevailing friendship script. Those women who prefer the friendship script might feel the need to re-negotiate it, when using dating apps. Our

research questions are the following: RQ1. What are the prevailing courtship scripts among wdw in Italy? RQ2. Are there generational differences in adopting those scripts? RQ3. How do wdw negotiate with the prevailing courtship scripts, on dating apps? Starting June 2023, we have carried out semi-structured interviews with self-identifying women dating women in Italy (20–29 yo and 40–65 yo). From the thematic analysis (Braun & Clarke, 2006), a multifaceted picture unfolds. Friendship emerges in participants' words, as a script and as a trigger for initiating relationships (especially in their first experiences with women). Hookups (the "sexually explicit" script) are an option, both on- and offline: they do not appear as preferred by participants (but no social stigma emerged). Especially young participants show a sort of ambiguity about gender roles: on the one hand, they refer to "masculine" and "feminine" roles among wdw (which is explained as triggered by society, but also interiorized by many women); on the other, fluidity and an overall rejection of traditional models are also mentioned.

GSC03 More-than-human intimacies in digital worlds: Identity, power, and inequality

PN 058 Decoding AI Intimacy: ChatGPT's Role in Psychological Support

[Maria Francesca Murru](#)¹

¹ University of Bergamo, Department of Literature Philosophy and Communication, Bergamo, Italy

I've struggled with OCD, ADHD, and trauma for many years, and ChatGPT has done more for me mentally in the past month than any human therapist in the last decade. I've shared raw, honest information about my trauma, career, relationships, family, mental health – and ChatGPT responds by providing highly accurate analyses of my distorted thought patterns, my fallacies, and my blind spots.¹ This is the starting of one of the most commented threads on Reddit about the possibility of using ChatGPT as a psychological advice tool. While therapeutic chatbots can rely on a longer tradition of usage, largely debated among psychologists' community and extensively explored by literature on AI, the adoption of general AI for psychological support can be classified as a (partially) unintended frame of use (Flichy, 2008). The recent launch of GPTs, custom versions of ChatGPT for specific use cases, has paved the way to a wide range of chatbots promising to serve as mental health advisors, offering "empathetic listening, personalized guidance," and "insight with a personal touch." Drawing on the research tradition of critical intimacy studies and feminist theories of care, this contribution will explore this new kind of "algorithmic intimacy" (Wiehn, 2023) that is established in a human-AI communication process elicited by users' quest for care and advice. Valuing the intimate as a socio-political field, the research field of critical intimacy studies considers how proximity is enabled, hindered, and exploited as a privileged perspective for "undoing" familiar connotations about "private" (Wilson, 2022:32) and recognizing structures of dominance and their conditions of possibility (Stoler, 2006). To achieve this, the presentation will discuss the data collected through the emerging practice of "App studies", where detailed engagement with user interfaces and their underlying operational logics is captured and analyzed (Dieter et al. 2019; Perrotta et al. 2022). More specifically, a series of simulated therapeutic queries have been submitted to ChatGPT 4 and to those GPTs promising various forms of psychological support: the requests are inspired by the most debated topics and examples of interactions quoted in the Reddit's thread about potentialities of ChatGPT in offering psychological support. The analysis aims at shedding light on the technical scripting embedded and enacted in interface design, especially in relation to the establishment of conversational frames concerning empathy, emotional mutuality and how they are related to anthropomorphic cues, such as gender, age, together with other verbal and nonverbal attributes (i.e. human/machine, embodied/disembodied, mobile/stationary) allowing to conceptualize the assistant as a communicative subject and, in turn, act toward it (Guzman, Lewis, 2020). Special attention will be dedicated to the ways in which the asymmetry structurally embedded in a care relationship is mediated (Couldry, 2008), therefore drawing specifically on insights from feminist theories of care, within the informational asymmetries at work in the ChatGPT's "machine habitus" (Airoldi, 2021). As science and technology studies (STS) on human-computer interaction have extensively claimed, the analysis of the technical scripting raises questions concerning the circulation of power and the production of subjectivation (Akrich, 1992), and consequently on how the intimate modes of human-AI interaction connect to the logics and mechanisms of global techno-capitalism.

GSC03 More-than-human intimacies in digital worlds: Identity, power, and inequality

PN 059 Pleasure Beyond the Human: Gender, Sex Toys, and Intimate Relationships among Young Adults

[Rachele Reschigliani](#)¹, [Cosimu Marco Scarcelli](#)¹

¹ University of Padova, Department of Philosophy Sociology Education and Applied Psychology, Padova, Italy

Despite the increasing prevalence of sex toy markets and their consumption (as seen in Comella, 2017; Ronen, 2021; Nixon & Scarcelli, 2022), the works of Döring & Pöschl (2018) and Dubé et al. (2023) underscore the understudied landscape of intimacy technologies and stigma provoked by their employment in intimate relationships. Nevertheless, there has been seen in multiple contributions (as in Nixon, 2018; Mayr, 2022; Comella, 2017; Lieberman, 2017) a general acceptance path and partial de-stigmatisation of sex toys for women's self-pleasure, also thanks to the push of the feminist movement and sensibility. On the other hand, (heterosexual) men still face various stigmas

when sex toys are employed in their self-pleasure practices and in their sexual intercourses (Pitagora, 2019; Ronen, 2021; Branfman & Anderson, 2018; Preciado, 2018). Informed by a combination of feminist, queer, and porn studies theories, our study aims to investigate the perception of the use of sex toys in heterosexual relationships and in self-pleasure practices of young adults through a gendered lens (Rubin, 1984; Rich, 1980; Butler, 1990). Employing a thematic analysis of 26 semi-structured interviews with Italian young adults aged 19–24, our research delves into the dimensions of individual and couple uses of sex toys. The paper unveils gendered stigmas and pleasures associated with sex toys use among young people in Italy. It also contributes to the broader conversation on their acceptance in different situations, from the individual to the interpersonal (coupled) usage in the Italian context. The findings highlight how the gendered experience might be sustained by so-called biological differences and necessities between men and women when it comes to self-pleasure, and by social variation of stigmas (for heterosexual men) and pleasures (for heterosexual women). We observe a distinct trajectory of acceptance regarding the use of sex toys among young women, but also a commodification of a 'female sexual biological need' in a neoliberal context. However, our analysis confirms a more intricate landscape for men, who face homophobic/homophobic (Anderson, 2009 cit. in Branfman & Anderson, 2018) and "sexually perverse" assessments when using sex toys for personal pleasure. As for the diversity of the use of sex toys between the single individual and the couple, our empirical material unveils several positive purposes for the heterosexual couple, while the individual use in a sexual intercourse is more stigmatised (especially if it intersects with the gender of the user). The findings reiterate the normative understanding of the sexual act and performance in the heterosexual couple (as in Fahs & Swank, 2013; Mulholland, 2011). The findings highlight distinct purposes and meanings associated with sex toy use, showcasing the complexities of navigating intimate technologies in the heteronormative sociocultural context of Italy for young adults. This exploration is crucial to understanding the intersection between sexual agency, sociocultural norms, and gender identity.

GSC04 Narratives of gender in popular culture, fiction and news

PP 0381 The ultimate Other? Orientalist representation practices and the growing politicization of diasporic Muslim women's portrayals in popular fiction series. A qualitative textual analysis of SKAM France and wtFOCK

[Salma Mediavilla Aboulaoula](#)¹

¹ Ghent University, Communication Sciences, Gent, Belgium

Every year, particularly leading up to the elections, Muslim women are brought to the forefront of public debates in Western-European countries, less as participants and more as a topic of discussion. The appropriateness of their hijab or other religious vestments, e.g. abayas, in public life is the recurring catalysator for these debates on Islam's place in secular Western countries. This is in line with several studies confirming that a growing politicization of Muslim women's mediated representations can be noticed in both fictional and non-fictional media content (Aquil, 2011) i.e., a hyper-surveillance and fixation on their bodies that render them into symbolical political playfields (Mirza, 2013; White, 2020). Byng (2010, p. 110) underlines the importance of these media representations in 'creating common sense understandings of a wide range of social events and issues, including veiling by Muslim women in Western nations'. Although this politicization is a global trend, the form it takes within these media representations adheres to the national contexts, including legislation on religious freedom, in which these media products are situated (Byng, 2010).

Research into these fictional and non-fictional media portrayals show that Muslim women are mainly approached from an outsider perspective (d'Haenens & Bink, 2006) and repeatedly represented in terms of oppression, victimization, exoticism, and terrorism (Ahmed & Matthes, 2017; Macdonald, 2006). This suggests that an Orientalist (Bullock & Jafri, 2000; Said, 1978) perspective is still dominating the discourses on and portrayals of diasporic Muslim women and reinforcing a Third World Women trope (Mohanty, 1988). While most studies focus on traditional news media (Ahmed & Matthes, 2017), studies that do examine fictional representations are predominantly conducted on American series pertaining to crime and terrorist genres, e.g., 24 (Hirji, 2011; Asultany, 2012). Thus, less is known about representational practices in European productions and the question arises whether the use of these stereotypes is just limited to the aforementioned genres. Hence, the aim of this paper is to (1) analyse and compare the modes of representation employed to portray the intersectional identity formation of diasporic Muslim teen girls in secular European countries, (2) identify possible *othering* practices and Orientalist tropes in the coming-of-age story.

Relying on an interdisciplinary theoretical framework consisting of postcolonial feminist studies and critical media studies, a comparative qualitative textual analysis was conducted of all seasons of the Belgian (5 seasons) and French (6 seasons) adaptations of the popular Norwegian teen series SKAM, respectively titled wtFOCK and SKAM France. Preliminary results show that in both adaptations the identities of diasporic Muslim teen girls are repeatedly politicized, especially their headscarf. This politicization is done to contextualize their identity formation as diasporic Muslimas in Belgium and France, but is at times sensationalized. The Muslim main characters were frequently *othered* as a means for the series to deconstruct and criticize this *otherness*. For wtFOCK, this deconstruction is rather limited as it actively uses Orientalist stereotypes (e.g., the angry Muslim father and passive Muslim mother) to

represent the Muslim side characters, consequently reiterating and reinforcing dominant tropes of oppression and victimization.

GSC04 Narratives of gender in popular culture, fiction and news

PP 0382 Unveiling power dynamics: A gendered perspective in contemporary European popular culture narratives

Elisa Paz Pérez¹

¹ EU Business School, Communication, Barcelona, Spain

Contemporary European popular culture narratives, disseminated globally through streaming platforms like Netflix, Amazon Prime, and others, provide a unique lens through which we can explore the intricate interplay between gender and power dynamics. This research delves into the narratives of three distinctive and popular television series – ‘The Crown’ (UK), ‘Borgen’ (Denmark), and ‘La Casa de Papel’ [Money Heist] (Spain) – to unravel how these productions contribute to the portrayal and construction of power structures.

The exploration builds upon existing literature that acknowledges the influential role of popular culture in shaping societal perceptions, particularly related to gender and political contexts. While the representation of gender in popular culture has been a subject of scholarly inquiry, a notable gap exists in understanding how these representations intersect with and influence power dynamics within political narratives, especially when considering the international accessibility of these European productions through SVoD platforms.

This research aims to address this gap by focusing specifically on the intersected **gendered portrayal of power within the selected television series**. By situating these narratives within the context of SVoD platforms, the study seeks to highlight the implications of a European vision reaching diverse, international audiences.

The gap in the literature becomes increasingly pronounced when considering the nature of these European productions. ‘The Crown,’ with its portrayal of British monarchy; ‘Borgen,’ providing insights into Danish political spheres; and ‘La Casa de Papel,’ merging high-stakes heist drama with social critique in a Spanish context, represent distinctive European perspectives on power, politics, and gender. The international availability of these shows on SVoD platforms not only allows for a broader audience reach but also positions them as cultural ambassadors projecting a European vision. The primary aim of this research is to analyze the complexities of power dynamics through a gendered lens within these European popular culture narratives.

The questions that this paper answers are: How do gender representations in ‘The Crown’ (UK), ‘Borgen’ (Denmark), and ‘La Casa de Papel’ (Spain) intersect with political power structures? What narrative strategies are employed in ‘The Crown,’ ‘Borgen,’ and ‘La Casa de Papel’ to convey power relations, specifically focusing on how gender is portrayed within political contexts?

Adopting a qualitative content analysis approach and critical discourse analysis, the study seeks to examine what is portrayed and how these portrayals contribute to broader discourses on power relations. By engaging in an in-depth examination of character interactions, plot developments, and thematic elements, the research aims to discern **how gender operates as a key component in shaping and challenging power structures within the chosen narratives**. In alignment with the exploration of gender and sexuality in the context of (dis)order in media and communication, this research contributes to the study of dynamics of power within European popular culture narratives.

GSC04 Narratives of gender in popular culture, fiction and news

PP 0383 The Coming of Middle Age: The complexities of menopause in Pamela Adlon's prestige dramedy *Better Things* (2016–2022)

Katrine Sommer Boysen¹

¹ University of Copenhagen, Department of Nordic Studies and Linguistics, Copenhagen, Denmark

In an article in *The New Yorker*, Alexandra Schwartz calls the recent tendency to depict midlife women “the coming of middle age” (Schwartz 2021) paralleling this menopausal change to the *Bildung* often seen in classic youth-centered coming of age narratives.

This representation of the menopausal women in new television dramedies is the focus of this paper. Extant research, such as de Beauvoir (1949), Friedan (2006) and Greer (1992), have noted that the (post-)menopausal woman in the past has been rendered silent and socially and culturally invisible. Deborah Jermyn has named this paradigmatic shift ‘the menopausal turn’ (2023) and Shani Orgad and Catherine Rottenberg have called it ‘the menopause moment’ (2023). They argue that the menopausal women are no longer neglected “as a joke” in contemporary media fictions (Waade and Leyda 2022) but come across as complex characters (Mittell 2025; Dunleavy 2017).

Inspired by the work of the Christine Geraghty's pioneering study of leading women characters in soap operas (1990), Margaret Tally's studies of the rise of the anti-heroine (2016), and Maria Sulimmas work on the connection between gender and seriality (2020), this paper focuses on female led tv dramedies explicitly addressing menopause. Theoretically grounded in the combination of gender/(post)feminist theory (Mulvey 1978; Rowe 1997; Gill 2007), cultural gerontology (Twigg and Martin 2015) and genre studies (Altman 1986; Hastrup 2011; Havas and Sulimma 2018) this case study methodically combines these theoretical positions in a new way, showing how menopause becomes a dramatic turning point regarding the feminine subject, body and experience which at times transgress the conventions of femininity.

The case study analyzes and discusses how menopause is represented and negotiated in Pamela Adlon's FX dramedy *Better Things* (2016–2022). Adlon plays the part of Sam Fox, a single mother of three (teenage) girls living in Los Angeles. During the series Sam and her friends hit menopause and the physical and mental changes are depicted as an equally liberating and restricting life change making the women at the same time more powerful and more invisible. In *Better Things* Sam and her friends all experience and explicitly address the fact that they are no longer getting the attention – from men and from women – that they used to. They are no longer looked at (Gill 2007; Mulvey 1978). The findings of this analysis will be related to similar dramedies also representing menopausal women, i.e. *And Just Like That...* (2021–) and *Fleabag* (2016–2019).

Keywords: Menopause, ageing, body, dramedy, gender studies

GSC04 Narratives of gender in popular culture, fiction and news

PP 0384 Ageing and Unruliness: Articulations of Gaga feminism in representations of aging, gender and sexuality

Sara De Vuyst¹, Katrien De Graeve²

¹ Maastricht University, Literature and Arts, Maastricht, Netherlands

² Ghent University, Languages and Cultures, Ghent, Belgium

In dominant Western media discourses, older women's anger and resistance are often portrayed as a consequence of the physical and mental decline inherently associated with ageing. These representations reinforce the image of older women as vulnerable subjects who are weak, frail and excluded from society. This article proposes an alternative reading of expressions of unruliness related to ageing, gender and sexuality in Western media and visual culture through the lens of Halberstam's concept of Gaga feminism. The aim is to explore how Gaga feminism's aesthetics of collapse, creative anarchy and experimentation can construct new constellations of ageing, sexuality and gender. We have conducted a critical, contextualised reading of a selection of cultural artefacts that express various elements of a Gaga aesthetic. Our study examined a variety of aesthetic forms, including documentary films, embroidery, fashion, performance art, music videos, comics and zines. Through our reading, we want to identify alternative vocabularies for older women's resistance. While media studies have typically focused on the various forms of stereotyping in representations of older women, they have told us less about the creative and unruly ways in which ageism, heteronormativity and sexism are subverted, destabilised and dismantled. This article aims to shed light on the potentially transgressive qualities of the representations of older women. Our analysis reflects on the three central principles of gaga, namely (1) new forms of social relations and sexualities, (2) more fluid articulations of gender, and (3) creative anarchy; and what they can mean for an anti-ageist project in media and visual culture. It demonstrates how cultural representations of and by older women are stepping off the beaten path and challenging norms and social power structures that govern how they should look, love and live their lives. In this way, this article offers insights into the creative and unruly ways in which ageism, heteronormativity and sexism can be subverted and destabilised in representations.

PP 0385 The New Normal: Analysing gender dynamics in a post-pandemic era in the Portuguese mainstream news media

Juliana Alcantara¹, Rita Basião Simões²

¹ University of Coimbra, Department of Philosophy – Communication and Information, Coimbra, Portugal

² University of Coimbra, Department of Philosophy – Communication and Information / Centre for Social Studies of the University of Coimbra, Coimbra, Portugal

The Covid-19 pandemic has significantly changed people's lives, inevitably spilling over into their professional routines. Journalistic work was mainly allocated to remote working, except for some roles that had to adopt a hybrid format, where journalism practice was carried out partly from home and partly in the newsroom. As the transition to a post-covid-19 world occurred, more changes were afoot. The new beginning coincided with two events: the end of the remote working recommendation by the Portuguese government and the start of the war in Ukraine. After all, the World Health Organization had not declared the end of the Covid-19 pandemic when the war in Europe began.

To better understand the post-pandemic era in the mainstream news media field, we describe and analyse events and perceptions of yet another change and the obstacles encountered when returning to work in person in the newsroom. Therefore, the question that guides this communication is: after the lockdown period, how do journalistic practices facilitate the maintenance and perpetuation of power relations and gendered cultural dynamics? We used the methodological combination to perceive expectations for the future experiences called by the interviewees as "the new normal". After the initial and impactful changes caused by the health and organisational impositions during the general lockdown, we are now examining the impact of the pandemic crisis on the workplace in times of a return to the exclusive face-to-face regime or in a hybrid format.

Firstly, thirty-one semi-structured in-depth interviews were conducted between October and December 2021 with journalists of Portuguese mainstream media (radio, television, daily newspaper, online media, and weekly magazines). Women and men from different hierarchical positions, backgrounds, and age ranges were invited to reflect on the profession during the second-year pandemic. In March 2022, the first author performed a participant observation on a reference Portuguese daily newspaper. This method extends to the in-depth semi-structured interviews conducted, in which we had access to the meanings of the lived realities.

We look more specifically at the effects on work strategies, departing from a sense of resilience and survival in an environment profession built on masculine standards of behaviour and subjectivity. The findings show a desire for a balance between personal and professional life, reflecting what was experienced during the first year of the pandemic and the pre-established routines. As a result, for some, job dissatisfaction is a reason, even if it can't be seen as an isolated factor, for wanting to give up the profession.

PP 0386 Online gender-based violence: Detecting awareness of platform affordances among Italian feminist activists

Mariacristina Sciannamblo¹, [Francesca Belotti](#)², Paola Panarese¹, Stefania Parisi¹

¹ Sapienza University of Rome, Communication and Social Research, Rome, Italy

² University of L'Aquila, Department of Human Sciences, L'Aquila, Italy

While it is undeniable that Information and Communication Technologies (ICTs) have significantly propelled development (van Dijck et al. 2018), it is becoming increasingly apparent that they have also sparked new inequalities and forms of violence (Di Maggio & Hargittai 2001; Segrave & Vitis 2017). This paper presents the results of an ongoing research project aimed at problematizing the intersections between the diverse forms of online gendered violence and platform affordances, from the emic perspective of those who counter the former and with the specific focus on their awareness about the latter. In this respect, the project addresses two main objectives: (1) detecting the role of platform design in the dissemination and reproduction of gender-based violence online; (2) mapping and understanding initiatives and experiments aimed at contrasting gender-based violence, also through the use of digital tools.

More specifically, we present and discuss findings emerged from 15 qualitative interviews conducted with the spokespersons of Italian anti-violence centers and feminist nation-wide networks, who are engaged in countering gender-based violence through digital tools, educational initiatives and collaborative practices. The narrative approach (Gherardi and Poggio 2009) adopted has allowed us to aggregate personal experiences, stimulate reflective thinking, and generate moments of learning.

The research is based on the understanding of digital technologies and gender as "entwined categories" (Lerman et al. 2003), which shape and are shaped by social structures, practices, culture and identities. Such an approach requires problematizing the role of technological affordances (Bucher & Helmond 2017), and specifically "gendered affordances" (Schwartz and Neff 2019), and how they work in concert with user practices, the operating mechanisms and the political economy of digital media as well as the broader sociocultural norms so as to favor abusive and misogynistic practices but also to provide users (especially women, LGBTQIA+ persons and other marginalized communities) with resources for resistance and self-determination.

Preliminary findings highlight a nuanced awareness among participants regarding digital media's affordances and operating mechanisms. Participants acknowledge the potential inclusivity of digital spaces, especially when technological features facilitate overcoming physical barriers to engagement for marginalized groups. At the same time, some participants are aware of the implications of platform operating mechanisms, notably processes of datafication and curation, persistence, and scalability, which can lead to surveillance and information disorder. Some participants express skepticism about solely relying on social media platforms for activism, often drawing a line between the "virtual square" and tangible societal actions. They question certain forms of postfeminist expressions on social media, identifying them as "pop feminism" that may disconnect activism from physical mobilizations.

GSC05 Online violence and harmful discourses

PP 0387 Making shame public: Female journalists countering hate speech

[Oleksandra Gudkova](#)¹, Katharine Sarikakis¹

¹ University of Vienna, Department of Communication, Vienna, Austria

This paper investigates the challenges female journalists in Western Balkans encounter when publicly confronting hate speech. How do they navigate the delicate balance between freedom of expression and the potential consequences of challenging hate speech in the public domain? How does it affect their careers and professional trajectories? The paper explores not only coping mechanism strategies of women but also how it affects their lives, both personally and professionally.

The effects of hate speech are not uniform, they disproportionately affect marginalised groups. Female journalists, in particular, face a unique set of challenges when confronted with hate speech in the course of their work. They are targeted not just for their reporting, but also for being women who report. Therefore, female journalists are confronted not only with the structural and cultural inequalities in their professions, but also an additional layer of pressure and gender based violence.

Hate speech is deeply ingrained in societies where armed conflict and a history of aggressive nationalism has dominated the politics of everyday life. That is why post conflict regions are especially important to look at. Reporters Without Borders' Media Freedom Index (2023) documents the pressing issue of hate speech in Western Balkans. Based on in-depth interviews with 53 female journalists in Western Balkans and Austria, this paper speaks of ways of negotiating with hate speech, how women respond and how it transpires into them going public as their strategy to regain power. The strategy considered by many not only as necessary but also as a duty towards the women and the public. The narratives emerging from these journalists illustrate that speaking publicly about their experiences is a reaffirmation of agency lost in the face of directed hate speech. Beyond viewing their profession as a job, these women see it as a dual commitment: to the profession and to the society.

PP 0388 Countering digital disinformation: Portuguese journalists' perceptions from a gender perspective

[Rita Simões](#)¹, Inês Amaral¹, Luísa Torre², Pedro Jerónimo², Tatiana Dourado²

¹ University of Coimbra, Faculty of Arts and Humanities / Centre for Social Studies, Coimbra, Portugal

² University of Beira Interior, Labcom, Covilhã, Portugal

The pressure to satisfy uninterrupted communication flows in tandem with verification practices of the often false, mis or manipulated information (Nakir & McSray, 2018; Carlson, 2018) from user-generated content has been viewed as an essential dimension of digitalization implications for journalistic production. Now seen as an intrinsic part of the media ecosystem (Tandoc et al., 2018), disinformation is used to favor certain actors and interests and also to discredit sections of the media, posing new risks to journalism authority (e.g., Allcott & Gentzkow, 2017; Carlson, 2020). Against this backdrop, news professionals are pressured to stress their democratic function as objective, truth-oriented disseminators, warranting their role as watch-doggers and assuming new ones in tackling false and misleading content virally spread with the support of digital technologies. While how journalists make sense of disinformation and cope with it has captured much research interest (e.g., Schapals, 2018; Schapals & Bruns, 2022), little attention has been paid to the role of gender in how it is perceived and tackled. As feminist scholarship has been highlighting (e.g., Chambers et al., 2004; North, 2009; Byerly, 2011; Djerf-Pierre & Edström, 2020; Ross, 2004; Silveirinha et al., 2023), to understand how the news media shape social and political life and influence gendered citizenship, research needs to uncover gender in supposed gender-neutral journalism practices. By doing so, we can, for instance, highlight how professional rules and norms can inbuilt and obscure gender bias, where positions, news beats, and topics regarded as feminine are accorded lower value and status. We can also stress differences between women and men in both their experiences and practices of professional work (Alcantara & Simões, 2023; McKay, 2000; Steiner, 1998; van Zoonen, 1998; Ziliacus-Tikkanen, 2008), even though a rooted journalism masculine culture masks those differences.

Bearing this in mind, in this study, we sought to identify how female and male journalists situate the causes and the interventions to tackle disinformation. Theoretically, we departed from a framework based on journalism and gender scholarship; empirically, we turned to data from a survey conducted between July and September 2022 among journalists working in Portugal (N = 485). We specifically focused on an open-ended question so that respondents could reflect, freely and optionally, on the drivers of disinformation and the relevance and effectiveness of Portuguese measures in combating it. We obtained 169 valid responses, 103 from male and 66 from female journalists, which we analyzed quantitatively and qualitatively. While our findings show no significant differences in journalists expressing their perceptions, apart from some nuanced understandings of countermeasures, they also reveal how traditional journalistic values, born in a masculine worldview (Bruin, 2000) but accepted as professional

standards, are mobilized in respondents accounts. We argue that this uniformity comes from a broad network of constraints within which journalism takes place (Reese & Shoemaker, 2016) that not only limit alternative ways of thinking but also structure professional practices in a highly gendered logic.

GSC05 Online violence and harmful discourses

PP 0389 Incivility against female politicians on YouTube and X

Anke Stoll¹, Jingyuan Yu¹, Aliya Andrich¹, Emese Domahidi¹

¹ Ilmenau University of Technology, Computational Communication Science, Ilmenau, Germany

Incivility on social media platforms and news comment sections states a relevant issue in academic and political discourse. A great body of research has investigated incivility in online discussions from various angles, including its prevalence (Coe et al., 2014), perception (Chen & Pain, 2017), and effects (Ziegele et al., 2018). However, research suggests that different public actors are not equally targeted by online incivility. Southern and Harmer (2021) found that female Members of Parliament in the UK were more likely to receive at least one uncivil tweet than their male colleagues. A content analysis by Döring & Mohseni (2020) also found that in comparison to male YouTubers, female YouTubers received more hostile feedback. Yet, there is a lack of empirical studies that examines what kind of incivility certain target groups actually encounter. In this study we aim to examine what distinct forms of incivility female politicians on YouTube and X (formerly Twitter) receive.

To investigate this research question, we conducted a quantitative content analysis on user comments replying to German female politicians' tweets and YouTube videos. Our research covers the timespan between 2020 and 2021, during which political online discussions were boosted by several major events, such as the German federal election and the coronavirus pandemic. To measure incivility, we developed a coding scheme for different subcategories of incivility, including insults, vulgarity, sarcasm, stereotyping, discrimination, accusation of lying, threatening, and further disparagement (Risch et al., 2021; Wilms et al., 2021). Two trained coders labeled 3.808 comments at this point of analysis (Krippendorff's alpha between 0.66 for sarcasm and 0.85 for accusation of lying).

Our preliminary descriptive evaluation showed that 1.758 comments directed at female politicians contained some form of incivility (46.17 percent). The majority of these were insults ($n = 949$; 24.92 percent), containing both explicit (e.g., name-calling) and implicit forms of abusive language. The second most frequent type was disparagement (i.e., belittling or demeaning a person, $n = 683$; 17.94 percent), which included telling a person to leave the discussion or not to speak out. In total, 664 comments (17.4 percent) contained either stereotyping or discrimination, including sexism, misogyny, as well as both negative and positive stereotyping. Examples include inappropriate expressions of affection, complementing external features such as hairstyle, or expressing positive surprise that a female politician is making rational decisions.

Preliminary results of our analysis suggest that female politicians in Germany face a severe amount of uncivil comments on social media, including insults, disparagement, as well as discrimination and stereotyping. Examining the different forms of incivility that female politicians encounter has critical implications for mental health support, platform-specific strategies, and policy interventions. Insights from this research can inform platform regulations and promote tailored communication strategies for female politicians. During our conference presentation, we will provide a comprehensive evaluation of the final state of the content analysis and offer detailed insights into the analysis steps. Our aim is to discuss the possible limitations and further steps for analyzing incivility against female politicians on social media.

GSC05 Online violence and harmful discourses

PP 0390 Tropes of sexual violence and rape fantasies in far-right discourse

Tina Askanius¹, Maria Brock²

¹ Malmö University, School of Arts and Communication, Malmö, Sweden

² Södertörn University, Culture and Education, Stockholm, Sweden

Recent years have seen increased scholarly attention paid to the prevalence of rape in far-right discourse (Gotell and Dutton 2016; Jane 2017) not least in the context of Sweden (Horsti 2017; Törnberg and Törnberg 2016; Åkerlund 2022). None of these studies, however, have delved into the affective and visual dimensions of this recurring trope.

This paper examines prevalent tropes of sexual violence circulating in contemporary far-right discourse in Sweden. We draw on a data set of visual memes ($n = 120$) that have been collected over an extended period of time and in the context of several research projects on far-right extremism in Sweden and the online cultures and platforms that undergird this movement. They originate from a wide variety of actors and have been circulated in a range of different online spaces, across the spectrum of mainstream social media to fringe subcultural forums. The common denominator to the motley array of visual ephemera in the data set is that all depict scenes of sexual violence, most often including rape, in a cartoonish, humorous and transgressive manner.

By turning our attention to such visual materials, we respond to calls for further research on 'the role that exploitative sexual images – including child pornography, 'rape fantasy' iconography and other misogynistic images – play in far right and white supremacist extremist cultures' (Miller-Idriss 2020, p. 489).

We explore a series of discursive figures and anthropomorphised representations of Sweden identified across these memes. These include Captain Sweden – a proxy for Sweden as a "cucked" nation, The Swedish Soyboy as an emblem of a feminized, castrated and perverted state, The Rapefugee invoking the threat of the abject (Muslim) Other and finally Sweden Yes! a cluster of memes circulating internationally signaling resentment towards multiculturalism, progressive movements and liberal politics more generally.

Combining Political Discourse Analysis (PDA) with techniques from visual analysis of far-right movements, we ask: What do such fantasmatic figures of sexual violation accomplish in a discursive sense? What is the affective investment in imagining scenes of violation? What does the visual framing of these scenes as 'humorous' and absurd enable?

Based on the analysis, we argue that these tropes serve as important instantiations of contemporary far-right ideology, forming nodal points in the articulation of the pervasive narratives surrounding the country's perceived decline and crisis circulating on the far right. Furthermore, beyond the domestic context of Swedish far-right discourse, the gendered and sexualised Sweden-memes articulated around fantasies of perversion and abjection have evolved into emblems of Western moral degeneration, sexual decadence, and a loss of male power across liberal democracies more generally.

GSC06 Feminisms, diversity and underexplored invisibilities

PP 0496 Dialogical feminism and creative methods: Imagining a "common world" through filmmaking

Núria Araña¹, David Archibald²

¹ University Rovira i Virgili – ESQ9350003A, Communication Studies, Tarragona, Spain

² School of Art – Glasgow University, Film and Television Studies, Glasgow, United Kingdom

This paper focuses on the possibilities of feminist knowledge production through audiovisual means, by reflecting on the preliminary research findings of the artistic research project "Filmmaking and the Academy in Times of (Dis)order: Deep Listening | Dialogue | Diffraction." This research aims to reflect on the possibilities offered by low-budget audiovisual technologies in developing alliances between the Academy, Art and Activism through building trans-local (Biemann, 2002) solidarities with feminist filmmakers across four distant cities: Havana and Matanzas (both in Cuba), Vilanova i la Geltrú (Catalonia), and Glasgow (Scotland). These four cities have been selected because they are historically related, conveying different historical processes and deep colonial wounds. Havana and Glasgow, and Vilanova and Matanzas, are twinned cities; yet these official twinings have privileged restricted actors ("white men in suits") while marginalizing other voices (black, poor, women, and LGBTQIA+ voices). By bringing together grassroots feminist activists, filmmakers, and academics from the Global South and the Global North, the project seeks to subvert reified binaries and borders (disciplinary, geographical, conceptual) through creative forms of knowledge production that surpass the limitations of the logocentric (mostly written) and ethnocentric academy.

In this work, we utilise filmmaking as a "dialogical device", one which is capable of opening cracks against hegemonic and colonial representations of "others", allowing feminist filmmakers, activists, and academics moments of sharing time and experiences through the screen, reaching towards a "radical empathy" (Spivak, 2012). Our diffractive, dialogical methodology conjoins the thinking of Bakhtin in *The Dialogic Imagination* (1940/1981) and Barad in *Meeting the Universe Halfway* (2007). Whereas Bakhtin's work stresses the importance of the dialogical as an open-ended, continuous movement, in which meaning is always already determined by context, and in an ongoing "chain of dialogues", Barad's work on diffraction involves the study of objects or subjects through analysis of how they intra-act rather than inter-act.

In our presentation, academics and activists turned filmmakers will screen segments of the audiovisual material shot within the project to reflect on the ongoing dialogues of the participants through their intra-actions with feminists from other parts of the world, highlighting the necessity of decentering the Western/Ethnocentric notion of Feminism which has overlooked Latin American and Caribbean feminism, as well as its minoritization in the Anglosaxon industry of Academic production (Curiel, 2007).

By listening to these women's voices, we theorise the multiple and contradictory roles that Cuban feminism has taken after the Revolution, when at least formally equal rights were passed for women (González Ortuño, 2019), even if patriarchal attitudes are still pervasive and feminist collectives are striving through the creation of new organisations such as the "Asamblea Feminista" (Maidana, Saldone & Soza Rossi, 2022) or "Articulación Afrofeminista" (Alina en OnCubaNews, 2022) to build a critical and complex perspective of a "common world" (Garcés, 2022).

Our aim in the paper, then, is to pose fundamental questions about the liberatory capacities, or otherwise, of audio-visual technologies. In the struggle to build a common world, we want to explore what cinema, and intersectional feminist lenses, can do.

GSC06 Feminisms, diversity and underexplored invisibilities

PP 0497 Television diversity? How to study intersectional representations in TV narratives

Tonny Krijnen¹

¹ Erasmus University Rotterdam, Media & Communication/M18-40, Rotterdam, Netherlands

The recent GLAAD report (2024) shows that in 2022–2023 the percentage of LGBTQ characters appearing in American scripted series was 10.6 percent, a drop with 1.3 percent. Contradictorily, current public debates critique the 'wokewashing' of TV. From the *Little Mermaid* to *Star Trek: Strange New Worlds*, fans and non-fans have raised questions about the casting and storylines that are 'so diverse they are distracting'. Simultaneously, some TV series, such as *Sex Education* or *Sense8* are lauded for their progressive, diverse representations. Yet, what diversity means, and how diverse the representations actually are, remains unclear as critiques in public debates are mostly based on viewers' experiences, intuitions and ideas.

Academically, researching televised representations is a longstanding tradition which has shown that studying representations is a complex affair. The complexity is manifold, yet three (intertwined) dimensions stand out. First, TV presents us with both visual and textual narratives that amplify, undermine, strengthen, contradict or supplement each other. Second, representations in one TV series are easily contradicted by the representations in another. This makes the meanings produced and identities articulated on a social level hard to grasp. Third, representations should be viewed from an intersectional perspective. However, taking multiple axis of power into account in an empirical unraveling of representation is extremely challenging (Hermes & Kopitz, 2021).

In this study, the focus lies on how to grapple with intersectionality. The question raised is 'How do the textual and the visual narratives in popular TV mutually inform each other and how does this contribute to an intersectional understanding of diverse representations?'. *Sex Education* is taken as a case study, as the series is lauded for its successful diverse representations. A mixed method design is used to analyse the series' first season. The textual storylines of the main protagonists (Otis, Maeve, Eric, Adam, Lily, Ola, and Aimee) are charted throughout the season with special attention for kernel events (Chatman, 1978) in terms of diverse representation of gender, sexuality, class, and race. For these kernel events, a semiotic analysis of the accompanying visual narrative is performed, after which the textual and the visual are synthesized in order to unravel what is meant by 'diverse representations' and how these can be understood from an intersectional perspective.

The results point towards 'surface diversity'. The visual narrative is employed to obscure the less diverse textual narrative. The junction of the textual and the visual narrative reiterates common narrative formulas and tropes, rather than to refresh or revolutionize them. Yet, the results do suggest that this set-up is a useful approach to understanding representation within an intersectional perspective.

GSC06 Feminisms, diversity and underexplored invisibilities

PP 0498 'You cannot expect such validation in real life': Midlife women's use of the AI companion chatbot Replika for romantic fantasy and emotional regulation

Iliana Depounti¹, Paula Saukko²

¹ Loughborough University, Communication and Media, Loughborough, United Kingdom

² Loughborough University, Criminology- Sociology and Social Policy, Loughborough, United Kingdom

There is long-standing research on women's use of media for romantic/erotic fantasy, including novelettes (Radway, 1984), soap operas (Ang, 1982), porn/erotica (Bellas & McAllister, 2023) and boyfriend simulations (Lee, 2022). This presentation explores the similarities and differences between earlier forms of media romancing and the use of an AI companion chatbot. Emerging research on AI agents and chatbots uses frameworks that assign novelty to human-machine communications. In this study, we focus on the user experience – we conducted qualitative, in-depth interviews with twenty mostly midlife female users of the Replika chatbot, whom we recruited online. Thematic analysis identified that the women used the bot, first, for fantasies of a companion they were lacking in real life, such as an attentive lover, friend or child, in the context of feeling alone (due to e.g. living alone, caring for partner or children, inattentive husband or having a chronic condition). Second, the bot was reflexively used for caring for or managing the self, such as validating one's worth and emotions to neutralize negative thinking, following the therapeutic ethos (Illouz, 2008, Gravel-Patry, 2023). The fantasies of an attentive partner were similar to previous work on romancing, although the women's life situations were more diverse than often investigated.

The rather utilitarian use of the bot for regulating emotions, however, was new and signifies the spirit of our time emphasizing self-management and positive thinking. The presentation explores how women use Replika as a paradoxical AI self-care tool that both conforms and circumvents gendered ideas of self-help narratives (Orgad & Gill, 2021). The romantic fantasy and regulation of emotions were both encouraged by the AI bot's algorithms; however, the women actively shaped their experience by assigning to their bots diverse roles and relationships that fulfilled their unique needs. The combination of hedonistic fantasy and utilitarian self-management indicates shifts in popular media consumption. The women's use of these functions tells us both about an imaginary solution to their problems and their resourcefulness in the context of diminishing levels of informal and formal support. The study contextualizes human-machine communication by discussing the individual experiences of female Replika users to understand better both change and continuity in our communication with media, from romance novels to AI chatbots.

PP 0499 Rediscovering women in communication research: An archival and hermeneutic analysis of Herta Herzog (1910–2010)

Leonarda García-Jiménez¹, Esperanza Herrero¹

¹ Universidad de Murcia, Communication, Murcia, Spain

Women were a constituting force in the foundation of communication research during the first half of the 20th century. So much so, that the field would not be what it is today without the feminine voices that helped shape research on communication, media, and audiences. The Bureau of Applied Social Research at Columbia University was the epicenter of female researchers in communication, as it bridged the emigration of many European female intellectuals to America – like Herta Herzog – and it facilitated the formation and incorporation of many other women researchers to the first analyses about media and audiences.

However, most of these women's names have been either lost or deliberately erased from a field's historiography that was soon shaped by the "founding fathers' myth." This simplistic narrative undermines our understanding of the field's complex origins, while consolidating a very masculinized view of a field that, contrary to our common belief, has always been largely inhabited by women researchers.

In order to recover historical female figures in the history of communication research, we implemented a methodology articulated on an archival and hermeneutic analysis. Specifically, we focus on the figure of Herta Herzog (1910–2010), an Austrian researcher who emigrated to the USA and worked at the Bureau from 1937 to 1943, where she published the first proposal of the theory of uses and gratifications in her article "On borrowed experience" (OBE) (1941). To reconstruct her figure, we studied six gray literature archival manuscripts related to Herta Herzog's article "On borrowed experience" (OBE). The manuscripts, dating from the late 1930s and early 1940s, are preserved in the archives of Columbia University. Through a critical-hermeneutic analysis of these archival materials we (1) explore the intellectual and creative process behind Herta Herzog's work; (2) hermeneutically analyze the critical and psychoanalytic components of OBE; (3) help to complexify the foundational narratives in the historiography of our field by bridging the gap between critical and administrative perspectives.

In conclusion, this approach allows us to readdress our historiography, by focusing on the prolific collaborative networks that helped shape early communication research. Definitely, including women in the stories we tell about communication research is not only beneficial for the history of women, but, furthermore, it is also a means for constructing a more complex, more trustworthy, and eclectic history of our field.

PP 0500 Postfeminist learning: How affect plays a role in the understanding of representations of sexuality in postfeminist television series

[Sofie Van Bauwel](#)¹

¹ UGhent, Communication sciences, Ghent, Belgium

This paper explores the notion of affect and affect theory (Jaggar, 1989; De Sousa, 2011; Ahmed, 2004; Sedgwick, 2003) in relation to the learnings out of popular media texts, in particular the understanding of representations of sexualities in postfeminist television series, like for example *Sex and The City*, *Girls*, *Fleabag*, *Insecure* and *And Just Like That*. In recent years, the landscape of television entertainment has witnessed a proliferation of narratives and characters that reflect postfeminist ideals, thereby offering viewers a lens through which to examine shifting paradigms of gender and sexualities. Drawing upon interdisciplinary scholarship in gender studies, media studies, and affect theory, this study embarks on an study of the emotional and visceral responses evoked by these representations, ultimately aiming to uncover the nuanced ways in which affect shapes and informs the audience's understanding of postfeminist representations on sexualities. Central is the recognition that postfeminism has engendered a complex terrain for the negotiation of sexual identities and desires. Within this contemporary mediated representations of postfeminisms in popular culture affective experiences emerge as crucial conduits through which viewers engage with, interpret, and critique the portrayals of sexualities and its intersections. Furthermore, it examines the extent to which affective responses may reinforce or challenge prevailing postfeminist narratives, shedding light on the potential consequences for viewers' personal beliefs and cultural attitudes. This study wants to contribute to ongoing dialogues surrounding the intersections of feminism, media, and affect theory. By delving into the affective dimensions of postfeminist learning, it provides a deeper understanding of the ways in which emotional responses mediate the interpretation of sexual representations in contemporary television. Ultimately, this paper aims to foster critical discussions within academia encouraging a nuanced and reflexive engagement with the evolving terrain of postfeminist media culture and its implications for the learnings of gender and sexuality through media.

During the presentation, I will give an overview of my PhD research on the challenges and opportunities for inclusive journalistic coverage of LGBTI topics. The thesis focuses on the Dutch-speaking part of Belgium, where most legal rights for LGBTI people have been obtained and where overt homophobia is not common in news media. The research is made up of four studies that investigate the news coverage through (a) a quantitative content analysis and a framing analysis of 1.570 articles published in 2021, (b) a critical discourse analysis of articles published after a presumed homophobic murder in 2021, (c) a thematic analysis of anti-LGBTI user comments on PAL NWS, a far-right alternative news medium, and (d) interviews with journalists about the production of LGBTI-related news stories. Theoretically, this research engages with concepts such as representation, the politics of voice (Couldry, 2010) and valuable journalism (Costera Meijer, 2022).

The findings show that the mainstream news coverage is generally inclusive, and that journalists aim to increase LGBTI acceptance, yet there is ample room for improvement. The qualitative studies showed that the Flemish often (re)produces homonationalist narratives and that it is susceptible to moral panics such as 'woke ideology'. These moral panics are pushed and magnified by far-right alternative news media, which function as a potential breeding ground for LGBTI-phobic ideas. The quantitative research shows that gay men remain the dominant voice for the broader LGBTI community. Journalists indicate more pitfalls for inclusive coverage as they are unsure which terminology to use or how to deal with deliberate LGBTI-phobic provocations from the far right. However, they also share many good practices such as the inclusion of LGBTI experiences in news stories unrelated to LGBTI topics, ties with LGBTI organisations, and newsroom guidelines for LGBTI-related terms.

PP 0502 20,000 Species of Bees: Commercial cinema as a tool for educating an LGBTQIA+ gaze

Cilia Willem¹, Iolanda Tortajada¹, Lucas Platero²

¹ Universitat Rovira i Virgili, Dept. of Communication Studies, Tarragona, Spain

² Universidad Rey Juan Carlos, Department of Psychology, Madrid, Spain

Trans children have been notoriously absent in many academic disciplines studying children and youth, including communication and media studies, thus excluding and ignoring the experiences of trans boys and girls (de Jesús 2016; Monaghan 2016). Additionally, in portrayals of trans children the pathological perspective often prevails, presenting transgenderism as a disorder or stating that there is no such thing as a trans child and, if there was, this is a result of "social contagion" (Missé 2018; Parra 2021).

While recent research has shown that children and youth are perfectly capable of expressing their own gender (Platero et al. 2022), in fiction and cinema transness in children is often problematized, imposing an adultist view on children's experiences. In fact, most of the commercial cinema and popular culture products focussing on trans children has been produced by adults and for adults (Richardson & Smith, 2023).

In this paper we focus on the potential of the movie *20,000 Species of Bees* (Urresola, 2023) as a tool for educating the LGBTQIA+ gaze from a queer epistemology perspective (Trujillo, 2022). The film portrays a family where both daughter and mother undergo an important identity crisis: the child as a transgender girl who experiences an awakening process while lacking support; the mother as an artist who gave up her career to take care of her three children and wants to get her life back as a sculpturer. Both pose important challenges to gender and sexual norms in which the traditional society is rooted: the child's dad denies her identity as a girl, and the mother's deceased father was a famous artist who never believed in her career or talent. Under their fathers' shadows, both mother and daughter struggle to find a way to pursue their path towards finding their own identity.

After analysing the themes and narrative resources used in *20,000 Species of Bees*, we argue that the film breaks with the conventional structure of mediated trans* identities as problematic, and allows for a new perspective on trans children and youth through the pedagogical use of media, particularly commercial cinema.

This presentation focuses on Uganda, a country infamous for its state-sanctioned homophobia. This international attention, including funding, has contributed to a steady increase of LGBT+ organizations in the country. Research on the Ugandan LGBT+ community has focused on the historical roots of discrimination, contemporary triggers, and legal analysis of anti-homosexuality bills, as well as studies of the role of traditional media in enabling and sustaining state-sanctioned homophobia. The agency of the LGBT+ community itself is a neglected area. Therefore, zoom in on LGBT+ activist organizations themselves and their use of more self-controlled social media platforms on which they are freer to self-represent and voice their concerns. In particular, we are interested in their connections with each other, given the growing number of organizations. Our aim is to understand the organization ecology by studying what activists and organizations are more central and more peripheral in the Ugandan LGBT+ Twittersphere. We focus on Twitter because it is the community's preferred social media platform. By mapping with whom Ugandan LGBT+ organizations relate, we can understand who/what is deemed important/ listened to/ poke-worthy, how they negotiate themselves in relation to the larger LGBT+ community and how they understand the LGBT+ struggle in Uganda.

Following an analytical framework around rationalities of mediated participation, we have studied with whom Ugandan LGBT+ organizations relate through first mapping retweets and @mentions. The network maps reveal a dividing line between more well-funded and internationally connected organizations and younger, more peripheral organizations. Complementing these maps with qualitative data (reading of Twitter feeds and interviews), we conclude that access to funds and negotiating visibility are rationales behind the network structure. The findings reveals an interesting use of Twitter, both as an instrument for advocacy work and as a means for organizations to express and negotiate themselves as either part of a larger international LGBT+ community, or to be seen and negotiate a place in an expanding Ugandan LGBT+ organization ecology. The network maps provide insight into what accounts are central and reveal a dividing line between more well-funded and internationally connected organizations and younger, more peripheral ones. Hence, the affordance of the platform differs. For centrally

located organizations, they used Twitter to link and relate to a global community, to funders, and to advocate for LGBT+ rights by alerting international allies and domestic power brokers. Newer and more peripheral organizations used Twitter to make themselves locally visible to more centrally located, well-connected and well-funded ones. Furthermore, Twitter is also used to boost and mobilize the community through positive news, reports, and issues of the day.

GSC07 LGBTQI+ representations: Challenges, opportunities and acceptance

PP 0504 Celebrification of transgender sportswomen through critical media coverage: First step towards public acceptance in Visegrád Group countries

[Kateřina Turková](#)¹, Alice Němcová Tejkalová¹, Anna Hrbáčková¹, Miroslav Langer¹, Veronika Macková¹

¹ Faculty of Social Sciences- Charles University, Institute of Communication and Journalism, Praha 1, Czech Republic

This study presents how the media personalization of successful transgender sportswomen in Visegrád Group (V4) countries contributes to building their celebrity status, no matter the tonality of coverage. As previous research uncovered, transgender athletes can become celebrities, and their adversity can even elevate their celebrity status (Thorpe et al., 2023; Williams, 2022). Nonetheless, the discussion in the public sphere is polarized and, in some cases, leads to the negative perception of transgender athletes, especially those succeeding in the female category; hence, the media play an essential role in their acceptance or rejection (Love, 2019). Still, the media presentation of athletes' stories brings them to the spotlight and contributes to increasing acquaintance, which has already been demonstrated by the gradual acceptance of female or LGB athletes (Knott-Fayle et al., 2023; Messner, 2010).

By adopting the qualitative framing method, this research examines how transgender sportswomen have been covered by online versions of the most read sports media in V4, composed of Czechia, Hungary, Poland, and Slovakia, in 2023. The aforementioned countries have been selected due to the previously documented illiberal backlash in those post-communist countries that, amongst others, broadly touch the implementation of LGBTQI+ rights (Guasti & Bustikova, 2023).

The results show that the "fairness versus inclusion" debate is the key topic of V4 sports media, which partially confirmed the findings of research aimed at Western media (e.g., Love, 2019). Conversely, media intention was evident, while "fairness" was prevalently stressed over "inclusion". The analyzed outlets commonly presented the topic through human-interest stories of individual cases or opinion interviews while mentioning and referring to the potentially "unfairly winning" individuals such as swimmer Lia Thomas or cyclist Austin Killips. We argue that this celebrification and identity construction of transgender sportswomen through media, even though prevalently negative, may paradoxically lead towards the more complex perception of transgender participation in sports while following the recorded path towards acceptance of female and LGB athletes in the past.

GSC07 LGBTQI+ representations: Challenges, opportunities and acceptance

PP 0505 Understanding chilling effects in digital spaces– A study of Ugandan LGBT+ advocacy in the wake of the draconian 2023 Anti-homosexuality Act

[Cecilia Strand](#)¹

¹ Uppsala University, Informatics and Media, Uppsala, Sweden

In May 2023, the Ugandan government passed one of the world's harshest Anti-homosexuality Act 2023 (AHA 2023). The vagueness of the offenses, combined with the severe punishment if convicted[1], creates a high level of uncertainty amongst activists, which is likely to have a chilling effect on activism, similar to that reported during the attempts to pass the predecessor- the 2009 Anti-Homosexuality Bill. A chilling effect exists when an entity, individual or legal entity, is deterred by fear of legal punishment, or other negative consequence and "engages in

self-censorship, that is, censors themselves and does not speak or engage in some activity" (Penny 2023: 1454). Against the backdrop of the AHA 2023, which directly targets LGBT+ activist and their rights advocacy; this paper seeks to explore if the AHA 2023, had a chilling effect on Ugandan LGBT+ activism in their key online social platform (OSP), Twitter. By comparing Twitter data sets from 2002 and 2023, as well as analyzing a post-AHA corpus consisting of 611 tweets qualitatively, the AHA 2023 appears to have produced a chilling effect on the content level, but not on the activity level. That is, the AHA 2023 did not stop Ugandan LGBT+ actors' digital activism but appears to have impacted the content in some critical ways. After the passing of the AHA, Ugandan LGBT+ activists' self-penned demands for equal human rights, practically seized. Rights demands did however not disappear from the Uganda LGBT+ Twittersphere but were primarily promoted and kept alive by international development as well as Western bilateral partners as well as human rights allies. The long-term impact of the discursive shift in Ugandan LGBT+ activism is still unfolding, and it is arguably too early to definitely identify the impact of the aforementioned troublesome chilling effects on content. The Ugandan case can however serve as a critical case study for understanding the chilling effects of introducing draconian legal tools to silence certain types of human rights advocacy. Given the indication of chilling effects on the content level, and with several countries being in the process of exploring similar bills, more research is urgently needed to deepen our understanding of the chilling effects of legal reforms copying the Ugandan AHA. Furthermore, this study also highlighted the need for more research on the methodological aspects of capturing the scope, ephemeral nature, facets, and duration of chilling effects.

[1] The penalty for individuals found guilty of the offense of promoting and abetting homosexuality is liable to imprisonment for a period not exceeding twenty years. Legal entities, which includes LGBT+ organizations found guilty, risks prohibitive fines and their license to operate. The Ugandan NGO bureau's arbitrary closure of the largest LGBTQ+ rights organizations, SMUG in August of 2022, on flimsy grounds makes the threat of closure highly credible.

GSC08 Digital discourses and femininities: Influencers, vloggers and identities

PP 0613 **Becoming digital housewife: Chinese breastfeeding mothers' discourse construction of digital motherhood on Xiaohongshu**

Bolin Zheng¹, Li Cheng¹, Zexuan Zhao¹

¹ Renmin University of China, Department of Communication, Beijing, China

Literature review

Digital motherhood and social media empowerment

Though somewhat divergent, current studies have dealt much with the empowerment of social media in the digital practice of breastfeeding mothers. The construction of digital motherhood is always affected or shaped in some way by external and institutional discourses.

Motherhood discourse and digital housewife

Current studies concerning digital labor in China, tend to regard users as weaklings who are either willing to be exploited or pretend to resist, but fail in elaborating the complicated relationship between exploitation and agency. To this end, we introduce digital housewife to conceptualize breastfeeding mothers' digital practice, which is a form of both affective and material labor embedded in a continuous game between agency and exploitation. Therefore, three questions guided our analysis:

RQ1: What typical motherhood discourse have breastfeeding mothers constructed on social media?

RQ2: How do other dominant discourse such as consumerism discourse on social media intervenes in the construction of motherhood discourse?

RQ3: Whether social media empower\pseudo-empower breastfeeding mothers?

Methodology

Data Collection

First, we restricted our search to May through June 2023, and we used "母乳喂养" or "哺乳" or "母乳" or "奶粉" as keywords and searched by relevance. After removing low-quality and duplicate samples, we finally selected 325 blogs for analysis.

Reflexive thematic analysis

For RQ1, we use qualitative reflexive thematic analysis to explore what kind of individual motherhood discourses are constructed. Specifically, all three members of this study first analyze data independently and then come together to discuss coding and theme development. Each researcher first coded a portion of the collected data independently, and then three researchers discussed the results until our findings could account for all samples.

Discourse analysis following RDT

Relational dialectics theory (RDT) emphasizes that meaning-making is a process that derives from the interplay or power struggle between centripetal and centrifugal discourses. For RQ2&3, this study uses discourse analysis to explore how the competition between discourses influences the meaning-making of motherhood.

Conclusion and discussion

We mainly identified five hybrid motherhood discourses, in which we found that some of the originally dominant discourses completed the incorporation of individualized motherhood discourses through partial compromises, such as the consumerism discourse and the medical discourse. Specifically, the consumerism discourse transformed breastfeeding mothers' personal emotional experience into a practical input-output process centering on economic rationality. Their personal breastfeeding experience also becomes a commodity that can be explicitly priced. Breastfeeding mothers usually consider their purchases and use of the platform to make money as a crucial approach to show their subjectivity and female value, so most of them are willing to take some radical risks, such as posting photos or videos that are suspected of being pornographic, inserting commercialized advertisements nimbly into posts sharing their breastfeeding experience, or advocating for content that contradicts women's physiological common sense even if this triggers a flood of offensive comments.

GSC08 Digital discourses and femininities: Influencers, vloggers and identities

PP 0614 Influencing as everyday feminism: Vlogging discourses of a Chinese rural migrant influencer

Yu Sun¹, Altman Yuzhu Peng²

¹ University of Glasgow, School of Social and Political Sciences, Glasgow, United Kingdom

² University of Warwick, Applied Linguistics, Coventry, United Kingdom

Amid Xi Jinping tightening grip on power, the momentum of China's feminist movements has suffered a downfall in recent years. This does not suggest that feminists and women have given up their struggles. Instead, they have ingeniously employed various creative means to engage gender politics within the limited degree of freedom permitted within the repressive party-state. Yet, much of existing literature has largely focused on feminist claims voiced out by such institutions or elite groups as non-governmental organisations and well-educated middle-classes, with limited attention being paid to marginalised women's suffering of and resistance to such gender injustices.

In the Chinese context, feminist struggles often take the shape of discursive activism within the everyday digital sphere, considering the limited space for street protests or alternative patterns of civic engagement under the party-state rule. This is also the case for marginalised women, who possess limited resources to negotiate their agendas with the sociopolitical establishment, rendering it one of the few channels that remains available to them. In this study, we use Huiling Wang (*Lingling*, *Peter and Four Cats* as her nickname), a Chinese vlogger and social media influencer, who self-identifies as a rural-urban migrant, as a case study of discursive activism to shed light on how feminist dissent from the marginalised, female rural migrants plays out across popular platforms.

Applying a multimodal critical discourse analysis, this research analyses the tactics of resistance adopted in the videos Lingling produces and distributes on a Chinese social media platform Weibo. By examining the discourses and the underlying ideologies articulated in those visual expressions, our analysis reveals that such discursive resistance entails three interlocked dimensions, characterised by its discursive and affective features, and the role that it fulfils in forming new ethical subjects. At a discursive level, Lingling projects her voices by appropriating argumentation strategies to challenge entrenched patriarchal gender norms in China, marking the feminist potential of her practices. At an affective level, the feminist voices are projected through colloquial or sometimes even vulgar languages to prime followers' affective responses, amplifying their spreadability in the digital sphere. Together with visual representation of the self as a woman from the margin, the affective-discursive practice feeds into her rationalisation of feminist arguments, which is typically accomplished by articulating her personalised observations and experiences that do not always appear in mainstream debates. Albeit with limits, this underscores an emphasis on the subjective change of female rural migrants as a marginalised group, making her discursive resistance distinctive within the broader spectrum of grassroots feminist activism, where the actual experiences and voices from the margin are consistently underrepresented. In this way, Lingling turns herself into a key node within the networks of marginalised women amongst whom she represents on Chinese social media platforms. The outcomes of the research make a meaningful extension to existing Chinese platform studies by offering a glimpse of feminist voices and practices from marginalised women.

GSC08 Digital discourses and femininities: Influencers, vloggers and identities

PP 0615 Women-life-freedom and Iranian celebrities: A study on hate speech on Instagram

Marzieh Ghavidel Darestani¹, Sven Jöckel¹

¹ Erfurt University, Philosophy Faculty, Erfurt, Germany

The mysterious death of a 22-year-old girl in Iran during custody by the morality police caused a women's movement with the slogan of Women-Life-Freedom. The movement became widespread with the help of social media such as Instagram and Twitter. #Mahsa_Amini became viral for days on social media platforms, and several celebrities in Iran used their power to raise awareness. Iranian celebrities who follow Islamic norms and codes by government's force in their profession and even in their private lives have broken their silence and become one with people in the street.

This movement revealed the neo-patriarchal ideology in the heart of Iranian society as many of the movement's supporter celebrities were criticized and threatened by the government and the wider society for their support. This subtle point became the keystone of this research. We aim to show the different types of hate speech toward Iranian celebrities who are supporters of the Women's Life Freedom movement on social media inside and outside the country.

Hate speech and civil society in Iran

Hate speech and online harassment on social networking, especially Instagram is a crucial subject as, across the world, this harassment mainly targets females. The case of Iran showed that the patriarchal belief of the society opened its way to modern life and individuals, specifically, females were not only targeted and threatened by the state authorities but also by anonymous people on online platforms. During the Women-Life-Freedom movement, Iranian celebrities directly targeted the state belief frame by sharing critical chain posts on Instagram about the mysterious death of Mahsa Amini. The National Security Police arrested several of them under the pretext of disturbance of the public mind and several celebrities left the country during the movement. Their action toward this social movement has paradoxical reactions as gaining more respect and positive feedback or receiving messages containing hate speech and harassment.

Research Goals

This research aims to explore the most common forms of hate speech and threats toward Iranian celebrities. It is crucial to reveal how supporters have been threatened by hate speech in the time of this movement from women for women. Research mostly focuses on Twitter rather than Instagram; however, celebrities started their support on Instagram as a first stronghold. Furthermore, the lack of research regarding online harassment and hate speech in Iran kept us to conduct novel research. This is novel research that focuses on celebrities' posts on Instagram during the women's movement and obtains the comparative attitude toward hate speech toward male and female celebrities inside and outside Iran.

Methodology and State of Research

To explore the various forms of harassment directed towards supporters of the Woman-Life-Freedom movement, we employ a qualitative content analysis. Our focus is on eight Iranian celebrities who have actively supported the movement both within and outside of Iran, evenly split according to gender. We classify hate speech into four categories (personal life, professional position, social-cultural concerns, religious attitudes, and sexist, and misogynic comments). Research is ongoing as of now.

GSC08 Digital discourses and femininities: Influencers, vloggers and identities

PP 0616 Femininity, fashion and performative identity on Instagram: Confirming or breaking stereotypes?

Raquel Dalmau¹, Cilia Willem¹

¹ Universitat Rovira i Virgili, Communication, Tarragona, Spain

In this paper we present the analysis of 88 Instagram posts of eleven of the most popular fashion influencers among 4th-grade girls from Barcelona, published along 2021. The main objective of the research is to examine if these fashion instagrammers represent new prototypes of femininity that deconstruct existing models, or rather if they perpetuate the same sexist stereotypes that fashion and beauty advertising has traditionally transmitted. To do this, we refer to Erwin Goffman's theory on performative identity (1959) and hyperritualization of femininity (1979), to Paloma Diaz Soloaga regarding feminine stereotypes in fashion, make up and perfume advertisements (2007, 2010 and 2018) and by Rosalind Gill on post-feminism (2003, 2007 and 2016), among other authors. Being it the first time that these authors have been combined in the same research, it connects disciplines as different as gender studies, fashion, advertising and sociology.

The selection of influencers for the sample was the results of a discussion group with 4th-graders (16-year-old girls) in Barcelona. The results of the analysis of 88 posts show that the physical features of the women portrayed are

quite normative: the seductive woman is alive and kicking, as are some post-feminist features such as femininity as a body capital, a trend toward self-sexualization, as well as Goffman's ritualization of subordination or feminine touch. In terms of gender and sexual identity, there is very little diversity. In conclusion, Instagram does not seem to promote new prototypes of femininity. In fact, beyond the woman as an object of desire, two apparently antagonistic stereotypes seem to coexist: that of the modern transgressive woman and that of the family woman, wife and mother (tradwife). From here, several questions arise: what do these two stereotypes say about our society? Is Instagram reflecting the variety of femininities that exist today? How do the analyzed publications influence teenagers, in Barcelona and beyond?

GSC08 Digital discourses and femininities: Influencers, vloggers and identities

PP 0617 False empowerment: a study of short video platform empowering rural, left-behind women in China

[Le Cao¹](#)

¹ Leuphana Universität Lüneburg, Institute for the Culture and Aesthetics of Digital Media, Lüneburg, Germany

The short video platform as an empowering tool has contributed significantly to the social visibility of rural, left-behind women in China, shifting them from being "invisible women" to a certain extent in reality to "visible women" in the virtual landscape. Based on the theoretical background (Dayan, 2013; Foucault, 2005; Lacan, 1981; Mulvey, 2013; Sartre, 2007) and practical strategy (Adams, 2017; Chang, et al., 2018; Thompson, 1995) of visibility, an attempt is made to decompose visibility into three dimensions, visible initiative, subjectivity and sociality, which constitute the core elements of individual self-presentation. These three come down in one continuous line as the "power" of empowerment (personal power, social power, political power), which are important elements in the construction of individual power. These not only focus on the empowering actions of individual initiative but also alert them about the risk of de-empowerment due to loss of subjectivity.

For this reason, the study was carried out from the perspective of the "visibility-power" relationship, and 130 rural, left-behind female users on the Kuai platform, located in County D of Sichuan Province, were selected as the research objects. 130 user profiles were analyzed, 17 of them were interviewed and 3 were observed on the ground in their rural villages to assess the effectiveness of a short video platform as an empowerment tool for rural, left-behind women in China.

The study found that the empowerment of rural, left-behind women by the short video platform has the following consequences: their income is increasing, but it is precarious; they experience a sense of "centrality" that they have never had before, but it is grounded in the traditional gender order, and this experience is a virtual "centrality" and "marginality" in reality. The rural, left-behind women face an unequal situation between being accepted economically and excluded socially. To summarise, the empowerment of rural, left-behind women through the short video platform can be false or incomplete. The "online micro-society" constructed by them is mainly based on the purpose of subsistence, shaping themselves with the expectations of others in the digital world and reproducing the gender order and structure of the society in reality, which is featured by passivity of initiative, objectivity of subject, and invisibility of visible.

Keywords: rural left-behind women, Chinese short video platform, false empowerment

GSC09 LGBTQI+ representation: Discursive shifts and navigating visibilities

PP 0707 The Living-dead: Death as a Metaphor for the (de)humanisation of Trans Lives

[Limichi Okamoto](#)¹, Abel Guerra¹

¹ London School of Economics and Political Science, Media and Communications, London, United Kingdom

This paper discusses the proliferation of death as a metaphor in the lives and rights of trans people, and how it functions as a way of navigating, reinforcing and disrupting social order. Death, and its metaphoric manifestations in threat, loss, and grief, is often weaponized by anti-trans advocates to dehumanise, trivialise and demonise trans-gender identities and their corporeal experiences – from punchlines in standup comedy routines and television shows where one “identifies as” an animal or an inanimate object to the mediated mourning of the ‘loss’ of public figures who transition into a different gender. On a more intimate level, death and grieving are also incorporated as affective rituals, often taking place in digital spaces, by the families and partners of trans people – both to make sense, accept, and support their transition or to state their rejection, definitive loss, and subsequent exclusion (Miseo, 2022).

For trans people themselves, death becomes part of shared vernacular and identity. “Dead name” is commonly used to refer to one’s pre-transition name, while “deadnaming” itself comes to designate an act of transphobic violence. Death is also the unspoken pre-condition to the “rebirth” experience associated with social and medical gender reassignment procedures, and the grieving of a past-self may become an important coping mechanism to grapple with the sense of discontinuity between pre- and post-transition identities. In these cases, the death metaphor may be empowering while also providing a language and a voice for trans people to elaborate on their experiences with pain and joy.

This paper draws on gender theory, media and transgender studies, to trace how metaphors of death are mediated and positioned in relation to trans lives/rights, and the prescribed norms, values, and relations of a ‘gender-critical’ social order. At its core, this research is inspired by Judith Butler’s (2009) discussions of death and grief, alongside its mournful expression and representation, as inextricably linked to power relations, recognition (of particular worthy, ‘liveable’ lives), and processes of othering and (de)humanisation. We aim to build on recent literature that highlights the forms and consequences of anti-trans discourses and rhetorical strategies. For example, we ask how death and grievability figure in the pathologisation of transgender identity, dysphoria, and transition-related healthcare (Billard, 2023), and the politicised fearmongering of abjected trans womanhood as an impending and existential threat towards the grievable bodies of cisgender woman (Bassi and LaFleur, 2022). In conjunction with the actual, corporeal death of trans lives, such metaphoric narratives are also positioned in an ambivalent relationship with the imaginative possibilities of the death-metaphor (Stewart, 2017).

Implementing a textual analysis of media texts collected from various social media and streaming platforms (TikTok, X, Netflix), this research proposes a framework for an analysis of how metaphors of death lurk into trans lives. The framework is threefold: 1) Grievability and dehumanisation in mockery; 2) The exclusionary ‘aggrieved’ loss of the naturalised body; 3) Intimate experiences of death as a passage for trans people and their close ones.

GSC09 LGBTQI+ representation: Discursive shifts and navigating visibilities

PP 0708 Universal missions/particular demands: Operationalizing public service media responsibilities through LGBTQ+ representation

[Florian Vanlee](#)¹

¹ Ghent University, Communication Science, Ghent, Belgium

Throughout Western Europe, public service media (PSMs) have been at the forefront of mainstream queer media representation in past decades. From introducing openly gay and lesbian couples to prime-time fiction series in the 1990s (Kerrigan & Vanlee, 2022) or addressing sexual and gender difference in children’s TV (Van Wichelen & Dhoest, 2023) to barring ‘stereotypical’ LGBTQ+ portrayals (Daalmans & Ter Horst, 2017) and seizing on digital formats to create room for explicitly queer representations aimed at specific audience segments (Dhaenens et al., 2022): Western European PSMs have and continue to embrace sexual and gender diversity. This openness undoubtedly stems from the public mission PSMs are tasked with. ‘Reflecting and including the diversity of the community served’ is a key requirement in public service remits (Donders, 2021), and queer media scholarship often understands textual characteristics of LGBTQ+ portrayals as a function of these duties (e.g. Kerrigan & Vanlee, 2022; Franklin, 2014; Edwards, 2009).

This assumption makes obvious sense. If PSMs are formally expected to ensure diversity and inclusivity, including sexual and gender difference in the content they produce and program is evident, as is consciously avoiding homo- and transnegative representational practices (Vanlee, 2019). But apart from demanding diversity and inclusion in general, remits never specify ‘diverse representation’ or ‘inclusive production practices’ (Donders, 2021). Indeed, remits rarely explicate the LGBTQ+ community as a mandatory part of ‘diversity’, nor do they determine what

'inclusive' representations are. Nevertheless, thoughtful portrayals of sexual and gender minorities have become key considerations in Western European PSM programming (Van Wichelen & Dhoest, 2023; Kerrigan, 2020). So if the remit itself only formulates indeterminate demands, the question is how and why these eventually produce very specific representations of sexual and gender difference.

This paper analyzes how three Western European PSMs – the Dutch NPO, Ireland's RTÉ and the Flemish VRT – translate universal demands for diversity and inclusivity into particular LGBTQ+ representational strategies. Drawing on constructivist institutionalism (D'Arma, 2018) and queer media studies (O'Brien & Kerrigan, 2020), it studies policy documents (e.g. annual reports; performance reviews) and initiatives (e.g. diversity steering committees; outreach activities) from their present remit term to understand how PSMs construct portrayals of sexual and gender specifically as a key operationalization of their public mission. Doing so demonstrates how PSMs operate in a 'densely structured context' (Hay, 2002), compelling them to navigate various, often conflicting, demands on their role and programming – articulated by their remit, political or civil society actors and popular discourse more broadly. Visible and outspoken commitments to 'queer-positive' representational practices allow PSMs to strategically align with prominent developments in popular media criticism – increasingly critical of 'problematic' LGBTQ+ portrayals (Ng, 2021) – and consolidate the participation of LGBTQ+ civil society actors in PSM governance structures (Dhoest, 2015). This is not to say that PSMs are not genuinely committed to bettering their representational practices. But highlighting efforts in this particular area of 'diversity and inclusion' strategically accentuates their overall compliance with hegemonic constructions of PSMs' public mission.

GSC09 LGBTQI+ representation: Discursive shifts and navigating visibilities

PP 0709 Fifty years of reviewing films about homosexuality: Discursive shifts in moral and aesthetic evaluations in Belgian Catholic film periodical *Film and Television* (1956–2005)

Frederik Dhaenens¹, Mendel Missorten¹

¹ Ghent University, Communication Sciences, Gent, Belgium

Throughout the twentieth century, film periodicals played "an important role in [...] intermediating between the realm of cinema and the audience's everyday life" (Biltreyst and Van de Vijver, 2020). Besides offering audiences aesthetic evaluations of films, they conveyed to audiences what the films were about and whether or not audiences should go and see the films (Anderson & Grether, 2017). Such symbolic power cannot be underestimated when reviewers discussed films about societal themes deemed morally contested at the time, such as homosexuality. Even though academic and public discourses on homosexuality in Western societies gradually shifted from the 1950s on, the sociocultural and political-legal recognition of LGBTQ people has been a slow, uneven, and difficult process (Beger, 2004; Altman and Symons, 2016). This prompts the question how film magazines evaluated films about homosexuality and to what extent their discourses and evaluations changed throughout the twentieth century.

This paper turns to Belgian's leading Dutch-speaking film periodical *Film and Television* [*Film en Televisie*], launched in 1956 and published by Belgian's Catholic Film League (CFL). The CFL, established in 1932 and modelled after the American National League of Decency, was part of the Catholic Action movement instigated by the Vatican in the 1920s (Biltreyst, 2007; Schokkaert, 2009). The movement tried to control the production and consumption of cinema, since it found the medium of film a powerful distributor of norms and values (McGregor, 2013; Biltreyst, 2007). With *Film and Television*, the CFL had a monthly magazine in which it shared ratings and reviews that, to use the editor's words, "champion morally unblemished and artistically valuable film production" (Van Liempt, 1956, p. 2). In practice, this amounted to film reviews reflecting on the film's moral and artistic qualities. Importantly, up to 2006, each film was given a morally-pedagogic rating, indicating for which audience the film was considered suitable. Given that *Film and Television* was launched when American and European films increasingly represented homosexuality with less ambiguity (Barrios, 2003; Russo, 1987), and the Second Vatican Council (1962–1965) brought along a 'softening' of the Church's stance on homosexuality (Westerfelhaus, 1998), *Film and Television* serves as an apt subject to explore how film critics looked at homosexuality in film.

Concretely, we rely on a historical discourse analysis of film reviews spanning 50 years (1956–2005). The sample consists of reviews of 120 films that feature narratives about same-sex desires and/or homosexuality. We pose the following three questions: (a) Which discourses are used to talk about homosexuality? (b) Which moral and aesthetic evaluations are made of films with homosexuality? (c) To what extent do we discern shifts in the discourses on homosexuality as well as the moral and aesthetic evaluations throughout the magazine's history? We will interpret our data in relation to changes in the magazine's mission and the sociocultural and political-legal history of LGBTQ rights in Belgium.

GSC09 LGBTQI+ representation: Discursive shifts and navigating visibilities

PP 0710 Non-binary depiction in live-action, teen fiction: Close-reading analysis of non-binary characters from Netflix's series

Vitor Blanco-Fernández¹, Sikemi Akinmade¹, Maria T. Soto-Sanfiel²

¹ Universitat Pompeu Fabra, Communication, Barcelona, Spain

² National University of Singapore, Department of Communications and New Media, Singapore, Singapore

This paper delves into the depiction of non-binary identities in live-action, teen-oriented TV series. The inclusion of non-binary characters in mainstream streaming television has been on the rise, evidenced by GLAAD's (Gay & Lesbian Alliance Against Defamation) monitoring effort "Where We Are on TV Report," which quantifies and defines non-binary characters in US television (GLAAD, 2022; 2023). Embracing this trend in contemporary Queer Television (Joyrich, 2014), this study seeks to address the following research questions: RQ1) What attributes define the representation of non-binary youth characters tailored for mainstream audiences?: RQ2.1) Do these attributes propagate stereotypes across the analyzed series? If not, RQ2.2) how divergent are the portrayals of non-binary youth characters?

To answer these inquiries, the study conducts an analysis of four non-binary, young characters from Netflix series: Darren from *Heartbreak High* (Hannah Carroll Chapman, 2022-today), Cal from *Sex Education* (Laurie Nunn, 2019–2023), Yael from *Degrassi: Next Class* (Linda Schuyler, 2016–2017), and Syd from *One Day at a Time* (Gloria Calderon Kellett & Mike Royce, 2017–2020). These series originate from Western, English-speaking contexts, yet are produced and narratively situated in four different countries: Australia, United Kingdom, Canada, and the United States, respectively.

The analysis employs close reading techniques (Brummett, 2019). Close reading allows researchers to pay close attention through an attentive and repeated reading of cultural products, focusing on concrete pre-selected traits. LGBTQI+/Queer Media Studies (Griffin, 2018) frequently utilize close-reading methods to investigate queer characters (e. g., Masanet, Ventura & Ballesté, 2022). Here, the analysis includes six categories: 1) identity, 2) embodiment, 3) attitude, 4) context, 5) social interactions, and 6) character development, following Blanco-Fernández, Villegas-Simón, & Soto-Sanfiel's (forthcoming) framework for non-binary representation analysis, based on their research on *HIT*'s non-binary character: Dan.

Main results show how the series reinforce prior misconceptions regarding non-binary identities. These misconceptions include the framing of non-binary identities as a clash between "new vs. old worlds," frequent misgendering, or the tendency to portray non-binary characters as obligatory activists, among many others. The evaluation of these results allows for novelty interpretation of previous frameworks from Trans Media Studies (Spencer & Capuzza, 2015), including the "trans fact" (Masanet, Ventura & Ballesté, 2022), transnormativity (Johnson, 2016), and the "cis gaze" (Villegas-Simón, Sánchez-Soriano & Ventura, 2023). However, the analysis also identifies significant disparities among the non-binary portrayals in the series. For example: different "coming out" narratives, sexualities, subcultures, or referents, among others. These variations indicate a broader spectrum of depicted non-binary characters and storylines than previously hypothesized. To end with, the paper refines, expands, and exemplifies Blanco-Fernández, Villegas-Simón, & Soto-Sanfiel's (forthcoming) proposed model of non-binary representation analysis. Thereby, the paper consolidates a methodological tool for subsequent analysis, making a significant contribution to the increasing field of Non-binary Media Studies.

PP 0711 From activist/influencers to activist-influencers: LGBTQ+ TikTok creators' navigating online visibility

Hanna Szabo¹

¹ Free University Berlin, Institute for Media and Communication Studies, Berlin, Germany

Online platforms have become fertile grounds for the emergence of prominent figures and trends. As contexts collapse, the negotiation of identity and the assumption of public roles have undergone substantial transformations, giving rise to new challenges (Marwick & boyd, 2011). Social media visibility and discourse surrounding the LGBTQ+ community have surged, concurrently facing scrutiny and attacks from political actors and the public (Abidin & Cover, 2018). The heightened visibility of LGBTQ+ people and issues are tied to both online activism and the rise of popular queer personalities. Online activism, personalised and rooted in a logic of visibility, offers unprecedented opportunities for LGBTQ+ individuals to advocate for rights (Vivienne, 2016). In contrast, microcelebrity culture involves strategic self-presentation for economic gain, blurring the lines between personal and performative identities (Duffy et al., 2021).

This study explores the strategies employed by LGBTQ+ activists and influencers on TikTok as they navigate visibility within platform and political constraints. Using a qualitative content analysis, the study focuses on prominent Hungarian LGBTQ+ TikTok creators' content, complemented by semi-structured interviews with queer influencers.

Purpose sampling ensures a comprehensive understanding, with categories tailored to Hungary's anti-gender context (Political Capital, 2022). The intricate interplay between microcelebrity culture and LGBTQ+ activism is crucial for understanding digital society dynamics. Amid global anti-gender movements and escalating anti-LGBTQ+ sentiments, the study underscores the significance of highly visible LGBTQ+ individuals as advocates.

Findings highlight the evolving platform culture, breaking down traditional boundaries between influencers and activists. The research in Hungary provides insight into the strategies, resilience, and adaptability of LGBTQ+ online activists and influencers. Openly embracing their LGBTQ+ identity in the face of rising anti-gender sentiments, they navigate identity and platform challenges, while meeting diverse audience and commercial expectations. This study contributes to a deeper understanding of online LGBTQ+ advocacy, emphasising the need to view highly visible individuals simultaneously as activists and influencers, recognising the blended nature of their online identities. It underscores the fluidity of roles, showcasing how they negotiate visibility to meet both consumerist and political demands, enriching our understanding of contemporary LGBTQ+ advocacy in the digital era.

PP 0820 Digital Motherhood: How do Latin American immigrant mothers in Denmark use digital communication for care and connection

Victoria Andelsman Alvarez¹, Florencia Nebreda²

¹ University of Copenhagen, Department of Communication, Copenhagen, Denmark

² Roskilde University, Communications, Copenhagen, Denmark

Migrant mothers inhabit a crucial intersection. As migrants, their identities and experiences are shaped by the borders they cross, serving as constant arenas for intercultural dialogue and conflict. As mothers in a time where traditional references, norms and values are being reconfigured (Livingstone & Blum-Ross, 2020), their role is becoming ever more complex. In this context, digital communication plays an essential role in understanding the diasporic experience, mediating practices of meaning-making, social inclusion and exclusion, community support, and identity negotiation (Alinejad & Ponzanesi, 2020; Leurs & Ponzanesi, 2018).

Through an interview-based study, this paper reflects on the experiences of Latin American mothers in Denmark as they navigate and make sense of the cultural intersection they inhabit, acting upon it through communicative practices. Grounded in feminist care perspectives and relational and intercultural communication, the study provides insights into how this group of individuals experiences parenting, considering the role of digital communication and the unique contexts and representations of living and raising children within diverse cultural backgrounds. It is guided by two key questions: How do migrant Latin American mothers utilize digital communication to negotiate identities and relationships with their families, countries of origin and host contexts? Second, how do they employ digital communication to seek support and foster social networks in Denmark and their countries of origin?

Our communications perspective views everyday interactions as rituals that shape and sustain social relationships. As such, it is integral to care, as it helps identify and address needs, articulate caregiving, and foster connections essential for the sustenance of individuals and the broader community. However, these interactions involve a negotiation of migrant identities with prevailing meanings and practices in the host society. This cultural interplay undeniably affects care practices, (re)configuring mothers' expectations, needs, and parenting possibilities.

Denmark's highly digitalized, gender-equal and child-focused welfare context adds a distinctive dimension to the interweaving of migrant mother identities and practices. By incorporating gender as a category of analysis, we aim to critically situate the migrant-digital experience, wherein gendered norms continue to exert influence. This is especially compelling when exploring the normatively fraught terrain of motherhood. Building on previous research, the study anticipates mothers acting as primary 'digital parents,' which raises deeper inquiries about the reconfiguration or persistence of gender dynamics in the migration-digital nexus. The paper also contributes to discussions

on migrant integration, and social cohesion. It underscores digital communication's role in (transnational) intimacy, diaspora formation, and support mechanisms for Latin American mothers.

PN 122 Resisting, manifesting, claiming: Web-based interventions of (feminist) women's movements in Turkey

Asli Polatdemir¹

¹ University of Bremen, Educational Sciences, Bremen, Germany

Websites have evolved into indispensable digital mediums for digital feminist activism, particularly within (feminist) women's movements in Turkey, where online and offline spaces intertwine more and more. Women+ and LGBTI+ activists use the Internet as both a space and a tool for empowering feminist agencies, collective mobilization, and pursuing gender equality-based rights. The (feminist) women's movements in Turkey have established their own digital counter-public spheres through websites on the Internet, cultivating spaces for (self)representation, sharing experiences, producing, archiving, and transmitting feminist knowledge, and disseminating diverse feminist (counter)discourses. Over 100 websites have been thoughtfully selected to represent a wide range of organizations and collectives that are dedicated to feminist-oriented agendas. These websites address a multitude of women's and gender issues, including gender equality, violence against women and LGBTI+ individuals, feminist politics, and much more. The websites vary in format and include NGOs, feminist news websites, collective platforms, blogs, and archive projects. These websites actively challenge patriarchal, misogynistic, anti-feminist, and anti-gender narratives, nurturing a thriving online environment for the circulation of diverse feminist activist demands. Using the critical discourse analysis toolbox, this study focuses on the nuanced role of websites as digital feminist interventions on multiple levels, with particular attention to the "About Us" sections as a unique digital genre. Brimming with discourses of (self)representation and self-identification, these statements, conducted in the different periods between 2018 and 2020, contribute to the (digital) visibility and heterogeneity of political positions within feminist movements. Recalling the use and relevance of the manifesto in feminist politics and activism, the study highlights the (counter)discourses of feminist empowerment and resistance embedded in these texts. It critically questions the attributions, historical contexts, and symbols shaping these manifestary texts, providing a nuanced examination of the power relations challenged and reproduced within the digital landscape. Furthermore, the study delves into the archival role of websites within the context of (feminist) women's movements in Turkey, aiming to conduct an inventory of selected websites. The critical discourse analysis of digital manifestary texts itself aspires to serve a (feminist) archival role while capturing the discursive mapping of the recent history of digital feminist activism in Turkey, focusing on the medium of websites. Building upon these analytical foundations, the discussion shifts its focus to the realm of resistance (counter)discourses, exploring the continuum of the past, present, and future. It investigates how the past is being (re)constructed within these manifestations and interprets the present socio-politically. Finally, the exploration extends towards envisioning feminist utopias, probing into the types of future visions integrated into the evolving narrative of feminist activism.

PN 123 "ur fav #hijabae on the internet": Subject positioning by digital Muslim feminists in Germany

Selma Güney¹

¹ University of Tübingen, Institute of Media Studies, Tübingen, Germany

Muslim women in Germany are adept at using digital platforms and combining them in a variety of ways: They produce podcasts about the relationship life of Muslims, YouTube videos about everyday racism, social media posts on current political debates. In this way, Muslim women take an activist stance in public sphere(s) and carry out educational and awareness-raising work. Melina Borçak, Namikas Schnack, Nour Khelifi and Esra Karakaya are just some of the Muslim feminists who address (activist) allies and curious followers with their transmedial content. They speak to "communities" as well as to broader publics. This presentation deals with such transmedial contributions by Muslim women media creators and addresses two overarching questions that interrogates their forms of self-(re)presentation. Firstly: Against which subject positionings do Muslim women resist? And secondly: Which subject positionings do they invest in? To examine these questions, the presentation draws theoretically on the work of Cultural Studies (e.g. Hall, 1994) and feminist and postcolonial theories of subjectification research and incorporates

media space theories. Self-positionings are understood as subjective practices of appropriation and engagement with subject positionings that can be adopted socially (Bosančić, 2017, 4–6; Spies, 2009, 70–72). They are interrelated with external positionings and structural subject positionings (Walgenbach, 2014, 82). Current studies show that digital media platforms offer new possibilities for intervention. Digital media practices can challenge traditional biopolitical paradigms of space and offer new possibilities for geographical and political self-positionings (Tuzcu, 2016, 150–154). In this presentation, these possibilities are discussed using an interview-based case study. The study deals with one of the most popular Muslim women in Germany, Esra Karakaya. The Berlin-based journalist, producer, presenter and founder and CEO of the online talk show "Karakaya Talks" mainly produces content in German, which she distributes via a wide variety of digital media platforms. As "ur fav #hijabae on the internet" the ethnically Turkish-Korean media creator offers alternative and "community-oriented" journalism for BIPOCs. The analysis applies the grounded theory method and shows that Esra Karakaya uses various media practices to engage with subject positionings in both reflected and reflexive ways (Bosančić, 2017, 5). In her video and audio content in particular, she engages with structural subject positionings and external positionings, which she experiences both from Muslim allies and by critics. Esra Karakaya resists essentialist and othering classifications and appropriates the collective self-positioning of feminist Muslims and BIPOCs who, like her, shape media spaces. Thus, she constructs her intersectional subject positioning in a unique and creative way, going beyond cohesive and predefined identity categories of the local German society, and she forms feminist and antiracist alliances in digital spaces. The aim of this study is to empirically show and discuss the emancipatory potential of digital media practices and the limitations imposed by digital media spaces in a post-migrant society.

PP 0922 Understanding British news media coverage of rape in the context of a high-profile rape case

[Ezgi Aral](#)¹

¹ Loughborough University, Criminology- Sociology and Social Policy, Leicestershire, United Kingdom

How the news media portrays rape has long been the subject of extensive investigations. Research has consistently revealed a recurring tendency to establish familiar patterns over time. An extensive body of literature on news narratives surrounding rape indicates a historical inclination towards misinformed and inaccurate depictions. Consequently, the news media has often been found to perpetuate rape myths and misconceptions, often distorting the dynamics of rape, as well as perpetuating misconceptions about victims-survivors and perpetrators. The most common narrative involves blaming victims-survivors of rape, and creating excuses for perpetrators. The news media has also been criticised for focusing on the events rather than conducting in-depth explorations of rape, neglecting its potential cultural structural reasons and the impact of the rape on the victims-survivors. However, recent research has revealed some consistent findings that while rape myths and misconceptions still appear in the news media, these are more subtle and indirect rather than more obvious and direct compared to previous studies, making them harder to challenge. Similarly, research has also shown that a shift in news coverage of rape from straightforward and single incident reports towards broader discussions, particularly after #MeToo. Nevertheless, a nearly constant aspect of the literature is that not all rape cases are equally newsworthy. Notably, research reveals that certain stories receive more media attention than others, and that 'celebrity rape' has emerged as a common genre due to their celebrity. Athletes' rape and sexual assault cases are particularly noteworthy because a disproportionate number of athletes, particularly footballers, have been accused of sexual offences compared to males in the wider community.

In this respect, this study examines whether, to what extent and in what way the commonly repeated pattern of rape myths and misconceptions persists, with an empirical focus on a high-profile rape case involving a celebrity footballer. The investigation of a high-profile rape case is due to the capacity of such cases to receive extensive media attention, and thereby draw public attention to and raise significant awareness of social issues. This presentation consequently begins with an overview of existing literature on news media representations of rape, and subsequently presents preliminary findings derived from content analysis conducted as part of the empirical phase of the study.
