In a society increasingly mediated by screens, works of fiction play a fundamental role in transmitting and legitimizing new social imaginaries. They create narratives with the potential to challenge, resist and reproduce dominant ideologies (Hall, 1982; Williams, 1983; Couldry, 2019). Due to its anthropological relevance in universal culture, motherhood is a constant source of representations, very often stereotyped. The female body, with its capacity for engendering, gestating and nourishing, has tended to be symbolically portrayed, perpetuating the conservative ideology of a binary global imaginary that has related women to home and care (Nash, 2004) or an imaginary of the monstrous and castrating mother (Creed, 1993). However, the last decade has witnessed significant changes, prompting us to question whether factors such as declining birth rates, new family models, advances in assisted human reproduction, new models in the staging of the reproductive body or the changes in cultural industries have contributed to creating new media imaginaries around the reproductive process.

The objective of this communication is to catalog the contemporary Spanish audiovisual fiction works available on video-on-demand platforms that explore plots related to reproductive processes (menstruation, pre-conception, infertility, pregnancy, childbirth, miscarriage, abortions, postpartum, breastfeeding and menopause), taking into account a gender and intersectional perspective (Hooks, 1984; Crenshaw, 1989). The goal is to assess whether the current social, economic, and political context has heightened the visibility of these processes and created spaces for questioning and redefining traditional representations. To achieve this, we will examine the presence of such works on major national servers (Filmin, RTVE Play, Atresplayer, Mitele, Movistar+) and global platforms with Spanish production (Netflix, HBO Max, Prime Video), analyzing their main technical characteristics and themes. The applied method involves a combination of systematic keyword searches on leading VoD platforms and a discourse analysis of work synopses (Greimas, 1973).

The initial hypotheses of the study raise several questions. Firstly, there is a noticeable upward trend in the representation of reproductive processes in national fiction, accompanied by an increased presence of women in creative teams and a greater diversity of genres and formats addressing these issues. This suggests a growing prevalence of discourses that challenge traditional roles in audiovisual content, debunk myths and taboos associated with the reproductive body, and engage with the challenges and difficulties linked to reproductive processes in our society. This marks a departure from conventional symbolic representations often found in romantic comedies or horror genres.

However, preliminary findings from this research indicate that the most realistic works or those shedding light on less represented reproductive processes tend to have smaller budgets and a reduced presence in the commercial circuit, resulting in a lower social impact. Consequently, their potential to transform the contemporary audiovisual landscape regarding reproductive healthcare appears limited.

In conclusion, our observations suggest that it is imperative to implement measures in the audiovisual industries aimed at enhancing the representation of reproductive processes. This is crucial for creating more inclusive and diverse narratives that could have a positive impact on the general audience.

PP 0924 Anti/pro porn? Deconstructing the dual legacy of the US Sex Wars: A multimodal critical discourse analysis on pornography in Flemish news media

[Leontine Hellemans](#)¹

¹ Ghent University, Communication Sciences, Ghent, Belgium

Due to the digitisation and changes in media regulations, porn has become an intrinsic part of Western popular culture. Pornographic images have found their way into advertising, films, and music; a process also known as the pornographication of the mainstream (McNair, 1996). The growing amount of pornographic imagery has sparked public debates, with mostly moral panic as a result. Dominant public discourses tend to sensationalise the changing relationship between sex and media, representing porn as 'an incontestable force negatively affecting the lives of its consumers' (Spišák, 2017). These debates find an historical basis in the anti/pro binary of the US Sex Wars, contributing to a transnational understanding of pornography as an inherently negative or positive media text

(Paasonen, 2009). This 'dual legacy' reflects itself in the sheer amount of media effects studies into porn consumption that have been preoccupied with the objectivation of women, the commercialisation of the intimate, and the overall harmfulness of watching porn. By exclusively focusing on causal-effect relationships, these public and academic discourses leave little room for porn consumers' unique intersecting identities, experiences, and contexts. This paper maps to what extent local discourses in Flanders have inherited the dual legacy of the US Sex Wars, by performing a Multimodal Critical Discourse Analysis (MCDA) in four Flemish newspapers (N = 223). The MCDA shows how newspapers have adopted many aspects of the anti/pro binary, by roughly defining porn as an inherently negative or positive media text. Moreover, Flemish discussions on pornography focus on the axis of gender alone, whilst ignoring possible intersectional differences such as age, social class, and ethnicity. Most articles in the sample neglect peoples' unique lived experiences and universalise those of white, heterosexual, and middle-class porn consumers. Therefore, they neglect decades of feminist, queer, and postcolonial critiques that have challenged these binary approaches to gender and sexual identity. By critically mapping these power structures, the current paper contributes to a move towards more critical perspectives in discourses on pornography.

PP 0925 Shaping identity in sex work: A comparative study of Italian and Belgian media

[Laura Tedeschi](#)¹

¹ Sapienza Università di Roma, Comunicazione e ricerca sociale, Roma, Italy

European societies have encountered significant and dramatic challenges from the pandemic period to the present, reflected in heightened demand for information among citizens, linked to the classical concept of 'Need for Orientation' (NFO). Human rights issues (seemingly) unrelated to recent crises may be given lower priority in journalistic agenda-setting, such as the rights of sex workers. This study comparatively analyzes media discourse on sex work in Italy and Belgium since the pandemic, exploring potential narrative differences in European countries with varying legislation on the rights of sex workers. Italy does not recognize sex work as a legitimate profession, while Belgium fully decriminalized it in June 2022. The analysis focuses on 15 Belgian newspaper articles (in Flemish and French) and 15 Italian articles from January 2020 to December 2023. The research considers the impact of the economic crisis and changes in relational dynamics due to the lockdown, which, according to scientific literature, contributed to increased user engagement on sex industry platforms and a narrative shift in media storytelling. The thirty selected articles underwent analysis through a combined quantitative content analysis method and CDA (Critical Discourse Analysis). The first approach provided an introductory overview of the general article theme, categorizing it (e.g., crime, interview with a sex worker, easy money, etc.). Additionally, a content analysis of the attached image was conducted to observe the article from its significant visual component. Hence, Critical Discourse Analysis was chosen as the method to examine how the topic is presented in a social context. In the case of newspaper articles, it aligns with the social theory of power, with reference to Foucault, aiding in understanding the formation of sex worker identities in the two countries that were analyzed. Given that power creates the subject by conferring identity, it becomes a condition for social visibility and audibility. Preliminary findings reveal common traits in the portrayal of sex worker identity in newspaper articles across the two countries, notably the emphasis on crime, reflected in the high number of articles, and the inclusion of questions about personal relationships in worker interviews. Significant differences emerge, particularly when considering additional identity indicators like nationality or age. The Italian narrative is marked by a higher prevalence of stereotypes and almost negligible attention to the actual living conditions of sex workers, a contrast to the situation in Belgium. The comparison of media narratives between two European countries is a significant reflection point concerning human rights attention during times of social crisis. Italy, in its policies, appears less attentive to the rights of minority populations, including LGBTQIA+ individuals, women, and migrants. Sex workers not only frequently belong to these groups but also remain a stigmatized category, and the media narrative appears to align with the limited institutional attention. Conversely, in Belgium, a country more attentive to the civil rights of minorities, the media narrative is less stereotypical, offering a more complex identity to sex workers.

GSC11 Media and sexual violence, sex work, pornography and reproductive process

PP 0926 Exploring youth media perspectives: young people using, Experiencing and giving meaning to porn. An ethnographic research in the Barcelona area

Maria-Jose Masanet¹, Laura Fernández¹, Sergio Villanueva Baselga¹

¹ Universitat de Barcelona, Department of Library and Information Sciences and Audiovisual Communication, Barcelona, Spain

This article focuses on the outcomes of the project 'TRANSGELIT' on young people learning about gender and sexualities through media and, in this specific case, through porn. The project proposes an ethnographic approach that follows the precepts of short-term ethnography (Pink & Morgan, 2013). This approach is appropriate for creating contexts in which researchers can go deeper into the research interests in a short period of time. This research followed five steps: a) Consent management; b) Participative and reflection workshops about gender and sexualities and about media uses, practices and perceptions; c) Co-viewing workshops to debate and reflect about specific media representations of gender and sexualities; d) Creative workshops for creating audiovisual content in which young people could explore specific topics about sexualities and gender that interested them; e) In-depth interviews to go deeper into the adolescents' discourses and understandings about the research topics.

Four educational centers from Barcelona participated in the project: two high schools, a group of university students and a non-formal education center which serves socially vulnerable adolescents.

During the fieldwork, the team observed porn was one of the main resources to learn about sex. Results indicate that porn was consumed for several purposes beyond entertainment and pleasure: to learn about sexual practices and on how to perform them and also to find references on diverse bodies and sexual experiences. However, when young people compared their own embodied sexual experiences with those represented in mainstream porn, some female participants argued that mainstream porn broke their expectations since it was perceived as "unnatural" or "not real" and cannot be trusted. Girls more often referred to mainstream porn as generating distrust, disappointment or even adding pressure to what it is expected to be doing in sexual relations (regarding poses or body appearance). Female participants also tend to identify mainstream porn with the male and heteronormative gaze, and explained that these visuals were distant from their own desires and sexual imageries. Male participants rely more on porn to inform themselves, starting to watch it at early ages, during school. Various female interviewees express having been introduced to porn in school after their male classmates publicly displayed a porn video. Some girls argue that also their male partners suggested they watch porn in order to learn and fulfill their desires and expectations.

On the other hand, porn can also be considered an useful tool for the creation of new sexual and gender dissident visual imageries (e.g., an interviewee explained he used porn to watch trans bodies in a sexual stage with the aim of learning and having satisfying sex with his trans couple). In fact, we found porn could in some cases become an important information resource for young people with non-normative sexual orientations, since they could find in porn other models and references beyond the heteronormative representations. At this point, we detected differences in the interaction and perceptions with porn between those participants who defined themselves as heterosexuals and those who don't conform to normative sexual and gender norms.

GSC12 Digital practices: Masculinities, young people, and (anti-)feminism

PP 1018 Women in the Spanish Twitch sphere: Streamers' perspectives, content, and audience dynamics

Celina Navarro¹, Adrià Padilla¹

¹ Universitat Autònoma de Barcelona, Department of Audiovisual Communication and Advertising, Barcelona, Spain

Twitch, initially a gaming-centric streaming platform, remains predominantly male-dominated, perpetuating a live streaming culture that has historically marginalized women (Cullen & Ruberg, 2019), since they are more likely to emphasize patriarchal structures and underlying inequalities (Banet-Weiser & Pruchniewska, 2017; Todd & Melancon, 2019). The onset of the pandemic prompted a shift in Twitch's landscape, with the platform diversifying its content offerings beyond gaming, providing viewers with a broader range of categories. However, despite these changes, female streamers remain a minority, and the majority of popular Spanish-language streamers continue to be men.

This research aims to compare Twitch streamers based on their gender, analyze their audience volume, and gain insights into the perspectives of female streamers regarding their activities on the platform. Data for this study was collected from Twitch over one month in 2023. An ad-hoc capture software, utilizing the API in real-time, extracted data from the Top100 live broadcasts in the Spanish language, identifying over 1 million different streamers. For each broadcast, information such as the number of viewers, ranking position (based on audience volume), and the title and category of the stream were captured, offering a quantitative overview of the situation of women on the platform. In addition, semi-structured in-depth interviews were conducted with 15 Spanish female streamers, varying in follower count and type of content broadcast, to comprehend their discourses regarding their presence on the platform.

Results indicate a significant difference in the number of male and female streamers in the Top100 Spanish-language broadcasts, with women comprising less than 10% of the sample. Female streamers also consistently obtain a significantly lower average number of viewers, with no presence in the top 10 streamers by viewership. While women engage in gaming content, their primary categories are more related to creating conversations with viewers. Examining their perspectives, female streamers highlight the prevalence of violence and aggression against women on the platform, often discussing these issues in the third person, underscoring their perceived fortunate avoidance of such aggressions.

The obtained results contribute to a quantitative understanding of the challenges women face in a male-dominated platform that holds a significant role in digital culture, particularly for young people. Additionally, the research analyzes the discourses women articulate to criticize, but also justify, these inequalities and Twitch's hegemonic culture.

GSC12 Digital practices: Masculinities, young people, and (anti-)feminism

PP 1019 Dating-Coaches, TradWives and Co. – Women anti-feminist Influencers on TikTok and Instagram

Mareike Fenja Bauer¹

¹ European-University Viadrina, European New School of Digital Studies, Frankfurt Oder, Germany

Social media platforms such as TikTok and Instagram can be useful tools for feminist (online) activism or queer community building. However, social media platforms can also be a tool for anti-feminist actors to spread their cis- and heteronormative worldview and propagate a patriarchal societal order.

While previous studies have identified various actors within the so-called 'manosphere', such as Incels or Pick-up-Artists, we still know little about women's involvement in (online) anti-feminism (but see Di Sabato and Hughes 2021; Mattheis 2021). Grounded in digital ethnographic data this qualitative study aims to shed light on the global phenomenon of women anti-feminist influencers on visual social media platforms by developing a typology of women anti-feminist influencers on TikTok and Instagram. Overall, this study is guided by the question of how women anti-feminist influencers engage in anti-feminist meaning-making processes and the dissemination of anti-feminism on visual social media platforms and uses theories of public spheres and practice theory as an analytical lens. By developing a typology of women anti-feminist influencers on TikTok and Instagram this study gives an overview of different anti-feminist actors as well as their narratives and strategies.

The study uncovers that women anti-feminist influencers adopt different roles to disseminate their anti-feminist ideas on gender, femininity, and society. For example, as so-called TradWives, anti-feminist influencers sell anti-feminism as a lifestyle while at the same time concealing their political agenda, anti-feminist dating-coaches and esoteric coaches incorporate anti-feminism in their business models and teach women how to be a #HighValueWomen or frame feminism as a supposed threat to one's mental health, and others act as explicitly political influencers such as anti-feminist political commentators.

The findings point to the unique role that women play as influencers within contemporary (online) anti-feminism beyond the so-called 'manosphere', contributing to our understanding of anti-feminism as an overall societal issue.

PP 1020 Negotiating gender and intimacy in Italian teenagers' everyday digital practices

Vittoria Bernardini¹, Cosimo Marco Scarcelli¹, Francesca Comunello², [Lorenza Parisi](#)³

¹ University of Padova, Department of Philosophy- Sociology- Education and Applied Psychology, Padova, Italy

² Sapienza University of Rome, Department of Communication and Social Research, Rome, Italy

³ Link Campus University, Human Sciences Department, Rome, Italy

The relationship between digital practices, gender, and intimacy in teenagers' everyday life is gaining growing attention. Existing research has looked at digital media as environments that offer young people agency and spaces where they can construct and perform their identity (boyd 2014) through bricolage practices (Willet 2008) and by experimenting with their own selves, also with regard to gender and intimacy (Livingstone & Mason 2015; Scarcelli 2015; De Ridder 2017; Metcalfe & Llewellyn 2020; Ferreira 2021). Studies have mostly focused on communicative interactions (e.g., 'sexting') in connection to gender and sexual ideologies (Ringrose et al. 2013; Scarcelli 2020); gendered dimensions of representations and self-representations of masculinity and femininity (Marshall et al. 2020; Caldeira 2021); and the use of platforms for self-expression and social support, especially for women and LGBTQ+ people (Tortajada et al. 2021).

The aim of our paper is to analyse how Italian teenagers (aged 16–18) (re)define their understanding of gender and intimacy by engaging with digital media and incorporating it into their daily lives. Our approach adopts a media practice paradigm in order to understand what young people do with and through digital media in the context of the specific situations in which they act (Couldry 2012), examining how teenagers (re)negotiate their gender identities and intimate life in their everyday use of digital media.

Our project puts young people and their experiences at the centre of the research process. We adopt a participatory design approach, which makes use of practical activities and material artefacts to stimulate the generation of knowledge and mutual learning among participants. Specifically, focus group interview guides and activities are co-constructed through preliminary workshops with a group of 10 teenagers, who act as 'epistemic partners' (Holmes & Marcus 2012) in devising focus group content and structure that is suitable for use in participatory focus groups with other teenage participants.

Using these activities, we are conducting six focus groups with students aged 16–18 from secondary schools in six cities located in three Italian regions. Focus groups employ mood boards as visual elicitation methods to prompt participant discussion and enable participants to express themselves and reflect about sensitive topics such as sexuality, intimacy, and gender identities (Spawforth-Jones 2021).

The empirical material collected from the focus groups will be analysed using critical discourse analysis (focus group transcripts) and visual content analysis (moodboards). The findings from the focus groups will be further discussed with the preliminary workshop group for validation.

Our results are expected to cover a wide set of digital practices, including the management of teenagers' self-representations on social media, their use and views on dating apps, the exchange of intimate content via mobile phones and/or the Internet, as well as the practices of sharing information regarding gender or sexual issues with specific networked publics.

GSC12 Digital practices: Masculinities, young people, and (anti-)feminism

PP 1021 From grill to gram: Representations of red meat and masculinities by male influencers

[Elina Vrijzen](#)¹, Sofie Van Bauwel², Charlotte De Backer¹, Alexander Dhoest¹

¹ University of Antwerp, Communication Science, Antwerp, Belgium

² Ghent University, Communication Science, Ghent, Belgium

In Western societies, there is a cultural association between masculinities and eating (red) meat. The consumption of red meat is linked with notions such as dominance, power and physical strength, and is not only essential for nourishment but also an important source of protein and therefore, necessary in fostering strength and muscularity. Consequently, the practice of eating red meat is perceived as a vital tool in sculpting the idealized male body, which is muscular, fit and in shape. Because of this, the cultural idea prevails that the consumption of red meat constitutes an essential part of a healthy male diet. The stereotype 'real men eat meat', the image of the idealized male body and the perception of masculinities are perpetuated through different kinds of popular culture, such as social media. While the documentary 'Game Changers' (2018) has sparked academic interest in the emergence of the vegan identity among male athletes and influencers, little attention has been directed towards influencers promoting a meat-centric diet to obtain an idealized male body.

The research endeavours to fill this gap by examining meat-eating men as producers of media representations on social media. We choose to focus on Instagram because of the visual focus inherent in the platform's success and relevance. Next to this, Instagram has drawn less scholarly attention than Twitter and Facebook. Through

a qualitative content analysis of a number of Instagram accounts, we investigate how male influencers communicate on the consumption of meat. Besides, we focus on how they construct and represent their own masculine identity in terms of a fit, healthy and strong body, and the role of eating meat in the process of obtaining this idealized male body. More specifically, we analyse which aspects of masculinity and meat consumption (such as dominance, aggression, and embodiment) emerge. Hereby, the study focuses on meat as a symbolic and practical tool for the construction of masculinities and the idealized male body. Inspired by the coding system of Cohen et al. (2019), we focus on two levels. Firstly, we analyse on the level of image (excluding hashtags and captions) where we focus on the representation of the male body, masculinities and the representation of meat. Secondly, we focus on the level of post themes, which includes the combination of the image, caption and hashtags. On both coding levels, we systematically examine how different aspects of masculinities and meat consumption concur to promote the idealized male body.

The study aims to contribute to a better understanding of the complex relationship between masculinities, eating meat and the male body and how men represent this relationship and themselves on social media. In this way, the research contributes to the knowledge on meat, media and masculinities in the academic fields of food, cultural and gender studies.

GSC13 Gendered digital spaces: Representations, struggles and experiences

PP 1125 Asla yalnız yürümeyeceksin! (you will never walk alone!) – Experiences and perceptions of feminists with regards to digital platforms to combat gender-based violence under everyday banal authoritarianism in Turkey

Dilara Asardaq¹

¹ Tampere University, Communication Sciences, Tampere, Finland

In Turkey, the masculinist hegemony of authoritarian politics can be said to be further fortified by the evident impunity and double standards surrounding violence against women and LGBTIQ+ (Yabancı, 2018). Nowadays digital platforms offer a great potential for broadly disseminating feminist ideas, shaping new modes of discourse about gender and sexism, connecting to different constituencies, and allowing creative modes of protest to emerge against authoritarianism and oppression (Baer, 2016). Digital feminist tactics involve hashtag campaigns, disclosure of sexual harassment or abuse on social media, agenda-setting, consciousness raising, video activism, digital archiving, data activism, etc. (Sener, 2021: 2). Eslen-Ziya (2013: 868) points out the advancing prominence of social media for Turkish women's movement as well, as they participate in debates in social media and social networking groups, generating networks and organizing protests. Hence, especially under rising levels of authoritarianism and oppression, it can also be said that the digital platforms have added a new dimension to the feminist struggle in Turkey.

Despite the highly visible forms of activism and the growing body of research interested in digital feminist activism and the responsive backlash (Baer 2016; Bowles Eagle, 2015; Clark 2016; Akyel, 2014; Shaw 2012), it is argued that there is not a lot of research yet exploring girls' and women's experiences of using digital platforms to challenge misogynistic practices and dialogue and this is also true for activism against gender-based violence (Mendes, Ringrose & Keller, 2019: 2-3). Moreover, lived experiences of authoritarianism and feminist online/ offline activism remains to be an understudied field requiring urgent intellectual attention. This remains to be relevant for Turkey as well, as there is a gap in research literature with regards to the experiences, perceptions and practices of feminist activists or women doing feminist activism online/offline under rising levels of everyday authoritarianism and oppression.

Therefore, the main research question this paper is dealing with is: How does the intensifying everyday authoritarian context shape the experiences of feminist activists, journalists, NGO workers, lawyers utilizing digital media platforms for activism against gender-based violence? Taking into account the academic literature on authoritarianism and digital media, in order to answer these questions, I used the methodology of interviews and carried out 10 semi-structured interviews with feminists from Turkey at the intersection of online/offline dimension, affect, intersectionality, agency and structure. According to the emerging patterns, under increasing authoritarianism, the research finds that feminist activists are affected by (i) political repression, state violence and criminalization, (ii) deteriorating economic situation, (iii) existence of rising levels of misogyny, trolls and disinformation, (iv) algorithmic invisibility, and (v) the digital divide. Despite this, the most important purposes of digital feminist activism and the primary aims of digital platforms under authoritarian conditions remain to be (i) political organization, (ii) justice seeking, (iii) revealing data and (iv) data memorialization and remembrance through digital archives.

GSC13 Gendered digital spaces: Representations, struggles and experiences

PP 1126 Influencing faith: The impact of religious influencers on gender discourse in contemporary societies

Hella De Haas¹

¹ University of Düsseldorf, Department of Social Sciences, Düsseldorf, Germany

The communication of religion and religious values has been a site of social (re)organization for decades (Knoblauch, 2009). Mediatization has changed religion on various levels (Hjarvard, 2008): Established institutions such as churches and clergymen are no longer the only communicators of faith and religious groups have organized themselves globally through media, refiguring connectivity (Hepp, 2013). Since religious affiliations and adherence to religious values have declined (Müller & Pollack, 2022), *authenticity* has become a key factor in attracting new members (Dawson & Cowan, 2004). Therefore, the voices of modern individuals have become more important in communicating faith. As social media platforms are a place where many ideas can be shared and even niche topics find their audience, *religious influencers* have emerged (e.g. Kühn & Simojoki, 2021). They often convey traditional religious values while presenting themselves as people of today (Mendl et al., 2023). Religious influencers differ in their religious affiliation, the space they give to religiosity in their online presence, and how they apply religion in their everyday lives (Krain et al., 2020). While there are religious influencers who find a balance between religious and non-religious values, there are still those who take a more extreme stance, especially regarding gender. Specifically, I ask how *religious influencers of the latter type address issues of gender, gender identity, and sexuality*.

To answer this question, I conducted a content analysis of 56 blog posts by the US influencer duo *Girl Defined Ministries*. *Girl Defined* uses common influencer tactics, such as creating parasocial bonds with their audience by encouraging them to do their own biblical research or asking specific questions about their decision-making. They challenge the social order around gender in several ways: 1) They present living according to religious values (or their free interpretation of various Bible verses) as the only right way to live. This includes living according to a 'God-given' purpose for female individuals. 2) They condemn any other or milder forms of religiosity or ways of finding one's gender identity. 3) They evoke shame in the reader for not being able to distinguish between these ways of living. While religion can be an anchor and source of hope for many people in contemporary societies (Papaleontiou-Louca, 2021), there are parallels between this particular case of religious influencers and antifeminist (Bauer, 2023) and right-wing influencers (Lewis, 2018). The use of 'controversial' topics like abortion, feminism, or suicide attracts attention in online spaces and provides a gateway through religion to radicalized messages (ibid.). In a society that strives for diverse and inclusive acceptance of not only equality in men and women but also gender nonconforming individuals and the LGBTQIA+ community, messages that condemn any identity other than 'God-given' can hinder the societal journey towards inclusivity. Especially when they are communicated by 'normal' people living 'normal' lives using 'normal' social media platforms. The content analysis provides insights into rather radical religious influencers, while considering faith as a more difficult narrative to argue with compared to facts or political views.

GSC13 Gendered digital spaces: Representations, struggles and experiences

PP 1127 Between lack of interest, normalisation of gender violence and fear of being cancelled: Anti-feminist and anti-LGBTIQ+ discourses among teenagers in Barcelona

Anna Iñigo¹, Laura Fernández¹, José Miguel Tomasena¹

¹ University of Barcelona, Department of Library and Information Sciences and Audiovisual Communication- Faculty of Information and Audiovisual Media, Barcelona, Spain

In recent years, some events related to gender-based and anti-LGBTIQ+ violence have transcended the Spanish media sphere, bringing discussions to numerous public spaces. Since 2017 we have witnessed the rise of the so-called 'fourth wave' of feminism, focused on generating an alternative to the social and economic model that causes the exclusion and exploitation of feminised bodies (Federici, 2017). This fourth wave of feminism cannot be understood without its spreading through social networks and the internet (Cabezas, 2021; Sued et. al., 2022). The movement for sexual and reproductive rights in Argentina and the #MeToo movement have been examples of how feminism has developed a transnational and transmedia strategy that has facilitated 'gender knowledge' (Rothermel, 2020).

Despite this, digital contexts have not only hosted feminist postulates, but also a global reactionary wave against the movement. We are living a moment of 'gender backlash' (Faludi, 1991) that articulates a resistance to feminist advance, understood as a reactionary counter-movement (Banet-Weiser, 2018) against a firmly institutionalised feminism. In the Spanish context, as more political power had feminism, a reactionary counter-movement of aggrieved men was forming online, while the far-right party Vox pitched itself to supporters who felt threatened by the increasing of what they called radical feminism (Beatley, 2019).

The aim of this paper is to understand how teenagers from the Metropolitan area of Barcelona are constructing and reproducing anti-feminist and anti-LGBTIQ+ discourses through the media they use in their everyday lives. This research is a result of the 'Transmedia Gender & LGBTIQ+ Literacy' project. We have adopted an ethnographic approach that follows the precepts of short-term ethnography (Pink & Morgan, 2013), running participative and creative workshops about gender and sexualities in four educational institutions, where teenagers created their own audiovisual content to explore specific topics. We have interacted with 181 young people from 14 to 22 years old with different gender identifications (male, female, non-binary and gender fluid) and conducted 47 semi-structured in-depth individual interviews. Then we used the qualitative software ATLAS.ti to analyse interviews, fieldwork notes and materials created during the workshops around anti-feminist and anti-LGBTIQ+ discourses and the media referents most referenced by them.

Preliminary results pointed out a lack of interest among young boys towards feminist topics expressed through humour and the fear of being 'cancelled'. On the other hand, we detected that a significant number of young people (especially men) felt a lack of interest and indifference towards the feminist and LGBTIQ+ movement and express 'fatigue' when teachers or researchers wanted to discuss these topics. Our research contributes to the academic conversation on anti-feminist and anti-LGBTIQ+ discourses by providing recent data on the type of hate speech that was reproduced in different classrooms of Barcelona and its metropolitan area. Our main contribution was to gather first-hand knowledge of the testimonies and perceptions of young people on gender issues. Our ethnographic approach allowed us to understand how these discourses are reproduced in the classroom and how they potentially shaped young people's understanding of gender violence and the construction of masculinities.

GSC13 Gendered digital spaces: Representations, struggles and experiences

PP 1129 Gendered gaming spaces: Investigating gender-technology relations amongst adult gamers

Claus Toft-Nielsen¹

¹ Aarhus University, School of Communication and Culture, Aarhus C., Denmark

In this paper I investigate gaming technology and the role this technology holds for gamers, but rather than taking a technologically-centric approach, I focus on how this technology is articulated, framed and discussed amongst gamers. What does it mean to *claim* to be technologically competent as a gamer – and conversely, what does it mean claim to struggle with such technology? Here technological mastery or expertise is not something displayed through gamers' expert skillset, rather technological expertise serves as a lens to unpack the complex ways in which gender, technology and identity is interconnected.

Firstly, I apply a tooled-up return to previous insights into technology, expertise and gender (Lynn 1987) in which I trace the co-construction of gender and technology by drawing on studies on media technology and gender (Corneliusson 2012, Wajchman 2000), as well as game culture and geek masculinity (Connell & Messerschmidt, 2005; Condis 2018). By doing this, I view technological expertise as not primarily a question of technological competence but also a result of power relations *around* operating assumptions of what constitutes technology and technological mastery. That is, technological mastery is contextually produced within a techno-social system (Jenson and de Castell, 2010) where technology, gender and identity intersect in complex ways.

Secondly, I focus on how technology practices and understandings with regards to gaming are performed by actual gamers. In doing so, I highlight how gendered identities and relations are produced or articulated both within and around, as well as a direct result of, the use of gaming technologies. Drawing on Conslavo's concept of *gaming capital* as a way of highlighting how both technological struggles and prowess are discursively boxed in, I investigate the technological gaming practices and how these in turn, informs gamers' gendered identities. In order to theorize and inform this intersection of technological use and gendered identity, I adopt and adapt Dovey's concept of *technicity* as a way of understanding how the privileging of certain technological skills, the ability to adopt and handle technologies, as well as the ways identities and gender are increasingly mediated by technologies and abilities, practices and relations with these technologies.

HCO01 Covid-19: Media coverage, campaign messages, and health behaviour

PP 0236 Just the right thing to do? Morality in the German media debate around mandatory COVID-19 vaccination

Mara Berlekamp¹, Anna-Luisa Sacher¹, Constanze Rossmann¹, Carsten E. Reinemann¹, Julia Neufeind², Leonard Kranz², Nora Schmid-Küpke²

¹ LMU Munich, Department of Media and Communication, Munich, Germany

² Robert Koch Institut, Robert Koch Institut, Berlin, Germany

In the global COVID-19 pandemic, traditional news media has played a pivotal role in disseminating information (Ali et al., 2020). In crisis communication, the moral dimension of media content is crucial, impacting both public health compliance and media outreach (Rosenfeld & Tomiyama, 2022; Solovev & Pröllochs, 2022). Previous research underscores the role of moralization for COVID-19 health responses (Graso et al., 2021), indicating that morality in the media discourse surrounding a COVID-19 vaccination mandate may be central to its acceptance as a public health measure. Considering the prominence of morality in the COVID-19 vaccination debate (Zhang et al., 2023), it prompts inquiry into the role of morality in the media discourse surrounding mandatory vaccination.

Despite investigations on the effectiveness of a COVID-19 vaccination mandate (Karavivanov et al., 2022) and public attitudes towards mandatory vaccination (Graeber et al., 2021), the moralization of the media discourse in the vaccination mandate debate remains to be studied.

To address this gap, we pose the research question:

RQ1: To what extent is the German media coverage of mandatory COVID-19 vaccination characterized by morality?

Research indicates that a significant part of the unvaccinated German population perceived the COVID-19 vaccination debate as predominantly moralistic (Henkel et al., 2023). Furthermore, in Germany, particularly unvaccinated individuals with low vaccination intention relied on information from alternative media, while vaccinated individuals with high vaccination intention primarily relied on traditional media during the pandemic (Schäfer et al., 2023). Considering that perceived morality often exceeds empirical evidence in debates (Atari et al., 2023), the question arises as to what extent German news media may have contributed to the divergent perception of morality in the mandatory vaccination debate:

RQ2: Does the morality in the debate differ among various news media?

Method

We conducted a standardized quantitative content analysis of German news coverage on COVID-19 vaccination mandate across 13 sources, encompassing regional and nationwide news (tabloid and quality press), alternative media, and online offerings of TV channels.

We analyzed $N = 1,241$ articles reporting on the mandatory COVID-19 vaccination debate in Germany, spanning from April 2021 to June 2022. Intercoder reliability ranged between .73 and .99 for all categories.

Results

(RQ1) The media predominantly reported neutral (84.4 %) about the topic rather than exhibiting moral bias (15.6 %) ($M = 1.16$, $SD = 0.32$). A Chi²-test demonstrates a significant association between the level of morality and the centrality of the topic in an article ($\chi^2(3) = 16.84$, $p < .001$, $\phi = .19$), indicating higher morality in articles where the topic is discussed more centrally.

(RQ2) A significant association between morality and the medium exists: $\chi^2(12) = 162.10$, $p < .001$, Cramer $V = .35$, indicating higher levels of morality in alternative media compared to traditional news media.

Discussion

Our results advance our knowledge of how vaccination mandates are portrayed in news media and examine the moral dimensions of the discourse, with implications for shaping media discourses in future health crises. Further results and implications for future health crises will be discussed during presentation.

HCO01 Covid-19: Media coverage, campaign messages, and health behaviour

PP 0237 Information disorder and data perception during the Covid-19 pandemic in Italy

Lorenzo Ugolini¹, Silvia Leonzi¹, Giovanni Ciofalo¹, Fabio Ciammella¹

¹ Sapienza University of Rome, CoRiS Department, Rome, Italy

The paper presents the findings of a five-year research project that examines the production, perception, and impact of information disorder within the Italian media landscape and its audience. The study focuses specifically on the perception of pandemic-related news and its impact on the Italian public. The paper analyses the issue of information disorder in health and scientific topics, which gained increased attention during the pandemic. Due to the necessity of conveying essential information, news consumption by citizens was characterized by a growing

use of scientific terminology and data. This included topics such as the spread of the SARS-CoV2 virus in Italy and the administration and efficacy of vaccines, which became a matter of extensive and controversial news coverage. Interpretations and graphical representations, in fact, have also become an important battleground in the field of information disorder, with cases related to mis-information (misreading and/or misinterpretation by users and commentators), mal-information (news items corrects in themselves, taken out of context for propaganda purposes), and finally disinformation (data and representations made up with intention to harm).

The paper discusses the findings of an empirical research conducted within the research project "The Social Effects of Fake News" from 2018 to 2023, with a specific adjustment in 2020 precisely to better understand the dynamics of pandemic-related information disorder. A survey was designed and carried out by conducting 399 face-to-face interviews with a reasoned choice sample, representative of the Italian population in terms of age and gender characteristics, with the aim to analyse the Italian audience's propensity to believe in false news content. Six news items (one true and five false) were selected to describe Covid trends, vaccine efficacy, and the role of physicians, scientists, media, and institutions. The purpose was to determine the probability with which respondents judged them as true or false. The answers were analysed using single-variate and multivariate analyses.

The approach to (fake) news consumption that emerges is one that we have termed "Know-it-all", to highlight how the driving force behind the trust placed in fake content is the belief to be more experienced and knowledgeable than, in particular, institutions, scientists, and mainstream news media. This aspect, among others, highlights the need for news media, and media in general, to use a more comprehensive approach to rebuild a bond of trust with the public, all the more so in context related to science and health where the information disorder can lead to knowledge disorder and, ultimately, to a wrong approach to illnesses, treatments and therapies.

HCO01 Covid-19: Media coverage, campaign messages, and health behaviour

PP 0238 From headlines to hesitancy: Using a linkage approach to examine media effects on COVID-19 vaccine uptake

Jakob-Moritz Eberl¹, Peter Tolochko¹, Noëlle Lebernegg¹

¹ University of Vienna, Department of Communication, Vienna, Austria

The COVID-19 pandemic has underscored the importance of comprehending media effects on vaccine hesitancy, a factor that can significantly influence vaccination rates and, consequently, public health outcomes (e.g., Allington et al., 2021). However, much of the existing research in this domain remains limited, often relying on cross-sectional approaches and focusing solely on media exposure rather than connecting it to specific media content. This study delves into the intricate relationship between media content and both general vaccine hesitancy and hesitancy specific to individual vaccines (i.e., AstraZeneca, BioNTech/Pfizer, Moderna, Sputnik), utilizing a linkage framework (de Vreese et al., 2017). We leverage five waves of data from a publicly available online panel survey (n = 1500), collected between March and October 2021 (Kittel et al., 2021). This survey data is then linked to results from an automated content analysis of vaccine salience and sentiment in approximately 8,000 news articles sourced from seven leading media outlets in Austria, based on respondents' self-reported media usage. Employing Multilevel Models for Change (MMC), we aim to measure the impact of media content on vaccine hesitancy by considering both the salience and sentiment of news coverage about individual vaccines and vaccination more generally. Furthermore, through the generative nature of the models, we can simulate synthetic outcome data, providing insights into the real-world implications of vaccination-related media bias on vaccine hesitancy. By adopting this innovative approach to examine these relationships, we contribute to the literature on media effects within the context of health communication. Our findings hold implications for policy-makers, journalists, health communication practitioners, and scholars interested in comprehending the role of media in shaping public attitudes towards vaccination, both during the COVID-19 pandemic and beyond.

HCO01 Covid-19: Media coverage, campaign messages, and health behaviour

PP 0239 Threat, self-protection, or prosocial? The effects of message appeals on young adults' COVID-19 protection measures

Constanze Rossmann¹, Anne Reinhardt²

¹ LMU Munich, Department of Media and Communication, Munich, Germany

² University of Vienna, Department of Communication, Vienna, Austria

Young adults' compliance with COVID-19 protection measures was comparably low in Germany. Presumably, the predominant use of prosocial messages in COVID-19 campaigns has failed to resonate with this age group. In support of this argument, we identified risk perception and self-protection, and not the protection of others, as the most influential factors of compliance among young adults in a formative mixed-method survey study based on the Theory of Planned Behavior and the Health Belief Model (Authors, blinded). This suggests that fear appeals and self-protection messages should be more effective than prosocial messages.

However, this evidence needs to be confirmed, especially since previous research on message appeals in COVID-19 communication yielded mixed results. Some studies found stronger effects for prosocial compared to self-protection messages (e.g., Yang, 2023), others showed no clear advantage for prosocial appeals (e.g., Miyajima & Murakami, 2021). Fear appeals also produced mixed outcomes, like increased threat perception but decreased vaccination intentions (Liu et al., 2022). Therefore, we formulate the following open research question:

RQ1: How do the (a) perceived severity, (b) attitude, and c) intention differ between threat, self-protection, and prosocial messages?

Building on the Health Belief Model, we further hypothesized that threat appeals influence intentions to comply not only directly but indirectly via increased risk perception:

H1: Threat messages influence intentions to comply indirectly via risk perceptions.

We conducted an online experiment with $N = 570$ participants aged 18–29. Participants were randomly assigned to one of three conditions: threat, prosocial, or self-protection appeal. The messages were incorporated in a 3-minute information video. After exposure, we assessed perception of COVID-19 severity, attitude, and protective intentions. To address RQ1, ANCOVAs were computed for each dependent variable using SPSS 29. Furthermore, we applied a serial mediation model with message type (threat vs. no-threat) as the independent variable, using PROCESS (Hayes, 2013; Model 4, 10,000 bootstrap samples) to answer H1. All analyses were controlled for gender, education, age, and prior infection. The results show a significant effect of message appeal on perceived severity ($F(2, 558) = 4.57, p < .05$). Specifically, fear appeal messages led to significantly higher perceived severity ($M_{adj} = 2.55, SE = 0.07$) compared to prosocial appeals ($M_{adj} = 2.27, SE = 0.07$). However, the stimuli did not alter participants' attitudes toward protective measures ($F(2, 558) = 2.64, p = .07$) or their protective intentions ($F < 1, p = .66$). In the mediation analysis, we found support for H1 (indirect effect: $b = 0.05, SE = 0.21, Lower\ CI: 0.16, Upper\ CI: 0.10$): Threat appeals led to higher perceived severity ($b = 0.23, p < .01$), which, in turn, increased the intention to comply ($b = 0.23, p < 0.001$).

Thus, our study confirms the results of our formative study in that emphasizing personal risks may be more influential in promoting compliance among young German adults than prosocial appeals. With this, our findings contribute to evidence-based communication strategies and provide insights into the nuances of messaging during a public health crisis.

HCO01 Covid-19: Media coverage, campaign messages, and health behaviour

PP 0240 Exploring the effects of news consumption, interpersonal communication, and trust in government on health behaviours: A longitudinal study

Adriana Solovei¹, Saar Mollen¹, Julia van Weert¹, Marijn de Bruin^{2,3}, Bas van den Putte¹

¹ University of Amsterdam, Department of Communication Science/Amsterdam School of Communication Research ASCoR, Amsterdam, Netherlands

² National Institute for Public Health and the Environment RIVM, Corona Behavioural Unit, Bilthoven, Netherlands

³ Radboud University Medical Center, IQ Healthcare, Nijmegen, Netherlands

Background

A wide adherence to behavioural regulations is crucial for limiting the spread of viruses during pandemics. Factors that can impact adherence to behavioural regulations include, among others, news consumption, interpersonal communication, and trust in government. However, there is scarce literature investigating how these factors influence each other over time. The current study aims to explore the longitudinal relationships between news consumption, interpersonal communication, trust in government, and adherence to behavioural regulations during the first year of the COVID-19 pandemic in the Netherlands.

Methods

We used data from a dynamic cohort study conducted by the Corona Behavioural Unit of the National Institute of Public Health and Environment in the Netherlands (RIVM). Data from four waves (May 2020–January 2021), on 6341 respondents, were analysed. A cross-lagged structural equation model was employed, in the programme AMOS 29, including four variables: news consumption frequency (regarding COVID-19), interpersonal communication valence (regarding governmental COVID-19 regulations), trust in government, and adherence to behavioural regulations, all measured in each of the four waves in the model. Given the large sample size, only effects above $\beta > .10$ were considered worth interpretation, at a p -value lower than .05.

Results

Preliminary results, focusing on handwashing behaviour, revealed reciprocal effects between interpersonal communication valence and trust in government, throughout all four waves in the model (β between .17 and .31). This means that, among the respondents in our sample, more positive interpersonal communication about the government's COVID-19 regulations led to a higher trust in government, and vice versa. No substantial effects were found between news consumption frequency and the other variables ($\beta < .07$), nor between adherence to behavioural regulations and the other variables ($\beta < .03$). For the ECREA 2024 conference, we plan to analyse and present the effects on adherence to other behaviours as well, namely COVID-19 testing, social distancing, quarantining, and hygiene regulations.

Discussion

Interpersonal communication valence and trust in government appear to influence each other. Therefore, public campaigns aiming to increase trust in government could focus on or promote positively valenced interpersonal communication among the population. The two-step flow communication theory, suggesting that interpersonal communication mediates the effects of news consumption on (health) behaviour does not seem to apply to handwashing behaviour. However, future research should explore this in the context of other behaviours, as well as investigate whether moderators, such as age, gender, or level of education, can further shed light on these relationships.

HCO02 Health communication about nutrition, substance use, and exercise

PP 0336 The role of communication in the formation of naive beliefs on the consumption of food supplements

Salvador Perelló Oliver¹, Ana García-Arranz¹, Rosa Berganza Conde¹

¹ Universidad Rey Juan Carlos, Communication & Sociology, Madrid, Spain

In recent decades, a dominant message has been perpetuated in the collective imagination by the media, marketing, and even scientific circles on the search for long-term sustainable wellbeing, a holistic approach focused on self-care, and preventative health. This has all been augmented by the global pandemic which has deepened the public's vulnerabilities in a drive for self-preservation. In this context, increasingly independent consumers face continuous decisions on their health in a setting of growingly complex health systems, and a market saturated with "miracle" products, at the same time as the population is exposed to health information that is not always accurate (Hong & Kim 2019; Im & Huh, 2017). Of all the categories included in the self-care sector, the most influential has been food supplements (FS) which has taken on a commanding position in the market reaching a market size of €32.6 billion in Europe in 2022 (Euromonitor International, 2023). It remains striking that today's much more sophisticated and empowered consumers still hold as healthy and promoting wellbeing products that may not have said properties and may even be harmful to the very health that they prioritize. What is conceived as potentially beneficial has been proven in many cases to be "health fraud" (FDA, 2019).

Whilst the general thrust of research has been shaped by the categorical need to foster due awareness of these products, given their potential risks (Chang, 2019; Ju et al., 2019), there is a significant pre-existing gap in determining the aspects that come together to form it. To bridge this gap, this study aims to analyze the role of communication in creating and/or reinforcing naive beliefs on FS. These are formed as a reflective aspect of the contradictory relationship between the search for preventative health and the consumption of harmless or potentially harmful products, as FS have been proven to be.

The methodology is based on an original CAWI survey conducted in Spain in 2020 on a sample ($n = 1200$ interviews) stratified by geographical area into the categories of population size, sex, and age with a confidence level of 95%, 2 sigma, and a sampling error of $\pm 2.89\%$.

The results show that only 20.6% of those surveyed say they do not give any credence to messages concerning these products. In turn, 75% still trust the false role attributed to these products in helping to cure illnesses; an assertion that, furthermore, is expressly forbidden by European legislation. Nevertheless, 39.7% believe that the government and legislation prevent the inclusion of false claims in marketing messages.

These and other findings bring to light the urgent need for appropriate and accurate information to prevent effects that may have dramatic consequences on public health. The economic interests of a spectacularly growing sector and the media need for its advertising fees will lead to serious problems stemming from a lack of ethics and the lack of compliance with the stipulations of legislation. Likewise, greater effort is required in education to counter shortcomings in health knowledge and the clear existing information deficits.

HCO02 Health communication about nutrition, substance use, and exercise

PP 0337 Responses to (un)healthy advice: Processing and acceptance of health content creators' nutrition misinformation by youth

Margot Lissens¹, Darian Harff¹, Desiree Schmuck²

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

² University of Vienna, Department of Communication, Vienna, Austria

Social media users often feel overwhelmed by the sheer amount of available information (Pentina & Tarifdar, 2014). Simultaneously, nutrition misinformation is flourishing on social media (Marocolo et al., 2021). According to dual-process models (Petty & Cacioppo, 1984), especially those who have low levels of involvement might be susceptible to adopt nutrition misbeliefs and change their diet accordingly based on heuristic cues, as they are less able and motivated to process misinformation in a systematic way in order to identify said misinformation.

Such heuristic cues can emerge from different social media personalities, who may disseminate nutritional misinformation: Celebrities, who are famous due to their profession outside of social media (Chiu & Ho, 2023); influencers, 'ordinary people' who built up celebrity status due to their successful self-presentation on social media (Pöyry et al., 2019); and (semi-)professional health content creators, who share their health expertise online (Thompson, 2023), e.g., health journalists. Source credibility theory postulates that acceptance of an endorser's message is dependent on the source's expertise, attractiveness, and trustworthiness (Ohanian, 1990). Source credibility has repeatedly been found to explain persuasive effectiveness of celebrities and influencers (e.g., Chiu & Ho, 2023). Within the nutrition context, all three sources stand out in at least one aspect of source credibility: Celebrities are attractive due to their successful career, influencers are trustworthy due to their 'ordinary people' status, and health journalists hold (self-declared) expertise. Thus, we aimed to research if these social media personalities differ in their ability to convincingly spread nutrition misinformation and what role involvement plays for these effects.

Method

To test our hypotheses, we conducted a survey-experiment ($N = 480$) among German youth ($M_{\text{age}} = 19.80$, $SD_{\text{age}} = 1.79$) using a 2 (presence vs. absence of nutrition misinformation) \times 3 (source, i.e., health journalist vs. celebrity vs. influencer) randomized factorial design. Pretests and manipulation checks indicated overall successful manipulations. All measures, except for adoption of misbeliefs, which were specific to the presented products, were based on established, validated instruments (Cronbach's $\alpha > .75$).

Results

Exposure to misinformation did not lead to adoption of misbeliefs ($b = -1.48$, $SE = 1.34$, $p = .27$) or dietary intentions ($b = 0.02$, $SE = 0.09$, $p = .86$) irrespective of involvement. Messages of health journalists, compared to those of influencers, led to higher misperceptions (i.e., a higher perceived nutritional value of the featured products), regardless if they shared misinformation or not ($b = -5.21$, $SE = 2.18$, $p = .02$). Involvement had no moderating impact on this effect ($b = -0.37$, $SE = 0.21$, $p = .08$). Exploratory analyses revealed that perceived source expertise was highest when the source was a health journalist—irrespective of presenting misinformation—which predicted increased adoption of misbeliefs in comparison with influencers ($b = -1.03$, $SE = 0.48$, $CI = [-1.97, -0.10]$) and celebrities ($b = -1.07$, $SE = 0.47$, $CI = [-1.97, -0.14]$).

In conclusion, adoption of misbeliefs was mainly determined by perceived source expertise, which young people readily attributed to (semi-)professional health content creators, even when they posted misinformation. Thus, our findings imply that young people rely on the expert heuristic when they encounter an unknown health content creator on social media, which entails a risk of falling victim to misinformation by self-declared health experts.

HCO02 Health communication about nutrition, substance use, and exercise

PP 0338 Promoting healthier eating habits: An online experiment examining the effect of nudges and components of the Theory of Planned Behavior on food choices among German university students

Janine Brill¹, Dominik Daube², Lars Guenther³

¹ Chemnitz University of Technology, Chair of Media Communication, Chemnitz, Germany

² University of Erfurt- Institute for Planetary Health Behaviour, Chair of Health Communication, Erfurt, Germany

³ Ludwig Maximilian University Munich- Institute for Communication Studies and Media Research, Department of Media and Communication, Munich, Germany

High-risk eating has emerged as a global health challenge, with dietary choices contributing to health problems and lifestyle-related diseases such as type 2 diabetes. Canteens are a common place for individuals to eat away from home and play an important role in shaping people's eating habits. However, the quality and healthfulness of canteen meals vary widely, from nutritious and well-balanced options to those loaded with unhealthy ingredients. This variability poses a challenge in promoting healthier eating habits and addressing the risk factors associated with poor dietary choices. Efforts to improve the nutritional information of canteen meals and raise awareness of healthier food options are crucial to addressing the global issue of high-risk eating.

Strategies such as *nudging* have been introduced to encourage people to make healthier food choices. Thaler and Sunstein's nudging approach involves subtly influencing people's behaviors by making small, strategic changes in the way choices are presented to encourage desired outcomes without mandating specific actions. Similar to menus displayed in canteens and online, nudges can be implemented in both physical and digital spaces (i.e., *digital nudging*). The use of behavioral theories is crucial to examining and understanding the factors that influence meal choice behavior.

Ajzen's Theory of Planned Behavior (TPB) describes human behavior based on an individual's intentions. According to TPB, behavioral intentions are influenced by three main factors: (1) *attitudes* toward the behavior, (2) *subjective norms* or social pressures related to the behavior, and (3) *perceived behavioral control* or the individual's belief in their ability to perform the behavior. Ultimately, these factors combine to shape an individual's intention to engage in a particular behavior, which in turn predicts the likelihood that the behavior will actually occur.

Given the limited research on the effectiveness of digital nudges in promoting healthy eating, our study examines the impact of digital nudges in online menus on promoting healthy meal choices (HMC), taking into account the components of the Theory of Planned Behavior (TPB).

Therefore, we pose the following research questions:

RQ1: How do a) attitudes, b) subjective norms and c) perceived behavioral control toward healthy eating influence food choices in canteens?

RQ2: How do a) attitudes, b) subjective norms and c) perceived behavioral control toward healthy eating influence the effectiveness of nudges in choosing healthy meal alternatives in canteens?

We conducted a pre-registered online experiment ($n = 318$) among university students in Germany. Participants were randomly assigned to one of four nudging conditions: a nutrition traffic light, a nutrition table, a combined condition, or a control condition with no nudge. Alongside meal choices, we collected data on TPB constructs and sociodemographics. Participants also provided open-ended responses explaining the reasons for their meal choices. Menus were tailored to vegan, vegetarian, or omnivore diets.

The data collection phase is complete and we look forward to presenting the results at the 2024 ECREA conference.

HCO02 Health communication about nutrition, substance use, and exercise

PP 0339 Introducing a school-based active involvement intervention integrating media to diminish adolescents' smoking and vaping behaviors

Sofie Vranken¹, Femke Geusens², Kathleen Beullens¹

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

² Uppsala University, Department of Women's and Children's Health, Uppsala, Sweden

Introduction

In Belgium, smoking onset occurs at 15.1 years, and vaping is on the rise among adolescents. This is concerning as smoking intensifies throughout adolescence, and is a major cause of cancer (WHO, 2021). This project aligns with the conference theme of examining disruptions in health by developing and testing an intervention targeting smoking/vaping among 13-to-15-year-olds, a critical phase for smoking initiation. Additionally, this intervention accounts for the role of media in smoking behaviors. Adolescents are pervasive users of traditional and social media, through which they frequently encounter glamorized portrayals of smoking/vaping (Allem et al., 2022; Barker et al., 2019). Building on the Social Cognitive Theory (Bandura, 2001) and Theory of Planned Behavior

(Ajzen, 2019), exposure to such content may lead to favorable smoking/vaping attitudes, outcome expectations, inflated normative perceptions, and an increase in these behaviors (Donaldson et al., 2022).

To effectively target these behaviors, some scholars argued that interventions should combine age-appropriate education and youth empowerment. One promising but under-explored approach lies in the theory of active involvement (TAI; Greene, 2013). Interventions grounded in the TAI consist of an analysis and design phase. In the analysis phase, individuals acquire health and media literacy skills as they learn to recognize determinants of smoking (attitudes, expectations, norms) and to examine pro-smoking messages prevalent in series, movies, and social media. In the design phase, adolescents craft their own anti-smoking campaign, enhancing their health literacy through counterarguing and peer discussions.

We are among the first to empirically test an active involvement intervention and to disentangle the long- and short-term effectiveness of it. We hypothesize that participants in the intervention compared to the control group show a decrease in (a) favorable smoking/vaping attitudes, (b) positive outcome expectations, (c) normative perceptions, (d) intention to engage in these behaviors, and (e) smoking/vaping behaviors immediately after the intervention and six months later.

Method

We employed a quasi-experimental pretest/posttest design, randomly assigning participants from secondary schools to the intervention ($n = 685$) or control group ($n = 525$). The intervention group undergoes the intervention in the form of school-based curriculum, while the control group receives. Ethically, the control group will receive the intervention post-study. To evaluate the effectiveness, a baseline measurement has been conducted before the intervention (Sept '23) consisting of questions regarding sociodemographic elements (age, gender, SES), smoking cognitions (attitudes, norms, expectations, intention) and behaviors (Greene et al., 2020). Two weeks after the pretest (Oct/Dec '23), the intervention group received an intervention and filled out a posttest survey with the same measures as in the pretest. The control group filled out the same survey. All participants will fill out a survey in April '24 to test the long-term effectiveness.

Results

We are only presenting the intervention protocol in this abstract because we are in the midst of our data collection, but will present the results of our hypotheses at ECREA.

Discussion

The study's significance lies in potentially paving the way for examining active involvement interventions' effectiveness. The findings provide guidance for future interventions addressing media and other health-risk behaviors.

HCO02 Health communication about nutrition, substance use, and exercise

PP 0340 Digitally enhanced fitspiration content on social media: A systematic literature review

Isa Vos¹, Thomas Friemel¹

¹ University Of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Relevance & Research Questions

Fitspiration content on social media platforms advocates a healthy lifestyle through exercise and healthy eating (Vandenbosch et al., 2022). However, the combination of idealized bodies promoting restrictive eating habits and excessive exercise can have adverse effects on body image (Vandenbosch et al., 2022). Photo modification enhances the discrepancy from offline bodies (Bij de Vaate et al., 2020) and is found to enlarge the negative effects on the exposed individual (Claeys et al., 2023; Kleemans et al., 2023). An example of photo modification is the use of augmented reality (AR) filters that have become available on various social media applications (Isakowitsch, 2023). Considering that social media users are frequently exposed to unattainable beauty ideals (Ward, 2016) and its recurrence in Fitspiration content (Delgado-Rodríguez et al., 2022; Harriger et al., 2023; Tiggemann and Anderberg, 2020; Tiggemann, 2022), understanding the idealized component and its associated effects is essential. An increasing body of literature is investigating various aspects of this new phenomenon including strategies how to mitigate negative effects (Easton et al., 2018; Naderer et al., 2022). However, guidance for technology providers, regulators, educators, and users is still limited because research spreads across various scientific disciplines and a systematic overview of the literature is yet missing. Therefore, the purpose of this literature review is to identify and classify (a) the research that investigates the utilization of enhanced Fitspiration content on social media and (b) the known effects on both individuals applying enhancement techniques and individuals exposed to the enhanced Fitspiration content.

Methodology

In 2015, the first AR filters on social media were introduced, namely Snapchat Lenses. Therefore, the literature review includes articles published between 2015 and 2023 on Web of Science, Scopus, and Dimensions following the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines (Page et al., 2021).

The used search query is: ("Social media" or "smartphone" or "SNS" or "TikTok" or "Instagram" or "Snapchat") and ("Fitspiration" or "Fitspo" or "workout") and ("edit*" or "alter*" or "modif*" or "enhanc*" or "filter" or "augmented reality" or "AR" or "photoshop"). All English articles are analyzed concerning research areas, theoretical models, and empirical findings. Study quality is assessed using the Mixed Methods Appraisal Tool (Hong et al., 2018).

Results

The search query resulted in 5074 potentially relevant articles, including 468 duplicates. Most articles were found in the research areas of health sciences (48%), psychology (31%), communication (14%) and computer sciences (6%). Furthermore, results indicate a growing relevance of this topic, with the number of yearly articles increasing from 176 in 2015 to 1048 last year. The cleaning and coding of the articles are ongoing and will be finished in the summer of 2024.

Implications

This systematic literature review is the first of its kind and will provide a comprehensive understanding of the current research in the emerging field of enhanced Fitspiration content. The overview of existing insights and the identified gaps will be used to inform various stakeholders and further work packages planned in this ongoing research project.

HCO03 Risk perception in health communication

PP 0452 Risk perception and communication of radon gas

[Jorge Vázquez-Herrero](#)¹, [Berta García-Orosa](#)¹, [Xosé López-García](#)¹

¹ Universidade de Santiago de Compostela, Communication Sciences, Santiago de Compostela, Spain

We present the results of a project on risk perception and communication about radon gas in Spain, where there are no previous studies on the construction and social perception of this health threat.

Radon is an odourless, tasteless and colourless radioactive gas, produced naturally by the decay of uranium from soil and rocks. It has been recognized as a human carcinogen (International Agency for Research on Cancer, 1988), being the second most frequent cause of lung cancer for tobacco users and the first cause in non-smokers. Despite its high concentration in several regions of the world, it is an issue that citizens know little about and do not recognize as a health risk (WHO, 2009).

Spain is a country where radon is very present. The mapping of radon potential has established priority action areas which represent 17% of the surface of the Spanish territory (Consejo de Seguridad Nuclear, 2017; García-Talavera San Miguel & López Acevedo, 2019).

The aim of the study is to understand the risk perception of radon and the degree of knowledge of the Spanish population, as well as to identify whether sociodemographic variables and the incidence of radon in their environment affect risk perception. The research method was based on a survey of the Spanish population (N = 1,985), with a nationally representative sample.

Results allow us to confirm that knowledge about radon is low. 70.5% state that exposure to high concentrations can cause lung cancer, but only 43.6% are aware of its natural origin; nor are its characteristics clearly known, as only 42.9% know that it is odorless. Regarding measures to reduce indoor radon levels, only one third indicate appropriate solutions.

The level of concern about the risk associated with radon gas is moderate (4 out of 7), although higher in the most affected regions. However, people are more concerned about the risk of more improbable events than exposure to a naturally occurring gas. Individual risk perception is significantly influenced by gender, knowledge about radon, self-perception of being a concerned person and the likelihood of radon affecting them or people close to them.

Prevention measures taken by the population are very low: 11.0% indicate that they have taken some action regarding this problem. There is also a lack of knowledge about preventive and regulatory measures. However, knowing about radon and taking measures correlates with risk perception and variables such as knowledge about radon.

As regards the information received, traditional and digital media are the most frequent channels. Participants identify the government (24.7%) as the most common source of information. We observed that having received information about radon correlates with risk perception and variables such as age, gender, region and knowledge.

The linear regression model indicates that individual risk perception is constructed based on perceived likelihood of being affected and of affecting family and friends, followed by self-perception of being a concerned person, gender and, with less influence, knowledge about radon and political-legislative actions.

HCO03 Risk perception in health communication

PP 0453 Understanding the public's awareness of antibiotic resistance and the relation with media exposure in the Netherlands

[Kato Helsen](#)¹, Gert-Jan de Bruijn¹, Heidi Vandebosch¹

¹ University of Antwerp, Communication Studies, Antwerp, Belgium

Background

The successful prevention and treatment of an increasing variety of diseases caused by bacteria, parasites, viruses, and fungi is at risk due to Antimicrobial Resistance (AMR). AMR refers to the fact that bacteria, viruses, fungi, and parasites evolve over time and stop responding to medications. It makes illnesses more difficult to cure and increases the risk of serious illness, death, and disease transmission (World Health Organization, 2024). Antibiotic Resistance (AR) or drug resistance represents a specific case of AMR. It represents one of the biggest threats to global health and leads to longer hospital stays, higher medical expenses, and higher mortality rates (World Health Organization, 2015). An important component of an effective and optimal public health response is enhancing the general public's understanding of the causes and consequences of AR in order to decrease antibiotic misuse (Hawkins et al., 2022). Many studies on AR focus on doctors, pharmacists, and patients (McCullough et al., 2015; Rusic et al., 2021). However, the general public also plays an important role in the combat against this health problem. For example, a major reason for AR appears to be overuse of antibiotics and by asking antibiotic prescriptions for non-indicated antibiotic treatment (Chanvatik et al., 2019; Hawkins et al., 2022).

Purpose

Although previous studies have shown low levels of AR awareness in the population and the inverse relationship between antibiotic use and AR knowledge, it is relatively understudied how and where people obtain information about AR and how this relates to knowledge about and awareness of AR (Chanvatik et al., 2019; Hawkins et al., 2022; McCullough, Parekh, et al., 2015). In other health domains, it has been found that media (newspapers, social media, etc.) play an important role in health information and that awareness can be influenced by the media people consume (Catalán-Matamoros et al., 2019; Scafield et al., 2010; Siliquini et al., 2011; van Rijn et al., 2019). Therefore, the study's objective is to investigate the association between news media exposure and knowledge and awareness of AR. These findings can help to develop and evaluate communication strategies targeted to the general public to increase awareness and form a starting point to conduct subsequent content analysis on the media used by the public.

Method

An online survey will be conducted in a representative adult population-based sample (ages between ≥ 18 and 65+). Since the study focuses on a large population, a panel will be used to obtain a representative sample. The questionnaire will consist of three main parts: antibiotic use, knowledge about antibiotics and AR, and information sources and media exposure.

Results & conclusion

Survey development is ongoing and data collection and analysis are scheduled to be completed in April and June 2024 respectively.

HCO03 Risk perception in health communication

PP 0454 The relation between information and vaccine behaviors: A quantitative survey of a stratified non-vaccinated German sample

[Markus Schäfer](#)¹, Elena Link¹, Selina Beckmann¹, Loraine Busetto², Oliver Quiring¹

¹ Johannes Gutenberg-Universität Mainz, Department of Communication, Mainz, Germany

² Goethe-Universität Frankfurt, Institute for Medical Virology, Frankfurt, Germany

Although vaccinations are a medical success story, they are often not taken up by a significant proportion of the population. The skeptical view of vaccination is called "vaccine hesitancy" covering psychological antecedents of vaccination such as attitudes towards their effectiveness and safety ("confidence"), perceiving oneself at risk ("complacency"), weighting the benefits and risks ("calculation"), being motivated by "collective responsibility", or perceiving structural or psychological barriers ("constraints") (Betsch et al., 2018; Cénat et al., 2023).

Among the multitude of factors contributing to vaccine hesitancy are information-related factors (Dubé et al., 2013). Against this background, our study strives for a better understanding of the relationship between information and vaccine behaviors as well as the relationships between the predictors. We supplement research on information seeking (Allington et al., 2021; Schäfer et al., 2021) by examining whether vaccine-related information is purposively avoided (Link, 2022). In addition, trust in several sources stressed as a determinant of vaccine hesitancy (e.g., Dubé et al., 2013; Falcone et al., 2022; Murphy et al., 2021), and functional vaccine literacy (Wang et al., 2018; Zhang

et al., 2023). as one component of health literacy, are considered as predictors of information behaviors, vaccine hesitancy, and intentions. Thus, we postulate that trust and vaccine literacy influence information-seeking and avoidance behaviors, which in turn influences vaccine hesitancy related to individuals' vaccine intentions.

To test the postulated model, we conducted an online survey of a stratified sample of non-vaccinated German residents ($N = 1,328$; age: $M = 46.6$, $SD = 15.6$; 50.4 % female) during the first phase of the COVID-19 vaccination program. We used established measures to capture vaccine hesitancy (Betsch et al., 2018), information behaviors and trust in ten sources (Link et al., 2022; McQueen et al., 2013), and functional vaccine literacy (Wang et al., 2018). For information behaviors and trust, exploratory factor analyses were conducted to explore their underlying structures. We calculated a mean index for information avoidance as the measurement was shown to be one-dimensional. Concerning information seeking, the analysis distinguished between expert sources and traditional sources. Further, trust in social media, one's social surroundings, and media sources were differentiated. The analysis was based on a sequential mediation analysis.

In total, the model explained 69.4 % of the variance in individuals' vaccine intention, between 32.9 % (constraints) and 44.5 % (confidence) of variance in vaccine hesitancy, and between 21.2 % (expert sources) and 26.8 % (traditional media) of the variance in individuals' information behaviors. Confidence, complacency, constraints, and collective responsibility were strongly positive related to vaccine intention. Whereas information behaviors were not directly related to vaccine intention, they were related to vaccine hesitancy. The findings revealed the strongest associations for information avoidance, media trust, trust in social media, and functional vaccine literacy. Information seeking and avoidance were most strongly associated with media trust.

Our findings support the role of information in vaccine behaviors supplementing the current state of research by covering information-seeking and avoidance behaviors and by uncovering the relations between the predictors.

HCO03 Risk perception in health communication

PP 0455 Identifying situational health information seeking patterns for uncertainty management in orthopedic implant patient journeys

[Charlotte Schrimppf](#)¹, [Tanja Fisse](#)¹, [Elena Link](#)², [Eva Baumann](#)¹, [Christoph Klimmt](#)¹

¹ Hanover University of Music – Drama – and Media, Department of Journalism and Communication Research, Hanover, Germany

² Johannes Gutenberg-University, Department of Communication, Mainz, Germany

Background

Knee or hip implants are inserted after years of progressive symptoms such as joint pain and immobility (Driban et al., 2020). For patients, these experiences are associated with the recurrent perception of uncertainty (Bolz-Johnson et al., 2020) as they find themselves in complex and unpredictable situations and feel insecure about their state of knowledge. As outlined in Brashers' (2001) Uncertainty Management Theory, medical (e.g. symptoms, treatment options), social (e.g. relationships), and personal (e.g. abilities) uncertainties can occur simultaneously, overlap each other, and occur at different points in the patient journey (PJ) (Stone & Olsen, 2022).

Depending on individuals' appraisal of uncertainty, health information seeking behavior (HISB) serve as a strategy to manage uncertainty (Brashers, 2001). When uncertainty is perceived as negative, information seeking can help to resolve ambiguity (Brashers & Hogan, 2013). When uncertainty is perceived as positive, information seeking can also serve to increase ambiguity by looking for conflicting information. For the success of the uncertainty management (UM), source selection determined by availability, expected outcome, and trustworthiness of sources is a crucial step (Johnson & Meischke, 1993; Link et al., 2022).

As the multidimensional and temporal nature of uncertainty and its consequences for UM strategies are rarely addressed in research (Kuang, 2018), we aim to extend the understanding by mapping uncertainties onto the PJ. Consequently, we ask the following research questions:

RQ1: What uncertainties do orthopedic implant patients experience at which points of their PJ?

RQ2: How do orthopedic implant patients manage these uncertainties using HISB?

Method

19 qualitative semi-structured interviews with patients who received a knee or hip implant within two years prior to the study were conducted in 2022. For analysis, we transcribed the audio-recorded interviews verbatim and analyzed each interview using qualitative content analysis (Mayring, 2010) with a combination of inductive and deductive coding.

Results and Discussion

Regarding RQ1, the PJ of orthopedic implant patients could be divided into six phases, from the first symptoms to living with the implant, characterized by different constellations and intensities of physical, psychological, personal/social, and treatment-related uncertainties. For example, treatment-related uncertainties were prevalent throughout

the PJ, psychological uncertainties occurred at the beginning, and social and personal uncertainties appeared at the beginning, in the middle and at the end of the PJ.

Regarding RQ2, patients reported frequent use of HISB to manage their uncertainties: Across various types, they described interpersonal sources such as health professionals, other affected patients, and their social network as most relevant. Media sources were occasionally mentioned, e.g. for decision making. Source preferences varied according to the type of uncertainty. For example, in the early phase, patients focused on sources with medical expertise regarding the physical experience of pain. For social and personal uncertainties such as work life, the social environment seemed to be more important.

Our results reveal a high degree of situational dependency of UM strategies over the course of a PJ. These findings should be considered to strengthen patients' UM skills in the spirit of patient-centered care (Epstein & Street, 2007).

HCO03 Risk perception in health communication

PP 0456 Can metaphor improve comprehension and acceptance of Patient Education Materials on immunotherapy?

[Nynke Bos](#)¹, Lisa Vandeberg^{1,2}, Anke Oerlemans¹, Marlies Hulscher¹, W. Gudrun Reijnen³

¹ Radboud University Medical Center, IQ Health, Nijmegen, Netherlands

² Radboud University, Behavioural Science Institute, Nijmegen, Netherlands

³ Vrije Universiteit Amsterdam, Department of Language- Literature and Communication, Amsterdam, Netherlands

Shared understanding between patients and healthcare providers is essential for informed decision-making in medical care (McCabe, 2021; Street Jr et al., 2009). Written patient education materials commonly complement verbal information from healthcare provider – patient conversations and contribute to enhancing patients' comprehension (Dierks et al., 2019; Humphris & Field, 2003). However, existing written materials are often insufficiently readable and understandable (Rooney et al., 2021), which makes them less effective. Written patient information materials should be accurate in content, but also accessible to people with diverse literacy skills. This can be achieved by, for example, avoiding jargon and using clear language and short sentences. Additionally, metaphors may contribute to the understanding when used in patient education materials, as they have the purpose to explain complex concepts in a more easy way. Psycholinguistic studies also suggest that the use of metaphors may influence attitudes and behavioral intentions towards medical-related topics (Krieger et al., 2010; Scherer et al., 2015).

In this study, we assess people's responses to various types of patient education materials to test which format results in optimal (subjective and objective) comprehension, attitudes and behavioral intentions, using the case of immunotherapy, which is a novel treatment for patients with invasive fungal infections. We aim to recruit a sample of 1,095 U.K.-based participants through Prolific Academic, based on power analysis. Participants will first be presented with a scenario about their relative being admitted to the ICU with a severe fungal infection. Next, they are randomly assigned to one of various leaflets in a between-subjects experiment. Leaflets include a standard leaflet, based on evidence-based practices for comprehensive language, and a standard leaflet including metaphors. After reading the leaflet, participants' subjective and objective comprehension, attitudes and intentions to accept immunotherapy for their relative will be assessed. Data will be collected and analyzed during Spring 2024.

HCO04 Social capital & methodological advances in health communication

PP 0608 Slovenian adult population's response to the "Together for Health" prevention and health promotion program. Reflecting on facilitators and barriers of the program's success through empowerment and capital theories

Tanja Kamin¹, Sara Atanasova²

¹ University of Ljubljana- Faculty of Social Sciences, Centre for Social Psychology, Ljubljana, Slovenia

² University of Ljubljana- Faculty of Social Sciences, Centre for Methodology and Informatics, Ljubljana, Slovenia

Empowerment is an increasingly popular concept in contemporary behaviour and social change discourse in the field of health, sometimes used as a vague goal in itself (Kamin et al. 2022). To achieve empowerment in health, we must address accessibility and allocation of valued resources related to specific problems (Laverack, 2006; Zimmerman, 1999). Finding out what resources individuals need to empower themselves in the field of health and improve their health outcomes is of great importance, but it is not necessarily enough. Resources are not equally distributed among people, and health related interventions can further affect this distribution in a positive or negative way (Kamin and Anker, 2014). Drawing on Bourdieu's (2002[1986]) theory of capital, we demonstrate how certain forms of resources (economic, social, and cultural capital) influence individual empowerment in relation to personal health care, which is related to positive (or sometimes negative) health prevention processes and outcomes.

The study is based on data collected in the project Barriers and facilitators to the Slovenian adult population's response to the "Together for Health" prevention and health promotion program related to noncommunicable chronic health conditions. We will present results of an online panel survey on a representative sample of general population in Slovenia (n = 1540, 30–65 years old), which are alligible to participate in "Together for Health" preventive program.

The results of the study reveal at least four important findings: (1) empowerment in the field of health occurs at the intersection of different factors at the micro, mezzo and macro levels; (2) different types of capital (resources) that people have in the field of health should be observed as either facilitators or barriers for health promotion program's success; (3) empowerment is not enough for desirable health processes and outcomes; and (4) public health interventions should better address the resources that (re)produce health inequalities among people.

These insights can significantly enrich the debate on (health-related) resources and their use by health professionals as part of health prevention and promotion programs to meet individual health needs and achieve (positive) empowerment outcomes in different social and health-related settings.

HCO04 Social capital & methodological advances in health communication

PP 0609 Social support through shared experiences. An exploratory analysis of various manifestations, reasons, and outcomes of implant patients interacting with affected others

Tanja Fisse¹, Charlotte Schrimppf¹, Elena Link², Eva Baumann¹, Christoph Klimmt¹

¹ Hanover University of Music- Drama and Media, Department of Journalism and Communication Research, Hanover, Germany

² Johannes Gutenberg University Mainz, Department of Communication, Mainz, Germany

Background

Patients – particularly those with invasive treatment such as patients in need for orthopedic or cochlear implants (CI) – possess diverse support needs. Beyond medical issues, they face challenges related to personal and social life (Brashers et al., 2003). To cope with these challenges, social support can be crucial (Cutrona & Suhr, 1992).

Social support covering informational, tangible, emotional, esteem, and network support from others (Cutrona & Suhr, 1992). Research indicates that connecting with individuals sharing disease experiences can be particularly beneficial (Niederkrotenthaler & Till, 2020). To access social support from other patients, various types of relations may emerge, often within weak ties (Wright et al., 2010). Offline/online self-help groups allow patients to connect with peers in a group-related setting (Chung, 2014; Love et al., 2012). Patients can also network on a direct, bilateral

level (e.g. in the waiting room). In addition, the rise of social media and influencers providing insights into their diseases (Wellman et al., 2022) facilitate indirect person-centered connections.

Since the role of different types of relations (bilateral, group-related, person-centered) for social support have not been considered in health communication research, we derive this exploratory research question:

Which forms of social support are sought and gained comparing the different types of relation?

Method

33 qualitative semi-structured interviews were conducted in 2022 with patients who received a knee/hip implant (n = 18), a CI (n = 13) or parents of children who received a CI (n = 2). For analysis, we transcribed and analyzed each interview using qualitative content analysis (Mayring & Fenzl, 2022).

Results and Discussion

Informational and emotional needs were central motives to connect with other patients – often compensating for other sources like physicians. Group-related relations were associated with motives such as entertainment and relief by expressing anger. Regular use of self-help groups fostered a sense of belonging, leading to the motive to keep up with group members' lives. Both group-related and bilateral relations were associated with the motives of orientation and providing support.

Regarding the gained forms of support, patients described functional and dysfunctional outcomes. Among *functional outcomes*, all interactions could provide informational and emotional support. Additionally, all types could promote esteem support as patients gained empowerment through role models, encouragement, and comprehensive information. Person-centered relations, including identification with fictional characters, allowed patients to enhance their disease-related self-acceptance. Network support was evident in bilateral and group-related relations, fostering friendships and a sense of purpose through providing support.

The *dysfunctional outcomes* were primarily emotional. In all types, patients felt anxiety and uncertainty when they learned of others' negative experiences. Bilateral and person-centered relations were associated with frustration when patients perceived others as doing better. Group-related connections led to anger when the communication was perceived as unfriendly or too grieving.

Our findings highlight the crucial role of social support from affected others identifying underlying mechanisms such as social comparison (Bennenbroek et al., 2002). The results can be used to derive guidelines for promoting supportive communication in various types of relations.

HCO04 Social capital & methodological advances in health communication

PP 0610 Rethinking stigma assessment: A pre-registered, multi-group study on alternative scales

Alexander Ort¹, Freya Sukalla²

¹ Universität Luzern, Gesundheitswissenschaften und Medizin, Luzern, Switzerland

² Universität Leipzig, Institut für Kommunikations- und Medienwissenschaft, Leipzig, Germany

Stigmatization, as a social process involving the co-occurrence of labeling, stereotyping, separation, status loss, and discrimination, is still widespread with negative impact on many groups, such as people with disabilities or mental illnesses. Consequently, the underlying aim of stigma research is to identify ways to overcome stigmatization. In this context, the use of conventional stigma scales that ask participants' level of agreement to negative stereotypes, such as "lazy" or "violent", has been critically examined for its potential to inadvertently reinforce those negative stereotypes and stigma (Ort and Sukalla, 2023). Drawing upon theoretical frameworks related to stereotype activation (Hilton & von Hippel, 1996; Bargh, 1999; Macrae and Bodenhausen, 2000; Greenwald et al., 2002), this study aims to assess whether alternative ways of stigma assessment can effectively measure stigma without contributing to its perpetuation or the fostering of stereotyping. The study's central hypothesis is grounded in the assumption that while traditional scales may activate and even heighten stigma and stereotypes, alternative assessments using positive phrasing or bipolar differentials as opposed to negative stereotypes are less likely to do so.

Our research design adopts a pre-registered 3 (target group) × 3 (scale version) factorial approach, focusing on three target groups: obesity, schizophrenia, and sexually transmitted diseases. We compare original stigma scales with positively rephrased versions and semantic differential scales. A power analysis (ANOVA, $f = .1$, $\alpha = .05$, power = .8) indicated the need for 967 participants to test the effects of different ways to assess stigma. Participants in the study are randomly assigned to engage with either the conventional scale or one of the alternatives. Subsequently, the survey probes into social distance and social comparison (upward/downward) as proxies for stigma towards the respective groups. These measures are instrumental in evaluating the impact of scale type on perceptions of stigma.

Additionally, the study delves into participants' cognitive and emotional responses to the scales. It includes an assessment of attitudes towards the scales. Participants will evaluate the scales on aspects such as quality, clarity, usability, and the extent to which they might be biased or stigmatizing. Qualitative open-ended questions will add

to this assessment, offering more profound insights into the participants' subjective experiences and perceptions. Currently, we have applied for approval from the ethical review board of the university and expect to start data collection in February. All results will be available to be presented at the conference in September.

We expect our study to significantly contribute to the stigma research field. By exploring the effectiveness and ethical considerations of different stigma scales, it will provide valuable insights into how public stigma is measured and understood. The findings will be of particular interest to researchers and practitioners in psychology, sociology, and public health, who are concerned with the ethical measurement of stigma. The implications of this research are potentially influencing future research methodologies and practices in the assessment of public stigma and guiding the development of more responsible and sensitive tools in stigma-related research.

HCO04 Social capital & methodological advances in health communication

PP 0611 How to introduce a quality label for health apps? A co-creation study to tailor supporting communication to user needs, increase understanding and support use

[Emilia Pajor](#)¹, [Corine Meppelink](#)¹, [Julia van Weert](#)¹

¹ University of Amsterdam, Department of Communication Science, Amsterdam, Netherlands

The use of health apps can be beneficial for health outcomes or disease management, but the number of health apps available in app stores is overwhelming (Carroll et al., 2017). Users struggle to determine which apps are safe, provide adequate health benefits, and handle data carefully (Essén et al., 2022). Such concerns can sometimes even prevent people from using health apps (Torous et al., 2018). To help people make informed choices about health apps, a European health app quality label has been developed (Hoogendoorn et al., 2023). In this label, scores on four quality criteria are displayed: "healthy and safe", "easy to use", "secure data", and "robust build". The score for each criterion can range from A (highest score) to E (lowest score) (CEN-ISO/TS 82304-2; International Organization for Standardization, 2021).

The aim of our study is to introduce the new health app quality label to future users in an understandable way. As the label itself is quite complex and contains more information than other labels such as the Nutriscore or the Energylabel, we applied co-creation to ensure that European citizens can understand the information provided by the label. Guided by the Double Diamond approach (Design Council, 2019) we investigated what aspects of the quality label are clear to future users and which elements require additional explanation.

In June-July 2023 (phase 1), five co-creation sessions (group interviews) and two individual interviews with participants from multiple European countries ($N = 22$; $M = 57$ years; $SD = 17.66$) were conducted. Inclusion criteria were being 16+ years old and smartphone user. Data were analyzed using systematic interpretative content analysis. Concepts of the Diffusion of Innovation Theory (Rogers, 2003) and Unified Theory of Acceptance and Use of Technology (Venkatesh et al., 2003) were used as sensitizing concepts during analysis. Based on the results, five explanatory animations in two languages were developed, in which the content of the health app quality label was explained, and awareness was raised for the need for such a quality label. In November 2023 (phase 2), participants ($N = 20$; $M = 44$ years; $SD = 15.74$) were invited to share their feedback on the animations in a focus group setting.

The main findings from our co-creation process were that the purpose and content of the videos were well aligned with participants' information needs. They also appreciated the short format and the clean, modern visuals. However, participants found the language used to be too complex. Some information was also found to be too detailed or unclear. Participants also expressed the need for more employment of the user's perspective and the inclusion of "human elements". Furthermore, they indicated that the animation should demonstrate how to find and open the label in app stores. Based on this feedback, the animations were improved to enable everyone in Europe, and especially those citizens who are vulnerable due to lower levels of health literacy, to make informed choices about health apps. This can ultimately empower this group and benefit their health and European public health in general.

HCO04 Social capital & methodological advances in health communication

PP 0612 Reproducibility of health-related literature samples: Standardized sampling for systematic literature reviews (STAMP method)

[Ayanda Rogge](#)¹, [Luise Anter](#)¹, [Deborah Kunze](#)¹, [Kristin Pomsel](#)¹, [Gregor Willenbrock](#)¹

¹ TUD Dresden University of Technology, Institute of Media and Communication, Dresden, Germany

With the field of health communication expanding, systematic literature reviews (SLRs) are increasingly necessary for mapping the research field and synthesizing research evidence. However, especially in the social sciences such as health communication research, scholars often face a theoretically and methodologically diverse publication sample. For instance, the influence of media content on help-seeking intentions for mental health problems is assessed by both qualitative interview studies and quantitative online experiments. This diversity typically requires

qualitative synthesis methods, which – unlike traditional meta-analysis – pose challenges for SLRs' replicability and reproducibility.

Therefore, we propose the STAMP method for STandardized sAMPLing for systematic literature reviews. STAMP extends existing SLR approaches such as the Cochrane guidelines or the PRISMA 2020 statement, which originate from the context of health care research, by incorporating expertise from communication science. Specifically, we argue that SLR screening itself should be considered as standardized content analysis, a method that is genuine to communication research. By adapting principles of content analysis, STAMP ensures a systematic and objective assessment of publications. Therefore, we see STAMP as a *supplement* that closes a gap in the screening and selection process to increase the replicability and reproducibility of SLRs.

In summary, the STAMP method comprises a four-stage procedure for the sampling process of SLRs. Stage 1 covers the development of a review protocol that contains the SLR's objective and scope, eligibility criteria for including publications and transparently documents the sampling process. This is followed by the development and validation of a search strategy in stage 2, leading to an extensive literature search within relevant databases and search engines. For stages 3 and 4, the eligibility criteria are transferred into categories of a codebook. In stage 3 – the abstract-based screening (ABS) – these categories are applied to the abstracts collected in stage 2, leading to an ABS score that transparently quantifies screening decisions. The ABS score is calculated as a sum index of all categories representing a publication's fit. In stage 4 – the full-text reading (FTR) – the categories are applied to the full-texts of the remaining publications. Again, these coding decisions are summarized through an FTR score. Finally, only publications above a predetermined threshold value of the FTR score are included in the final sample.

As the scoring system of the STAMP method originates from standardized content analysis, it allows not only for rigorous documentation but also enables measuring inter- and intra-coder reliability of the sampling process. Another strength is its adaptability to the heterogeneous as well as interdisciplinary research landscape common for the field of health communication. Here, STAMP can be used both for SLRs that aim at building a concept in a vaguely defined research area or summarizing empirical evidence within a well-defined research field. Despite its strengths, we will discuss limitations of the STAMP method and discuss the procedure based on an SLR developed in the field of health communication.

HCO05 Technology acceptance in health communication

PP 0702 Neglected narratives: A critical examination of ageing, digitalization, and health in Nordic Media Coverage

Anette Grønning¹, Elisa Tiilikainen², Helena Sandberg³

¹ University of Southern Denmark, Department of Design – Media and Educational Science, Odense M, Denmark

² University of Eastern Finland – Finland, Department of Social Sciences, Kuopio, Finland

³ Lund University, Department of Communication and Media, Lund, Sweden

This paper addresses critical challenges facing the Nordic countries and their aging population, focusing on digitalization and health development. It stems from the interdisciplinary HAIDI-project, aimed at generating new knowledge to counteract health disparities resulting from changing demographic patterns and addressing digital divides threatening inclusion and democracy. Due to increased longevity, the ageing populations in the Nordics are inevitably affected by older citizens' chronic conditions and limitations in functional capabilities in daily living, increasing the need for more effective healthcare systems. The proposed solution is the employment of digital health and welfare services (Erlingsdottir & Sandberg, 2019). However, research indicates a decline in older people's use of digital media technology with age (König, Seifert, & Doh, 2018). Despite increasing adoption, some older individuals remain inexperienced users (Poli et al., 2019), influenced by sociodemographic and economic status, limited exposure to technology, the active choice to abstain from digital technology, and physical or cognitive impairments (Rasi-Heikkinen, 2022). Lack of necessary skills also plays a role (Kwiatkowska & Skórzewska-Amberg, 2019), while relational components and warm experts (close relatives) can both support and hinder older adults' digital media use (Martínez, 2022).

This study investigates the public debate and framing of individuals aged 75 and above in relation to digital technologies and health in news coverage across Denmark, Finland, and Sweden, to better understand to what extent they have a say in matters of importance to them. Earlier research on the representation of old demographics indicates exclusion and ageist portrayals (Iversen & Wilinska, 2020; Kinnunen, Könönen & Vakimo, 2022; Varjakoski, 2022). This study is based on news articles from 15 regional and national newspapers in the three countries, from January 2017 to December 2022. The total sample of articles was 319 (DK= 105, FI= 86, SWE= 128).

A code book (32 variables) was developed through an iterative process by all researchers. An ICR-test resulted in a Krippendorff's α of 0.70–0.78, indicating *substantial* agreement in coding, crucial for cross-cultural studies. Variables explored include article type, size, headlines, visuals, framing of individuals, gender, themes, subject positioning, power dynamics, and tonality. Noteworthy findings indicate substantial differences in the coverage across the countries. In Finland, 78 percent of the coverage comprised opinion articles, compared to 53 percent in Denmark and 23 percent in Sweden. Swedish newspapers had the highest proportion of news articles, suggesting varying

priorities across the countries. Another finding is the limited depiction of older people alongside news coverage, with 36 percent of articles lacking illustrations. On a national level, Finland has the highest number of non-illustrated articles (65 percent), followed by Denmark (29 percent) and Sweden (5 percent). Our study also indicates surprisingly few human-interest stories with the demography at hand, and differences in the power dynamics, referring to the diversity of voices heard. In sum, our results indicate that the fate of one of our future crucial challenges is not receiving the media attention it deserves in Nordic societies.

HCO05 Technology acceptance in health communication

PP 0703 Intersection of e-health literacy and individual empowerment: Theoretical foundations and empirical insights on the case of online health community users

[Sara Atanasova](#)¹, [Gregor Petrič](#)¹

¹ University of Ljubljana- Faculty of Social Sciences, Centre for Methodology and Informatics, Ljubljana, Slovenia

In health communication field, it is well known that the concepts of e-health literacy and individual empowerment are highly intertwined. The ability to access, understand, validate, evaluate, process and apply online health-related information to real-life health problems can, as many studies have shown (Schulz et al., 2017; Papp-Zipernovszky et al., 2021), lead individuals to empowerment and thus to better health outcomes. Interventions in the field of (public) health therefore often target population groups with lower levels of e-health literacy and empowerment (Pourazzavi et al., 2020). However, some authors critically observe that higher levels of e-health literacy do not necessarily lead to empowerment and that it is possible to be empowered but not e-health literate (Schulz & Nakamoto, 2013; Palumbo, 2017; Petrič et al., 2017). For example, e-health literate individuals are not necessarily willing to become empowered and feel more comfortable in a dependent role (Gellerstedt et al., 2022) or the health care system conditions restrict people in their path to empowerment. On the other hand, given the ubiquity of online health information, which is not necessarily of the highest quality, e-health literacy could be based on misinformation and disinformation resulting in "bad health literacy" (Schulz & Nakamoto, 2011). This could lead to greater but misperceived (dysfunctional) empowerment or even disempowerment (Petrič et al., 2017; Schulz & Nakamoto, 2011). A useful starting point for investigating intersection of e-health literacy and empowerment is Schulz and Nakamoto's (2013) model of four different profiles of individuals/patients defined by different (low or high) levels of health literacy and empowerment: High-need patients, needlessly dependent patients, dangerous self-managers, and effective self-managers. Currently, there is a lack of empirical research that confirms existence of these different profiles of individuals based on their level of e-health literacy and individual empowerment along with an examination of their respective characteristics. The aim of this study is to empirically investigate and identify different groups of individuals based on their level of e-health literacy and individual empowerment as well as to examine their socio-demographic and health-related characteristics. The study is based on data collected with an online survey (n = 784) among the users of the largest online health community in Slovenia (Med.Over.Net). The preliminary results, based on a cluster analysis, show that combinations of different levels of e-health literacy and individual empowerment result in similar groups as defined by Schulz and Nakamoto (2013). The results show that the groups differ also according to trust in doctors, some aspects of perceived quality of online information (e.g. readability), health status and chronic conditions. Interestingly, the results also point to a challenge in identifying 'dangerous self-managers' (those with a misperceived empowerment, often based on bad literacy skills), as respondents tend to overestimate the level of perceived e-health literacy and empowerment. This study aims to uncover and reflect on these important theoretical and methodological (measurement) dilemmas. This may advance future research and caution healthcare intervention developers to more effectively consider the nuances in populations with varying levels of e-health literacy and empowerment.

HCO05 Technology acceptance in health communication

PP 0704 Realizing technology's potential to better patient-provider communication, mitigate health inequalities: The imagination challenge

[Matthew Matsaganis](#)¹, [Lisa Mikesell](#)¹, [Ryan White](#)², [Riva Touger-Decker](#)³

¹ Rutgers University, School of Communication and Information, New Brunswick, USA

² Rutgers University, School of Health Professions, Newark, USA

³ Rutgers University, Rutgers School of Health Professions and Rutgers School of Dental Medicine, Newark, USA

Rationale

Researchers, healthcare professionals and organizations, as well as policymakers have shown sustained interest over the last two decades in the effects of information and communication technologies (ICTs) on healthcare and health inequalities more broadly, and on patient-healthcare provider communication more specifically. Various forms of technology (e.g., electronic health records, telehealth applications, wearable activity trackers, smartphone apps) are increasingly used by healthcare professionals and patients. The recent COVID-19 pandemic amplified interest in the adoption of ICTs and their impact in healthcare and on health disparities, as various forms of technology

were employed to address pandemic-related challenges, such as the impact of public orders for physical distancing on healthcare seeking. The pandemic also strengthened concerns that ICTs can exacerbate health inequalities and generate new ones. Given the promises and perils of digital health tools, we examine:

RQ1: How are ICTs used currently by health professionals and patients in local, diverse communities?

RQ2: How do healthcare providers and patients envision using such technologies in the future?

RQ3: What are individual, organizational, and community-level factors that enable and constrain the use of health ICTs?

Research Design

We investigate stakeholders' perspectives on the use of health ICTs in healthcare settings through a mixed-methods research design. In this paper, we focus on findings from semistructured interviews with healthcare providers ($n = 20$) and patients ($n = 20$), recruited across four primary care clinical sites (including but not limited to university hospital-affiliated health centers and federally qualified health centers) serving diverse communities. Interviews were conducted in English and Spanish. The duration of patients' interviews was 20–60 minutes, whereas of providers 30–70 minutes. All interviews were transcribed, and Spanish-language interviews were translated prior to analysis. Data analysis was a multistage process informed by *flexible coding* procedures described by Deterding and Waters (2021).

Findings & Interpretation

Even among patients with considerable relevant experience, ICT use to pursue health-related goals and particularly to facilitate communication with healthcare providers was highly episodic. Several sociodemographic predictors that the ICT adoption literature suggests are typical emerged in our analysis (e.g., age, socio-economic position, formal education). Even among those most experienced, however, use of ICTs in healthcare was limited. Additionally, interviews with healthcare professionals highlighted that the rapid adoption of ICTs during the COVID-19 pandemic transformed patient-provider communication across clinical sites significantly, primarily through deployment of telemedicine/telehealth applications. However, this adoption was forced by the emergent nature of the crisis, and clinical sites did not have the time to develop necessary *organizational complements* to ensure maximum payoff. Our data suggest that one of the key challenges to realizing the potential of ICTs is to be found in the seeming inability of patients and healthcare professionals to imagine how ICTs could improve healthcare and patient-provider communication in the future.

Conclusion

We conclude by discussing implications of findings for theories of technology adoption, particularly in healthcare, and articulate goals for interventions promoting ICT adoption for improved patient-provider interactions.

HCO05 Technology acceptance in health communication

PP 0705 Exploring technology-based ageism in healthcare: Nurses' and nursing students' perspectives on welfare technologies for older patients

Simona Hvalič-Toužery¹, Gregor Čehovin¹, Katja Pesjak², Sanela Pivač², Vesna Dolničar¹

¹ University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

² Angela Boškin Faculty of Health Care, Angela Boškin Faculty of Health Care, Jesenice, Slovenia

The literature suggests that patients often adopt welfare technologies (WTs), including telemedicine, telecare, and social robotics, based on recommendations from healthcare professionals, who play a crucial role in motivating their adoption. However, recent studies highlight age-related stereotypes among healthcare professionals regarding the technological capabilities of older individuals, potentially impeding the incorporation of WT in the care of older patients (Leonardsen et al., 2023; Mannheim et al., 2021).

Despite nurses comprising a significant portion of the healthcare workforce, there is a substantial knowledge gap regarding the perspectives of nurses and nursing students on the use of WT in the care of older patients and the potential influence of ageism on these perspectives. This study aims to address this gap by examining the impact of ageism on the perceptions of nurses and nursing students concerning the technological capabilities of older individuals, specifically focusing on smartphones and smartwatches. Additionally, the study explores the perceptions on the appropriateness of implementing welfare technologies in the care of older patients.

Data analysis relies on responses from a web survey completed by nurses ($n = 244$) and nursing students ($n = 234$), recruited through nursing organizations and universities via multiple channels between September and December 2023. Participants underwent assessment using the Attitudes Towards Older Adults Using Technology (ATOAUT-10)

scale, Expectations Regarding Aging (ERA-12), and a set of self-developed questions related to attitudes toward the use of WTs in the care of older adults.

Preliminary findings indicate that nursing students exhibit higher levels of general and technology-based ageism compared to nurses, although ageism is present in both groups. Specifically, mean scores for responses to all 12 items on the ERA-12 5-point scale are lower among nurses than among nursing students, with 10 of these differences and the total ERA-12 score being statistically significant based on t-tests ($p < 0.05$). The mean scores of responses to the ATOAUT-10 5-point scale are also lower for nurses than for nursing students in 9 of the 10 items, with statistical significance found in 4 of these differences (t-tests, $p < 0.05$) and the total ATOAUT-10 score. Nursing students exhibit a significantly ($p < 0.05$) more negative general attitude towards social robotics in elder care than nurses.

This study contributes to a more comprehensive understanding of healthcare professionals' influence on the adoption of WTs. Identified disparities in attitudes between nurses and nursing students underscore the potential of interventions and educational initiatives to mitigate ageism, thereby enhancing the acceptance and implementation of WTs in elder care.

HCO05 Technology acceptance in health communication

PP 0706 Factors determining the behavioural intention of informal carers of older people to use telecare: An application and extension of the UTAUT model

Vesna Dolničar¹, Nejc Berzelak², Simona Hvalič-Touzery¹

¹ University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

² Social Protection Institute of the Republic of Slovenia, n.a., Ljubljana, Slovenia

Telecare represents a significant opportunity to support informal carers who provide long-term care to older people. It can improve the quality of the care they provide, as well as their social life and state of health. This is particularly important as research highlights the significant impact of caring on the mental and physical health of informal carers. Despite its potential, there is limited understanding of factors influencing informal carers' behavioural intention to use telecare (Hvalič-Touzery et al., 2022). Research in this area is often limited to the key variables of technology acceptance models, i.e. usefulness and ease of use. However, this focus is critiqued for its limited scope, lacking in both breadth and depth (e.g. Dwivedi et al., 2019). Our study proposes an extension to the Unified Theory of Acceptance and Use of Technology (UTAUT) model. This extension incorporates perceived psychosocial outcomes (e.g. peace of mind, reduced anxiety), aiming to identify also health-related factors influencing the behavioural intention of informal carers of older people to use telecare. Our research focuses on two groups of telecare functionalities, namely personal alarm systems and mobility-related devices. Data used for the study were collected in 2021 on a sample of Slovenian residents aged 40 years or older who provide informal care to older relatives or family members. The sample was obtained from an online access panel. Appropriate sample selection, nonresponse conversion measures and weighting techniques were used to assure sufficient representativeness of the sample for the target population. In total, data obtained from 530 respondents were eligible and sufficiently complete for inclusion in the presented study.

Composite measures of performance expectancy, effort expectancy, facilitating conditions, technology commitment, perceived psychosocial outcomes and social influence were studied as predictors of the behavioural intent, measured as the expressed degree of willingness to use telecare solutions. Confirmatory factor analysis was performed to verify the measurement of latent constructs. The effects of interest were studied using ordinary least-square regression analysis, which included socio-economic characteristics of family carers, types and burden of provided care, and needs of care recipients as additional control variables.

The results reveal statistically significant effect of perceived psychosocial outcomes on the willingness to use telecare solutions. Significant effects are observed also for two UTAUT constructs (performance expectancy and social influence), although their size is considerably lower compared to perceived psychosocial outcomes. The findings of this study underscore the critical role of perceived psychosocial outcomes in shaping the behavioural intentions of informal carers towards telecare acceptance, thereby offering a more holistic insight in the understanding and development of telecare solutions.

HCO06 Well-being & mental health

PP 0815 Unintended damage? COVID-19 health messages, their impact on mental well-being, and its implications for message effectiveness: An interview study with students with varying levels of depressive symptoms

[Spela Dolinsek](#)¹, Christin Scholz², Julia C. M. van Weert², Bas van den Putte², Corine S. Meppelink²

¹ University of Amsterdam, Persuasive Communication – Health communication division, Amsterdam, Netherlands

² University of Amsterdam, Persuasive Communication, Amsterdam, Netherlands

Introduction

Health messages are not routinely checked for their potential impact on mental well-being. Nevertheless, research suggest that exposure to specific message strategies may negatively impact mental well-being of the recipients. The global decline in mental well-being during the COVID-19 pandemic was partially linked to the extent of exposure to pandemic information, but also to specific types of messages (e.g., those using negative emotional appeals). Individuals with symptoms of depression might be particularly susceptible to these adverse effects, given their inclination to selectively process information, emphasising the negative. Consequently, they may develop higher reactance toward certain messages than others.

Message exposure's impact on mental well-being can diminish the effectiveness of health messages, leading recipients to engage in information avoidance, defensive processing, and maladaptive responses to regulate their emotions, as seen during the COVID-19 pandemic. Effective communication is vital for mitigating a pandemic and it also helps reduce uncertainty and fear about health risks. Therefore, it is imperative to focus on message strategies that recipients perceive as effective without causing harm to their mental well-being.

So far, health communication has largely overlooked the impact of health messaging on mental well-being, and the role of pre-existing depressive symptoms in message processing, particularly concerning general health issues like pandemics. They also tend to neglect the multi-dimensional nature of mental well-being (consisting of hedonic, eudaimonic and social well-being). Lastly, not much is known about the relationship between mental well-being outcomes and effectiveness of health messages, as studies predominantly focus exclusively on the latter.

Therefore, the aim of this interview study is to explore how participants with varying levels of depressive symptoms perceive the impact of the health messages about COVID-19 on their mental well-being (RQ1) and their adherence with recommended behaviours (RQ2).

Methods

We conducted 30 semi-structured interviews with students (aged 18–25), evenly divided between those with higher and normal levels of depressive symptoms. During the 1.5-hour interviews, participants shared their perceptions of the effectiveness and mental well-being outcomes of exposure to official health messages during the COVID-19 pandemic and engaged in an interactive activity where they were asked to reflect on 12 existing pre-tested COVID-19 messages by official sources with varying message characteristics (e.g., hope appeals). Thematic analysis was used to analyse the data.

Findings

Preliminary findings suggest that participants perceive certain messages as impactful for their mental well-being (both negatively and positively), particularly the hedonic component. Noteworthy determinants of (in)effectiveness of messages include information overload, ambiguity, and lack of inclusivity. Trust in the source appears to be a prerequisite in message processing. For some participants, messages that negatively impact their mental well-being are recognised as particularly effective and some consider them ineffective for their emotional impact. Results will be presented considering similarities and differences in impressions of those with normal and higher levels of depressive symptoms.

This study contributes to the field of health communication by providing further insights into effective and less harmful communication techniques for those with varying depressive symptomatology, to prevent further harming a population that is already vulnerable.

HCO06 Well-being & mental health

PP 0816 Open and authentic? The effects of editorial production and prominence on the perceived authenticity of and empathy with mental health related self-disclosures on YouTube

Andrea Kloss¹, Felix Frey², Katharina Klinge³

¹ Macromedia - University of Applied Sciences, Faculty of Culture - Media - Psychology, Leipzig, Germany

² University of Leipzig, Institute for Communication and Media Studies, Leipzig, Germany

³ Macromedia - University of Applied Sciences, Faculty of Culture - Media - Psychology, Berlin, Germany

Mental illness is currently one of the greatest health challenges for societies. Although it is a widespread phenomenon, those affected are still socially stigmatized, which can result in experiences of exclusion or discrimination as well as serious health consequences if those affected are reluctant to seek treatment (e. g. Farrelly et al., 2014). Whereas many sufferers hide their mental illness for these reasons, others deliberately disclose their illness in their social environment, but also to strangers (Meisenbach, 2010). Research has recently discovered the destigmatizing potential of such self-disclosures in social media (e. g., Berryman & Kavka, 2018; Mickles & Weare, 2020; Misoch, 2015; Parrot et al., 2020; Ma, 2017; Blight et al., 2017). However, there is hardly any research on factors preventing possible negative reactions to such self-disclosures, such as social distancing. A mediating factor in this context appears to be the perceived authenticity of the self-disclosure (Nah, 2022), and an important role for destigmatization processes is also attributed to the empathy of the recipients with those affected (Hecht, Kloß & Bartsch, 2021). From previous research, it can be assumed that factors such as the type of production of the YouTube post and the prominence of the protagonist might affect perceived authenticity and empathy. To test these and identify possible further relevant factors, we designed two consecutive studies to investigate the following main research question: **Which characteristics of mental health related self-disclosures influence their perceived authenticity as well as the recipients' empathy towards the protagonists of these self-disclosures?**

A standardized manual content analysis of self-disclosure videos on YouTube ($N = 43$) and corresponding user comments ($N = 2.461$) was intended to capture perceptions and assessments of (self-selected) users under natural conditions. In an online experiment ($N = 203$), excerpts from six of the YouTube videos analyzed in the content analysis containing self-disclosures by depressives were used in a 2 (production: editorial vs. non-editorial) x 3 (degree and type of prominence of discloser: TV-celebrity vs. social media influencer vs. no public figure) between-subjects design.

In the experimental study, the influence of production and prominence of the self-disclosing persons was tested using a two-factor analyses of variance. Results show neither significant main effects nor significant interaction effects for both dependent variables authenticity and empathy. However, for the content analysis, bias-corrected binomial regression analyses revealed that users perceived self-disclosures of ordinary persons as significantly more authentic than those of influencers and TV-celebrities. Users were significantly better able to imagine the thoughts and feelings of the protagonists in self-disclosures by ordinary persons than those of influencers and TV-celebrities. Interestingly, the professional-journalistic editorial embedding of self-disclosures has different effects for the different types of protagonists. In both studies, the participants' or users' perception of authenticity and the intensity of their cognitive empathy were also positively correlated. Implications of these results and limitations of the studies will be discussed in our presentation.

HCO06 Well-being & mental health

PP 0817 Mental health to go: The role of mental health podcasts in the context of overcoming the stigmatization of mental illness

Alina Meyer¹, Anna Freytag¹, Eva Baumann¹

¹ Hanover University of Music- Drama and Media, Department of Journalism and Communication Research, Hannover, Germany

Background

In the era of individualized, on-demand, and mobile media consumption, podcasts have recently gained massive popularity (Huber et al., 2008; Kupferschmitt & Müller, 2021). Originally entertainment-focused, podcasts have evolved into a prominent source for health information in general, and mental health information in particular (Carlson, 2023; Carotte et al., 2023; Maiwald, 2020). Concurrently, despite increased societal acceptance, individuals experiencing mental health conditions still face stigmatization (Huber et al., 2015) and suffer from self-stigmatization (Corrigan et al., 2013). These developments prompt questions about mental health podcasts' potential to promote positive attitudes and behaviors regarding mental health.

There are a few first quantitative investigations of mental health podcasts (e.g., Carotte et al., 2023). The aim of the current contribution is to gain a more in-depth understanding of (1) the motivations that lead individuals to engage with mental health podcasts and (2) how regular listeners of mental health podcasts perceive podcasts' influence on their mental health related attitudes and behaviors.

Method

We conducted 10 semi-structured qualitative interviews in Germany in 2023. Respondents varied in preferred podcast formats, mental health-related factors (personally experiencing a mental illness, family member of someone experiencing a mental illness, general interest in mental health), age (22–59 years, $M = 31.6$, $SD = 10.3$), and gender (70% women). The interview guide covered questions on usage motives, the formation of parasocial relationships with podcast speakers, and the perceived impact of the podcasts on one's attitudes and behaviors. Verbatim transcriptions underwent computer-assisted qualitative content analysis, utilizing inductive and deductive coding strategies.

Results

The qualitative data provide comprehensive insights into the potential of mental health podcasts for the destigmatization of mental illness:

(1) *Motivations for listening.* Participants shared various reasons for engaging with mental health podcasts, driven by individual life situations and cognitive needs. Those directly affected seek self-understanding, while family members and those with personal interest aim for comprehensive education and empathy. Social interaction needs are evident, with family members seeking advice and knowledge they can share.

(2) *Parasocial relationship and identification.* By sharing their own experiences, podcast speakers play a significant role in encouraging involvement with mental health issues. Identification with shared experiences creates a strong emotional connection, fostering a supportive framework for individuals facing mental health challenges.

(3) *Knowledge and information dissemination.* Mental health podcasts contribute to educate listeners about mental illnesses, as they, for instance, provide realistic portrayals of psychotherapy. They dispel misconceptions and contribute to reducing prejudices.

(4) *Self-reported attitude and behavior changes.* Respondents reported positive changes, including increased sensitivity and openness towards mental illnesses. Podcasts had an impact on their self-awareness and recognition of negative thought patterns. In the view of the listeners, podcasts facilitated access to therapeutic help, and led to an increased willingness to speak openly about mental health challenges.

Discussion

The study reveals that mental health podcasts play a valuable role in addressing mental health stigma. By combining expert knowledge and individual experiences, podcasts can be considered a promising medium for promoting stigma coping and reducing self-stigma among people experiencing a mental illness. Implications for anti-stigma communication will be discussed at the conference.

HCO06 Well-being & mental health

PP 0818 The longitudinal relationship between health anxiety and health-related internet use in adolescence: A three-wave panel study

[Adela Svestkova](#)¹, David Smahel¹, Lenka Dedkova¹

¹ Masaryk University- Faculty of Social Studies, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

Health-related internet use, i.e., reading, watching, or interacting with health-related content, presents a popular source of health information for adolescents, thanks to its accessibility, availability, and breadth. Yet, apart from its benefits, health-related internet use may also impact adolescents negatively, for example, through its association with health anxiety (HA), i.e., unreasonable worries related to one's health. The increased HA motivates health-related internet use as a reassuring behaviour. However, frequent interaction with health-related media may increase rather than mitigate HA through disconcerting and catastrophic content. People with high HA are expected to be the most susceptible to both of the effects, as they frequently seek relief in health-related media and interpret them more catastrophically. However, we miss longitudinal evidence to inform the theory (te Poel et al., 2016). Also, there is a lack of within-person evidence of the expected causal effects. The current study focused on the long-term reciprocal relationship between health-related internet use and HA. We studied adolescents with high, medium, and low trait HA separately as the motives and cognitions related to their health-related internet use likely differ (Fergus & Bardeen, 2013), as may its consequences.

We analysed the data from 2,500 Czech adolescents, aged 11–16 (50% girls, in Wave 1) using a random-intercept cross-lagged panel model (RI-CLPM), which allows studying within-person effects. The data were collected in three waves six months apart, beginning in June 2021. The sample represented Czech households with children in terms of region, municipality size, and parental education. We used the level of HA in Wave 1 as the grouping factor.

Although adolescents with high trait HA were the most frequent health-related internet users, an increase in their HA was not followed by increased health-related internet use, and vice versa. This may be due to the ceiling effect, where both HA and health-related internet use are too high to be affected by the other variable (te Poel et al.

2016). This new finding is contrary to the common belief that people with high HA are the most susceptible to the negative effects of health-related internet use. On the other hand, increased health-related internet use predicted an increase in HA for adolescents with medium HA, and the variables affected each other reciprocally between W2 and W3. Partially, we found support for both effects also in the low-HA group. This is an innovative finding as it was believed that the lower the HA, the lower the susceptibility to negative effects of health-related internet use.

Our study newly revealed that adolescents with medium to low, rather than high HA, may be susceptible to negative long-term effects of health-related internet use. The evaluation of health-related content in adolescents with medium HA may already be affected by their HA, and their HA may still increase as a reaction to distressing information, contrary to the current literature. Our findings are important for the interventions related to health-related internet use. Researchers and practitioners should pay attention mainly to adolescents with medium HA.

HCO06 Well-being & mental health

PP 0819 Phubbing in Spanish university students: Prevalence and associated factors

Vicente Villalba Palacin¹, Adrien Faure Carvallo¹, Sánchez Gómez Lydia¹, Calderón Garrido Caterina²

¹ Universitat de Barcelona, Departament de Biblioteconomia - Documentación y Comunicación Audiovisual, Barcelona, Spain

² Universitat de Barcelona, Departament de Psicologia Clínica i Psicobiologia, Barcelona, Spain

The omnipresence of smartphones has radically transformed our forms of communication, giving rise to new modes of interaction that not only facilitate the creation of social ties and knowledge in virtual environments, but have also created a particularly palpable paradox in our contemporary society. While these devices bring us virtually close to people who are miles away, they distanced us paradoxically from those who are physically close to us, thanks to the insidious phenomenon of phubbing. The phubbing behavior is characterized by the tendency to ignore those around us in favor of attention to the smartphone during a conversation, has become a detrimental behavior linked to symptoms of psychological impulsivity, anxiety, FoMO, less academic performance and depression, generating negative effects that deserve a thorough analysis. s. Young university students, mostly those between 18 and 24 years of age, are who spend the most time on the phone, about 33% of their awake time. In this context, the present study focuses on exploring the presence of phubbing among university students, considering a representative sample of 783 participants from the University of Barcelona. The results obtained through the application of a phubbing scale and a sociodemographic questionnaire reveal an alarming prevalence of the phenomenon, with 49% of the sample manifesting this behavior. Surprisingly, no significant differences were observed in relation to age, gender, field of study or academic year, which underlines the transversal relevance of the excessive use of smartphones in the educational context. Given these findings, there is an urgent need to implement preventive strategies and interventions aimed at safeguarding the mental health and well-being of students. Education about the risks associated with phubbing and the promotion of healthy habits of use are presented as fundamental tools. In addition, there is an urgent need to develop programs that address Internet addiction and other problems related to impulsivity in university students, thus providing effective support and detecting potential problems early in the academic environment.

HCO07 Sources of health information

PP 0917 Ask Google, a doctor or a friend? A diary study on the health information repertoires of Ukrainian refugees in Germany

Janine Brill¹, Veronika Karnowski¹, Constanze Rossmann²

¹ Chemnitz University of Technology - Institute for Media Research, Chair of Media Communication, Chemnitz, Germany

² Ludwig Maximilian University Munich - Institute for Communication Studies and Media Research, Chair of Communication Studies, Munich, Germany

Germany hosts more than one million Ukrainian refugees, who often face health problems (mental and physical) and barriers to accessing health information. While we know that refugees often use traditional mass media and smartphones as search modes, search engines as intermediaries, and online sources and confidants as sources of health information, we do not know much about how they combine these. That is, we lack knowledge about refugees' health information repertoires. So we ask:

RQ1: What health information repertoire types can be identified among Ukrainian refugees in Germany?

When seeking refuge in another country (and culture), processes of acculturation come into play. Changes in language and the origin of information sources are crucial in this process. Therefore, in order to gain a comprehensive understanding of the health information behavior of Ukrainian refugees in Germany, we also ask:

RQ2: What are the characteristics of the health information repertoire types (RQ1) in terms of source origin and language?

Methods

We conducted an online diary study in August and September 2023 with 19 Ukrainians living in Germany since February 2022. The diary study resulted in $n = 109$ entries, i.e. health information searches.

We assessed, among other things, *search modes*, *intermediaries*, and *sources* used for health information, as well as *source origins*, *languages*, *proxy searches*, and *topics*. In a pre-survey, we assessed participants' sociodemographics, health status, and language skills, among others.

Results

At the situational search level ($n = 109$), the diary data show that smartphones (48%) and online sources (50%) were frequently used. Confidants (28%) were consulted more often than health professionals (16%). Searches were mainly related to (the treatment of) health problems (65%) such as information on medical treatments. Information was often sought and received in Ukrainian (58%). However, the sources used were just as often of German origin as of Ukrainian origin (40%). Although participants often sought health information for themselves (57%), they also often sought information for others (49%).

A qualitative typology at the individual search level ($n = 19$) identified four repertoire types (RQ1): (1) *Online seekers*, who use only electronic devices, search engines, and online sources for health information; (2) *Confidant consulters*, who mainly ask trusted people for health advice; (3) *Professional consulters*, who tend to consult health professionals, and *Copious consulters*, who use a variety of health information sources, including online sources, confidants, health professionals, and traditional mass media. The qualitative typology was confirmed by latent class analysis.

The types differ in terms of language and origin of sources (RQ2). While the language and origin of the sources of *Online Seekers* and *Confidant consulters* is mainly Ukrainian, the language and origin of the sources of *Professional consulters* and *Copious seekers* is typically Ukrainian and German.

By obtaining detailed information about the health information of Ukrainian refugees in Germany and identifying repertoire types, we can gain more knowledge about how to effectively reach this target group and potentially contribute to improving refugees' information seeking and, consequently, their health.

Further results and limitations will be presented at the ECREA conference.

HCO07 Sources of health information

PP 0918 Prototypes of doctor-patient relationship in consultations on negative health effects of electromagnetic fields

Lyn Ermel¹, Claudia Riesmeyer¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

Concerns regarding negative health effects of electromagnetic fields (EMF) are relatively high in the German population (Götte & Ludewig, 2019), and general practitioners (GPs) are the first place to go for patients (Huss et al., 2004). Mostly, patients themselves raise concerns that their symptoms are related to EMF. GPs less commonly agree with that assumption, and therapy options or protective measures are rarely discussed. However, an efficient doctor-patient relationship substantially determines the course of medical treatment, and physicians' advice on EMF, e.g., relocation, can have drastic consequences on patients' lives (Berg-Beckhoff et al., 2010).

Theoretical Background

According to Roter and Hall (2006) there are four prototypes of doctor-patient relationships varying in the extent of patients' autonomy and physicians' authority: *paternalism*, *consumerism*, *mutuality*, and *default*. In a paternalistic relationship, physicians dominate the consultation, and patients have a rather passive role. Physicians act according to the patients' alleged best interest, and patients follow the physician's recommendations. *Consumerism* is characterized by dominant patients who demand physicians for information. Decisions are based on patients' preferences but taking account of professional norms. A balanced doctor-patient relationship is represented by the prototype *mutuality*. The control of both parties is almost even, and the communication is determined by negotiations based on patients' values and physicians' advices. The fourth prototype, *default*, stands for a rather inefficient doctor-patient relationship characterized by frustration or diverging expectations on both sides that can, e.g., ultimately lead to patients' drop-out of physicians' care. Based on these prototypes, we examined which doctor-patient relationships were represented by physicians in our sample (RQ).

Method

To investigate physician's perceptions of the doctor-patient relationship in consultations on EMF, we conducted guideline-based focus groups and in-depth interviews with GPs ($n = 15$) and pediatricians ($n = 10$) in (### anonymized for review process). The interviews took place from June to August 2023 via Zoom. Physicians were asked questions regarding their prior experience with EMF-related consultations and their (hypothetical) handling of such patients.

Results

In our interviews, the prototypes of *paternalism* and *consumerism* were most common. Physicians who showed a rather paternalistic attitude were, to some extent, open to patients' concerns about EMF but insisted on their own assessment. In most cases, physicians would prefer to conduct an anamnesis or to establish a differential diagnosis instead of relating symptoms to EMF. In cases of *consumerism*, physicians were approached by their patients but

did not make specific therapy recommendations and handed the responsibility for treatment decisions back to the patients. Physicians who corresponded to *mutuality* were open to patients' EMF concerns and tried to empathize with them. They did not try to convince them with their own opinion but rather aimed to find a mutual decision. Two physicians said that they would not give advice to their patients regarding EMF, which would indicate a *default* in their relationship. One even says that his patients probably know that he cannot give specific advice; therefore, they do not ask him about EMF.

Implications of these findings and limitations will be discussed in the presentation.

HCO07 Sources of health information

PP 0919 Prison physicians dilemma: The relationship between prison physicians' bifunctional role on their intra-role conflicts and identity construction

Rebecca Kammerer¹

¹ Ludwig-Maximilian-Universität München, Department of Media and Communication, München, Germany

The German prison system is a total institution (Goffman, 2020; Irwin & Cressey, 1962; Grapendaal, 1990; Schwartz, 1971), characterized by an enclosed set-up for inmates, where all areas of life, including all contact persons, are controlled. Prison physicians are one of these contact persons. Their working role is characterized by a bifunctionality of tasks (legally stipulated security mandate and health care, e.g., Hillenkamp, 2005; Keppler, 2009; DeViggiani, 2007). This bifunctionality can influence the physicians' working routines in prisons as well as their communicative actions towards the inmates, and thus, role conflicts can arise (Dahrendorf, 2006). Consequently, their identity construction can be influenced (Keupp, 2008; Mead, 1972; Schwarz & Stöver, 2010; Stöver, 2013), affecting prison physicians' performance (Meier, 2005).

The current state of research shows that prison physicians need to be more studied. In particular, there needs to be more studies investigating bifunctionality. This research aims to determine to what extent intra-role conflicts and identity construction can be identified in prison physicians due to their bifunctionality.

A qualitative research design was chosen to answer this question, as it collects more in-depth and personal data and can thus generate further insights and theories. Eight guided, problem-centered interviews (Raithel, 2008; Witzel, 2000) were conducted via Zoom with prison physicians from three federal states in Germany. This methodological approach provided insights into the subject's perception and their ideas of reality to identify and understand the conflicts, challenges, and difficulties and the (self-)perception and (self-)positioning of the prison physicians. All interviews were transcribed verbatim, anonymized, pseudonymized, and evaluated with qualitative content analysis, according to Kuckarzt (2018).

The qualitative research revealed that the setting of a total institution causes intra-role conflicts among prison physicians. This is due to the physicians' involvement in decisions on detention or transfer to specially secured detention rooms. Furthermore, it is also through their position of power over the inmates. Prison physicians play a helping role for the inmates with a duty of care, but are also part of the prison system, making them subject to various expectations. Physicians constantly find themselves in a tense relationship between justice and medicine. The prison physician is in a permanent adjustment process, influenced by every experience, and urged to find a compromise. Therefore, identity construction is a subconscious solution for coping with intra-role conflicts. However, the formation of compromises and the addition of other external influences can lead to new intra-role conflicts. This means that the prison physician is caught in a constant dilemma between medicine (being a helper to the inmates) and justice (being part of the prison system). The resulting of intra-role conflicts can be resolved by constantly balancing them within the identity construction. The problem here is that new intra-role conflicts can also arise as a result of the weighing up within the process.

HCO07 Sources of health information

PP 0920 Single episodes of health information seeking and avoidance: Findings of an experience sampling methods study of German residents suffering from acute or chronic illness

Elena Link¹, Eva Baumann²

¹ Johannes Gutenberg-Universität Mainz, Department of Communication, Mainz, Germany

² Hanover University of Music- Drama and Media, Department of Journalism and Communication Research, Hanover, Germany

When individuals are faced with disease-related uncertainty, health information-seeking and avoidance serve as coping strategies (Brashers et al., 2002). Information seeking describes individuals' efforts to obtain information from selected sources (Johnson & Meischke, 1993), whereas information avoidance is understood as a purposeful decision to prevent the acquisition of relevant but potentially unwanted information (Sweeny et al., 2010). Although it is known that such strategies are tied to specific issues and embedded in situational contexts, a granular description of the real-life episodes of information behaviors is scarce. In addition, there are only preliminary findings about the relationship between information-seeking and avoidance suggesting that both behaviors are distinct, not causally

related but correlated concepts (Link et al., 2023). In particular, there is a lack of evidence on single episodes of information behaviors and their interrelations within and between individuals. Therefore, we ask:

RQ1: *How can single episodes of information-seeking and avoidance be characterized regarding sought issues, used sources, and situational contexts?*

RQ2: *How are the seeking and avoidance episodes related to each other on the within- and between-person level?*

We conducted an Experience Sampling Methods (ESM) study combined with a presurvey of a sample of German residents currently affected by an acute or chronic disease. The sample was recruited via a commercial German online access panel. The ESM study covered 14 days; the participants were asked three times a day at random times to answer questions on their information behaviors. Only individuals who responded to 28 out of 42 invitations (response rate: 66 %), resulting in 13,578 completed ESM protocols from 383 respondents, were included in the analysis. The respondents aged between 18 and 84 years ($M = 52.9$; $SD = 13.7$). 52.3 % were female, 34.5 % reported to be acutely ill, and 65.5 % suffered from chronic disease. To answer the research questions, we conducted descriptive analysis and Bayesian multilevel within-between models applying *rstanarm* in R.

To answer RQ1, the findings revealed that information seeking was seldom, but more common ($n = 1,358$, 10 %) than avoidance ($n = 281$, 2.1 %). Online sources and health professionals were the major sources for information seeking. The individuals searched most often for certain diseases or symptoms. Seeking was most often performed at home and mostly alone. The participants reported a general avoidance behavior of health-related issues, but also to avoid threatening disease and death-related information. Avoidance reveals not to be source-specific; it was mostly performed at home but less often alone.

The multilevel model (RQ2) revealed weak negative effects on the within-person level showing that an individual's increased information-seeking impacted the same person's decreased avoidance and vice versa. At the between-person level, we found a weak positive association: People who more often searched for information than others also avoided information more often than others.

The study provides a situational perspective on information behaviors and contributes to construct clarity suggesting that some individuals are more active in performing both information behaviors than others and showing a weak causal relation between individuals' coping strategies.

HCO07 Sources of health information

PP 0921 Making sense of genes. On biohackers' use and experience of direct-to-consumer genetic tests

[Carsten Stage](#)¹

¹ Aarhus University, Communication and Culture, Aarhus C, Denmark

Since the launch of direct-to-consumer genetic testing (DTC GT) in 2007, millions of people have purchased a DNA home testing kit in the hope of learning more about their health or ancestry (Regalado 2019; Saukko 2017). Without medical intermediaries, DTC GT gives the consumer (mediated) insight into their risk of developing conditions such as Alzheimer's disease, cancer and Parkinson's disease. DTC GT companies frame genetic self-testing as empowering customers through the democratisation of knowledge (Tutton & Prainsack 2011; Turrini 2018). However, the DTC genetic health tests have also spurred debate due to the commercialisation of genetic testing, the lack of data control and clinical guidance, the risk of overdiagnoses and excessive medicalization and the questionable medical validity of the results (Schaper et al. 2019; McGowan et al. 2010).

This paper explores how DTC GT has been taken up, used and experienced as an aspect of biohacking practices. Biohacking is premised on a "central belief in intervention into the very living matter of the body" (Cozza, Ellison and Katz 2022, 4) and on an interest in how genetic knowledge can be used to slow down aging, increase human performance and tweak health problems outside health institutions. In that way biohackers experiment with "technoscientific solutions around the optimisation of health and performance" (Cozza, Ellison and Katz 2022, 2). Biohacking has moved from being subcultural to becoming a more widespread everyday practice of trying to shape the human body through technological intervention, quantification and self-experimentation (Rifai 2022; Lupton 2016).

Based on 20 interviews, the paper investigates how biohackers use and experience DTC GT, and how they navigate a communicative situation where genetic risks are made sense of in mundane or non-professional settings and where digital interfaces are involved in buying, receiving, understanding and processing test results. The paper thus seeks to answer the following three research questions: 1) How do biohackers navigate the communicative situation linked to receiving genetic risks assessments via digital communication of DTC GT results? 2) How do biohackers interpret and process the risk of getting particular diseases revealed by DTC GTs? 3) What characterizes the 'genetic imaginary' and sense of genetic agency articulated by the biohackers in relation to the use of DTC GT? Are genes, for instance, narrated as 'essentialist' predictions or rather through a 'post-genomic' language that stresses the potential of reprogramming genetic dispositions? (Bull 2019; Franklin 2000)

Through this study the paper sheds light on a new and increasingly important cultural situation, where genetic information is more easily available and used for various types of self-organized bodily optimization and/or experimentation. This calls for research that explores not only the pitfalls and dangers of this type of epistemic and institutional 'disorder', but also how different types of users – like biohackers – agentively produce and make sense of genetic information in everyday engagements with their body and health.

HCO08 Production, representation, and effects of health issues

PP 1013 Literacy as an essential element of health journalism: Portuguese journalists' practices

[Ana Peixinho](#)¹, [Felisbela Lopes](#)², [Clara Almeida Santos](#)¹, [Rita Araújo](#)², [Alberto Sá](#)²

¹ University of Coimbra, Faculty of Arts and Humanities- CEIS20, Coimbra, Portugal

² University of Minho, Centro de Estudos de Comunicação e Sociedade, Braga, Portugal

Looking for what remains in journalism after the changes promoted during the COVID-19 pandemic, we find few elements in Portugal that maintain practices that were reconfigured during this long period of global public health crisis. Nonetheless, those news production processes continue to underline the importance of health literacy.

A survey amongst Portuguese journalists working for national media outlets (n = 200) during the first severe lockdown (May 2020) showed several changes (remote work, priority given to different news sources and to different news genres). One of those changes was the particular attention given to health literacy, expressed through the integration of specific elements in the news pieces that encouraged behavior change in order to prevent disease and promote health (Araújo et al. 2021; Lopes et al. 2020). Another survey was conducted in 2023 (n = 222), to understand whether the changes in professional practice and news production introduced by the COVID-19 pandemic were maintained in the post-pandemic period. 187 respondents (84.2%) stated that they continued to value the promotion of health literacy, and highlighted as a priority the "resource to sources more focused on contextualization than on daily affairs" – this is a change introduced during the pandemic. With less incidence, but still relevant, is the use of speech genres with an educational and explanatory nature, such as infographics, and complementary genres, such as surveys, questions and answers, and explanatory boxes.

These discursive practices closely linked to literacy seem to reconfigure health journalism, which during the first two decades of the 21st century, in Portugal, did not show such marked features (Lopes & Araújo, 2017).

Several authors recognized the importance of communication and health literacy in fighting COVID-19 (Finset et al. 2020; Fielding, 2020), highlighting the media's role as partners in the public answer to a health emergency while being mediators between institutions and publics (Mheidly & Fares, 2020). That role is still deemed essential by Portuguese journalists, according to survey results, and it should be widely discussed. Indeed, while the pandemic introduced new practices and new contents, it also contributed to the increase of several information disorders. Simultaneously, it underlined the significance of health literacy in searching, accessing, and understanding of health information, recognizing the centrality of journalism as a primary source of information and an agent of behavior change.

Therefore, the aim of this study, based on the aforementioned survey, is to understand: the level of consolidation of practices that validate journalism as a primary source of health information, especially during public health crises; to organize the main procedures and discursive devices that journalism uses to assume a primary role in the strategic, global, proactive and concerted response of various sectors of society.

HCO08 Production, representation, and effects of health issues

PP 1014 Between healthcare and headlines: The representation of family doctors in local newspapers in Germany

[Janine Nadine Blessing](#)¹, [Michael Johann](#)¹

¹ University of Augsburg, Department of Media- Knowledge and Communication, Augsburg, Germany

The role of family doctors in Germany (also referred to as primary care physicians or general practitioners) has increasingly come under the media spotlight, particularly during the COVID-19 pandemic. Despite making up a significant proportion of Germany's medical workforce and facing critical challenges such as a shortage of young practitioners (Bundesärztekammer, 2022; van den Bussche, 2019), their portrayal in local newspapers has not been thoroughly analyzed (Medcalf & Nunes, 2018; Wangler & Jansky, 2020). This study seeks to bridge this gap by examining how family doctors are represented in German local newspapers. Understanding this portrayal is vital

for comprehending public trust and perceptions of healthcare, especially in regions where family doctors are often the primary healthcare providers.

Utilizing framing theory (Entman, 1993) as a theoretical foundation, this study systematically examines the nature and extent of media coverage concerning family doctors. Framing theory is instrumental in understanding how media can construct and influence public perceptions and discourse, particularly in contexts laden with controversy or societal importance. Specifically, the study is guided by three research questions:

RQ1: What is the frequency of coverage about family doctors in regional newspapers?

RQ2: What are the identifiable frames in the coverage of family doctors?

RQ3: How has the representation of family doctors evolved from 2018 to 2023?

The study employs a quantitative content analysis of local newspaper articles from all German federal states, proportionately representing the market penetration of family doctors as reported by the National Association of Statutory Health Insurance Physicians (KBV, 2022). This analysis is anchored in a hybrid category development approach, blending deductive categories derived from related framing research with inductive extensions to capture unique nuances in the examined media coverage.

The findings shed light on a notable increase in the media coverage of family doctors during the COVID-19 pandemic, particularly in the context of vaccination campaigns. This coverage is characterized by a blend of personalized stories, emphasizing individual experiences and contributions, and generalized discussions about the broader roles and challenges faced by family doctors. A significant aspect of the study is the identification of a gender disparity in media representation, pointing to an underlying gender bias in healthcare coverage.

The study's results are significant for multiple reasons. Firstly, they provide a nuanced understanding of how media frames family doctors, which is crucial for shaping public perception and trust. Secondly, the findings contribute to the broader discourse on healthcare representation in media, particularly during health crises. The study underscores the importance of balanced and equitable media representation in healthcare, influencing both public opinion and policy-making.

HCO08 Production, representation, and effects of health issues

PP 1015 Controversial knowledge. Disrupting genetic knowledge hierarchies on YouTube

[Ann-Katrine Schmidt Nielsen¹](#), Carsten Stage¹

¹ Aarhus University, Department of Scandinavian Studies and Experience Economy, Aarhus C, Denmark

Direct-to-consumer genetic testing (DTC GT) is a new health and lifestyle technology enabling users to test for various genetic diseases, conditions, and traits without the assistance of medical staff and institutions. In this paper, we focus on how the arrival of health managerial DTC GT to a global market has spurred social negotiations and conflicts related to genetic knowledge and technologies between test users and medical experts. Specifically, we are interested in how the new at-home genetic tests are discursively constituted across professional and user perspectives on YouTube, an increasingly important platform for sharing and obtaining health information. We thus ask:

To what extent and how does the spread of DTC genetic testing generate discursive disruptions and controversies on YouTube?

How does YouTube as a platform shape the communicative formats and aesthetics of this discursive encounter?

To answer these questions, we investigate 24 YouTube-videos – 12 from a test user perspective (sponsored and non-sponsored content) and 12 from a professional perspective (i.e., geneticists or medical professionals or science and health dedicated organizations/media outlets) – within a discourse analytical and media aesthetic framework. The analysis shows how two conflicting discourses constitute DTC GT as, on the one hand, a medical technology that necessitates professional guidance and general caution and, on the other, a device for generating interesting facts and narratives about the self online. While medical experts and science professionals position the test user as an easily impressable patient that lacks critical knowledge of the scientific, ethical, and medical implications of genetic testing, test users approach the new DIY technologies in a more casual and playful manner. They selectively regard and disregard genetic information and use alternative and personal interpretation frames (e.g., family histories, personal anecdotes, embodied experience, other self-tracking technologies) to incorporate selected results into their online self-narratives; this confirms previous (sparse) qualitative research into test user perspectives.[1] Furthermore, we conclude that even if the deprofessionalization of genetic knowledge is opposed by professionals on a content level, they often imitate the genre and style of test user videos due to the platform's prioritization of certain genres and aesthetic expressions. Our study, thus, not only contributes new knowledge of how scientific gatekeeping is challenged by DIY health technologies, but also offers new insights into how medical and scientific experts turn to and utilize the logics of social media platforms to address issues related to genetic accuracy, misinformation, and confidentiality. Ultimately, the paper raises questions of how to engage in health communication on YouTube

in a context where sedimented knowledge hierarchies are disrupted and where new DIY health technologies demand an understanding of test users not as people lacking fundamental knowledge, but as people driven by a genuine 'genetic curiosity' and engaged in alternative knowledge practices.

HCO08 Production, representation, and effects of health issues

PP 1016 Effects of metaphorical communication on vaccine confidence in the adolescent population

Fabiana Nuccetelli¹, Valeria Gabellone¹, Elisa Gabrielli², Pier Luigi Lopalco¹

¹ University of Salento, Department of Experimental Medicine, Lecce, Italy

² University of Bologna, Department of Medical and Surgical Sciences, Bologna, Italy

The World Health Organization has included vaccine hesitancy among the top global health threats. Vaccine hesitancy can be defined as delay or refusal of vaccination despite the availability of vaccination services. Parents of young children and adolescents often refuse vaccination because of distrust of health institutions, low confidence in vaccine efficacy and fear of adverse events. As for the perception of vaccine risk, the decision-making process of the individual can be strongly affected by emotions which operate automatically and are rooted in experiential thinking.

The use of metaphors is common in public health communication and increased during the COVID19 pandemic. Metaphors can describe complex human experiences and stimulate emotional reactions. Although some evidence has supported the persuasive potential of metaphorical language over scientific language, further research is needed to understand the effects of metaphorical framing in health care contexts other than emergency.

Our study aimed at comparing the effects of neutral scientific talk with war- and protective metaphors on health communication. An online survey was conducted on a sample of Italian teenagers randomly selected to three study arms. Each participant was invited to watch a specific version of an informative video on infections and vaccines (group 1: neutral scientific approach, group 2: metaphorical war- and group 3: metaphorical protective approach). After watching the video, each participant responded to an ad-hoc questionnaire collecting anonymous demographic information and asking 10 specific questions on the topic of infectious diseases and vaccinations. A synthetic vaccine confidence index (VCI) was built dividing the sum of the scores obtained from the answers to the eight positive questions by the score obtained from the two negative ones. The higher the index, the higher the level of confidence.

Preliminary results referred to 362 subjects randomly allocated to the three groups are reported. No significant differences regarding age, sex and geographical area were detected between groups. Median age of the sample was 16 years (mean 15.7) and 52.5% were girls. The general attitude towards vaccination in group 2 and 3 was largely positive, with the majority agreeing (strongly or tend to agree) on the fact that vaccines are important (group 2: 63%; group 3: 90%), safe (group 2: 59%; group 3: 68%), effective (group 2: 66%; group 3: 89%), and do not generate anxiety (group 2: 41%; group 3: 59%). Higher level of distrust against vaccines was found in group 1, where 50% of participating adolescents are strongly or tend to be anxious about getting vaccinated. These data are confirmed by comparing the VCI between groups, which is lower in group 1 (VCI = 3.9), compared with group 2 (VCI = 6.1) and group 3 (VCI = 7.8).

The results of our survey suggest that emotional involvement evoked through the use of metaphorical language may have, at least in the short run, some positive effect on vaccine confidence. If confirmed, this evidence can inform public health communication programmes.

HCO08 Production, representation, and effects of health issues

PP 1017 Multi-method study on the role of social media in body image development among individuals with a visible difference

Laure Dedecker¹, Chelly Maes¹, Lara Schreurs¹, Laura Vandenbosch¹

¹ KU Leuven, Social Sciences – School for Mass Communication Research, Leuven, Belgium

Throughout the years, numerous studies examined the role of social media in users' body image (Vandenbosch et al., 2022). Researchers agree that social media has the potential to exert a (typically small) influence on negative and positive body image components (Rodgers et al., 2022; Saiphoo & Vahedi, 2019). Overall, this line of research has neglected sensitivity groups. Among such groups, individuals with visible differences [in short: IVD] (i.e. 'a scar, mark or condition on your face or body that makes you look different') (Changing Faces, n.d.) are potentially highly susceptible for social media effects as their development of a healthy body image is challenged (Rumsey & Harcourt, 2007). Moreover, social media influencers with visible differences [in short: SMIVD] have grown in popularity. Such influencers may function as 'super peers' and affect IVD's body image via social comparison processes

(Pan et al., 2022). Despite their possible (substantial) impact, it is unclear how this health-related topic (i.e. visible differences) is portrayed by SMIVD and how this content is perceived among IVD.

Using a multi-method approach, this study aimed to fill these gaps by conducting (1) a content analysis of the posts of SMIVD and (2) in-depth interviews among young IVD about appearance culture on social media. The content analysis explored the portrayal of visible differences in combination with negative (e.g. adherence to narrow appearance ideals) and positive (e.g. inclusion of body positive messages) appearance cues in these SMIVD's posts ($N = 629$). The in-depth interviews investigated young IVD's perceptions of the role of social media and SMIVD in the development of body image ($N = 10$).

The content analysis indicated that SMIVD depict their visible difference in the majority of their posts (75.4%) in combination with one or more body positive theme(s) (54.3%). The most popular body positive theme was inner positivity (87.1%), followed by self-appreciation (45.9%) and body self-care (10.79%). The results also showed that beauty ideals were present in the large majority of the posts (98.17%) and that visible differences and beauty ideals significantly co-occurred. Additionally, we found that certain positive and negative appearance cues go hand in hand in SMIVD's posts, possibly challenging the positive effects of positive appearance cues on follower's body image. Moreover, multilevel negative binomial regression analysis indicated that the presence of a visible difference significantly predicts the number of likes received on the influencers' post. This finding could indicate a social reinforcement process of the portrayal of visible differences by SMIVD.

The interviews revealed that young IVD have endorsed the potential of body positive content. Yet, they do not automatically consider the posts of SMIVD as body positive. Some of them even indicated that they do not want to be confronted with visible differences on social media and exposure to their own visible difference raised feelings of reluctance. These findings highlight that future research should take into account that increased online representation of different appearances on social media are not considered by all users as body empowering content.

HCO09 Communication about cancer: From screening to survivors

PP 1120 The importance of 'peace of mind' and the construal of the screening as predictors of colorectal cancer screening intentions among young people

Deborah Kunze¹, Anika Hähner¹, Sven Engesser¹

¹ TUD Dresden University of Technology, Institute of Media and Communication, Dresden, Germany

Early detection of colorectal cancer (CRC) is crucial, as the chances to cure it at an early stage are higher (Wong et al., 2021). However, participation in screening interventions, such as colonoscopy or faecal tests, remains low (Klabunde et al., 2015). Moreover, recently there has been a growing prevalence of early-onset CRC, affecting young people under the age of 50 (Akimoto et al., 2021). Hence, investigating effective communication strategies to encourage participation in CRC screening programmes is of great importance.

Past research has mainly investigated the influence of gain- and loss-framing on CRC screening intentions (Lee-Won et al., 2017; Lucas et al., 2016; Myers et al., 1991), albeit with mixed results. Additionally, the perception of CRC screening as health-affirming or disease-seeking ('construal of screening') has been identified as a predictor of screening intentions (Lipkus et al., 2019). Furthermore, the feeling of 'peace of mind' associated with the screening programme appears to play an important role (Honein-AbouHaidar et al., 2016; McGregor et al., 2015; Robb et al., 2008). Thus, we assume that the influence of framing on CRC screening intentions is mediated by 1) an individual's construal of the screening interventions and 2) an individual's association of CRC screening with 'peace of mind'.

To test these assumptions, we conducted an online experiment with a 2 (gain- vs. loss-framing) x 2 ('peace of mind' mentioned vs. not mentioned) factorial between-subjects design ($n = 178$; age: $M = 32.51$, $SD = 15.48$). Accordingly, we developed four flyers on CRC screening. Participants read one of the four flyers, followed by questions regarding their intentions to undergo colonoscopy and faecal tests, their construal of the screening, and their association of the screening with 'peace of mind'.

Our findings revealed that both colonoscopy and faecal test screening intentions are not influenced by gain- or loss-framing as well as the emphasis on 'peace of mind' in the stimulus material. No statistically significant differences were observed among the four groups. Furthermore, the construal of the screening and the associated feeling of 'peace of mind' did not serve as mediators of this relationship. Instead, we identified that both a construal of the screening as health-affirming (rather than disease-seeking) (colonoscopy: $\beta = .17$; faecal test: $\beta = .28$) and a stronger association of the screening with 'peace of mind' (colonoscopy: $\beta = .42$; faecal test: $\beta = .17$) led to higher CRC screening intentions.

We conclude that communication strategies aimed at enhancing CRC screening intentions among young people should primarily focus on promoting screening as health-affirming and fostering the feeling of 'peace of mind'. Gain- and loss-framing alone might not be sufficient. Currently, we are conducting a follow-up experiment to replicate these findings, addressing limitations of the first online experiment (e.g., strengthening the experimental

manipulation of 'peace of mind') and investigating the role of further emotions, such as disgust and embarrassment. Results will be discussed with regard to both experiments.

HCO09 Communication about cancer: From screening to survivors

PP 1121 Communicating about cervical cancer screening with visual displays: A longitudinal experiment

Yasmina Okan¹, Eric Stone², Dafina Petrova³, Wändi Bruine de Bruin⁴

¹ Pompeu Fabra University, Department of Communication, Barcelona, Spain

² Wake Forest University, Department of Psychology, Winston Salem, USA

³ Andalusian School of Public Health, Cancer Registry of Granada, Granada, Spain

⁴ University of Southern California, Sol Price School of Public Policy, Los Angeles, USA

To make decisions about cancer screening participation, eligible individuals often consider written information materials including leaflets and websites. However, such materials generally include quantitative information about screening benefits, risks and possible results that can be hard to understand (Okan et al., 2019). Simple graphical displays such as icon arrays and tree diagrams represent quantitative information in ways that can support understanding. Yet, little is known about the relative effectiveness of both formats, especially in the longer term. Here we examined the effectiveness of icon arrays relative to tree diagrams and to purely numerical formats in the context of the UK's National Health Service (NHS) cervical cancer screening program.

We conducted a well-powered longitudinal online experiment involving 3,100 UK women eligible for cervical screening (25–64 years) varying in numeracy and graph literacy. We tested the effectiveness icon arrays relative to the tree diagram currently used in NHS information materials, and a numerical-only format. We also examined whether the presence (vs. absence) or explanatory text referring to different types of screening results (i.e., abnormal vs. no abnormal cervical cells) moderated effects of presentation format. We assessed the impact of the different presentation formats immediately after participants viewed the displays (initial assessment) and at 1-month follow-up. Participants completed multi-item measures assessing *gist knowledge* of probabilities of different screening results (i.e., essential, bottom-line meaning), *verbatim knowledge* (i.e., precise words or numbers), perceptions of the likelihood of adverse results, screening intentions, affective reactions, and user evaluations (e.g., trust and liking). At 1-month follow-up, we also assessed self-reported screening behavior.

Presentation format did not significantly affect verbatim or gist or knowledge of probabilities at initial assessment. However, icon arrays were associated with better gist knowledge of absolute magnitudes than tree diagrams and numerical-only formats at 1-month follow-up. Participants exposed to icon arrays also perceived lower likelihood of adverse screening results and reported stronger screening intentions at initial assessment. For displays without explanatory text, icon arrays were also associated with more positive user evaluations and less negative affective reactions than tree diagrams at initial assessment.

Our findings provide evidence supporting the use of icon arrays as an effective tool for communicating about cervical cancer screening results, with effects that endure over time. The use of icon arrays in the NHS cervical screening leaflet and other information materials should not be costly to implement and could support informed decision making while reducing perceptions of potential adverse results and promoting screening uptake. Additionally, our study highlights the importance of considering diverse outcome measures in the evaluation of communication formats, including different types of gist knowledge, which has implications for the evaluation of public understanding of probabilities and health risks.

HCO09 Communication about cancer: From screening to survivors

PP 1122 Doctor-patient communication and management of long-term adverse effects of cancer on general health

Andreea Sumanu¹

¹ University of Bucharest, Doctoral School in Communication Sciences, Bucharest, Romania

Cancer patients are generally unaware of the potential long-term adverse effects of cancer and its treatment on their overall health. These effects can vary depending on the type of cancer, the stage of the cancer, and the specific treatments received.

Doctor-patient communication is crucial in managing the long-term adverse effects of cancer on general health. Doctors need to provide patients with clear and accurate information about the potential long-term effects of cancer and its treatment and to discuss strategies for managing these effects.

Objectives

This study aimed to identify the impact of cancer patient-physician communication on the long-term adverse effects of cancer and treatment on overall health.

Methods

A quantitative research study was conducted focusing on patients who are part of 4 support groups for Romanian cancer patients and their relatives on Facebook. For the cross-sectional study, participants were chosen from these groups and asked to complete a detailed questionnaire regarding their knowledge and experience of the long-term effects of cancer and its treatment.

Results

The results of this study revealed that most patients were unaware of the long-term adverse effects of cancer and treatment on their general health.

A large proportion of those who took part in the study stated they were not informed about the long-term adverse effects of cancer on their general health, and now face cardiovascular disease, kidney damage, infertility, cognitive changes, as well as emotional and psychological effects.

Discussion

Under these circumstances, I believe that patient education and empowerment are also important in managing the long-term adverse effects of cancer. Patients should be encouraged to ask questions, seek information, and advocate for their own health needs.

The majority of the interviewed patients claimed they were more likely to have benefitted from the support of cancer support organizations or online resources that provided information and guidance on managing long-term health risks.

I consider that by working together, patients and healthcare providers can develop strategies to support patients' ongoing health needs and improve their quality of life.

HCO09 Communication about cancer: From screening to survivors

PP 1123 Live streaming as a new mode of health communication: The felicitousness of interaction in Egyptian breast cancer awareness events

Basma Salem¹, Paula Saukko², Jessica Robles¹

¹ Loughborough university, Media and Communication, Loughborough, United Kingdom

² Loughborough university, Criminology – Sociology and Social Policy, Loughborough, United Kingdom

Live-streaming is increasingly used in health communication, but there is hardly any research on it. Drawing on Goffman's (1963, also Hall 2018) theory of situated interaction and conversation analysis (CA) (Schegloff, 2007) we examined whether the interaction enabled by live-streaming was felicitous in terms of whether audiences received expected answers to their comments. We identified a technological challenge of responding to a high volume of real-time questions, and a situational challenge of how to handle inappropriate questions, which highlight key dilemmas of this new mode of communication.

We analysed seven highly engaged Facebook live-streaming sessions (thousands of likes/comments) by two Egyptian charities during their breast cancer awareness campaigns (October 2021, 2022). Using the analytical concept of adjacency pairs from CA we examined the sequences of comments and (expected) responses in the sessions.

We identified three main types of sequential interactions in the video chat: First, most audience contributions were *compliments*, such as religious praises for the charity, responded to by an appreciation (heart emoji), which fomented ritualistic phatic communication. Second, the audience posted *medical questions* and received answers either via chat or orally. Charities' responses were generally designed to clarify campaign content. However, medical questions posed two challenges. One, audiences asked questions related to their personal medical history, indicating misaligned expectations of doctor-patient communication. Two, it was difficult to answer the high volume of chat questions. Both challenges led to unanswered questions. Users could repost questions numerous times, showing an unmet expectation. Third, resulting from questions not being answered, users often provided *peer answers* to each other's questions, generating a parallel social occasion to clinicians' streaming, which could offer useful information but could also take the conversation in potentially misleading directions.

The phatic exchanges of compliments and appreciations were similar to Goffman's (1963) unfocused public interaction that does not deliver information but enhances a sense of social presence and politeness. The requests for focused responses to individual medical questions highlights a possible mismatch between the novel context

of streaming versus a medical consultation. The parallel peer-to-peer interaction in the chat may enhance learning and engagement but also interjects a real-time parallel that is challenging to manage and potentially confusing and distracting in terms of the content of the conversation between clinical campaigners and audiences.

In conclusion, the analysis highlights key types of interactions in live-streaming in the health context, which resonate with social media rituals ('likes'), may create misaligned expectations about what questions are appropriate in this novel context, pose technological challenges for those managing these interactions, and expose potential problems with peer-to-peer interaction. Mapping these interactions offers conceptual and practical insights on key types and their implications in this developing space.

HCO09 Communication about cancer: From screening to survivors

PP 1124 Recovered from cancer – No questions left? An analysis of information needs and behaviors among long-term cancer survivors in Germany

Elisabeth Hopfe¹, Winja Weber², Eva Baumann¹, Viktor Gruenwald³, Susanne Weg-Remers²

¹ Hanover University of Music- Drama and Media, Department of Journalism and Communication Research, Hanover, Germany

² DKFZ German Cancer Research Center, Krebsinformationsdienst KID, Heidelberg, Germany

³ University Hospital Essen, Department of Uro-oncology, Essen, Germany

Cure rates for cancer have improved significantly, and the number of long-term cancer survivors (LTCS) is increasing¹⁻³. Follow-up care in Germany usually lasts for about five years after treatment, and LTCS are then either considered recovered or chronically ill^{4,5}. However, cancer and the various types of local and systemic treatments lead to late effects that can massively impair physical and mental health, quality of life, and life expectancy⁶⁻⁹. While oncologists are in charge for immediate cancer treatment and follow-up care, general practitioners or other medical specialists might not feel responsible, competent or lack knowledge about late effects of cancer and different cancer therapies¹⁰. These circumstances result in a care gap for LTCS shaped by uncertainties and unmet supportive needs increasing the risk of poorer health¹¹. Needs-oriented information is crucial to bridge this gap¹².

As cancer information services (CIS) are known to play an important role in the cancer information pathway¹³, we analyzed $N = 24,197$ telephone or e-mail inquiries of cancer patients to the largest cancer information service in Germany between 2019 and 2023 to describe information needs and behaviors of LTCS in Germany. About 30 percent of the inquiries were from LTCS ($n = 7,006$). They were on average 65.1 years old and 66.1% female. The main disease situation of these patients was relapse (35.1%), followed by the phase after initial treatment has been completed (33.0%). The dominating tumor regions were breast (46.7%) and male genital organs (primarily prostate, 22.1%), corresponding to the most common cancers in men and women. Information needs of LTCS in general were similar to those of short-term cancer survivors, however, LTCS requested information on certain topics, like living with cancer (58.3% vs. 52.3%; $\chi^2(1) = 73.28$, $p < .001$, $\phi = 0.06$), more frequently.

A closer look at the information needs of LTCS reveals gender differences: Men made significantly more inquiries about treatment (69.3% vs. 60.9%; $\chi^2(1) = 47.59$, $p < .001$, $\phi = -0.08$) and diagnostics (40.8% vs. 28.7%; $\chi^2(1) = 104.99$, $p < .001$, $\phi = -0.12$), whereas women asked more questions about living with cancer (62.4% vs. 50.5%; $\chi^2(1) = 91.65$, $p < .001$, $\phi = 0.11$) and psychological aspects (34.7% vs. 25.8%; $\chi^2(1) = 57.31$, $p < .001$, $\phi = 0.09$). The health condition at the time of the inquiry also plays a decisive role. LTCS with metastases mainly requested information on treatment (83.7% vs. 52.2%; $\chi^2(1) = 627.52$, $p < .001$, $\phi = -0.34$), while those without metastases focused on information on living with cancer (62.5% vs. 51.6%; $\chi^2(1) = 66.50$, $p < .001$, $\phi = 0.11$).

LTCS still have information needs and actively seek information and advice. However, LTCS are a heterogeneous group with specific information needs according to their health status and gender. The findings point to the need for a targeting approach offering needs-adjusted information and a support infrastructure for LTCS, which is not yet provided by the German health care system.

IIC01 Amplifying marginalized and underrepresented voices

PP 0721 A culture-centered approach to artistic communication for social change: A close reading of murals painted in socioeconomically marginalized communities in Tierra Blanca, Ecuador and Athens, USA

[Benjamin Bates](#)¹

¹ Ohio University, Communication Studies, Athens, USA

Participatory communication strategies for social change and development efforts are framed as ways to empower communities to express their collective desires and to express them in ways that challenge dominant power structures. Researchers in health communication have used participatory strategies to discover health and development concerns within communities and to find ways to assist communities in resolving these concerns. These strategies have ranged from community radio and television, to community theater and song, to, most recently, participatory arts projects such as mural-making. Because artistic communication is often seen as inherently resistive to dominant power structures, mural-making has been claimed to be a way for communities to disrupt dominant definitions of health and wellbeing and to express unique, community-based solutions to promoting positive social change and development. As Mohan Dutta argues, however, communication techniques developed to allow the expression of local voices are often infiltrated by or coopted by dominant regimes of the communicative infrastructures. We ask whether artistic approaches, specifically mural-making, are susceptible to cooptation away from social justice by these infrastructures. To answer this question, this paper engages two sites through close reading and discourse analysis of murals created in two socioeconomically marginalized communities to reveal (dys)functional and (un)predictable consequences of applying participatory approaches absent a commitment to centering local voices. The first site is a school-based mural in the community of Tierra Blanca, Loja, Ecuador. The second is in the town of Athens, Ohio, USA. At both sites, advocates for these murals have argued that their acts of mural-making empower communities by surfacing voices that are often marginalized. Applying concepts from Dutta's Culture Centered Approach to health communication, however, reveals that the disruptive potentialities of these murals are coopted by dominant regimes of meaning-making and recommit the reader to established norms, values, and relations of marginalized people to larger social orders. In Dutta's terms, artistic focus on Agency and Culture becomes secondary to (re)articulations of Structure. Specifically, the close reading of the mural in Tierra Blanca shows that the mural displaces community voices and promotes recommitment to the Catholic Church and to the (then) conservative government's values to promote a vision of individual moral responsibility as the solution to health and development problems. The close reading of the mural in Athens demonstrates that the intended message of supporting developmentally disabled artists in advocating for inclusion becomes erased by the site where the mural was painted; the mural exits service to the arts and enters service to consumption and capitalism. These murals, although potentially disruptive reveal that mural-making can become dysfunctional in expressing community-based voices and function, instead, to reinvigorate communicative infrastructures within the community. Moreover, these murals also trouble claims that artistic communication, as a means of communication production, are inherently resistive to dominant orders. Rather, they remind us of Dutta's claim that participatory approaches are often coopted by the regimes they challenge and must be constantly refreshed and revised if they are to remain modes of effective communication resistance.

IIC01 Amplifying marginalized and underrepresented voices

PP 1033 Mediated negotiation of multiethnic order: Cross border conviviality in Trieste, Italy

[Zlatan Krajinac](#)¹

¹ University of Zagreb, Faculty of Political Sciences, Zagreb, Croatia

This paper draws from my ethnographic research into communicative practices of conviviality that take place across and despite state borders between the largest ethnic minority group, the people from nearby former Yugoslav countries and Italians in the northeastern Italian port of Trieste. I adopt a non-media-centric perspective (Krajinac, Moores & Morley, 2016), which observes the interlocking of media with everyday life, and defines communication as combinations of movement of people, goods and information (Morley 2017). My study is based on 15 depth-interviews and year-long participant observation in private and public spaces of the city where they congregate. The analysis suggests that the peaceful conviviality of these groups stems from a working communicative triad, encompassing a) embodied interactions (friendship networks: traversing of neighboring parts of Italy, Slovenia and Croatia), b) appropriated digital spaces (such as WhatsApp, where friends work out a polyglot space of belonging in which they share news and jokes), and c) specific urban scenography (intercultural social spaces like libraries and cafés, bilingual restaurant menus and road signs). Though uneasy, at times reproducing inherited stereotypes or historical narratives of post-WWII conflict, the ex-Yugoslav/Italian conviviality generates a novel cultural form connecting friendship, digital/embodied mobility, and geographical imagination. Constructed as a city of transit, and historically 'replaced' to different political territories, Trieste takes pride in its brand of ex-Habsburg and 'free port' cosmopolitanism. Mediated practices of conviviality I studied place Trieste at the centre of an imagined cross border

space, encompassing nearby cross border parts of north-eastern Italy, south-eastern Slovenia and south-western Croatia. My respondents' activities of traversing the space daily and their communications that mix cultural facets of both Italian and Slavic worlds (language, music, food), make Trieste an elective "capital" of their makeshift social world, preferred as such historically to the ex-socialist Balkan Other as the nearest 'Western European' city and to local Italians in response to their invisibility among compatriots in Italy (the majority of whom admit to be unaware of the city's existence in the country). Quotidian exchanges and mobilities elasticize very different lines of flight that brought these people into touch and serve them, in the era of renewed nationalisms to negotiate a sense of order that I term "more-than-national" (difference seen as undeniable but also indispensable to the overall order).

IIC01 Amplifying marginalized and underrepresented voices

PP 0723 Reckoning with subaltern science: A case study from India

Subin Paul¹, David Dowling²

¹ IE University, School of Business, Madrid, Spain

² University of Iowa, School of Journalism and Mass Communication, Iowa City, USA

In light of the dominance of "Western" scientific discourse in English-language media, the question arises regarding how and to what extent a prominent born-digital science magazine such as India's *The Wire Science* (TWS) positions itself with respect to indigenous cultural practices. The question of how, precisely, cultural logics are refuted or reinforced by TWS's journalism can be addressed through the array of positions in its coverage of subaltern science, the science produced by "those who have been at the receiving end of hegemonic structures." This paper critically examines media narratives of fisheries science as one form of subaltern science based, in this instance, on the social hierarchy of caste.

In our case study of "The Science of the Seas" (hereafter, "TSOTS") multimedia feature series in TWS, the traditional compass functions to serve local fishing methods, yet in a revised way to reflect the uniqueness of wind currents in India. This study of scientific discourse in TWS is premised in the understanding that the global circulation of scientific methods suggests multiple post-Western globalisms whereby the West does not bear a one-way relationship with the Global South. TWS coverage has opened the possibility of local Indian practices influencing and advancing Western science. However, the framing of the Indian fisherman in "TSOTS" hardly casts him as a viable path for further inquiry so much as an exotic wonder of an ancient, and highly mystical, relation with the sea.

Methodologically, this study provides a cultural-critical interpretation consonant with the call for qualitative approaches using smaller, manually collected data samples for deeper analysis of born-digital media content. This method suggests that media communication research can benefit from the "thickness" of "small data" through selective manual collection of content produced. In the spirit of Clifford Geertz, our analysis thus aims to thicken the critical significance and contextual sensibility of scientific knowledge as expressed through "TSOTS" in TWS. Our interpretation is executed here as a process that attributes meaning to discourse originating in one context, which is the text of "TSOTS," which we then translate into the discourse surrounding the broader cultural and ideological context of indigenous knowledges and Western science. Our choice of focusing this study on "TSOTS" was determined in part by the protracted (June 2021-August 2023) engagement with the indigenous knowledge system of fishing.

The lexical choices shaping definitions of science along with the representational casting of the fisherman and his methods reveal key rhetorical strategies by which "TSOTS" broaches the ways non-Western natural science and knowledge is served by Western European science. Although the spirit of a holistic understanding of plural sciences is invoked in "TSOTS," we show that its caste privilege ultimately elides deeper consideration of points of contact and exchange between cultures. Our analysis thus reveals that while the idea of representing subaltern fisher science in English-language media is novel, caste hierarchies are inscribed into the story narrative of "TSOTS" in such a way that it prevents subaltern science from fully emerging, thereby reinforcing the primacy of Western science.

IIC01 Amplifying marginalized and underrepresented voices

PP 0724 What do underrepresented scholars write about? Exploring the thematic content of Latin American and international communication research

Felipe E Barreto De Souza Martins¹, Emese Domahidi¹

¹ Technische Universität Ilmenau, Computational Communication Science Group, Ilmenau, Germany

In the field of Communication research, a significant imbalance prevails, marked by an uneven global distribution of academic capital—a measure of recognition and influence in academia (Demeter, 2019). This disparity reflects socio-economic inequalities and contributes to a skewed portrayal of global communication phenomena and impacts the discipline's representation and narrows the overall scope of contributions (Barreto de Souza Martins, 2023).

Our study embarks on a comprehensive exploration to address this issue, focusing on a comparative analysis of Latin American and international publications in Communication research. We analysed Communications science

articles from 2002 to 2022, including sources encompassing both international and Latin American journals. This approach aimed to unveil prevalent themes in these distinct literature bodies and understand their temporal distribution. We posed two research questions: What overarching topics have existed in the past 20 years of communication research in Latin America and international journals and how did these topics evolve over time? Additionally, we asked regarding the influence of journal origin, publication language, and year of publication on the probability of an article being classified within these overarching topics.

Our analysis, leveraging computational text methods, dissected the content of 119,158 unique articles. We identified that 50.27% (n = 52,936) of abstracts featured 48 identifiable topics, categorized into eight overarching themes: Socioeconomic Issues and Identity; Creative Industries and Culture; Physical and Mental Health; Technology and its Impacts; Communication Strategies and Practices; Corporate and Organizational Communication; Regional-Focused Studie; and Education and Meta-Studies. We have discerned that the likelihood of topic classification is influenced by the papers being available in Latin American or international journals.

Our analysis uncovers trends in Latin American research towards themes deeply rooted in local norms and behaviours, reflecting a focus on contextual, culturally nuanced explorations. Collaborative efforts to integrate already existing research from these less represented areas can substantially widen the current scope of communication science.

Addressing the issue of thematic representation in communication science as a mere supply and demand challenge can be highly misleading. The longstanding underrepresentation of a significant portion of the global research community contributes to a narrowed perspective in the field. Recognizing and rectifying this imbalance is not just about merely being inclusive; it's about further developing the field with a broader array of culturally relevant observations, thus leading to enhancements and improvements over the reliability and reproducibility of Communication science.

IIC01 Amplifying marginalized and underrepresented voices

PP 0725 Indigenous filmmaking in Latin America: Development and visibility in the context of digital communication

Juanjo Balaquer¹, Arnau Gifreu-Castells²

¹ University of Granada, Information and Communication, Granada, Spain

² Autonomous University of Barcelona, Audiovisual Communication and Advertising, Barcelona, Spain

The evolution of film and its technological development led to an increase in access, allowing the inclusion of new actors in the sphere of audiovisual creation. In this context, Indigenous peoples made their own film productions, gaining visibility (Ginsburg, 2002) and challenging ethnographic perspectives (Moore, 1992). Therefore, the concept of Indigenous filmmaking acquired relevance, referring to the film production made by "those people variously called 'indigenous', 'tribal', or 'first nations': in sum, the still-residing descendants of the original inhabitants of territories subsequently taken over or circumscribed by alien conquest or settlement" (Shohat y Stam, 2014, p. 32).

Indigenous film has particular significance in Latin America (Gleghorn, 2017). In 2011, Abel Ticona, member of Centro de Formación y Realización Cinematográfica (CEFREC) – an organization that promotes audiovisual production by Indigenous communities – explained that this cinematography "has started to be more present thanks to the emergence of digital equipment, which made it possible for Indigenous people to easily access technology" (Dagron, 2014, p. 61).

This research intends to evaluate how Indigenous filmmaking has evolved and whether the context of digital communication has helped to increase and consolidate its productive structures and visibility. Therefore, the objectives of the research are:

- (1) To analyse Indigenous Latin American filmmaking in the last two decades, and
- (2) To assess the visibility of this cinematography.

To do so, the research employs a mixed method, qualitative and quantitative, based on the analysis of information and databases contributed by the national film agencies of some of the Latin American countries which are part of the study – INCAA in Argentina, for instance. These countries have been selected based on their high Indigenous population and/or their development of the film industry, including Mexico, Bolivia, Colombia, Chile, Peru and Argentina.

The information obtained from these official agencies will be supplemented with semi-structured in-depth interviews with some organizations linked to Indigenous filmmaking, such as Coordinadora Latinoamericana de Cine y Comunicación de los Pueblos Indígenas (CLACPI) or the aforementioned CEFREC.

PP 0835 Western media assistance to Africa since the 1960s: Towards a liberal paradigm

[Terje Skjerdal](#)¹

¹ NLA University College, Journalism and Media Studies, Kristiansand, Norway

The study investigates past and current foreign intervention in African media and journalism with the view to identify the frameworks which have guided media development since 1960. The aim of the study is to query whether today's media assistance is accustomed to the criticism which has been posed throughout the years as a result of failed attempts in the past. The study consists of two parts: firstly, a broad literature review of media development in Sub-Saharan Africa since early interventions by UNESCO and others in the 1960s until today's multifaceted media development 'industry'. Secondly, a scrutiny of 26 evaluation reports of recent media development projects by Western agencies in 24 countries in Sub-Saharan Africa with a view to describe current tendencies in African media intervention. The method for the second part is document analysis, where the reports are read critically in order to detect contemporary media development jargon, themes and approaches.

Media assistance is found to belong to five categories: journalism training and skills; infrastructure and institutional development (including direct support to media organizations); policy reform and media accountability (for example press councils); media support mechanisms (such as journalist unions, media advocacy organizations and press freedom day events); and higher education and research. The total volume of media assistance to Sub-Saharan Africa is uncertain, but the support coming from OECD countries to the region is likely to be around USD 100 million annually.

The overall conclusion of the study is that Western media assistance is increasingly reflecting a liberal paradigm, both on the overall media systems level and when it comes to favoured journalistic practices and ideologies. Media development programmes emphasize the democratic functions of the media and have as one of their main objectives to introduce and strengthen independent media. In terms of journalism ideology, professional standards are typically benchmarked against globally acknowledged principles such as accuracy, fairness, balance and objectivity. The preferred professional model is monitorial journalism, while interventionist, collaborative and locally inspired frameworks have little appeal. In the 60-year period covered by the study, the modernization and Africanization paradigms are found to have faded, while the liberal paradigm has become dominant.

IIC02 Representations in news media and global media events

PP 0836 Pan-Arab news satire: Transnational critiques and the contingency of satire

[Yazan Badran](#)¹

¹ Vrije Universiteit Brussel, Communication Sciences – ECHO/imec-SMIT, Brussel, Belgium

News satire, as satirical interventions into the sphere of contemporary politics, has garnered increased scholarly attention in the past two decades (Baym, 2009). However, the deep articulation between political satire and national political cultures and contexts remains the predominant perspective in current scholarship. This fails to account for

cultural/political contexts of satire that do not align well to unitary nation states, as well as the increasingly complex processes of deterritorialization of both producers and audiences of such satire due to migration and displacement (Bernal, 2013). This paper aims to focus on the transnational dimensions of news satire through an in-depth study of the content of pan-Arab news satire—as exemplified by satirical news websites such as *Al-Hudood* ('The boundaries/borders', 2013–present, independent)—which has come to garner large transnational following across the Arab World and its diasporas. This sphere of news satire is strongly characterised by its transnational dimension whether at the level of production, content, or reception.

This paper aims to examine the concrete critiques formulated by pan-Arab news satire, the transnational stance underlying them, and the synergies and tensions these entail vis-à-vis satire as a genre. The study is based on a thematic and discursive analysis of *al-Hudood's* political coverage over a 6-months period (Nov 2022–May 2023) complemented by in-depth interviews with staff satirists at the media outlet. Our preliminary analysis shows three main interlinked critiques in *al-Hudood's* coverage: (1) a domestic political (democratic) critique; (2) a socio-economic critique; (3) a geopolitical critique. Whether reflecting on the economic crises in Lebanon or Egypt, the civil conflicts in Syria or Sudan or the Israeli-Palestinian conflict, these different levels of critique invariably depart from a regional and transnational lens in making sense of different situated (national or local) realities and contexts across the region. This, we argue, privileges an understanding of power as fundamentally transpiring across borders and of resistance and social change as a profoundly transnational undertaking. On the other hand, we argue that these critiques have to contend with tensions between these different scales (local-transnational) whether at the level of production (e.g., in terms of the imagined audiences) or the satirical texts themselves (e.g., in terms of their inherently intertextual nature) which in turn highlight the contingency and ambiguity of satire as a form of 'rebellious humour' (Billig, 2005).

IIC02 Representations in news media and global media events

PP 0837 News about Africa on YouTube: A comparison of Chinese and non-Chinese media

Dani Madrid-Morales¹

¹ University Of Sheffield, School of Journalism- Media and Communication, Sheffield, United Kingdom

During the twentieth century, news flows to and from Africa were dominated by Anglo-American news media and by those belonging to former colonial powers. Since the mid 2010s, Chinese State-owned media such as Xinhua, CGTN (China Global Television Network) and *China Daily* have been attempting to challenge this status quo, by pouring large sums of money into their coverage of Africa. In presenting their reporting of the continent, Chinese journalists and editors describe themselves in opposition to dominant news organisations in Europe and North America, whom they accuse of focusing predominantly on negative portrayals of the continent. Instead, Chinese media claim to give more prominence to "positive news". In recent years, several studies have explored Chinese media's coverage of Africa, particularly on television, both on its own terms and comparatively. However, many of these studies tend to provide a fragmented picture (e.g., they focus on a very small sample or a very short time frame); findings are sometimes contradictory (e.g., some studies claim that Chinese media use a predominant "positive" frame, while others claim they do not); and because studies use disparate methods, varying units of analysis and loosely operationalized variables, comparisons across studies are difficult.

Trying to overcome some of these limitations, this paper presents evidence derived from a multimodal computational content analysis of 24 months (2021–2023) of news coverage by Chinese (CGTN and Xinhua's New China TV) and non-Chinese (BBC, France24, Al Jazeera English and Africanews) news media on YouTube. All the selected broadcasters regularly post news clips and full news bulletins on the platform. Using a combination of computational text analysis and computer vision tools (supervised, semi-supervised and unsupervised machine learning, and object detection), this paper offers a systematic description of news about Africa and offers evidence to assess the impact, if any, of Chinese media's news reporting on representations of the continent.

The findings suggest that news coverage of African countries on CGTN and *China Daily*, unlike the other four news organisations, is quantitatively at par with that of countries in Europe and the Americas; is generally more positive than negative; and is thematically more diverse. However, this increase in volume and diversity is not consistent across the continent. Chinese media, like their non-Chinese counterparts, focus on a limited number of countries (e.g. South Africa, Kenya, Egypt...), which means that most African nations are not only underreported, but their coverage tends to be episodic and monothematic. The paper concludes by locating the findings in ongoing debates

about our current knowledge of news media's coverage of Africa and drawing attention to the methodological advantages of using multimodal computational tools to the analysis of large news corpora

PP 0838 The global success of a U.S. project? Soft Power and the Women's World Cup

[Joshua Coe](#)¹, [Dafne Pérez](#)¹, [Ida Dreier](#)¹, [Qixuan He](#)¹, [Lucie Barbier](#)¹, [Alexis von Mirbach](#)¹

¹ Ludwig Maximilian University of Munich, Media and Communications Sciences, Munich, Germany

Global mega-events such as the Women's or Men's FIFA World Cup are not simply a showcase for the game, but shaped by economic, military, and cultural influences that interact with global, national, and local politics. The last Men's World Cup in Qatar in 2022 was widely discussed with the concept of soft power and public diplomacy (Brannagan & Giulianotti, 2018). The women's game is strongly associated with the fight for women's rights, such as the equal pay movement. Indeed, the eyes of the world are upon the Women's World Cup and while they are, U.S. wins stand to both bolster the country's prestige and offer a platform for the country's soft power projection. In terms of soft power, research shows that women's football has the potential to bring about social acceptance of gender norms in Arab countries. When the soft power of the World Cup, as measured by sporting results, is contrasted with the hard power of military "sticks" and economic "carrots" (Nye, 2008, p. 94), as measured by GDP and defense spending, a difference between the men's and women's tournaments becomes apparent: While the men's tournament is dominated by Europe and Latin America – and has historically been empty of the great powers du jour such as the United States, Soviet Union/Russia, and China – the women's tournament is significantly more correlated with global power relations. Against this backdrop, our specific research question is: To what extent – intentionally or not – has the Women's World Cup become a tool of U.S. soft power strategy, and what does it look like? Our presentation is part of a "Communications History of the FIFA Women's World Cup" project, in which we analyze the coverage of the event by leading newspapers in 14 countries since its inception from 1991 to 2023. Our theoretical framework is based on Luhmann's disciple Uwe Schimank, who worked out three services of the sports system in exchange with t to the political system: a) national identification b) system competition c) symbolic politics. We divide our results into three stages: 1991–1999 conquering of new territory; 2003–2011 German rise and U.S. fall; 2014–2023 Return of the US and global success.

IIC02 Representations in news media and global media events

PP 0839 Signed "One and many other taxpayers": The role of the Swedish welfare state in the court of public opinion on the Sámi

[Anne Schäfer](#)¹

¹ Nord Universitet, FSV, Bodø, Norway

During the 1960s, the Swedish welfare state experienced its heyday, often referred to as the gold standard of postwar social democracy. Funded through progressive taxation, its many rather ambitious social policies placed Sweden among the most egalitarian societies in the world at the time. But even so, continuing discussions about the welfare or lack thereof of its indigenous Sámi population indicates that not all was well in the state of Sweden: Despite officially being equal to their fellow Swedish citizens, Sámi spokespeople as well as their ombudsman were adamant that Sámi were structurally discriminated against and that they were being treated as 2nd class citizens. This begs the question how those disruptions, these moments of social disorder, played out in the court of public opinion.

In newspapers, radio, television, articles, and reports about minorities, i.e. "them" (here: Sámi), are more often than not written by a group that represents "us" – in this case the Swedish majority – that has few or no ties to the minority group they write about. As a result, the focus is often on how "they" are not like "us" and therefore a problem. This is as true today as it was 60 years ago, when many an article was written about "the Sámi problem" and issues concerning the Sámi community were often discussed in one fell swoop with other minorities, among them Sinte and Romani people, or in comparison with people of color in the United States, both First Nations and Black Americans. Back in the 1960s, the media landscape in general was much less diverse and less accessible. This is also a time before social media provided relatively low-threshold platforms for private citizens to make their thoughts and opinions heard and engage in a public exchange on issues covered by newspapers and other media. One of the few possibilities to participate and contribute in the court of public opinion and political debate was to write letters

to the editors of newspapers and hope that they were published. The few letters that were chosen for publication provide both insights into the individual opinions of those who felt strongly enough about certain issues to write and send a letter to the respective publication and insights into which opinions were deemed important enough to be printed in the first place.

This study departs from one incident in which a TV program about the precarious circumstances of many Sámi prompted a rather indignant and lengthy letter to the publisher in which the truthfulness of the portrayal as well as the intentions of the program makers were seriously questioned. This letter, signed by "One and many other taxpayers", provoked two more responses by other readers, one who signed with their given name and one signed by "also a taxpayer". Using practice-oriented document analysis, this paper, which is still in its early stages, seeks to investigate the contemporary discourse on Indigeneity and minorities in the 1960s and locate therein the role of the welfare state and its taxpayers.

IIC03 Cosmopolitan communication studies: Toward deep internationalization

PN 133 Stepping out of the epistemic comfort zone: Questioning knowledge production in communication studies

Hanan Badr¹, Anna Litvinenko²

¹ University of Salzburg, Communication Studies, Salzburg, Austria

² Freie Universität Berlin, Communication Studies, Berlin, Germany

Research on de-westernizing and decentering communication and media studies highlighted among other things postcolonialism in research on the media systems of the so-called Global South (Ganter and Badr, 2022; Glueck, 2018), barriers to enter the international academic community for non-Westerners (Suzina, 2021; Freelon et al. 2023), centrality of Western Anglophonic theories (de Albuquerque et al., 2021), as well as structural limitations to de-westernizing academic publishing (Goyanes, 2019). Additionally, research has shown that major communication markets such as China and India are under-represented in global media science (Thussu, 2018). Despite the rich academic traditions in regions like the Middle East, post-Soviet states, and East Asia, English-speaking communication studies have largely overlooked academic production schools from these areas. Media practices in different parts of the world are still interpreted through a Western conceptual framework, raising questions about whether the community of values extends to methodologies and theories and whether this is beneficial. Around four concepts: Power and capital, Construction of concepts, Location and Mobility and Visibility and Invisibility the presentation questions the epistemic construction of our knowledge. It critiques the taken-for-granted epistemic authorities in communication studies and advocates to transform the discipline for more inclusive communication studies, which means reconsidering the knowledge production in our discipline on individual and organizational levels. If communication and media studies were to broaden their scope, they need to address the challenge of interconnecting culturally-specific research approaches and moving beyond macro-regional conceptual filters.

IIC03 Cosmopolitan communication studies: Toward deep internationalization

PN 134 De-Westernizing Media Systems Research

Melanie Radue¹, Carola Richter², Johanna Mack³

¹ University of Passau, Communication Studies, Passau, Germany

² Freie Universität Berlin, Communication Studies, Berlin, Germany

³ TU Dortmund, International Journalism, Dortmund, Germany

This presentation will show why a decolonization of concepts in media system research is necessary and how we can deal with and overcome problems in existing media systems research. While much work has been done in recent years to diversify the research on media systems and include new dynamics, some regions of the world remain "blind spots" that hardly appear. In consequence, the existing concepts cannot grasp the realities in these contexts and the over-application of dominant approaches based on Eurocentric case studies lead to biased research. This has effects on knowledge production and understandings of norms, but also on practical issues such as media assistance. For a truly cosmopolitan or decolonial approach to media system analysis we therefore push for creating awareness of the unreflected use of the concept of "media system" and foster a broader and more inclusive analysis. "System" should not be treated as an analytical box. Instead, "media contexts", "media ecologies", "communication ecosystems", "media configurations" or other contextualizing concepts all add to a deeper understanding of our research objects. The necessity of de-westernizing and decolonizing existing concepts brings us to inductive approaches and context-led research as a research program that will be outlined in this presentation. In a first step, we need to reflect our positionality and reconfigure it through processes of "unlearning" and "relearning" (Datta, 2018). Understanding the "positionality" of media contexts and acknowledging path dependencies and impacts from different (f)actors in various world regions is key when we want to go beyond trying to find a one-fits-all-typology for media context analyses. Secondly, by means of a deep (historical and transnational) contextualization and inductive approaches we can pay respect to indigenous knowledge, voices, and epistemologies. This also means,

in a third step, to consciously include the margins in our methodologies, e.g. by means of context-sensitive research, qualitative mapping or participatory methods.

IIC03 Cosmopolitan communication studies: Toward deep internationalization

PN 135 Comparative media ethics: The role of universalism in cosmopolitanism

Barbara Thomass¹

¹ Ruhr-University of Bochum, Media Studies, Bochum, Germany

Media-ethical thinking is strongly connected to norms. Although the context-bound character of norms is state of the art in academic media ethics, there is still the endeavor to declare essential norms as universal. A fundamental expression of universal norms for media and communication are the respective paragraphs in the UN Declaration of Human Rights. Therefore, this contribution analyses the different dimensions of universalistic thinking. Starting from a brief explanation of universalistic thinking, the presentation investigates the philosophical origins and dimensions of universalism and its historical development. It reveals contradictory implications of the concept and shows how it became a significant influence in philosophy about the state. It sketches the development from the Greek polis and the Roman Empire, via the philosophy of Enlightenment and the French Revolution to the twentieth century and the debate about universal human rights. With this background, we point to the limits of universality in view of context and power and discuss the relation between cosmopolitanism and universalism in media ethics.

IIC03 Cosmopolitan communication studies: Toward deep internationalization

PP 0942 The unrevealed Colonial Perspectives of German Newspaper Studies from the Weimar Republic to the 1940s. Or: The lack of epistemic memory in the field of communication studies

Stefanie Awerbeck-Lietz¹

¹ University of Greifswald, Political Science and Communication Studies, Greifswald, Germany

To this day, German communication studies struggle for internationality, not least with regard to epistemic justice (Richter et al. 2023). From research on the history of communication studies, we know a great deal about the international flow of people and ideas from Germany caused by emigration and flight after 1933 (the exodus of academics from newspaper studies to the US and elsewhere, Kutsch 1988, Author 2001). After 1945, the difficult re-integration of "Publizistikwissenschaft" into the international field followed (Löblich 2010). The Status Quo of research is: We are aware of the 'Nazification' of German newspaper studies, which was not only ordered by the state, but also operated from within academia by NS-conformist scholars (Kutsch 2010, Jedraszcyk 2016).

This presentation will complement this knowledge regarding the today forgotten books and articles about the African continent published between 1928 and 1943 in the context of German newspaper and radio studies by founding figures like E. Dovifat (1942), K. Wagenführ (1942) and W. Hagemann (1929, 1943).

Dovifat and Wagenführ (together with the journalist R. K. Dietze) mapped African press systems and early technologies for broadcasting. Hagemann, then still working as a journalist (he became a professor at the University of Münster in 1946), dealt with 'colonial methods' (critically in 1928, later opportunistic towards the NS).

With the works of Dovifat and Wagenführ, the early roots of media systems research and 'development communication' get visible – in the sense of the Western narrative of the "civilisation" of the apparently "uncivilized". They shared this normative idea of "civilisation" with Hagemann.

None of the three can be said to have been a convinced Nazi, the picture is ambivalent (Hagemann and Dovifat never joined the NSDAP, Hagemann was considered an "opponent" by the regime, Wiedemann 2015; Dovifat denounced the NS-racial politics, Pfeiffer 2018, and lied for his Jewish assistant, Author 1999). Nevertheless, such possibly opposing or antagonistic motivations were hardly visible to their readers or students. Dovifat and Wagenführ knowingly published their research on behalf of the NSDAP's colonial-political office ("Kolonialpolitisches Amt").

The presentation outlines the epistemic constellation of ideas about media and development on the African continent in relation to a specific milieu of academics. On the basis of published sources (1928–1943), it will be shown that the first steps towards comparative media system research in Germany cannot be reduced to their ambivalent appearances within NS academia, but must also be seen in the light of colonialist thinking.

IIC03 Cosmopolitan communication studies: Toward deep internationalization

PN 136 Diversity in and through the Media: cosmopolitan perspectives on challenges and opportunities

[Christine Horz-Ishak](#)¹

¹ TH Köln, Intercultural Communication, Cologne, Germany

This presentation asks what we can learn from a diversity approach to communication research and teaching. First step is to de- and reconstruct the existing value, practice, and policy of (cultural) diversity in and through the media (Media Diversity) from a cosmopolitan perspective. The Diversity concept is criticized as too ambiguous and hierarchical, implicitly rooted in a White/Western liberal framework. In this sense, Diversity in institutions like the media is so far rather a "performance culture" (Ahmed, 2012, p. 84), that simply accounts for the existence of diverse group representatives in journalism and media, instead of fostering structural changes. Diversity is criticized to depoliticize and bureaucratize difference while it celebrates it. Concepts like critical multiculturalism, however, are acknowledged for their normative dimensions, that recognize unequal power relations and are committed to elimination of structural inequalities (Zayani, 2011; Kaltzada, 2019). Taking these critical implications as a starting point it is, however, argued that Diversity as a value, a practice, and a policy has the potential to represent a "meta concept" that connects earlier theories like multiculturalism or antiracism under one roof without eliminating their critical implications. A cosmopolitan communication research can thus emphasize the normative-democratic dimension of Diversity (and not the utilitarian one) and take into account intersecting power relations, exclusions – but also empowerments in the media. This may help to shed light on inequalities and eliminate asymmetries of power on the structural level (Badr et al., 2021). This leads to the third step and the question in how far cosmopolitan scholarship may profit from alliances built with activists related to Media Diversity – or be an activist itself in the first place – to have an impact to media practice and structures. On this foundation the fourth step includes a glance at the current debate and situation in Germany and international best-practice cases, that give a showcase of cosmopolitan structures in the media (Horz, 2016; 2020).

IIC04 Hate, love, us, and them: Mediated representations

PP 0722 Racial load and literacy in the city: Insights from non-white women in Bordeaux and Rotterdam

[Mélodine Sommier](#)¹

¹ University of Jyväskylä, Language and Communication Studies, Jyväskylä, Finland

This presentation offers insights into the way non-white women living in Bordeaux (France) and Rotterdam (the Netherlands) perceive discourses about race/racism to materialize in their everyday urban surroundings. Focusing on racial landscapes (James et al., 2015) zooms in on the way cities mediate race and racism. Furthermore, racial landscapes, capture the contradictions of discourses of race and racism in Europe: erased from public spaces, dominated by whiteness, connected to a post-racial narrative (Salem & Thompson, 2016), and yet deeply embedded in "the archite(x)ture of European space" (Goldberg, 2006: 340). Cities are strategic venues where meanings are (re)produced, contested, and rendered (in)visible—for instance through street names, statues, places of worship etc. (Sassen, 2012). Thus, focusing on racial landscapes helps understand how the continuities of France's and the Netherlands' colonial and racist past shape today's supposedly post-racial urban realities. This study draws on several fields of study: ethnic, racial and gender studies, cultural studies and urban communication, and is informed by postcolonial feminism. This interdisciplinary approach offers a unique conceptual lens to reveal the range of social processes intertwined with race and space since gender, class and sexuality are communicated through both space and race (Mishra, 2013; Neely & Samura, 2011). Addressing the intersection between race, gender, and space is crucial since urban centers are typically constructed by and for (white) men (Massey, 1994; Pain, 2001).

The study is articulated around the following research question: How are race and racism communicated in urban settings, as identified and recorded by non-white woman living in Bordeaux and Rotterdam? This study uses

photo-diary and photo-elicitation as research design whereby the participants (n= 25) took photographs of the city and brought them to the interview. Photographs offered insights into the signs participants perceived to contribute to the (re)production of race/racism in Bordeaux and Rotterdam and were instrumental in giving more depth and materiality to the interviews. The presentation will discuss the methodological implications of using such a research design for data collection and in connection to ethics, whiteness in academia and the researcher's positionality. The findings presented in this presentation will primarily draw on the interviews which were analyzed using the main tenets of qualitative textual analysis (Braun & Clarke, 2006; Tracy, 2010).

The interviewees revealed various forms racial representations and racism can take through their everyday urban experiences (e.g. covert, blatant, cultural) that echo discourses of race and racism in Europe while also incorporating national (i.e. French and Dutch) discursive aspects. The participants also brought in various identification strategies (e.g. connected to imagined geographies, and labels such as Afropean, Afro descendants or mixed-race), and addressed intersections between race, gender and social class. The results reveal how the 'racial load' (Soumahoro 2020) manifests in concrete ways in urban contexts while pointing to ways of using cities to develop 'racial literacy' (Twine & Steinbugler, 2006).

IIC04 Hate, love, us, and them: Mediated representations

PP 1034 Mourning and visual tropes in photojournalism: Exploring the influence of repetition

Zuzana Jarolímková¹, Barbora Součková¹

¹ Faculty of Social Sciences- Charles University, Institute of Communication Studies and Journalism, Prague, Czech Republic

In recent years, it has become increasingly common to encounter mourning in the news media, mainly due to ongoing wars or pandemics. The grief associated with the loss of close ones is a significant subject and a powerful emotion that is often captured through news photography. Even though mourning can refer to different matters, we argue that the journalistic images constantly resemble each other. Different locations and faces, but the composition or other visual practices are often similar and repetitive. In this research, we observe the visual form of mourning by comparing two significant world events – the coronavirus pandemic and the war in Ukraine.

The repetition of topics in visual culture was already noted in the 19th century by Aby Warburg, who used pathos formulas to draw attention to certain depictions (gestures) associated with recurring emotions, regardless of culture (Didi-Huberman, 2009). Marianne Hirsch (2012) later defined established images representing certain events or emotions under the visual figures of memory. She demonstrated these primarily through photographs from the Second World War that represented the conflict and created a way of remembering, a so-called 'postmemory', for future generations. Moreover, this could also be highlighted by the constantly recurring themes and stylisations in photography called visual tropes (Zarzycka & Kleppe, 2013). Their use is meant to evoke emotions, corresponding to the turn towards the effect, which is evident in the news media in recent years.

This trend also emerges in news photography depicting mourning. To reveal this phenomenon, we are conducting a case study of news photographs published in the online mutation of The New York Times, a news media outlet with significant worldwide impact and relevance, and a substantial number of its original photographs. We are employing a qualitative social semiotic analysis (Cople, 2013) of 30 photographs published in the first six months after the outbreak of the coronavirus pandemic in 2020 and the war in Ukraine in 2022. In addition, we are supplementing the analysis by identifying visual tropes (Zarzycka & Kleppe, 2013).

Preliminary results highlight the recurring patterns of pathos, depicted primarily by repetitive themes, gestures, and visual figures that appear in both studied events. Among the included photographs, visual tropes were identified in more than half of the cases – most frequently, the mourning man or woman, the funeral, the coffin, and the dead male body. The women captured in the images often showed stronger emotions, suggesting the use of gendered visual stereotypes. With the results obtained, the research offers insight into the visual representation of mourning in two widely covered media events in recent years.

PP 1035 Ascribing identities and co-constructing the 'Other' online: A multimodal framing analysis of a news report in YouTube

[Shomaila Sadaf](#)¹, [Margarethe Olbertz-Siitonen](#)¹

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

This study explores the multimodal resources and narratives through which the Other is formed, and identities are ascribed in online spaces. In line with recent research, identity is seen here as constructions of belonging which go hand in hand with processes of in-group and out-group formations that may also lead to othering (Kroskrity, 2000). Identities are neither fixed nor limited, but rather contextual, intersectional, and interactively achieved (Pennington, 2018). The goal of this study is to explore and develop an understanding of how people co-construct the Other and make certain identities relevant in social media using multiple modes.

In the beginning of the year 2018, the British government decided to include relationships, sexual orientation, and sex education into the curriculum of state funded primary schools. However, the addition of information related to LGBTQ+ in the curriculum has been met with resistance, particularly from religious parents. For example, the British Muslim community has voiced their concerns and protested against the actions taken by the British government. YouTube has been used by news companies to air video stories covering the protest and narratives of the protestors along with the position of school officials.

The analysis centers on a news report shared on YouTube dealing with the protest of a local group of parents against the addition of information about LGBTQ+ in the curriculum in the UK, as well as a selection of comment chains that were evoked by the post. The video was uploaded in 2019. By the time of this study, the selected video had approximately 169,000 views and around 6000 comments. In deference to the multimodal nature of YouTube videos, this study utilizes multimodal framing analysis (Moernaut, Mast & Pauwels, 2020) as a method of choice. In addition, we draw on discourse analytic procedures in scrutinizing followers' responses and exchanges.

Our ongoing analysis indicates a hierarchy of ascribing identities in the data. Drawing on multimodal resources, the media works with social categorizations throughout the documentary, presenting and classifying involved conflicting parties in the light of their own visible and audible identifications. The protesters can be seen to construct a strong group identity as Muslim parents (e.g., clothing and reference to shared values). While the video appears to be designed as a news report that puts forward facts, the media does not seem to succeed in taking a neutral position consistently throughout the video. At times, the use of images, sounds and language contributes to the formation of "us" vs "them", where the audience is implicitly encouraged to pick a side. By investigating selected comments, the analysis further illuminates that and how these positions are taken up and expanded by the audience. Only towards the end of the news report, this problematic opposition is addressed and critically reflected through an expert interview that is – interestingly – visually located outside the previously presented 'battlefield'.

This study contributes to the growing understanding of the discursive construction of the Other in social media using multiple modes.

IIC04 Hate, love, us, and them: Mediated representations

PP 1036 The reproduction of 'climate migration': Racialisation and future social disorder in media framing of an unstable category

[Sian Cowman](#)¹

¹ Maynooth University, Department of Media Studies, Maynooth, Ireland

In recent years, the category of climate migration has become established in political and media discourse. However, the category is unstable and contested due to the complexity of migration and its multi-causal nature; and reproduction of 'climate migration' frequently masks and depoliticises this complexity. This is not solely a conceptual problem with consequences for public knowledge, but a political problem also, as the concept can be instrumentalised to advocate for different interests.

Despite this instability, it is widely reproduced by civil society and media, often articulated to push for climate action. It's also reproduced by political actors to advocate for border securitisation, framed as a catalyst of potential societal collapse. Representation of climate migrants in the media portrays them as both threats and victims, typical of migration coverage broadly.

Although the category first emerged from the environmental civil society sector expressed as concern for environmental degradation, the framing was closely linked to colonial, racialised ideas of overpopulation causing land degradation and resulting migration in regions such as the Sahel and Bangladesh. A focus on these geographical regions continues today in reproduction of 'climate migration', along with a hyperfocus on numerical predictions of movement of people across borders.

Allusions to apocalypse or collapse also frequently appear, such as Al Gore's exhortation to climate action at the 2023 World Economic Forum in Davos, referring to '...these waves of climate refugees predicted to reach one billion in this century; we would lose our capacity for self-governance on this world.'

These predictions proliferate despite an acceptance that science's ability to predict movements of people based on climate change is limited. The category acts to disassociate environmental and climatic changes from the historical and contemporary impacts of exploitation and dispossession which leave people vulnerable to climatic shocks in the first place. Equally as fundamental, yet less considered, is how the category of climate migration further reproduces coloniality and racialisation by creating an imaginary of climate migration as future social disorder.

Despite this instability and misrepresentation, 'climate migration' is still widely reproduced by international institutions, academic disciplines, civil society organisations, political actors, and in the media. This paper examines the framing, interpretation and significance of the category of climate migration in media and political discourse. It presents a mixed-method analysis of how the category is reproduced in professional journalistic output in international media titles.

The quantitative research draws on a corpus of more than 3000 newspaper articles to document the regions and numbers that climate migration is most associated with, and the sources and key phrases that inform the reporting. The qualitative analysis examines long-form feature articles and their accompanying images, and clips of broadcast content, to provide discourse analysis of how climate migration is framed and presented. In conclusion, the paper will reflect on the significance of media framing of climate migration for action or activism on climate change, and the treatment of people categorised as climate migrants.

IIC04 Hate, love, us, and them: Mediated representations

PP 1037 Love migrants as digital diasporas: News and media use experiences of migrant women in Turkish-Greek mixed marriages

Eylem Yanardagoglu¹

¹ Yaşar University, New Media and Communication, Izmir, Turkey

This presentation is based on a field research that focuses on the digital media and news consumption patterns of Turkish-speaking migrants in Athens, who are in mixed marriages with a Greek spouse.

Seen as a typical Southern European country, Greece has both deep-rooted and strained historical ties and past with Turkey. Living together in the same geography for centuries has created many social and cultural similarities between the two countries. They also share a conflicting history by positioning themselves as the 'other' in the formation of both Turkish and Greek national identities. (Bülent Gökay & Lily Hamourtziadou, 2016). The disorder between the two nations dated back to the forced population exchange following the Lausanne Peace Treaty. It was one of the various migration waves. (Mert Tekin, 2010: 83-85).

Istanbul Rum Community (Greek Orthodox Community of Istanbul) were expelled and/or migrated from Turkey to Greece in the 1960s due to the deterioration of the bilateral relations. The political refugees from Turkey also found refuge in Greece in 1970s, 1980s and 1990s. Since mid-2000s, a new type of migration from Turkey is observed among the urban, educated, affluent classes due to democratic backsliding. The new migration from Turkey to Greece have increased among the of young, educated, urban, white collar workers. Another inter-cultural and diasporic connection was established through the increasing number of mixed marriages between Greeks and Turks in the last decade.

It is observed that the internet and social media platforms, which are seen as a combination of news or various communication platforms, on the one hand will improve the trust of the citizens in their government, contribute to the self-development of political institutions. On the other hand, they have the power to magnify the inequalities and prejudices existing in society (Tolbert and McNeal, 2003). These inequalities or prejudices could be magnified in diasporic networks.

By focusing on the news media and digital media use of these community in Athens, this research explores the ways in which Turkish speaking first generation migrant women in Athens negotiate their positionality and identification within the (dis)order in Athenian public sphere, fellow migrant solidarity networks and their communication networks back in Turkey. It also explore of the spouses in these mixed marriages as media users who are citizens of minority/diaspora communities in a polarized, pluralistic and crisis-ridden media system. The interviews are based on self-reflection on daily presence in diasporic and local networks as well as their news consumption in their everyday transnational experiences. Through in-depth interviews conducted 2023 in Athens with a dozen migrant women, information is obtained on how social and new media tools used by this community in Athens in Greece affect the potential development of these migrant women's digital citizenship practices.

IIC05 Language ideologies and generational differences

PP 1140 Struggling for second place: The role of English in multilingual families – A comparative study in five linguistic environments

[Anastassia Zabrodskaja](#)¹

¹ Tallinn University, Baltic Film- Media & Arts School, Tallinn, Estonia

Due to the increase in migration worldwide and the digital turn in education prompted by the pandemic (Karpava, 2022), English as an international language plays a crucial role in both educational and home language (HL) environments. Children raised in multilingual families need to acquire their HL and the majority language (ML), as well as English, which is a global lingua franca (for an overview, see Jenkins et al., 2011). English is also an obligatory subject in schools in many countries. Furthermore, English serves as a common contact language not only in professional and educational spheres but also in close social relationships worldwide (Pietikäinen, 2017). It is frequently used as a mediating language among family members, both between partners and among all or some family members (Crystal, 2003; Björkman, 2009; Seidlhofer, 2009).

The aim of the current study is to investigate the role of English in multilingual families in Cyprus, Estonia, Germany, Israel, and Sweden, particularly its impact on the development of HLs and MLs in the pre- and post-COVID-19 period. A total of 50 multilingual families, ten in each country, were under investigation (for an overview, see Zabrodskaja et al., 2023). The researchers employed a qualitative approach for data collection and analysis, utilizing case studies based on interviews with parents and observations of family language policy (FLP) and language management patterns at home. The comparative study focused on the presence of English in HL environments of endogamous and exogamous families with immigrant and minority backgrounds in the five countries under investigation, its role in FLP (online) education, positive and negative effects on the use and maintenance of HL and ML, and (digital) literacy skills development.

The results of the study showed that the presence of English depends on its societal role in each country. English plays a significant role in all five countries, serving as a vehicle for the spread of popular culture and entertainment. In Cyprus, English is widely spread due to its post-colonial situation. In Estonia and Germany, it is the most popular foreign language and the language of inter-ethnic communication. Until the establishment of the state of Israel, English was the official language and continues to be important for government and commercial purposes today. In Sweden, English is even considered a second language.

The comparative analysis addressed parental beliefs and practices, revealing both variations and similarities. Exogamous families use English for language brokering purposes, employing it as a mediation tool for communication among parents and children. Schooling is another factor influencing the use of English at home, as it is an obligatory foreign language in schools. In Cyprus, some children even attend private English-speaking schools and private tutoring centers. The influence of the pandemic, lockdowns, and the digital shift in education triggered an increase in English-mediated digital communication and online activities. Overall, the findings suggest that the English language permeated the HL environments and FLP of multilingual families, especially during the pandemic, and that families needed to navigate a multilingual situation at home, supporting three languages: HL, ML, and English.

IIC05 Language ideologies and generational differences

PP 1141 Reproducing essentialism? – How ChatGPT and other Large Language Models explain interculturality and the field of intercultural communication

[Marko Siitonen](#)¹

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylän yliopisto, Finland

Emerging AI-applications such as large language models (LLMs) and other types of digital content creators challenge the dynamics of human communication in multiple ways. The field of intercultural communication is no different in this regard. Already before the recent explosion of AI-tools in the form of ChatGPT and others, scholarship warned us about the possibility of algorithms reinforcing existing social inequalities and prejudices (Caliskan, Bryson & Narayanan, 2017). Many cases of algorithms exhibiting racist and sexist biases have been reported over the years, ranging from the way search engines (Papakyriakopoulos & Mboya, 2022) and facial recognition algorithms (Cavazos et al., 2021) may reproduce existing power structures and stereotypes. New concerns have been raised related to the way AI-generated content appears to be biased as well (Fang et al., 2023).

Less attention has been given to the way AI content creators may also reinforce and strengthen existing knowledge constructs and truth claims within academia, and more specifically, intercultural (higher) education. We know that tools such as ChatGPT are already used in communication and language education (AlAfnan et al., 2023), but what kind of a view on culture, interculturality, and the field of intercultural communication do they present to their users, and what could this mean for the attempts to challenge and renew the field? Through a number of use cases

and their close reading, this study presents how LLMs inform their users on the concept of interculturality, the field of intercultural communication, and the main theories and models (and theorists) that characterize the field. The study illustrates how AI-generated content may reproduce traditional (essentialist) views into culture and interculturality and over-emphasize 'classical' views instead of newer developments, thereby reinforcing the status quo and even actively working against attempts to challenge hegemonic knowledge constructs. Implications for scholarship and intercultural (higher) education are considered.

IIC05 Language ideologies and generational differences

PP 1142 Breaking the barriers: Unveiling the impact of immersive learning media in boosting cultural intelligence among international students in Germany

Yi Xu¹, Kathrin Knutzen¹, Tuo Liu²

¹ Technische Universität Ilmenau, Institute of Media and Communication Science, Ilmenau, Germany

² Goethe-Universität Frankfurt, Institute of Psychology, Frankfurt, Germany

In the process of globalization, increased international migration and educational exchanges have fostered more opportunities for intercultural communication. Cultural intelligence is considered central to understanding cultural diversity, intercultural communication, and adapting to new cultures or societies (Sharma & Hussain, 2019). There is a wealth of literature on how cultural intelligence is influenced by factors such as individual characteristics, international experience, and intercultural communication education and training (Iskhakova, 2018; Solomon & Steyn, 2017). Immersive learning media, such as virtual reality and 360-degree tools, can be used to enhance cultural knowledge and intercultural understanding (Shadieff et al., 2021; Song, 2019). However, researchers have rarely examined how immersive learning media (along with other factors) can contribute to improving cultural intelligence in intercultural communication education from the perspective of pedagogical utility.

Research questions

Against this background, this study aims to answer two questions: (1) Can intercultural communication education be facilitated by immersive learning media to improve international students' cultural intelligence? (2) What factors significantly contribute to the improvement of international students' cultural intelligence in intercultural communication education?

Methods

We developed a social VR platform based on Mozilla Hubs that allows instructors and students to create avatars with their cultural identities, navigate between lecture halls and cultural spaces, and interact with other users. We also used 360-degree videos that showcase authentic multicultural business environments to further enhance students' immersive learning experience in intercultural environments.

Intercultural Communication is a required course for international graduate students at a German university. From October 2022 to February 2023, sixty students from twenty-three countries completed the course. Before and after the semester, the students were surveyed using the Cultural Intelligence Scale (Thomas et al., 2015). They also completed a questionnaire that included measures of VR social presence, spatial presence, user experience, and students' previous VR experience and learning status (online/onsite).

Results

We used the latent change score model within regularized structural equation modeling for data analysis. Results showed that international students did indeed make significant improvements in cultural intelligence after one semester of training. In terms of factors, students with higher hedonic usability scores experienced more pronounced improvements. Conversely, students with higher initial cultural intelligence performance made smaller gains.

Students' improvement in cultural intelligence was not influenced by social presence, spatial presence, previous VR experience, or online versus onsite learning.

Outlook

Immersive learning media can serve as innovative pedagogical tools that go beyond traditional teaching methods in intercultural communication education. International students benefit from their engagement and interactivity. Rarely, cross-cultural training has been conducted in virtual environments due to its novelty, high cost, technological complexity, and low availability. With further advancement of new technologies, it is promising to say that immersive learning media can serve as an innovative and useful instructional tool in intercultural communication education.

IIC05 Language ideologies and generational differences

PP 1143 Generational and Cultural Differences within and between Turkish-Dutch and Dutch citizens in The Netherlands

Mustafa Akpinar¹, Lisa Vandeberg¹, Paul Hendriks Vettehen¹, Hanneke Hendriks¹

¹ Radboud University, Social Sciences, Nijmegen, Netherlands

The percentage of Dutch citizens with unhealthy lifestyles, including overweight and excessive smoking, is above the global average and has been increasing over the past years. On an individual level, these unhealthy behaviors reduce the quality of life and health and increase the probability of cancer, cardiovascular diseases, or even early death. On a societal level, unhealthy behaviors lead to increased pressure on the healthcare system.

Dutch citizens with a non-western migration background are overrepresented in this health problem. Dutch citizens with a Turkish migration background (Turkish-Dutch citizens, the largest migrant group in The Netherlands) are among the most overrepresented in these unhealthy behaviors. Differences exist between Dutch and Turkish-Dutch citizens that may account for these health disparities, including cultural differences. Based on the literature, we assume that cultural differences are crucial for health behaviors and may be essential factors in explaining how Turkish-Dutch citizens process and respond to health messages. Therefore, this study aims to map cultural differences between Turkish-Dutch and Dutch citizens to reveal the acculturation process of Turkish-Dutch citizens. Here, it is vital to assess any differences across generations because home culture orientations of ethnic minority groups are indicated to reduce (in a non-linear, multi-dimensional way) over generations. In a cross-sectional survey (N = 470), we studied (a) language, (b) cultural values, (c) national identification, and (d) media use in three generations of Turkish-Dutch and Dutch citizens.

Current analyses of the data test our hypothesis that Turkish-Dutch citizens' language (H1a) proficiency, (H1b) dominance, (H1c) preference, (H1d) use, and (H2) media preferences will increasingly resemble their native Dutch counterparts. We also explore (RQ1) to what extent the cultural values (in terms of collectivism/individualism, hierarchy/egalitarianism, and masculinity/femininity) and (RQ2) national identification of Turkish-Dutch citizens shift towards Dutch across generations.

Preliminary results indicate that the acculturation process of Turkish-Dutch citizens is proceeding as expected in certain areas, such as language. Still, as far as national identification is concerned, it appears to stagnate in the third generation. These outcomes and the complete analyses between and within both Turkish-Dutch and Dutch citizens across generations will be discussed during the conference.

ICS01 Interpersonal communication in the workplace/workspace

PP 0351 Life coaching communication practices in Romania: The coachees' perspective

Dumitrita-Dorina Hirtie¹

¹ National University of Political Studies and Public Administration, Communication, Bucharest, Romania

As a human development practice, coaching can be defined as a method of "helping individuals regulate and direct their interpersonal and intra-personal resources to better attain their goals" (Grant, 2006, p. 153). Research in coaching has evolved under the facets of multidisciplinary perspectives. Coaching as a conversation (Bachkirova & Kauffman, 2009; Starr, 2003) places a strong emphasis on the relationship and communication between coach and client – known as coachee. As such, communication studies sit at the heart of the coaching relationship. In this sense, interpersonal communication in coaching may employ directive and non-directive practices that may be shaped using technology and diverse approaches to coaching. However, research on communication practices demonstrating the nature of the directiveness and non-directiveness of communication in coaching practice in terms of techniques used and the attributes of the coach is still underway.

Moreover, with the recent changes brought about by the COVID-19 pandemic, remote work has become part of the new normal, with people spending more time at home in general. This has facilitated the further development of the online coaching industry. In this new reality, coaching practitioners have used varied approaches in their work with coachees. The coachees' perspective is equally necessary to reflect the effectiveness of the recent past and current coaching communication practices. Also, the coachees' perspective is less present in coaching research.

By employing a quantitative-based methodology, the current paper surveys the preferred coaching approach by Romanian coachees. More specifically, the study aims at exploring the coaching needs and experiences of students and non-students (adults) with various coaching activities in Romania. In this direction, the paper will explore what coachees find new in the online environment from the offline environment, the means of communication used, the frequency, language, type of questions preferred, and what other interpersonal communication skills are being exercised in the coaching process. The survey will consider, for example, the types of coaching sessions participants have attended, if they intend to participate in, what are the main motivations for participating, what skills they appreciate in a coach and other aspects. By delving into the coachees' perspective in Romania, the study aims at contributing to the coaching literature in Central-Eastern Europe.

Keywords: life coaching; interpersonal communication; online coaching; directive communication; non-directive communication

ICS01 Interpersonal communication in the workplace/workspace

PP 0352 Dialogue with combatants in the communication practices of army chaplains in the context of military conflict

Olesia Liubashenko¹

¹ Taras Shevchenko National university of Kyiv, Methodology of teaching Ukrainian and Foreign Languages and Literatures, Kyiv, Ukraine

The evolving dynamics of current geopolitical processes suggest that the societal landscape in the near future may depend on the communication abilities of those shouldering vital responsibilities in wartime contexts. This study focuses on the workplace dialogues of military chaplains operating in conflict zones, engaging in dialogic interactions with frontline combatants. Notably, their dialogues with clients display features of both interpersonal and professional communication simultaneously. The concepts of communication as dialogue (Baxter, 2006) and dialogue as a practice (Létourneau et al., 2023) allow us to explore their communicative practices in these two focal points.

Therefore, this research aims to achieve two main objectives: firstly, to develop a typological framework for the dialogues conducted by chaplains, and secondly, to describe the communicative strategies and techniques used to make effective communication decisions in a professional setting.

The research methodology includes a comparative analysis of samples of workplace dialogues, the systematic categorization of effective communication interactions, interviews with chaplains, and discussions with combatants serving in the combat zone in Ukraine. The data were collected during two training sessions in two experimental

series, spanning from February to October 2017 and from March to November 2023, led by the author in training groups. These groups included combatants and army chaplains who were preparing to serve in the military conflict zone of Ukraine, as well as those who already had experience working in combat positions.

The research findings include categorizing chaplains' dialogues based on: 1) the nature of the soldier's personal issue; 2) the planned outcome of the dialogue (Kaminsky et al., 2006); 3) the goal of the dialogue; 4) the communication strategy employed by the chaplain to achieve the goal. The study has also helped identify types of dialogues that, according to the combatants, were considered more or less beneficial. During the training, we compiled examples of speech expressions, phrases, and shared vocabulary used by combatants and chaplains that positively impact the effectiveness of dialogic interaction in frontline communication practices.

ICS01 Interpersonal communication in the workplace/workspace

PP 0353 Questions as a device for constructing shared communication competence in interprofessional teamwork

[Tessa Horila](#)¹

¹ Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

Competent communication is a foundational interest in communication researchers (Graves, 2021), also in the context of teams. In healthcare, interprofessional teams are assembled to ensure and increase patient care, satisfaction, and safety (IPEC, 2016). The proposed presentation introduces a work-in-progress case study that examines how questions function as a device for constructing and displaying team-specific communication competence in an interprofessional healthcare team's communication. A question is defined as a phrase, statement or act inviting response from others (Stewart & Cash, 2011). Their functions include initiating, maintaining, and controlling interaction, seeking information, expressing interest and opinions, and encouraging participations (Hargie, 2017).

Studies of interprofessional teams have shown that questions are used, for example, to solicit information and confirmation (Lee et al., 2021), to manage boundaries and tensions, and to signal authority (Arbor, 2008). Some possible connections between questions and competence have been suggested. Lee et al. (2021) suggested, that the enabling function of questions can lead to better joint decision-making and patient care, as questions invite and bring about perspective-taking, sharing of experiences and a lowered hierarchy. Arbor (2008) proposed that questioning can be a strategy of skilled communication that enables interprofessional collaboration, contributes to decision-making and preserves the etiquette of the team – essentially, maintains its effectiveness and appropriateness (see Spitzberg, 2013).

In the present study, communication competence is approached from a constitutive perspective, and defined as shared communication competence (Horila, in review): dynamic and emergent competence constructed, negotiated, and enacted in everyday meaning making processes, rather than as individual knowledge, skills, and motivation that precede team interaction. While mainstream approaches to competence focus on post-positivistic, individualist perspectives, calls for systemic, interpretivist and processual research of competence have been made (Jablin & Sias 2001; Wrench & Punyanunt-Carter, 2015).

The aim of this study is to understand how questions are used to construct and display communication competence in interprofessional team communication. Two research questions are posed: (1) How are questions used to construct and negotiate shared meaning of the team's tasks, relationships, and goals? (2) How are questions employed to maintain effectiveness and appropriateness of team communication?

The dataset comprises 5 informal team meetings of an interprofessional orthopedic nursing team in a Finnish hospital. The research setting of this case study is built on a data-driven notion that the team's interaction includes frequent and versatile use of questions by members. In addition, focus group interview data of the team discussing their work practices, is employed.

A discourse analysis of the meeting data will be employed to identify and analyze patterns of question use (for a similar protocol, see Lee et al., 2021), and to understand the ways in which the team negotiates and manages the effectiveness and appropriateness of their communication using questions. Interview data will be qualitatively and inductively analyzed for meanings that members give to question use.

The presentation will introduce the findings of the analysis and the theoretical and practical implications that this study has for both interprofessional teamwork, as well as communication competence research.

ICS01 Interpersonal communication in the workplace/workspace

PP 0354 Reflecting physicians' views of communication and interprofessional teamwork through Constitutive metamodel of communication

Emma Sallinen¹

¹ Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

Interprofessional teamwork is an inevitable way of working for health care professionals and it has been proven to be beneficial since it leads to more quality care for patients, better stress management for team members. Though interprofessional communication is influenced by the whole team, physician's role and communication have an extensive effect on interprofessional team's communication. There have been success mapping out the stances and conceptions physicians have on interprofessional teamwork but studies that investigate the communication view of physicians are lacking.

Traditionally communication view has been a way for scholars to position their study to the field of communication and expose the personal epistemology of the scholar (Craig 1999). Even though Craig's (1999) *Constitutive metamodel of communication* has been used to map the field of communication and elucidate different views on communication this metamodel has rarely been used to analyze how study's participants' personal communication view is reflected in the way they communicate or conceptualize social interactions. By examining communication view of physicians, it is possible to gain knowledge on what physicians think is possible through communication and how this reflects to interaction with the team and further effect the whole interprofessional team's communication. Therefore, this study aims to identify:

RQ1: What kind of communication model, if any, can be identified in physicians' thinking?

The study was conducted by gathering 65 essays from physicians during their specialization training. The data were analyzed utilizing thematic analysis by analyzing the language physicians used to describe interprofessional teamwork, interprofessional practices and leadership in interprofessional teams. Special interest was on how the physicians were describing communication processes. The analysis is still in process.

In the preliminary findings, physicians seem to describe their communication view from both meaning-oriented and transmissional view of communication. There were both meaning-oriented and transmissional content in same essays which could imply that the division between transmissional and meaning-oriented view is not a dichotomy but rather a continuum.

Meaning-oriented view of communication can be detected when physicians portray interprofessional teamwork as communication and collaboration among the team. Communication is seen as the essence of teamwork and overall condition for working interprofessionally. When interprofessional teamwork is described to be constructed together in team's communication it can be argued that physician sees communication as meaning making process.

Transmissional view of communication can be spotted when physicians used the term tool to describe interprofessional teamwork which implies that they see communication as a tool to transfer information. If teamwork and its essence are seen only as information gathering and reporting it to physician, communication is seen as tool or medium to share information from sender to receiver. Physicians also use terms like message, sender and receiver in their essays which implies that they see the process of communication as information processing.

PP 0355 Between the exclusivity of profession and the inclusivity of interprofessionality: Retheorising interprofessionality in health care teamwork

Malgorzata Lahti¹, Leena Mikkola²

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

² Tampere University, Communication Sciences, Tampere, Finland

Today's health care organisations increasingly rely on interprofessional teamwork that brings together representatives of different administrative and health care professions and specialties. Such collaboration of diverse experts has been shown to support the provision of comprehensive and effective treatment plans, especially in complex patient cases. While interprofessionality appears to be of high practical importance, there are still substantial gaps in our understanding of this phenomenon. Research has tended to explain successful teamwork with attitudes

and communication skills held by individual team members. However, in the face of profound transformations that health care work practices are undergoing, counting on skills training or attitude change is not enough; a thorough rethinking of interprofessionality is needed. Interprofessional teamwork demands a holistic systems approach where professional boundaries are redefined and team members develop a sense of mutual accountability, striking a balance between identifying individual professional expertise and recognising shared goals and characteristics (Baxter & Brumfitt, 2008).

In our ongoing project, we reconceptualise interprofessionality from a communicative constitution perspective as a process where team members collaboratively invoke and negotiate meanings of their professional identities in relation to one another. It is the element of navigating and resolving the tensions between the exclusive notion of profession and the inclusive notion of interprofessionality that we see as a potentially fruitful avenue for deepening our understanding of interprofessional teamwork. We apply and integrate two socio-constructionist frameworks geared towards exploring co-occurring conflicting meanings attached to self, relationships and the social world: critical discursive psychology (CDP) and relational dialectics theory (RDT). CDP uses the analytic concept of ideological dilemmas to capture the contradictory character of explanations about the social world (e.g., Wetherell, 1996). RDT allows us to understand individual and relationship identities as meaning making originating in the interpenetration of competing discourses (Baxter, 2011).

In two rounds of analysis, we separately applied CDP and RDT to a theoretically rationalised dataset of two focus group discussions conducted in 2019 with members of an orthopaedic clinical team at a central hospital in Finland. The first discussion (1 hour 11 minutes) involved four nurses; the second one (1 hour 22 minutes) was conducted with two nurses, two ward clerks, and a physiotherapist. The research participants reflected on the topics of interprofessional teamwork and communication in the team. Working with CDP, we identified two sets of ideological dilemmas: *professional identities as essentially different vs. the team as an organically evolving entity*, and *stagnant institutional hierarchies vs. organisational democratisation*. The RDT analysis pointed to a dialectical opposition between the discourses of *professional/structural hierarchy* and *expertise/competence*. In the presentation, we will deliberate on the complementarities between these findings and integrate them to develop a model explaining interprofessional health care teamwork.

ICS02 Influencers and assistants: Interpersonal questions of digital communication and AI

PP 0471 Green encounters: Influence of interpersonal involvement with digital opinion leaders on users' green behavioral intentions

Zoe Olbermann¹, Holger Schramm¹

¹ University of Wuerzburg, Institute of Human-Computer-Media, Wuerzburg, Germany

Digital opinion leaders play a central role in interpersonal communication. In environmental communication, the focus was particularly on social media influencers (SMI), who can positively influence environmentally conscious behavioral intentions in their role as greenfluencers. So far, the effectiveness of the type of environmental message (e.g., Boermann et al., 2022) as well as the cross-situational connection of users to the respective greenfluencer in the form of parasocial relationship (e.g., Knupfer et al., 2023) have been examined. This study addresses a research gap by examining the role of the SMI in a first contact in the specific media usage situation. Based on the literature (e.g., Katz, 1957; Merton, 1949), central characteristics of digital opinion leaders are identified (perceived similarity, expertise and approachability) in order to establish an impact model that can explain the persuasion processes in the media reception situation in detail. We assume that the three central characteristics in the social media context can be influenced by the representation of expert status (=> expertise), the living conditions (=> similarity) and the willingness to share (=> approachability). We also assume that the three perceived characteristics of the opinion leader lead to a stronger interpersonal involvement (parasocial interactions and wishful identification), which positively influences the processing of the message (positive thoughts) via stronger personal relevance and less psychological distance. Positive thoughts, in turn, should positively influence behavioral intentions via stronger perceived self-efficacy.

To test the model, a 2x2x2 between-subject laboratory experiment (N = 231, M_{age} = 21.85, 75.4 % female) was conducted. A fictitious influencer was created, about whom the participants received preliminary information to manipulate both the expert status and the living conditions. The participants then watched an Instagram reel in which the influencer explains tips for an environmentally conscious life. The conditions differed in terms of the

influencer's willingness to share. Finally, the participants answered a questionnaire that tested all constructs on a seven-point Likert scale.

The results show that the representation of the living conditions influences perceived similarity ($F(1, 229) = 32.38, p < .001$), the representation of expert status influences expertise ($F(1, 229) = 37.13, p < .001$) and the willingness to share influences approachability ($F(1, 227) = 3.39, p < .001$). Two multiple regressions show that all three characteristics predict both parasocial interactions ($F(3, 227) = 15.73, p < .001, R^2 = .17$) and wishful identification ($F(3, 227) = 28.53, p < .001, R^2 = .26$). Two serial mediation models show that wishful identification and parasocial interactions influence both personal relevance (PSI: $b = .75, p < .001$; wishful identification: $b = .56, p < .001$) and positive thoughts (PSI: $b = .20, p < .001$; wishful identification: $b = .17, p < .001$). Positive thoughts influence self-efficacy ($b = .58, p < .001$), which explains the environmentally conscious behavioral intentions ($b = .51, p < .001$).

The results show that parasocial interactions and wishful identification are important mechanisms in persuasion through interpersonal communication. In our presentation, we will discuss the limitations of our study and future research.

ICS02 Influencers and assistants: Interpersonal questions of digital communication and AI

PP 0472 Understanding the trustworthiness of virtual influencers as a prerequisite of their impact in creating AI-based content

Castulus Kolo¹, Joschka Mütterlein², Sarah Anna Schmid²

¹ Macromedia University of Applied Sciences, Faculty of Communication- Media and Psychology, Munich, Germany

² Macromedia University of Applied Sciences, Faculty of Business- Design and Technology, Munich, Germany

A new group of influencers has attracted a considerable number of followers in social media (Moustakas et al., 2020). So called virtual influencers (VI) are like humans in their appearance and adapt emotions and other characteristics based on artificial intelligence (Batista da Silva Oliveira & Chimenti, 2021). Hundreds of them already (Choudhry et al., 2022) document a fast-growing trend as independent third-party endorsers who shape audience attitudes (Agnihotri & Bhattacharya, 2021).

An advantage for brands in collaborating with VIs is controllability (Berryman et al., 2021; Sands et al., 2022). Brands can ensure that the image of the VI serves their objectives (Zhang & Wei, 2021). As further aspects in which VIs perform better than human influencers, Berryman et al. (2021) emphasize flexibility, plasticity, and access. Appel et al. (2020) believe that with stronger computing power and better algorithms, VIs will become much more prominent on social media, being able to invariably act on brand values and interact with followers anytime.

Albeit their increasing relevance, there is relatively little theory-based research on their perception by their followers and their impact respectively (e.g. Thomas & Fowler 2021; Sands et al. 2022). How exactly (1) do such VIs perform compared to real human influencers, and (2) are users aware of following VIs or do they care at all? In our proposed contribution we shall address these two research questions after an introduction of different categories of VIs and having set a theoretical context for our empirical study. Thereby parasocial interaction theory put into an influencer marketing context (Chung & Cho, 2017) shall guide our structural equation modelling (SEM) approach.

Based on an experimental set-up with a VI (in one group labeled as such and in a second one without labelling) and a culturally similar human influencer (in a third group wrongly labelled as VI and in a fourth one unlabeled), we develop a SEM that is stable and significant across all four groups with a total of 250 questionnaires completed by respondents between 15 and 30 years old. The stimulus material was taken from the accounts of @rozy.gram as VI and @mulbada as human influencer, both having a Korean background and being mid-range influencers known for having intimate relationships with followers. Apart from tracing back source trustworthiness as major driver for purchase intention in influencer marketing (Chung & Cho, 2017) and central variable of the SEM primarily to perceived self-disclosure and parasocial relationship, and secondarily to general trust in media, technology affinity as well as frequency of social media interactions, we also find that trustworthiness doesn't generally differ between VIs and human influencers but only for specific users.

Our results confirm that VIs just as their human counterparts have a similar potential to engage in influencer marketing and content creation as media makers in general. Although the study is necessarily limited by its sample size, the focus on Asian protagonists, and the experimental design with closed questions, it suggests besides the mentioned results also further research of academic as well as practical relevance.

ICS02 Influencers and assistants: Interpersonal questions of digital communication and AI

PP 0473 Moving beyond warmth and competence: Understanding users' needs for social cues in service interactions with conversational agents

Michelle Van Pinxteren¹, Mark Pluymaekers²

¹ Behavioural Science Institute- Radboud University, Communication Science, Nijmegen, Netherlands

² Zuyd University of Applied Sciences, Professional Communication in a Digitalizing Society, Maastricht, Netherlands

In recent years, virtual service agents have been increasingly deployed in service interactions to substitute or augment human service employees. These agents' ability to mimic human appearance and communicative behavior, also known as social cues, is widely believed to enable a human-like interactional experience that can benefit relational outcomes. Yet, users' needs for these social cues are subject to individual and contextual differences (Chattaraman et al., 2019; Shumanov & Johnson, 2021) and timing (Dwivedi et al., 2022). Although prior research has laid the foundations for uncovering patterns related to users' needs for social cues in conversational agents (e.g., Belanche et al., 2021), these studies primarily focus on users' needs for warmth and competence. However, this narrow focus has inadvertently neglected potential additional needs for social cues in conversational agents. Moreover, most of the research conducted in this field adopts a quantitative approach, focusing on formal testing of relationships and effects rather than exploring users' needs by means of in-depth discussions on their preferences. Hence, this study aims to explore user preferences regarding the use of social cues by conversational agents across various service contexts and uncover the underlying latent needs associated with these preferences.

For this purpose, this study utilized an approach grounded in the principles of generative design. (Sanders and Stappers, 2012). This approach allows researchers to uncover users' preferences and their underlying tacit and latent needs by harnessing the creativity of the users. Twenty participants engaged in a generative session during which they actively designed a virtual service agent tailored for either a medical or financial context. In order to express their tacit and latent needs, participants followed four distinct phases: 1) sensitization to the topic, 2) creation of the agent's appearance using a face generator, 3) formulation of the agent's verbal and non-verbal communication strategies through the use of storylines and gamecards, and 4) completion of a survey. Subsequently, the researchers conducted interviews with the participants to uncover the latent and tacit needs that underpinned their choices. The researchers analyzed these interviews using a grounded theory approach.

The findings of this study emphasize variation in users' needs concerning the visual attributes and verbal as well as non-verbal behaviors of conversational agents which are demonstrated to go beyond warmth and competence. Additionally, the findings reveal communicative needs that are commonly shared, suggesting their universality across users and contexts, thus requiring no personalized adaptation. Conversely, specific communicative needs are notably associated with specific phases of the service interaction, service contexts, and user characteristics. Therefore, researchers and designers are encouraged to embrace a broader perspective concerning users' needs for social cues in conversational agents.

PP 0474 Over(under) accommodative voice-based assistants: The mediating effects of perceived accommodation when applying stereotype content models to machines

Matthew Craig¹, Chad Edwards², Autumn Edwards², Xialing Lin³

¹ Kent State University, College of Communication & Information, Kent, USA

² Western Michigan University, Communication and Social Robotics Labs, Kalamazoo, USA

³ University of Central Florida, Nicholson School of Communication and Media, Orlando, USA

The proliferation of voice-based assistants (VBA) has aided in numerous applications for users, such as finding information, language tutoring, and practicing social interactions. While VBAs should accommodate users' task-related needs (e.g., a VBA language tutor adjusting the progression of lessons to match the pupil's skill), what happens when a voice-based assistant attempts to accommodate its communication with the user? Previous human-machine communication (HMC) research illuminates users' likely process for considering VBAs accommodative communication when evaluating the machine agent. For instance, the Computers are Social Actors (CASA) paradigm (Reeves & Nass, 1996) suggests people apply cognitions relevant to human-to-human communication (e.g., gender and social cues) to interacting with machines (e.g., voice-based tutor on a desktop computer).

A growing and more contemporary perspective in HMC research argues that people, when coming to interact with machines, carry expectations for the interactions and, as such, apply relevant human-media scripts to foster intentional interactions (e.g., a social robot with a face affords communication; Gambino et al., 2020). Because of these expectations and applications of scripts to the human-machine interaction, initial impressions significantly impact how that machine is evaluated. For example, studies show that initial communication with machine actors often leads to heightened uncertainty, diminished liking, and lower evaluations of social presence compared to

interactions with humans. Additionally, individuals exhibit adaptive behaviors, accommodating their communication to effectively engage with machine actors (Fortunati et al., 2022).

Building on prior research, particularly that of Gasiolek and Giles (2015) and Authors et al. (2023), this work enhances our understanding of how individuals assess VBAs exhibiting excessive or insufficient accommodation in initial interactions. Via the stereotype content model (Fiske et al., 2002, 2007, 2018), this experiment broadens insights into how people evaluate VBAs in instances of over- and under-accommodation. Hence, the following research questions and hypotheses are offered:

RQ: Are the relationships between the stereotype content model (warmth and competence) and (a) evaluation of communication and (b) evaluation of the speaker mediated by the perceived appropriateness of communication accommodation?

H1: VBAs using overaccommodative communication are perceived as (a) more warm and competent and (b) more accommodative than underaccommodative VBAs.

H2: VBAs using overaccommodative communication are evaluated more positively (evaluation of communication and evaluation of the speaker) than underaccommodative VBAs.

Following informed consent, participants (n = 193) in this human subjects review board-approved online experiment were randomly assigned to read a brief vignette of receiving over or under-accommodative messages from a VBA before completing a survey. Results suggest that users' impressions of VBAs (warmth and competence) lead to different evaluations of VBAs as a speaker and its communication indirectly through its perceived accommodation. Moreover, VBAs using overaccommodative communication were evaluated more positively than those using underaccommodative communication. As such, VBAs should be considered over rather than underaccommodative. Results are discussed in light of communication accommodation theory, human-to-human interaction script theory, and features designers should consider when building communicative AI, such as VBAs.

ICS02 Influencers and assistants: Interpersonal questions of digital communication and AI

PP 0475 Attentional and emotional effects of AI-generated content on young university students

Vicente Villalba Palacin¹, Sánchez Gómez Lydia¹, Franganillo Jorge¹, Calderón Garrido Caterina²

¹ Universitat de Barcelona, Departamento de Biblioteconomía- Documentación y Comunicación Audiovisual, Barcelona, Spain

² Universitat de Barcelona, Departamento de Psicología Clínica y Psicobiología, Barcelona, Spain

The wide use of mobile phones has created new forms of communication and interrelationships that facilitate the creation of social links and knowledge in virtual environments. Young university students, mostly those between 18 and 24 years of age, spend the most time on the phone (IAB, 2022). In this context, artificial intelligence (AI) has recently been implicated, generating controversy over the automated creation of synthetic content (Franganillo, 2023). Apart from helping the work of media professionals, it also involves risks associated with the authenticity or falsification of information, which makes it necessary to promote greater ethical, social and responsible awareness in the information consumption of consumers, to prevent the use of AI from leading to problems of misinformation in the future (Davenport & Mittal, 2022). Today, it has already been proven that the use of mobile devices or the Internet causes addiction, anxiety and poor academic performance (Balta et al., 2018; Baranova et al., 2022) in young university students, among others; and recent studies show that AI has the same persuasive potential as a human (Huang & Wang, 2023). The aim of this research is to determine if there are differences in influence, in terms of emotion (EDR) and attention (EDL), to news created by traditional media compared to those generated by AI (GPT-4) and to analyse if this has a direct effect on the well-being of the individual in order to determine its impact on the consumption of information by young people. To achieve this, *Sociograph* is used. Through two electrodes, this tool allows the measurement of electrodermal activity (EDA) (Aiger, 2013) and to know the activation to different inputs. In addition, Ryff's (1989) well-being questionnaire is used to check whether there is a correlation between the results of activation and the emotional well-being of the participants. Eighty young university students, who are part of the social group that spends the most time in virtual environments, participated in the study. The preliminary results of this research show differences of activation (EDA_i) depending on the communicative tone of the synthetically generated content, with higher activation in news with a more sensationalist charge. Participants show greater activation with synthetic news compared to news created by traditional media. No differences in activation were found according to the gender of the participant. Finally, a positive relationship is found between activation to synthetic news and participants' emotional well-being. These findings recognise the relevance of synthetic content and its impact on young people, as it can compromise their emotional well-being and lead to misinformation in their information consumption. It is important to establish mechanisms that allow the identification of synthetic content so that it does not affect their information consumption.

ICS03 Diverse diversity: Perspectives on inclusion and identity

PP 0578 What matters in accessible communication for people with neurodiversity?: A systematic review

[Cátia Casimiro](#)¹, [Carla Sousa](#)¹, [Michael James Heron](#)²

¹ Lusófona University, Centre for Research in Applied Communication- Culture- and New Technologies CICANT, Lisbon, Portugal

² Chalmers University of Technology- University of Gothenburg, Computer Science and Engineering, Gothenburg, Sweden

'Neurodiverse people' is an umbrella term that encompasses autistic people, people with intellectual disabilities, those with dyslexia, and everyone who differs from what is considered neurotypical (Hughes, 2016; Doyle & McDowall, 2022). These people are often denied a fundamental right – information – because society does not appropriately value the importance of communicating in an accessible manner. This has implications across all spheres of life.

The Convention on the Rights of Persons with Disabilities (CRPD) was fully ratified in 2008. Articles 9 and 21 within this treaty relate to the rights of individuals when making decisions and to the accessibility of the information upon which those decisions are built (Office of the High Commissioner for Human Rights, 2006). These are important humanistic principles that are often underserved. The extent of that deficit, however, remains unknown.

This work reports on a systematic literature review as conducted following the PRISMA methodology (Page et al., 2021). Through this review, we explored the most common approaches by which accessible communications are created and the theoretical foundations they build upon.

We seek to codify the best practices employed in the literature and shed light on the importance of having accessible communication available as a standard. This review explored significant works recorded in Scopus, EBSCO, Web of Science, and B-On. We identified relevant papers through a combination of keywords and terms within a scoping date range of May 2008 to December 2023 to capture the post-ratification period of the CRPD. We include both quantitative and qualitative work in this study, therefore adopting a two-folded approach to limit bias analysis (Sousa & Costa, 2022).

Several articles were excluded due to multiple criteria, such as non-peer-reviewed status, unavailability in Portuguese or English, being secondary studies, adherence to the medical model of disability, lack of relevance to human subjects, or concentration on impairments not conventionally encompassed within the 'umbrella' of neurodiversity.

Our work resulted in several observations that we can build upon in future analyses. We found that accessible communication research applied to neurodiverse people tends to cluster around several knowledge domains – specifically health information, web accessibility, research participation, linguistics, public services, workplace inclusion, and alternative and augmentative communication. One observation of this work is the utilitarian focus of the existing literature: while much is given over to the pragmatics of day-to-day life, little attention is paid to more personal or recreational pursuits. There is then a research gap regarding quality of life.

Our future work will focus on communication in entertainment and playful settings as a crucial part of full social inclusion, specifically in the short term with regards to the development of accessible rulebooks for board games. These offer a compelling use case for the principles we intend to explore, as they are simultaneously technical documents and highly nuanced instructions for play. We expect this challenging intersection of traits to yield much more promising insight into accessible communication in other contexts.

ICS03 Diverse diversity: Perspectives on inclusion and identity

PP 0579 How does neurodiversity impact information processing, communicative competence and task performance in video mediated interactions?

[Naama Meir](#)¹, [Nehama Lewis](#)¹, [Orit Hetzroni](#)²

¹ University of Haifa, Department of Communication, Haifa, Israel

² University of Haifa, Department of Special Education- Faculty of Education, Haifa, Israel

This study applies the limited capacity model of motivated mediated message processing (LC4MP: Lang, 2000, 2017) model to understand how neurodiversity influences cognitive information processing and the ability to convey information effectively in the context of video-mediated interactions. The LC4MP model has been tested among neurotypical populations, but not (to our knowledge) among neurodiverse populations whose unique characteristics may impact information processing and communicative outcomes.

Design and Procedures

The study uses a 2 (group: autism/neurotypical) x 2 (channel: audio only/ video and audio) x 2 (control over the ability to choose a channel vs. no control) repeated-measures experiment. Our sample comprises adults with autism ($n = 20$) and neurotypical participants ($n = 20$). Participants were sent a link for the Zoom meeting and a file containing the shapes for the tangram task a few days before the interaction (to print). Participants were randomly assigned to one of three conditions. In one condition participants communicated through audio channels only, and

could not control the channel. In the second condition, the interaction was via audio-visual channels when participants were not able to control the channel. The third condition allowed participants to choose between audio-only or audio-visual communication. Each participant completed three tasks (one task for each experimental condition), when the order of experimental conditions was randomly varied within participants.

The tangram task

This task was adapted from prior research (Marshall & Novick, 1995). Participants received a drawing of a two-dimensional shape made of seven geometric black shapes while only the researcher received the geometric shapes that make up the complete shape. The shapes used for each task were randomly assigned to participants. Participants were asked to explain to the researcher how to build the complete form, when they communicated verbally only (not through gestures). The maximum time given for each conversation was ten minutes. When participants felt they had completed the task, they were asked to declare it verbally. The audio and video channels were recorded (with participants' consent) to allow assessment of communicative performance.

Results

We found that individuals with autism were rated lower in communicative competence (vs. neurotypical individuals), which was, in turn, negatively associated with task performance outcomes. When participants were given control over the channel, those with autism had reduced communicative competence, which was associated with lower likelihood of task completion and reduced scope of task performance. Contrary to expectations, results suggest that providing people with autism control over the channel (camera on or off) may impede communication efficacy and reduce task performance. Having to make a decision about the channel may inadvertently increase feelings of uncertainty among autistic people, increasing demands on cognitive load, reducing effective communication.

Implications

When communicating with people with autism, providing structured and predictable interactions may help facilitate effective communication. The findings contribute to the understanding of the communication challenges that individuals with autism may experience during mediated interactions. The findings also underscore the need to provide support for this group that is matched to their unique communication needs, and can enhance their interpersonal interactions.

ICS03 Diverse diversity: Perspectives on inclusion and identity

PP 0580 Enhancing the Cognitive Accessibility of information in research: Insights from Intellectual Disability Studies

Carla Patricia Sousa¹, Cátia Casimiro¹, João Lêste², Filipe Luz³

¹ Lusófona University, Centre for Research in Applied Communication – Culture – and New Technologies CICANT, Lisbon, Portugal

² PUC-Rio, LINC-Design, Rio de Janeiro, Brazil

³ Lusófona University, HEI-Lab, Lisbon, Portugal

Current research has shed light on the pivotal role of accessible communication and easy-to-read materials in enhancing information accessibility for individuals with Intellectual Disability (ID), including the need to produce and evaluate these approaches (Sutherland & Ishrwood, 2016), and emphasizing how informational inclusion is a precursor to full participation and citizenship. This study aims to systematize insights into fieldwork in the area of communication and media involving populations with cognitive differences, with a special focus on adults with ID. Methodologically, it is situated on a virtual border between a constructivist paradigm of knowledge construction – which values the horizontality of roles between researchers and participants for the results and meanings obtained (Guba & Lincoln, 1994) – and a perspective of critical theory, closely linked to critical disability studies – based on the need to emphasize the voice of people with ID and their needs in scientific research for social change (Goodley, 2013; Guba & Lincoln, 1994).

Thirty people with ID, supported by two different NGOs in Greater Lisbon (Portugal), took part in the study, which was developed within the scope of a broader creative accessible media production research project. The communicational and informational accessibility procedures implemented included: simplification of textual content; inclusion of images and photos; reduction of Likert scales; and production of materials about research and ethics procedures to support people with intellectual disabilities during their participation. The data was collected using systematic observation grids, which were filled in during each session of the research project. The results obtained open up a relevant field of reflection on the maintenance of meanings in previously validated research instruments and scales that have to go through processes of simplifying information and accessible communication, such as the implementation of easy-to-read texts. Noted limitations include the way in which accessible written communication, in languages where nouns and adjectives always vary in gender – such as Portuguese – becomes less inclusive in this respect. In other words, if we consider that disability studies can benefit from the implementation of an intersectional lens that understands the multiple oppressive systems and their impacts (Moodley & Graham, 2015), we have to think about how, paradoxically, accessible communication excludes the female gender and gender-neutral neologisms. Future studies should include the validation of scales, under standardization and

psychometric principles, as well as the construction of communication guidelines to promote the inclusion of these people in scientific research.

ICS03 Diverse diversity: Perspectives on inclusion and identity

PP 0581 Help-seeking among sexual and gender minorities: Examining the role of Transphobia, Masculinity, and Femininity

Kai Kuang¹, Shujun Liu², Runsen Chen³

¹ Tsinghua University, Communication, Beijing, China

² Cardiff University, Social Sciences, Cardiff, United Kingdom

³ Tsinghua University, Public Health, Beijing, China

Individuals who identify as sexual and gender minority (SGM; e.g., lesbian, gay, bisexual, transgender, and queer plus) often face greater mental health challenges than their heterosexual and cisgender peers, but frequently encounter barriers to help-seeking for mental health. Prior research identified perceived help-seeking stigma (Eisenberg et al., 2009), perceived social support (Spengler et al., 2023), and knowledge related to help-seeking (Rüsch et al., 2014) may influence SGM individuals' help-seeking intentions and behaviors. However, it remains unclear whether and how individual differences may moderate the associations in Chinese cultural contexts, where help-seeking for mental illness among SGM individuals, especially SGM emerging adults, is rarely examined. To address these gaps, this study examined the moderating role of (a) transphobia, (b) masculinity, and (c) femininity on the associations between the aforementioned predictors and help-seeking intentions and behaviors among SGM emerging adults.

Method

We recruited participants via Chinese social media platforms (e.g., WeChat, QQ). To be eligible for the study, individuals needed to (a) live in China, (b) be between 18 and 29 years old, (c) identify as a sexual and/or gender minority, and (d) experience mental health problems at the time of the study. A total of 141 participants were initially enrolled in December 2021. They completed baseline questionnaires and were subsequently followed up at three different intervals: immediately after the intervention ($n_2 = 139$), one month later ($n_3 = 138$), and three months later ($n_4 = 137$). Considering the nested nature of the longitudinal data, we used multilevel modeling (MLM) to analyze 557 observations reported by 141 participants over the four waves.

Results

Results of the MLM analyses suggested that transphobia moderated the positive association between help-seeking knowledge and help-seeking intention ($b = -.08$, $SE = .03$, $p = .01$). The positive association is stronger for individuals with lower levels of transphobia ($b = .18$, $SE = .04$, $p < .001$) compared to those with medium levels of transphobia ($b = .11$, $SE = .03$, $p < .001$). For individuals with higher levels of transphobia, the association was not significant ($b = .03$, $SE = .04$, $p = .506$). Transphobia also moderated the association between help-seeking stigma and help-seeking behavior ($b = .04$, $SE = .02$, $p = .039$). Additionally, masculinity moderated the positive association between perceived support and help-seeking behavior ($b = -.03$, $SE = .01$, $p = .029$), and femininity moderated the negative association between perceived stigma and help-seeking behavior ($b = -.03$, $SE = .01$, $p = .014$). These findings offer theoretical implications for understanding the mechanisms of help-seeking among sexual and gender minorities and practical insights for designing interventions to encourage help-seeking for mental health issues in these specific minority groups.

ICS03 Diverse diversity: Perspectives on inclusion and identity

PP 0582 A right to indigenous identity: Persuasion through listening in virtual identity negotiations of the Forest Sámi

Sanna Ala-Kortesmaa¹

¹ Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

This study critically examines the essential role of horizontal listening in shaping the identity negotiations of the indigenous Forest Sámi minority within the context of virtual discussions. Employing a qualitative research methodology

and conducting a thorough content analysis of 361 responses gathered from online conversation threads, the research delves into the various dimensions of horizontal listening, exploring its levels of persuasion, diverse applications, underlying motivations, and targeted recipients within the complex dynamics of identity negotiation.

The study unravels a strategic facet of horizontal listening within these virtual settings, shedding light on its adaptability to different identity negotiation needs. The primary three functions of horizontal listening identified encompass educating others about the unique aspects of the Forest Sámi identity, fortifying their advocacy for Indigenous and cultural rights, and contributing to the development of a more inclusive societal framework. This multifaceted process serves as a democratic platform for expressing and integrating a spectrum of viewpoints, aligning with fundamental principles of social justice.

In the data analysis, patterns of collective horizontal listening emerge as the predominant influence at the macro level. Two distinct collective listening behaviors—shared thematic repetitions and shared emotional support—constitute persuasive narratives aimed at presenting the externally unified Forest Sámi identity. This narrative extends its influence beyond the in-group to encompass other Sámi groups and the larger society, emphasizing the collective identity of the Forest Sámi. At the meso-level, in-group and out-group listener positions shape persuasive interactions, revealing diverse strategies such as educational listening by external individuals and identity-strengthening efforts within the in-group. The micro-level analysis highlights the use of individual and collaborative listening strategies employed by Forest Sámi individuals to influence in-group members, adding depth to the understanding of how horizontal listening operates at various levels of identity negotiations. This data-driven approach enhances the study's credibility and contributes nuanced insights to the persuasive dynamics of horizontal listening in virtual discussions.

The findings highlight the need for in-depth exploration of intergenerational communication dynamics within the Forest Sámi community, opening avenues for future research. As this study unveils the strategic and influential role of horizontal listening in virtual identity negotiations, it holds relevance for scholars, policymakers, and communities engaged in Indigenous identity discourse, advocating for cultural rights, and fostering inclusive societies.

ICS04 Narrative and emotional power of communication

PP 0932 Unity and separation in interpersonal communication: Developing a method for analyzing blocking and threading narratives

[Karoliina Karppinen](#)¹, [Leena Mikkola](#)¹, [Malgorzata Lahti](#)²

¹ Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

² University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

When interacting in the social world, people move between simplistic and complex explanations about others that can be respectively called block and thread narratives (e.g., Holliday, 2016). Block narratives are based on presumed social categories that reduce identities to sets of simplified characteristics, thus emphasizing differences and boundaries between people. Thread narratives, on the other hand, bring to light the complexities of identities and highlight things that are mutual and similar to us as humans. We constantly navigate between simplifying categorizations and complex views of identities to position ourselves in relation to one another. In this presentation, we describe our efforts to develop methodological solutions for analyzing these separating and unifying narrative practices to better understand the dynamic, interactive processes of constructing social order.

The analytical concepts of blocks and threads have been developed and mainly applied in the context of intercultural education. However, the framework can be potentially highly useful in understanding communication practices in all contexts where people's diverse backgrounds may become central to coordinating joint action and constructing a shared social order. One example could be interprofessional teamwork that brings together representatives of different professional groups to work towards shared goals. When examined from a constitutive communication perspective, the notion of interprofessional teamwork can be approached as a social construct where meanings of professional identities as essentially different and as interconnected are constantly negotiated. In addition, previous methods to studying blocks and threads limit to analyzing interview and ethnographic data. We decided to apply the analytical concepts to the dataset consisting of audio-recorded interprofessional healthcare team meetings and group interviews, which elicited a need for methodological development.

Our aim is to develop a qualitative communication method for analyzing blocking and threading narratives that is applicable to diverse research contexts and data. The development of this method is in process. The basis for the method is a three-step analysis process adapted from positioning analysis (see Kayi-Aydar, 2021). The first step includes identifying positions by exploring how different social categories are made relevant in the data. Second, the positions are examined to identify the narratives these positions are embedded in. The third step consists of examining what kind of significance the found positionings have in the course of the stories. If the positionings indicate fixed boundaries and identities, they are considered block narratives. When the positionings imply fluidity, negotiability, similarity or commonality, they are regarded as thread narratives. In the presentation, we will introduce the method in more detail and illustrate its use through data examples gathered from interprofessional healthcare

teams. We will also discuss possibilities for future applications of this method, as well as its limitations and practical implications.

ICS04 Narrative and emotional power of communication

PP 0933 The interaction between migrants and non-migrants during Policy Lab meetings

Claudio Baraldi¹, Antonella Capalbi¹

¹ University of Modena and Reggio Emilia, Studies on Language and Culture, Modena, Italy

Multistakeholder Policy Labs are initiatives promoted by the European Parliament to improve citizens' participation in the elaboration of policies on specific themes, through the collaboration of interested citizens, specialized stakeholders and decision-makers. During Policy Lab meetings, coordinated by at least two facilitators, plenaries and small group workshops alternate to make proposals about possible policies on the chosen theme. This presentation concerns a European project in which Policy Labs were implemented in six cities with the aim of supporting migrants' participation in enhancing new local policies. The presentation concerns the policy lab meetings in one of these cities, Modena, in Northeast Italy, involving young migrants, stakeholder working with migrants in different fields and policy officers and makers. The presentation is based on (1) the video-recordings of these meetings, in particular focusing on the plenary sections, in which the different social actors interlaced their contributions and narratives, coordinated by two facilitators, and (2) the participants' narratives on these meetings produced during interviews and focus groups conducted after the meetings themselves. The presentation shows both effective and ineffective ways of facilitating young migrants' contributions to proposals about local policies that should support their inclusion in the local community, that is successful and unsuccessful ways of facilitating young migrants' exercise of agency in the context of the Policy Lab. First, the analysis of video-recordings and interviews/focus groups shows that several young migrants were active in contributing to the interaction and that their involvement did not depend on the level of mastery of the Italian language, rather on their interest in telling stories about their specific condition as migrants. Second, the analysis shows that the stakeholders, and sometimes the policy officers and maker, tried to be helpful in defining problems and proposals, but in fact they amplified the barriers to migrants' participation. Third, the analysis shows that the facilitators acted to ensure equity in participation, but undervalued, or were not able to reduce, the different level of competence and confidence in contributing to policy discussions between the migrants on the one hand and the stakeholders and policy officers on the other. Against this background, the analysis shows that, while the young migrants were very active when they were involved, there were several phases of talk during which they were excluded by the long narratives provided by the stakeholders. The presentation shows that equity and empowerment is not absolute values in facilitation of group work, rather they should be adapted to the specific composition of the group, in particular the different levels of competence and confidence in talking in public contexts.

ICS04 Narrative and emotional power of communication

PP 0934 Power as identity category in Russian-language political discourse: The case of Belarus

Anton Dinerstein¹

¹ Polish Academy of Sciences, Institute of Slavic Studies, Warsaw, Poland

This study is part of a larger project that attempts to understand how key political concepts, such as "power," "sovereignty," "state," and related cultural terms, such as "people" and "country," that are used in Russian-language political discourse and everyday interactions about politics using the Russian language, impact the ways people in former Soviet countries, such as Belarus, make sense of politics.

Conceptually, this study is rooted in sociolinguistics, cultural communication, and cultural discourse theory, and thus it looks at language and everyday communication in their relationship to the existing social, cultural, and historical contexts. The data are based on participant observation, public discussions, and media accounts about political topics.

One research problem addressed in this study is an attempt to explicate what it means when Belarusian officials, such as the Chairperson of Belarus's Central Election Commission, say things like: "The Tsikhanovsky group was striving to shatter the situation, used the collection of signatures directing it toward the change of power."

Explicating such statements beyond their face value requires an understanding of local cultural logic that informs the political discourse in Belarus. This means that it might be more instrumental to approach the political process as it is defined and made sense of in communication locally to reach a better understanding of how such social and political relationships become possible in a given culture in the first place.

Another research problem addressed by this study is explicating the linguistic constraints that the Russian language imposes on the understanding of key political concepts, such as "gosudarstvo" which is literally translated into English as "state," or such political terms as "vlast" which is literally translated into English as "power."

Eventually, this paper explores how the concept of power becomes an identity category in Russian-language political discourse. The Belarusian case shows how various actors, such as public officials, the opposition, and regular citizens attribute personality traits to power when discussing political topics. This happens by using a set of political terms most salient in the local political discourse, such as "state," "country," "people," and "West" and via their relationship to the terms "power" and "authorities."

As a result, such personification of power allows for the reproduction of a logical fallacy based on the metonymic use of key political terms that leads to the reproduction of discursive opposition between 'authorities' and those not involved in direct political governance. Eventually, this leads to a specific understanding of politics that discursively excludes those not affiliated with official political posts and institutions from the political process, thus discursively depriving them of the political will. Knowing how politics is conceptualized in local discourse may help in developing a more efficient and inclusive political process by both insiders and outsiders.

This research is part of the project No. 2022/45/P/HS2/02636 co-funded by the National Science Centre and the European Union Framework Programme for Research and Innovation Horizon 2020 under the Marie Skłodowska-Curie grant agreement no. 945339.

ICS04 Narrative and emotional power of communication

PP 0935 Swearing, emotion, and life experiences: A qualitative analysis of autobiographical memories of swearing

Karyn Stapleton¹, Richard Stephens², Kristy Beers Fägersten³, Catherine Loveday⁴

¹ Ulster University, School of Communication and Media, Belfast, United Kingdom

² Keele University, School of Psychology, Staffordshire, United Kingdom

³ Södertörns University, School of Culture and Education, Stockholm, Sweden

⁴ University of Westminster, Department of Social Sciences, London, United Kingdom

Introductory note

This paper reports on a first systematic study of autobiographical memories of swearing. It is a follow-up to a previous presentation in which we discussed the quantitative results. In this paper, we present the qualitative findings.

Research question

Swearing is the use of taboo linguistic terms, which are likely to cause offence (Beers Fägersten, 2012; O'Driscoll, 2020; Beers Fägersten and Stapleton, 2022; Stapleton and Beers Fägersten, 2023). Swearing produces powerful cognitive, emotional, physiological and interactional outcomes, which are not observed with other forms of linguistic communication (Stephens et al., 2009; Stapleton, 2010; Vingerhoets et al., 2013; Stephens & Roberston, 2020; Stapleton et al., 2022). However, the source of these effects is poorly understood at the level of individual biography and experience (Stapleton et al., 2022). While classical aversive conditioning (ACC; namely, childhood punishment for swearing) is often thought to play a role (Jay et al. 2006), there is little *direct evidence* for the ACC hypothesis. Moreover, other types of experiences throughout the lifespan are likely to contribute to individual associations with swearing.

Research Aims

Our study is a first empirical investigation of personal experiences and associations with swearing throughout the lifespan. We apply the methodology of *autobiographical memory* (Loveday et al. 2020) to *systematically elicit and analyse memories of swearing*. Through this, we aim to better understand how swearing acquires cognitive, communicative and emotional power for individuals.

Methodology

A repeated measures survey design was used to elicit recollections prompted by swear words versus recollections prompted by neutral words. There were six exemplars of each word category. Participants (N = 273) completed the survey online. Mean age was 29.5 years (SD 15.0). Participants were asked to supply specific recollections for each of the exemplar words. They then completed a set of quantitative survey items, which drew on autobiographical memory elicitation techniques (Janssen and Murre, 2008) and were designed to probe specific details of the recalled events and word associations.

Analysis and findings

The data were analysed as two discrete sets before being triangulated. The quantitative analysis used descriptive and inferential statistics to establish prominent word categories and patterns of experience. These have previously been presented. The open text recollections, which are the focus of the present paper, were coded qualitatively to identify recurrent patterns of content and meaning, and to examine how recollections were discursively constructed.

In this presentation, we provide an overview of the following data features:

- Generic vs. Specific recollections;
- Thematic Categories and their relative frequency;
- Presence/Absence of Others (including, where relevant, family and/or authority figures); and
- Emotional Valence of recollections.

Conclusion

Through our analysis, we provide a first detailed qualitative investigation of autobiographical swearing memories. Together with the quantitative analysis, previously presented, this study provides unique empirical insights into how swearing acquires psychological and interactional power within people's life experiences.

ICS04 Narrative and emotional power of communication

PP 0936 Discussion mechanisms and general circumstances of emotional news discussion – An analysis based on the Model of Collective Information Processing

Désirée Hammer¹

¹ University of Münster, Department of Communication, Münster, Germany

Emotions can influence political judgement or participation intent (Valentino et al., 2011) and thus impact politics. Looking at elicitors of emotions regarding politics, most research has focused on news itself. However, a copious amount of information is processed through interpersonal discussion about news (Eveland, 2004). Yet, little is known about the influence different interpersonal discussion mechanisms have on emotions, as well as affective news discussions in general.

Therefore, epistemic interests are general circumstances of affective talk and its discussion mechanisms. Circumstances refer to location, partners and topics, as well as the intensity of different emotions. The Model of Collective Information Processing (MCIP) (Schindler, 2023) is used as a heuristic to uncover discussion mechanisms that influence emotions.

The MCIP includes two dimensions. The first, *automatic/systematic*, depicts the depth of elaboration. *Systematic* discussions elaborate in detail, while *automatic* discussions are superficial. The second dimension, *closed/open*, refers to the difference of opinions. A more *closed* approach suggests a confirmation bias, while a more *open* approach indicates a discursive character.

An online-survey with $n = 464$ participants was conducted in April 2022. A quoted sample was drawn and asked to remember the last emotional discussion about news they had, name the topic and assess characteristics of the discussion. Four regression analysis models were implemented with the dependent variable being happiness, sadness, anger and fear.

Results indicate that most emotional news discussions take place at home and with close peers, such as friends, family and partners. The most prominent topics are war, climate and human rights. The valence of emotional news discussion is predominantly negative.

Systemic processing has a reinforcing effect on negative and no significant effect on positive emotions. This suggests that more detailed discussions activate appraisal processes which arouse negative emotions in particular. Openness diminishes negative and reinforces positive emotions. Conversely, this implies that the more alike opinions are during a discussion, the stronger the experienced negative emotions might be. This implies a reinforcing spiral (Slater, 2007) where people with the same opinion reinforce each other's emotion through reiteration.

In summary, while emotional news discussions are mostly private and in primary groups, their effect on should not be ignored, especially due to the implication that likeminded discussions reinforce negative emotions, which have a stronger influence on opinion and participation intent compared to positive emotions.

ICS05 Digital family communication and young people online

PP 1023 Mediated forms of intergenerational family communication in different European countries

Cristina Ponte¹, Tiago Quintanilha¹

¹ Universidade NOVA de Lisboa, Instituto de Comunicação da NOVA ICNOVA, Lisboa, Portugal

In 2021, a module on communication, digital perception and digital use was introduced for the first time in the European Social Survey (ESS), a large cross-national comparative study that had its beginnings 20 years ago.

Academically led by sociologists and political scientists, previous rounds of data analysis in this study focused exclusively on living conditions, socio-structural dynamics, and attitudinal dimensions (including public opinion) of European citizens. The decision to include in round #10 a module on communication in digital times is certainly related to the acknowledgment of a deep and fast mediatization in different social domains that took place in the past decade (Couldry and Hepp, 2017; Hepp, 2020). The application of this new module (2021–22) ended up coinciding with the pandemic and post-pandemic times, and with forms of interpersonal communication imposed by prolonged lockdowns.

Applied to representative samples in 31 countries (total: 59,685 respondents), this module on digital communication included questions aimed at perceptions about the internet and the devices used in communication between family members. Questions on parent-child communicative practices included digital texting (email, SMS) and video messages, besides voice calls by phone. For media researchers, the novelty, comparability, and representativeness of this same survey constitute an opportunity to look for old/new possible patterns of mediated forms of communication among family generations in different European regions.

As far as the scientific background is concerned, we emphasize theories on mediated communication (Madaniou and Miller, 2012; Couldry and Hepp, 2017), media generations (Bolin, 2017) and on family as a “communicative figuration” (Hepp and Hasebrink, 2018) composed by a particular actor constellation, frames of relevance and communicative practices. The focus of this work is on the answers provided by the age group between 45–55 years old (later adults) by emphasizing the use of devices privileged by these actors to communicate both with their children (12+) and parents, and to reflect on the implicit frames of relevance.

We seek to answer the following research questions:

- 1) How do sociodemographic factors, as well as practices and perceptions about digital environments influence the mediated forms of communication of later adults with their children and their parents? Are we in presence of different patterns of mediated communication?
- 2) Is it possible to identify patterns of similarity and differentiation between different countries that participate in the ESS?

To address these research questions, SPSS statistical software was used to analyse the collated data, in accordance with both descriptive and multivariate analysis.

It is hoped that this cross-comparative analysis can contribute to informed and contextual perspectives of the dynamics of mediated forms of family communication in Europe.

ICS05 Digital family communication and young people online

PP 1024 The platformisation of 'family doings': How digital platforms afford intergenerational family practices such as communication and play across generations

Maja Nordtug¹, Kristinn Hegna¹

¹ University of Oslo, Department of Education, Oslo, Norway

Today, families are conducted through a myriad of digital platforms (Taipale 2019). Families for instance communicate through platforms such as Snapchat, Whatsapp, and Messenger, and they play with each other through gaming platforms such as Roblox. However, across generations, the different platforms afford differently, and digital inequalities between generations pose a challenge to intergenerational relations in an age of platformisation of the family (Erstad et al. 2023). To further understand the platformisation of family, we wish to explore how digital platforms afford intergenerational family practices such as communication and play across generations.

In researching how something affords, Davis & Choinard argues that we must 'ask not only how objects afford but also for whom and under what circumstances?' (Davis & Choinard 2016: 244), thus stressing that affordances do not only lie with technology but occur in the relationship between users and technology, at the intersection of artifacts, actors, and situations. In this paper, we aim to understand how, for whom and to what extent digital platforms afford family practices such as intergenerational communication and play across three generations in various Norwegian families. Thus, we seek to understand how digital platforms transforms how to do family, and how that is influenced by how the platforms affords across generations.

Our discussion rests on preliminary analyses of a dataset of qualitative in-depth interviews with children/youth aged 9–18 years, parents, and grandparents from 20+ diverse families in Norway. The data stem from the European research project *Platforming families: Tracing digital transformations in everyday life across generations (PlatFAMs)* (2024). The aim of the underlying study is to gain a deeper understanding of how family relations are platformised through technology and as part of mediated culture and sociality (Erstad et al 2023). The analysis of this paper is informed by perspectives of platformisation (van Dijck et al. 2018), 'doing family'/family practices (Morgan 2011), a relational perspective of affordances (Davis & Choinard 2016) as well as relational processes across generations and in families (Roseneil & Ketokivi 2016). The findings will give a deeper insight into how various platform-user relationships affect intergenerational family practices.

ICS05 Digital family communication and young people online

PP 1025 Between adaptation and consistency – The situational context of parental media education strategies

Janina Hagner¹, Larissa Leonhard¹, Ruth Wendt¹

¹ Ludwig-Maximilians-Universität München, Department of Media and Communication, München, Germany

Research on parental media education strategies (MES) mostly focused on television use and was conducted before digital media became an integral part of everyday life. With the rapidly changing digital media landscape, media education is becoming a more and more complex task. In addition, a variety of situational factors in everyday family life require a flexible adaptation of MES. As children must develop skills for self-regulation and media appropriation, their parents are responsible for establishing rules on media use and to regularly review and adapt them.

To gain detailed insights into which parental MES are particularly relevant in which everyday family life situations, we conducted a qualitative diary study. By applying this innovative approach, subjective experiences and specific

usage habits can be precisely recorded by using the process of writing down self-evident actions or situation-dependent feelings.

The homogeneous sample included seven families with at least one child aged between three and five years. The focus on this age group was chosen because of existing evidence for the major role of parental MES in early childhood and the potentially harmful influence of media consumption on infantile development. The diary study took place on four consecutive days, consisting of two weekdays and the weekend, resulting in data material of 28 days. First, the participating parent (7 females; 35.4 years) filled out a general questionnaire, including socio-demographic information as well as insights into the household's media equipment, the focused child's media attachment, media rituals and general parental MES. Subsequently and on the following evenings, a semi-structured diary questionnaire on the child's leisure activities, media use and special situations that required discussion or adaption of MES was answered.

The findings showed that children grow up with a broad media repertoire and the daily media consumption of three to five-year-olds was around one hour. Parents mainly used the MES of co-use or restrictive measures. When stressful situations arose in everyday family life, parental MES were adapted. Such adjustments primarily concerned restrictive measures, where rules were loosened or tightened in short term (e.g., when the child was sick). Restrictive measures such as limiting the duration or content of use thus seem to be easily adjustable. In comparison, the situations in which media were used together were usually ritualized and showed consistency over different situations. The child could rely on certain times and activities, which gave them a sense of security and continuity. The descriptions of the situations in the diaries also gave the impression that the moments of sharing were seen less as an educational tool but more as an opportunity to build a closer bond between the family members.

In future, the valuable insights of the diary study could be extended by conducting quantitative surveys or standardized experience sampling to see if the found relevance of the situational context of parental MES can be verified for a more heterogeneous sample of families and across more diverse situations.

ICS05 Digital family communication and young people online

PP 1026 Does online communication improve or diminish adolescents' social skills? Findings from a 3-wave RI-CLPM

Vojtěch Mýlek¹, Lenka Dědková¹

¹ Masaryk University- Faculty of Social Studies, Interdisciplinary Research Team on Internet and Society, Brno, Czech Republic

This preregistered study examines how adolescents' online communication impacts their social competence. This broad competence includes a variety of specific skills, such as friendship initiation, assertiveness, perspective-taking, or empathy. According to the *internet-induced social skills hypothesis*, online communication provides adolescents with opportunities to practice and improve social skills (Valkenburg et al., 2011). However, some scholars proposed that using the internet, especially social media, might diminish social skills by detracting from deep social relationships in favor of weaker ties (see Konrath, 2013) or exposing youth to online communities that reduce perspective-taking (see McNaughton et al., 2022). Empirical research on various aspects of social competence provides mixed findings. In a longitudinal study, online communication increased adolescents' ability to initiate new offline relationships (Koutamanis et al., 2013), while in a cross-sectional study, it was linked to less prosocial behavior (McNaughton et al., 2022). Regarding broader internet use, a two-wave study shows that adolescents' social media use predicts higher empathy one year later (Vossen & Valkenburg, 2016). However, studies on university students report no association between internet use and social self-efficacy (Esen et al., 2013) and a negative association between Facebook use and interpersonal competence (Jenkins-Guarneri et al., 2012). Overall, existing results do not provide a clear account of the effect of online communication on adolescents' social skills. Existing findings may also be dated, underscoring the need for new evidence.

In this longitudinal study, we investigated the relationships between adolescents' online communication and social self-efficacy – their belief in their own interpersonal skills (Muris, 2001), which forms an important part of social competence and closely relates to subjective well-being (Li et al., 2014). We focused on online communication with offline friends and people adolescents met online. Our data come from a three-wave online survey of 2,500 Czech adolescents (T1: age 11–16, $M = 13.43$, $SD = 1.70$; 50.0% female) collected in 6-month intervals between June 2021 and 2022. In T1, quota sampling was used to ensure our sample represents Czech households in basic socio-demographics. We analyzed the data using a random intercept cross-lagged panel, which separates between-person differences from within-person dynamics (Hamaker et al., 2015). See our preregistration here: https://osf.io/pv96f/?view_only=125a362f127943839eaa78a4ece2dfa0.

The results show that on the between-person level, adolescents who more frequently communicate online with offline friends also communicate more frequently with online acquaintances and have higher social self-efficacy. However, on the within-person level, which is more informative for causal interpretation, communicating more frequently with offline friends or online acquaintances did not improve (nor diminish) adolescents' social self-efficacy six months later. We did not find any significant effects of self-efficacy on online communication either. The results

further showed that more online communication with online acquaintances in T2 leads to less online communication with offline friends in T3 (though not from T1 to T2), which is consistent with the displacement hypothesis. In summary, our study suggests that while social self-efficacy and online communication are linked, talking to people online does not seem to impact adolescents' offline social competence.

ICS05 Digital family communication and young people online

PP 1027 "This space is mine, not theirs." Czech teachers of media education navigating interactions with students on social media

Karolina Simkova¹

¹ Charles University – Faculty of Social Sciences, Institute of Communication Studies and Journalism, Prague, Czech Republic

The amount of time children spend online today is steadily increasing (e.g., EU Kids Online 2020, Common Sense Media 2021). A significant part of their screen time is spent on social media networks. One of the important tasks of teachers of media education is therefore to help them learn and understand the benefits and risks of being present on these social media networks and provide support (De Abreu 2016, Selwyn 2017). At the same time, teachers, like most of the population, spend a lot of time online and use social media accounts. What happens when teachers meet their students online? How do teachers navigate these out-of-school interactions?

This qualitative study focuses on the experiences of primary school teachers of media education in the Czech Republic with whom I conducted 17 semi-structured interviews. I focused on the different approaches teachers take to interacting with their students aged 11–15 on social media. The interviews were conducted mainly online, through Zoom. They were then transcribed, and a thematic analysis was carried out.

It turns out that some teachers have a very detached approach to interacting with their students on social media – they see their social media accounts as 'their space'. Of course, this practice is often adopted by their students, too (e.g., Ito & al. 2009, boyd 2014). This need for privacy sometimes goes so far that some teachers even resort to using a different name on social media to avoid being found by students. Others, however, see social networking as an opportunity for extended communication with students on school matters, e.g., in the form of a class group chat, which they believe is useful. Students may, of course, welcome this and use it or they may not seek this form of communication outside of school. However, some teachers also experience very unpleasant interactions with students on social media that could be described as cyber harassment – such behavior can then lead to greater caution and disengagement on the part of teachers and affect interpersonal relationships as well as classroom dynamics. Yet, the teachers' response to such a situation is crucial. It is an opportunity to offer students empathy and help them become aware of their behavior (boyd 2014).

Teachers' views of interactions between themselves and their students on social media are described, for example, in the ethnographic book *The Class* (Livingstone & Sefton-Green 2016). Otherwise, however, this topic has not received much attention. There is a fair amount of interesting work that focuses solely on children's presence on social media and peer-to-peer communication, but not on the dynamics that can arise when teachers and their students interact there. Additionally, in the Czech context, social media use by teachers of media education has barely been researched, and if so then mostly with quantitative methods (e.g., JSNS 2023). This study offers insights into how digital platforms are reshaping traditional modes of interpersonal communication in educational settings and comes up with results that could be useful for both researchers and teachers.

ICS06 Getting closer or moving away? Examining skills, motivation and identity in mediated communication

PP 1130 Examining digital divides regarding skills for social interaction and collaboration among employees in EU countries

Steliana Doseva¹, Danilo Harles², Hannah Schmid-Petri³

¹ Bavarian Research Institute for Digital Transformation, Research, Munich, Germany

² Bavarian Research Institute for Digital Transformation, Think Tank, Munich, Germany

³ University of Passau, Chair of Science Communication, Passau, Germany

In Europe, a fundamental level of digital knowledge is essential for over 90 percent of professional positions, but according to the European Commission 40 percent of employed European Union (EU) citizens lack basic digital skills. This digital skills gap might negatively affect the innovative capacity and economic growth of the EU. Digital divides in member states could therefore exacerbate inequality and social disorder by increasing economic imbalances in the EU.

For employees in the EU, the digitalization of work processes across sectors and the establishment of home office opportunities during the pandemic have increased the relevance of digital tools for collaboration and social interaction. In this context, abilities needed to effectively apply such tools have become essential. While some studies already provide evidence regarding digital skills divides among EU citizens, there is a lack of research examining the

aspect of digital communication and collaboration competencies. Against this background, our research question is whether there are digital divides among European employees regarding their digital competencies for social interaction and collaboration in the workplace.

Our second research question aims to investigate the role of social media usage, as well as attitudes and perceptions regarding digital technologies within one's organization, in the formation of digital divides in a cross-country context as these variables can be seen as important factors associated with digital skills

We address these issues by performing a secondary analysis of online survey data (N = 2,865) from five member states of the European Union (Finland, Spain, Italy, France and Austria) conducted by the Bavarian Research Institute for Digital Transformation and SZ Institute between November 2022 and January 2023. The survey employs a self-assessment test developed by the European Commission's Joint Research Centre for the measurement of digital literacy. Through combining 17 of its items into an index (McDonald's Omega = .93), we were able to operationalize digital literacy regarding social interaction and collaboration.

Based on different sociodemographic variables, we have observed significant differences in digital literacy between social groups in all countries. Lower levels of digital literacy were observed in the older age groups, among female employees, people with lower education and income. In a cross-country comparison, the biggest gaps concerning age and education were found in Spain, while the biggest gender and income gaps were identified in Austria. Policymakers and employers need to ensure that the digital skills divide in the work environment is being reduced rather than expanded. Our results reveal which groups in each country require particular attention.

Regarding employees' social media use, our results show that heavy users in all countries had significantly better levels of literacy than soft users. Moreover, employees who perceive training measures in their organization as rather good mostly show significantly better digital literacy. However, the employees who perceive the attention toward digitalization in their organization as rather too high do not necessarily have higher levels of digital literacy. In this respect, the results vary from country to country.

At the conference, we will discuss conceptual and applied implications of these findings.

PP 1131 Reviving presence through art-based media literacy education

Andrea Winkler-Vilhena¹, Roman Gerodimos¹, Paul Mihailidis²

¹ Bournemouth University, Communication and Journalism, Poole, United Kingdom

² Emerson College, Journalism, Boston, USA

In a society of hyperconnectivity (Brubaker, 2022) we are increasingly connected to our devices while becoming increasingly dis-connected from people and the physical world around us. This research project explores how we interact and engage with others when our attention is absorbed by digital gadgets. We ask, whether we can still be present in our interpersonal social interactions in a world in which a big part of human communication happens in virtual spaces; and how presence can lead to more caring and just societies.

In a series of art-based media literacy workshops, which are part of an ongoing PhD research project, we investigate how seeing, interacting with, and making art can revive our sense of presence and thus promote a practice of "caring with" (Tronto, 2020). After a brief theoretical introduction by the facilitators, workshop participants look at an art exhibition that is set up around them and that was curated especially for this purpose. The artworks elicit a group discussion on how digital devices might affect their presence with others and as such their personal and social relationships. In small groups, participants are asked to make art objects which express what presence means to them and why they think it is, or isn't, important.

This research argues, that we can promote care and overcome the interpersonal divides (Bugeja, 2018) and civic distance (Mihailidis, 2023) that characterize current times, by reviving the value of presence. We need creative media literacy interventions that make people more aware of how human relationships and communication are affected by the omnipresence of digital devices. And we need to do so from a perspective that uses interdisciplinary knowledge about global current affairs as a third pillar of media literacy (Gerodimos, 2021). By using the arts, media literacy education can contribute to embedding this "embodied knowledge" (Barbour, 2016) into people's daily interactions.

ICS06 Getting closer or moving away? Examining skills, motivation and identity in mediated communication

PP 1132 Internet users' willingness to share information in diverse online contexts and with different actors: An empirical test of the dual privacy calculus theory

[Jošt Bartol](#)¹, [Vasja Vehovar](#)¹, [Andraž Petrovčič](#)¹

¹ University of Ljubljana- Faculty of Social Sciences, Department of Sociology, Ljubljana, Slovenia

Background

Internet users' decisions to share or not share their information online are complex and shaped by the context of information sharing, the actors who can access their information, and the sensitivity of information. While prior research conceptually elaborated on the significance of these factors, studies that would empirically investigate them together are lacking. This paper addresses this gap by drawing on the dual privacy calculus theory to propose a conceptual model that explains internet users' willingness to share their information of low and high sensitivity in different online contexts and with different actors. Three contexts, differing in the presence of actors, were studied: e-commerce (organizations only), social network sites (organizations and peers), and instant messaging (peers only). In each context, the willingness to share information of low and high sensitivity was considered. In line with the dual privacy calculus theory, the model presumed that willingness to share depends on a risk-benefit assessment, guided by individuals' control over their information. Accordingly, privacy concerns, perceived benefits of information sharing, and perceived privacy control were tested in the model as antecedents of willingness to share information and examined at both the organizational (e.g., concerns about organizations' privacy practices) and peer level (e.g., concerns about peers' privacy practices).

Methods

The study adopted a quantitative approach, utilizing structural equation modeling on a large, nation-wide sample of 1,666 internet users aged 18+ from Slovenia. Participants were recruited from the largest Slovenian online access panel and completed a web survey questionnaire in November and December 2023. Measurement instruments were derived from existing literature, translated into Slovenian, and assessed through cognitive interviews and a pilot study.

Results

The most important factor of willingness to share information was perceived benefits, with both monetary and social benefits predicting willingness in all contexts and information sensitivity levels. In contrast, privacy concerns and control related to organizations were important in decisions to disclose information in e-commerce and social network sites, while privacy concerns and control related to peers were important in instant messaging. Interestingly, privacy concerns about organizational privacy practices influenced willingness to share information across all contexts, except sharing low sensitivity information in instant messaging.

Conclusion

This is the first study to empirically test an original conceptual model based on the dual privacy calculus theory to explain internet users' willingness to share information in different online contexts and with distinct (institutional and social) actors. While users' information sharing decisions were complex and contextual, perceived benefits were the key consideration in information sharing across online contexts. Nevertheless, users seemed to be aware that they were sharing their information on privately-owned platforms, even in peer-to-peer settings, and therefore worried about how organizations might use their data. This can impede the potential of online services for forming and sustaining relationships among individuals. Finally, the study shows that the dual privacy calculus theory is a useful lens to understand disclosure decisions across contexts and in relation to different actors.

Keywords: dual privacy calculus, institutional and social, online contexts, perceived benefits, privacy concerns, privacy control, information sharing

ICS06 Getting closer or moving away? Examining skills, motivation and identity in mediated communication

PP 1133 Dissolved or integrated? Self in the era of social media

[Velta Skolmeistere](#)¹

¹ University of Latvia, Faculty of Social Sciences, Riga, Latvia

The self in the postmodern society has been described as saturated and, as such, dissolved (Gergen, 1991), which has been even more furthered by technologies (Turkle, 1997; Davis, 2011). At the same time, context-collapse (Marwick & boyd, 2011) and real-name web (Hogan, 2013), the phenomena brought up by the rise of social media, have been seen as contributing to creating a more integrated version of self (i.e., Marinucci, 2010; Hodkinson, 2011; Miller, 2011; Brekhus, 2020). The latter statement mostly lacks empirical evidence, but, instead, is often based on logical speculation that due to the aforementioned specifics of social media, one, in most cases, presents a united version of his/herself to various social circles, and from that, learns about him/herself.

This paper offers a qualitative insight into the perspective of social media users about their selves in the context of their role identities, exploring how the interaction between their role identities is experienced both in real life and on social media. The paper uses the term 'integrity' to describe the state where the identity standards (Burke & Stets, 2009) of the identities one possesses are coherent (not contradictory) with each other. Regarding the context of social media, it draws inspiration from the concept of deep mediatization (Hepp, 2019) that sees media, especially, social media not only as an alternative space of communication, in which one immerses him/herself, but as a reality of life that has interwoven daily interaction and, therefore, has also influenced how one sees him/herself (Wandel & Beavers, 2010).

The research is based on 25 semi-structured interviews (the age range of the respondents being 23–45) with Latvian people with various levels of social media usage activity, as well as with differences regarding other criteria (occupation, family status, usage of an anonymous account, influencer status, etc.).

One of the interesting findings from the initial results reveals that people, who show a greater level of integrity when describing their real-life identity interaction, tend to see social media as rather fragmenting, while for those, who see more contradictions between their identity standards, social media are either used as a reflection tool in search for a more integrated version of themselves or social media are used to present a united, yet rather superficial layer of self that is acceptable for all social circles one is connected to. The paper offers a more nuanced analysis of the different perspectives observable in the interviews regarding integrity, interaction of identities, presentation of the self on various social media, and its influence on one's view of him/herself.

ICS06 Getting closer or moving away? Examining skills, motivation and identity in mediated communication

PP 1134 An inquiry of audience's appraisals and reactions to cyberhate in news discussions on social media: The role of perceived group entitativity

[Maria Jaron Bedrosga](#)¹, [Jörg Matthes](#)²

¹ Masaryk University, Interdisciplinary Research Team on Internet and Society IRTIS, Brno, Czech Republic

² Advertising & Media Psychology Research Group, Department of Communication, Vienna, Austria

Cyberhate, the hateful and biased expressions which attack groups and individuals because of their group identities and characteristics, is one of the major society-wide issues threatening values of equality and disrupting social cohesion (Foxman & Wolf, 2013). Cyberhate is becoming prevalent on social media and in news discussions, with the majority of young people encountering it as an exposed audience or bystanders (e.g., Machackova et al., 2020; Reichelmann et al., 2021). Social media discussions provide exposed audiences opportunities to react to cyberhate, and their appraisal of the situation influences their reactions (Dominguez-Hernández et al., 2018) – they might stay passive, reinforce the hate, or dispute the biased expressions and engage in counter-speech. Prior research brought insights into factors related to specific reactions, signifying the role of existing stereotypes and prejudice in negative reactions (Cuddy et al., 2007). This was shown in research (e.g., Dessel et al., 2017; Gonultas & Mulvey, 2022) on groups with higher perceived entitativity, i.e., the degree to which groups are perceived as homogenous and impermeable 'entities' whose members share the same characteristics (Lickel et al., 2000), such as ethnicity, religion, sexuality. However, research on exposed audience's cognitive and behavioural processes in cyberhate targeting low-entitative groups (e.g., weight-based) is still largely missing, which poses a huge limit in our understanding of reactions to these incidents, which are nevertheless quite prevalent in the online environment (e.g., Brooker et al., 2017; Jeon et al., 2018). Thus, drawing from the social identity theory (Tajfel & Turner, 1979), which postulates a positive relationship between the level of out-group entitativity and out-group prejudice (Agadullina & Lovakov, 2018), we intend to expand our knowledge by investigating variances in responses to cyberhate targeting groups with diverse levels of entitativity. Specifically, as cyberhate is motivated by biased intergroup attitudes (Mondal et al.,

2017). we will focus on perceptions of different levels of (out)group entitativity and bystanders' attitudes and inquire about their role in bystanders' appraisals and reactions to cyberhate.

The study is part of a starting project awarded by MSCA's seal of excellence. The data will be collected as a part of a multi-method investigation (online survey, qualitative inquiry) in spring 2024 and analysed in summer 2024. The expected sample size is 1.000 young adult European participants (aged 16-25). Online survey data will be utilised to investigate participants' experiences with cyberhate on social media and in news discussions. To gain an in-depth understanding of their appraisals and motivations to react to cyberhate, the participants will also describe their perceptions of the entitativity of diverse groups targeted by cyberhate and their appraisals and potential reactions to different cyberhate incidents.

The findings will contribute to the current cyberhate audience and bystander research by shedding light on processes affecting responses to diverse cyberhate incidents. The discussion will also review how the findings can inform policymakers and educators addressing intolerance toward groups with varying levels of entitativity and journalists reporting about groups and group members.

JOS01 AI and automation

PP 0001 Exploring whether and why automation affects the comprehensibility of data-driven news articles

Florian Stalph¹, Sina Thäsler-Kordonouri¹, [Neil Thurman](#)¹, Ulrike Schwertberger¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

In today's data-heavy information environment, journalistic reporting with and about numbers is crucial as it provides readers with information necessary to fulfil their role in democracy (Nguyen & Lugo-Ocando, 2016). Therefore, the comprehensibility of such reporting is vital. An important factor contributing to the comprehensibility of news articles is their *textual composition* (Göpferich, 2009). In data-driven reporting, textual composition includes the presentation of numerical information (Waite, 2020) as well as word choice and linguistic clarity (Meyer, 1975).

At the same time, data-driven reporting is becoming increasingly automated. Automation systems change journalists' approaches to writing news texts (Diakopoulos, 2019), which can impact article composition. For example, automated news articles may contain traces of the rigid templates with which they can be produced (Diakopoulos, 2019), fewer of the key editorial features of journalistic writing (Caswell, 2019), and more numerical information (Author, forthcoming). Some journalists believe that automated news production can decrease the appeal and comprehensibility of news articles for readers and, therefore, post-edit automatically generated articles before publication (Thäsler-Kordonouri and Barling, 2023).

In light of 1) how article composition may affect readers' understanding of numbers in the news and 2) data-driven journalism's increasing automation, this study investigates how readers evaluate the article composition features in data-driven reporting that was produced with and without the help of automation (RQ1) and how readers' evaluations of these article composition features affect how comprehensible they believe data-driven reporting produced with and without the help of automation to be (RQ2).

We conducted an online survey experiment (N = 3,123) with a sample of UK online news consumers, in which we presented respondents with news articles (N = 24) produced either with or without the help of rule-based automation and asked them about their perceptions using criteria developed in a qualitative pre-study (Authors, 2023).

Factor analysis reduced the article dimensions and criteria investigated to five categories: *numeric features*, *writing style*, *sentence and paragraph length*, *descriptive language*, and *word choice*. Although the perception of news stories produced with automation did not differ significantly from those produced without regarding *sentence and paragraph length* and *writing style*, they were evaluated as significantly less comprehensible. Mediation modelling showed this last result can be explained partly by readers' perceptions of the other article features – *numeric features*, *word choice*, and the amount of *descriptive language* – which were all rated significantly worse in articles produced using automation than in those written manually.

Our results suggest that the use of rule-based automation in the production of data-driven news articles changes their perceived compositional makeup in ways that negatively impact comprehensibility. However, our study also suggests ways in which such articles could be made more comprehensible. Specifically, when post-editing such automatically generated articles, journalists should aim to further reduce the amount of numbers, better explain words that readers are unlikely to understand, change inappropriate wording, and increase the amount of descriptive language.

JOS01 AI and automation

PP 0002 Making new news use feel familiar: A longitudinal study of how changing news repertoires among young adults normalize over time

Chris Peters¹, Kim Schrøder¹, Josephine Lehaff², Julie Vulpius¹

¹ Roskilde University, Department of Communication & Arts, Roskilde, Denmark

² University of Groningen, Faculty of Arts, Groningen, Netherlands

Studies of everyday life frequently note shifts whereby the novel, strange, and disruptive become taken-for-granted, familiar, and mundane through processes of rationalization and normalization (Highmore, 2002). Similarly, with media, processes of 'domestication' gradually situate media devices, genres, and habits into familiar routines (Silverstone, 2005). What is harder to grasp is how this occurs in a digital media landscape beset by rapidly developing informational technologies (Moe & Ytre-Arne, 2022; Swart et al., 2022). Also challenging are methodological issues of empirical recall that impact how accurately people can reflect on what, exactly, has changed in terms of their 'media repertoires' (Hassebrink & Hepp, 2017; Peters & Schrøder, 2018) and why (Vulpius et al., 2022). Given these challenges, this paper aims to investigate what impacts how and why news repertoires become meaningful. Developing an innovative, longitudinal, comparative research design over a two-year period, it interrogates what causes different configurations to become meaningful in everyday life, probing how people articulate changes in their news repertoires over time.

Specifically, the article compares the transformations of news and information repertoires of 24 Danish participants, aged 18–24, meeting this same group of young adults first in 2019 and then again in 2021. In both meetings, the

study conducted an iterative research encounter consisting of a Q-sort exercise (where participants rank preferences relationally amongst 36 legacy, social, non-traditional, and personal news and informational sources), think-aloud protocols (whereby they explain their rationales for ranking while they sort), and semi-structured interviews (before and after the sorting exercise, to reflect on typical informational preferences and sociocultural practices). Upon completing the sorting exercise on the second occasion, in 2021, participants were presented a record of the exact same sorting exercise they completed two-years earlier, in 2019, to reflect on their stated changing preferences over this timeframe. Responses were transcribed in NVivo and analyzed with a thematic content analysis to identify perspectives related to change.

The paper finds that changes in news and informational preferences are normalized over time, often viewed as insignificant and 'natural' by people after the fact—even when the associated alterations in their sensemaking practices are, in fact, quite significant. Despite such processes of incorporation, what at first appear to be unconscious changes by participants are often revealed to be driven by issues around routine, proximity, relevance, and feeling. Such thematic are associated with—often reinforced by—life stage factors, emotional responses, normative assessments, and the materiality of media platforms and devices. Routine changes are driven by life stage factors that demand new rhythms in everyday life. Proximity involves informational preferences changing due to geographic or social distance. Relevance, for this group of participants, were changes anchored in new life circumstances or technological developments relating to emerging informational 'needs'. Finally, feelings are related to topics, genres or outlets impacting affective characteristics of engagement (see also Steensen et al., 2020). This study's findings have significant civic implications in terms of changing assessments and sentiments of worthwhile patterns of use, and how life factors and mediated affordances shape perceived informational practices.

JOS01 AI and automation

PP 0003 Between intentions and perceptions: Unravelling the impact of journalistic post-editing strategies on readers' liking and comprehensibility perceptions of automated journalism

Sina Thäsler-Kordonouri¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

Increasingly, journalistic news production is being supported by automation to help journalists cope with the ever-increasing demand for timely reporting while newsroom resources are scarce (Diakopoulos, 2019). This process, referred to as automated journalism, is helping to increase newsroom productivity through natural language generation (NLG) applications that scale the production of data-driven news articles (Haim and Graefe, 2017). Journalists' use of these applications is changing their approach to news writing and impacting the composition of news stories (Casswell, 2019; Lewis & Westlund, 2015). As a result, journalists have found that automatically generated news without significant human involvement often lacks narrative and editorial quality (Diakopoulos, 2020; Thurman et al., 2017). Therefore, they sometimes decide to "post-edit" (Author, forthcoming) automatically generated stories before publishing them as news articles, taking various editorial steps to improve the appeal and comprehensibility of the stories for the reader (Thäsler-Kordonouri & Barling, 2023).

Using a 3 (article source: manually written, automated, post-edited) × 12 (story topics) between-subjects online survey experiment with a representative sample of UK online news consumers by age and gender (N = 4,734), the present study investigates how readers perceive these editorial changes and whether they result in post-edited reporting being perceived as more appealing and comprehensible than automated reporting. In the online experiment, each of the 36 treatment groups read a news article that was either written manually by a journalist, automated using a data-driven template, or automated and then post-edited by a journalist. The authorship of the articles was not specified. Within each of the 12 topics, each story (automated, post-edited, manually written) had the same data source, perspective, and geographical focus.

This study follows on from a previous analysis of the post-editing process, in which the post-editing strategies of journalists were investigated in qualitative interviews (Author, forthcoming). The previous study's results show that the most important strategies are to *reduce the number of figures, add contextual information and increase the local focus* of automated reporting. The present follow-up study now examines a) the extent to which journalistic these post-editing strategies are related to the overall likeability and perceived comprehensibility of data-driven news reporting, including the automated, post-edited and manually written types; b) whether the actual journalistic post-editing performed leads to different reader ratings between automated and post-edited news stories in terms of the post-editing strategies revealed in the previous study (author, forthcoming); and c) how post-edited stories actually perform in terms of likeability and comprehensibility compared to automated and manually written stories.

The results extend research on journalistic work with automated journalism and its effect on the readership by identifying how readers perceive and evaluate post-editing practices. As automated journalism represents a "structural transformation of making news and engaging with the audience" (Helberger et al., 2022, p. 1606), this is a relevant research endeavour that, given the increasing automation of data-driven journalism, helps to determine the impact of these technologies on perceptions of the journalistic profession.

JOS01 AI and automation

PP 0004 Mapping the research landscape of algorithm-driven journalism: An interdisciplinary systematic literature review of research trends and future pathways

[Aynur Sarisakaloğlu](#)¹

¹ Technische Universität Ilmenau, Institute of Media and Communication Science, Ilmenau, Germany

The algorithmisation of communication processes introduces novel approaches to gathering information, producing, distributing, and consuming journalistic content, along with incipient challenges for the field of journalism (Newman, 2022). It is imperative to synthesise scholarly evidence to advance knowledge in journalism research, considering the interdisciplinary nature of academic engagement. However, a systematic understanding of the developments in algorithm-driven journalism, which encompasses the use of automation and artificial intelligence technologies throughout every stage of the news value chain and reception process, is lacking. Against this backdrop, this study aims to investigate the present state of research on algorithm-driven journalism and identify research gaps through a systematic review, following the methodological approach outlined by Petticrew and Roberts (2006). As such, the present study contributes to ongoing research endeavours by (1) providing a bibliometric overview of the existing body of literature, (2) mapping research trends based on a set of content-related variables, and (3) generating a synopsis of future research.

To ensure a comprehensive scope, the sample selection was based on all available English-language research, theoretical and empirical, in journals across ten databases in the fields of Communication Science and Computer Science up to December 2022. A full-text database inquiry was conducted by employing search phrases deduced from concepts commonly used in previous studies on algorithm-driven journalism. A total of 348 peer-reviewed publications were included for full-text analysis. Coding categories were first developed deductively based on the research questions and the extant academic literature. These categories were further specified inductively by applying Mayring's (2008) qualitative content analysis summary technique as an exploratory study. Subsequently, the qualitatively gathered data was converted into a quantitative evaluation.

The findings of the review illuminate the evolving landscape of algorithm-driven journalism research, starting with early publications in 2011 and experiencing a steady increase in research activity from 2013 onwards. Notably, these studies predominantly originate from the USA, the United Kingdom, and the Netherlands, with male scholars contributing most frequently. The publications explore various application areas of algorithm-driven journalism, covering the expectations and perceptions of both journalistic actors and recipients, the algorithm-based transformation of journalism, and the potentials and challenges associated with integrating algorithmic systems into journalistic workflows. The prevalent theoretical frameworks are often based on normative theories, while in over half the publications no theory was employed. The majority of identified publications adopt an empirical approach, predominantly employing qualitative research methods such as interviews and the purposive sampling method, with a focus on investigating the aforementioned countries.

In conclusion, this study proposes a synopsis of potential avenues for future journalism research emphasising the importance of enhancing research designs, validating results, conducting representative studies, and modifying existing actor-oriented theories to adequately describe emerging socio-technical forms of journalism shaped by the algorithm-driven transformation of work environments.

The originality of this research resides in its comprehensive and interdisciplinary approach to reviewing literature from a communication and technology standpoint that has not been systematically undertaken to date, thereby offering scholars a solid roadmap for advancing the field.

JOS01 AI and automation

PP 0005 Less hype, more drama: A comparative analysis of journalistic discourses on AI after ChatGPT in the US, The Netherlands, and Brazil

[Rik Smit](#)¹, [João Magalhães](#)¹

¹ University of Groningen, Center for Media and Journalism Studies, Groningen, Netherlands

The term 'AI' has become a freely-floating signifier, connoting different things in different contexts. While meanings have an intricate social life, media institutions, and particularly professional journalism, tend to play a disproportionate role in shaping them. Research on AI discourses has empirically explored this role, documenting how these media professionals' framing of AI relates to ethics, policymaking, and public opinion formation (e.g., Ouchchy, Coin, & Dubljević 2020; Köstler & Ossewaarde, 2021; Reeve, Colom & Modhvardia, 2023).

More often, the news media's amplification and magnification of AI-related issues have been discussed as a form of hype. In Vasterman's (2005, p. 515) classic definition, a media hype is a "media-generated, wall-to-wall news wave, triggered by one specific event and enlarged by the self-reinforcing processes within the news production of

the media.” This ultimately “expands one specific frame,” such as utopian or dystopian views, “which then becomes dominant in the public arena” (Vasterman, 2005, p. 516).

This paper asks whether and how professional journalists have created simplistic and universal narratives about AI. Is there indeed a media hype about AI, and is this even the right term to apply to the amplified news coverage on AI since the release of ChatGPT 3? To what extent is this coverage similar across countries, given that journalism is deeply affected by national dynamics, norms, and priorities?

We address these problems through a comparative critical discourse analysis (Carvalho, 2008) of how the ‘news-papers of record’, New York Times (US), De Volkskrant (NL), and Folha de S.Paulo (BR), covered AI after the release of ChatGPT 3 in 2022, an event widely seen as a major landmark in the development of public knowledge (and, supposedly, ‘hype’) about artificial intelligence worldwide.

Our analysis of a total of 554 news articles suggests that while journalists did portray AI as a sort of inevitable technology, this inevitability can hardly be understood as producing one simplified and universal story. Instead of media hype, we argue, those outlets’ depiction of AI after ChatGPT might be better understood as a complex form of ‘technological drama’ (Pfaffenberger, 1992).

This paper contributes to the scholarship on journalistic representations of AI, first and foremost, by suggesting that the idea of ‘AI Hype’ might itself be a hype—or, at the very least, a far from obvious phenomenon. Secondly, it demonstrates the usefulness of Pfaffenberger’s work to make sense of public narratives on emergent technologies. As we point out, maybe research on AI discourses should become more skeptical of the idea of ‘hype’. It is time for more drama.

JOS02 Journalistic sources

PP 0006 Public figures in the news: A cross-national qualitative analysis of their role in eating disorder and new media discourse

Valerie Gruet¹, Amy Ross Arquedas²

¹ Northwestern University, School of Communication, Evanston, USA

² University of Oxford, Reuters Institute for the Study of Journalism, Oxford, United Kingdom

Public figures are key stakeholders in popular culture’s global production, consumption, and distribution practices. Over the last decade, their pervasive media attention has increasingly focused on body image and eating disorders, shaping public discourse (Berkowitz, 2019; O’Brien, 2021). Media studies largely focus on how exposure to idealized images and appearance comparisons, facilitated by new media technologies, negatively impacts the onset of eating disorders (Brown and Tiggemann, 2016, 2022; Halliwell and Dittmar, 2004). Meanwhile, journalism studies underscore the endemic nature of celebrity news, highlighting media and public figures’ role in the development of these pathologies (Dubied and Hanitzsch, 2014; O’Hara and Smith, 2007; Shepherd and Seale, 2010). However, little has been inquired about the intersection of media, health, and popular culture concerning journalistic narratives.

This qualitative content analysis examines depictions of public figures, considered in this paper as celebrities and influencers, in the news coverage about eating disorders and new media from 2010 to 2019 in the United States ($N = 626$), and the United Kingdom ($N = 635$). The study focuses on the influential 2010s, marked by cultural shifts in popular culture, a rapidly changing new media landscape, and the steady rise of eating disorders (Galmiche et al., 2019; Goggin, 2012; Rodgers et al., 2019; Rodriguez and McNally, 2019). News articles were extracted from the Nexis Uni database (Nexis Uni, n.d.) and coded inductively using MAXQDA software to explore relationships and underlying conceptualizations across countries and time (Braun and Clarke, 2006).

Findings show that journalistic narratives centered the role of public figures across three critical points. First, trendsetting was portrayed as promoting unhealthy behaviors tied to normative beauty ideals and eating disorders. Second, they faced heightened surveillance and scrutiny on beauty standards, especially regarding weight maintenance and extreme thinness, symbolically linked to eating disorders. Finally, they shared their struggles online to reduce stigma, bolster body positivity and eating disorder awareness, and change normative beauty norms and practices. Coverage in the United States focused on body aesthetics, whereas the coverage in the United Kingdom prioritized concern over self-harm and public responsibility, notably through tabloids (Conboy, 2014). Differences across countries emerged within journalistic cultures and practices, shaped by local variances and emerging forms of new media over time (Di Salvo & Negro, 2016; Lück et al., 2018).

Portrayals of public figures across countries revealed a strong connection between celebrities, media, and audiences, which involves the shaping of beauty standards, ultimately rooted in the appearance and body aesthetics of public figures, generating substantial interest from the masses. However, these same figures also became enmeshed in the intricacies of this body-centric system, playing a pivotal role in further perpetuating and challenging it. This study contributes to the journalism literature, specifically pertaining to celebrities vis-à-vis health news, examining how celebrities impact journalistic constructions of science and technology, shaping cultural narratives and societal norms.

particularly concerning eating disorders. It is critical to understand public figures' influence on health discourse for effective prevention, recognition, and care in a media environment saturated with appearance-centric content.

JOS02 Journalistic sources

PP 0007 Unveiling data pluralism: A multimodal analysis of data source diversity in the Swiss media during the Covid-19 pandemic

[Andrew Robotham](#)¹, [Céline Dupuis](#)¹, [Nathalie Pignard-Cheynet](#)¹

¹ University of Neuchâtel, Academy of Journalism and Media, Neuchâtel, Switzerland

The abundance of data indicators and data visualizations in the news during the Covid-19 pandemic was unprecedented. News organizations had to rapidly adapt and implement innovative approaches to access, interpret and visually represent quantitative information on the state of the crisis (Desai et al. 2021). In data journalism, the question of data provenance, along with journalists' dependence on institutional sources, is paramount (Ramsälv, Ekström, and Westlund 2023; Zamith 2019). During the pandemic, countries overwhelmingly relied on governmental sources (Mellado et al. 2021). This issue becomes even more critical as the underlying structure of data, such as how they are collected in the first place, is rarely questioned (Lowrey, Broussard, and Sherrill 2019).

In this study, we categorize data sources and analyse their diversity (government, academic, self-collected, etc.) in traditional Swiss media during the Covid-19 pandemic. Using computational methods, we extract the interactive data visualizations and their respective sources embedded in over 180'000 online articles from local and national newspapers as well as Switzerland's French-speaking public service broadcaster. In addition, we explore the availability of downloadable raw datasets from the data visualizations and the presence of meta-discourse about the original data collection process, as a means of ensuring transparency and acknowledging the constructed nature of data.

This research documents institutional and alternative sources that were used during the health crisis, with a comparison between public, private, local, and national news outlets. By revealing the prevalence of specific sources and how they evolve over time, this study identifies possible distinction in data provenance at different stages of the pandemic. Furthermore, it addresses the important question of how these data were presented and accounted for. Data source meta-discourse, we argue, partly reflects how critically journalists view the constructed nature of the quantified information sources that are becoming ever more central to their work.

JOS02 Journalistic sources

PP 0008 Theoretical contributions involve reinvigorating news-making studies and transforming the relationship dynamics among journalists, the newsroom, and news sources

[Endah Saptorini](#)¹

¹ Bournemouth University, Communication and Journalism, Bournemouth, United Kingdom

Purpose

The newsroom is experiencing disruption due to the prolonged COVID-19 pandemic as it grapples with navigating routine transitions amid unexpected crisis events. Unlike most other crises or disasters, the novel coronavirus has abruptly disrupted the newsroom itself. The background offers context to examine how the news-making process changed during the newsroom crisis, what journalists experienced as gatekeepers, and the implications for journalism practice. This study relies on place-based journalism theory (Usher, 2019) and disrupting gatekeeping (Van der Meer et al., 2017) to investigate how news-making changes and impacts the newsroom culture. It aims to contribute to the ongoing debate regarding the centrality of the newsroom and the relevance of gatekeeping in digital journalism.

Methodology

This study employed ethnographic methods and focused on three Jakarta-based Indonesian newsrooms: SCTV, a television station, and two digital newsrooms, Liputan 6.com and BBC Indonesia. The data collection includes approximately 245 hours of offline and online observations, 35 in-depth interviews, and an analysis of internal documents. The fieldwork for this study spanned over 15 months, from the first wave of the COVID-19 pandemic in Indonesia in April 2020 to the second wave in July 2021.

Findings

Three main findings emerged from the data. First, the findings show that the physical newsroom is valuable to journalists regarding news-making and communication culture during a crisis. While the pandemic forced journalists to leave the newsroom for their safety, this does not indicate that the traditional newsroom is obsolete. TV and radio platforms, as well as broadcasters, rely heavily on the newsroom compared to their online counterparts. Second, newsroom reconfiguration caused by the pandemic created tension as making news in the newsroom was inseparable from their professional journalistic identity and authority. Third, the pandemic puts journalists in a challenging position to maintain their role as gatekeepers. The impact of social distancing hindered journalists from finding and verifying sources, resulting in a dependency on official sources, with significant consequences for power relations between journalists and state authorities. However, the concept of gatekeeping remains relevant in the mainstream media.

Originality/value

Theoretically, this study reinvigorates news production studies by laying the theoretical groundwork for understanding changing journalistic practices and newsroom culture in crisis environments. It also fundamentally alters the relationship between journalists and the newsroom—the central place of newsmaking—and the relations between journalists and their news sources. Empirically, the study contributes to a better understanding of the legacy newsroom and the digital newsroom within a rapidly evolving field of journalism from a non-Western case study.

PP 0009 Authenticity and intimacy in live blogs about the US presidential debates

Hendrik Michael¹, Valentin Werner²

¹ University of Bamberg, Communication Studies, Bamberg, Germany

² University of Bamberg, English Linguistics, Bamberg, Germany

The present contribution engages with the larger topic of discourse and politics through assessing live blogging (LB; Thurman & Walters, 2013) as a form of web-native (political) journalism. Discourse practices in online reporting have been found to be characterized by hybridity in terms of (i) sticking to strategic rituals of objectivity to create accountability on the one hand (e.g. Singer 2005; Lasorsa et al. 2012) while (ii) also being marked by storytelling or "news as narrative" (Wahl-Jorgensen & Schmidt, 2019) to make the world more transparent, recognizable, and graspable. Relating to the latter in LB specifically, Tereszkievicz (2014) discussed how it creates polyvocality by relying on amateur sources and featuring interactions between reporters and users. From a similar vantage point, Steensen (2016) described an "intimization of journalism" by increasingly blurred boundaries between the personal and the professional perspective on social media.

The present study, which uses political LB about the last presidential debates in the United States (2020) as a case in point, explores whether such LB represents polyvocal discourse involving the expansion of voices and perspectives, fostering authenticity through including everyday voices as sources and emphasizing transparency through the presence of a reliable narrator who regularly provides updates and fact-checks; and (ii) whether it is a form of intimate discourse representing immediacy and emotionality, blending the professional and private roles of the communicator and the audience.

The study relies on a purpose-built corpus of LB coverage of the two televised US presidential debates (Donald Trump vs. Joe Biden). Data were collected from four popular media outlets (*The Guardian*, *Daily Mirror*, *New York Times*, *Wall Street Journal*). The overall corpus size amounts to 61,490 tokens. To facilitate a discourse-oriented mixed-methods approach (O'Keeffe, 2006; Bednarek & Carr, 2020) a combined quantitative-qualitative analysis

with AntConc and MAXQDA was conducted. For the operationalization of the hypotheses established categorizations from journalism studies (e.g. Donsbach & Klett, 1993; Singer, 2005; Bruns, 2018) to annotate sourcing practices, (multimodal) markers of transparency and authenticity, as well as (lack of) linguistic indicators of journalistic objectivity were applied.

As is visible both in sourcing and from a linguistic perspective, the results highlight the abovementioned practices of blending and the integration of new media practices that result in creating different modes of conveying information through storytelling and thus create journalistic perspectives that are intimate and authentic.

JOS02 Journalistic sources

PP 0010 Audiovisual perspectives of quality journalism: A case study of automating television news

[Stefanie Sirén-Heikel](#)¹

¹ University of Helsinki, Media and Communication, Helsinki, Finland

Legacy news broadcasters are leveraging automation and AI in television news production to maintain high-quality linear products, whilst reorienting to an online first mindset. This shift necessitates substantial alterations in broadcast news production, involving reallocation of limited resources, redefinition of work roles and identities, and reimagining news products.

This paper presents a case study of a change project within a legacy news organization, focusing on an overhaul of the audiovisual production of television news. The study follows a workgroup responsible for facilitating this change, comprising managers and workers representing key stakeholders from both audiovisual and journalistic staff. Addressing the following questions, the study aims to fill a gap in journalism studies by considering the perspectives of an often-overlooked group – the audiovisual broadcasting staff:

- How are the core tenets for maintaining high-quality news broadcasts managed when implementing automation and AI?
- What roles do workgroup members perform, whom do they represent, and what causes tension during negotiations?
- What are potential ripple effects of the changes, and how are they justified?

Research material is collected through ethnographic methods, including participant observation, interviews, and document analysis. The primary research material consists of observations of weekly workgroup meetings during the second half of 2022 and the second half of 2023, supported by interviews and observation of news broadcasts.

Preliminary findings suggest that audiovisual staff see themselves as integral to news, working alongside journalism by providing the framework for maintaining a high-quality product. When negotiating how to transform their work with automation and AI, tensions arise concerning what is considered essential for upholding this framework, linked to a sense of *craft*. When expected to keep the quality with less hands-on deck, the affordances of automation and AI become integral – in addition to moving task away from the audiovisual staff. Redesigning workflows have ripple effects also affecting the journalistic staff, representing a minority in the workgroup. The roles the workgroup members perform are multifaceted: safeguarding the work roles they represent, evaluating changes through personal experience, and advocating for changes that streamline processes. Unifying the group is a perceived sense of threat to quality, such as a concern that an emphasis on online first may diminish investment in broadcast news.

This paper contends that involving technical staff, such as audiovisual personnel, enhances comprehension of the major changes occurring in journalistic organisations. When implementing impactful technologies like automation and AI, considering a broader perspective enables a more holistic understanding of their implications for the practices and production of journalism.

JOS03 Safety I

PP 0011 Who has their back? Organizational support and preventive mechanisms for journalists under threat in Brazil, Cameroon, Croatia, and Mexico

[Martina Hrgović](#)¹, [Anna Oczos](#)¹, [Erika Contreras](#)¹, [Jessé Krüger](#)¹, [Janara Nicoletti](#)¹

¹ Ludwig Maximilian University of Munich, Department of Media and Communication LMU Munich, Munich, Germany

Freedom of the press has declined in the last decade, pushed by the democratic backlash in several countries. According to the V-Dem report, around 5.7 billion people live in authoritarian countries or fragile democracies, representing 72% of the global population. In this context, the violence against media has been increasing in recent years, including physical assault, death, harassment, online attacks, and several other types of threats that compromise their professional and private life with profound effects on their journalistic routines and health.

Reporters Without Borders (RSF) indicated that almost 800 journalists were jailed in 2023. In the same year, the number of killings reached 95 people; another 65 were missing at the beginning of 2024, as indicated by the Committee to Protect Journalists' (CPJ) monitoring tool.

Despite the growing efforts to protect journalists and offer training to work in dangerous areas, studies show they are still vulnerable and fighting alone in their daily practice. Protection measures, when existent, are insufficient or ineffective to tackle the problem.

In this paper, we analyze the support mechanisms offered to journalists victims of violence in four countries: Brazil, Cameroon, Croatia, and Mexico. In common, these nations share an increased hostility against the press coming from political leaders, and some of them are also under restrictive legislation that endangers the freedom of the media.

Semi-structured interviews were conducted to investigate the organizational support and prevention mechanisms in safeguarding media workers. Participants comprised journalists who had experienced various types of violence in their line of work. A predetermined set of open-ended questions guided the interviews. The sample size was defined through a purposive sampling strategy, ensuring representation from local, regional, and national levels and diverse news beats. The research adhered to ethical guidelines, obtaining informed consent from participants and ensuring confidentiality and anonymity. Interviews were transcribed verbatim and analyzed thematically to identify patterns and commonalities.

Particularly in Cameroon and Mexico, physical violence, imprisonment, and assassinations try to silence journalists by force and impose a regime of fear on those who cover human rights, politics, or work with investigative journalism. Interviewees from both countries informed that protection mechanisms are ineffective, and to keep doing their jobs, they use avoidance strategies or self-censorship. Besides the lack of prevention protocols and support from news organizations, Mexican journalists also experience revictimization within newsrooms, with the violence they endure and its effects being trivialized. In Cameroon, among many risks journalists face, any support from the organizational side is mainly symbolic, limited to solidarity within the journalistic network.

Online violence – especially against women – tries to silence Brazilian journalists who also face judicial harassment and other types of attacks with low support or without any help. Croatian media workers find the most comfort and support inside the journalistic community, mainly from their colleague network. The support is more efficiently gained nationally rather than in the newsrooms, including offering free psychological help and receiving private and public support from the Croatian Journalist Association.

JOS03 Safety I

PP 0012 Emotional labour in journalism: A systematic review

[Maja Simunjak¹](#)

¹ Middlesex University, Faculty of Arts, London, United Kingdom

Discussions of the role and impact of emotions in journalism increasingly capture aspects of the topic pertaining to journalists' labour. These are often examined through the lens of *emotional labour* – a sociological concept that refers to efforts that workers exert when they manage emotions that arise in relation to work in order to satisfy professional requirements of their roles (Hochschild 1983). The growing interest, and consequently, scholarship, in journalists' emotional labour, as well as the early evidence showing that it may contribute to impaired health and decreased job performance (Kotisova 2019; Hopper and Huxford 2017), warrant a comprehensive look at the studies in the field with the aim of establishing the state of play and identifying the agenda for future research.

To this end, a systematic review of scholarship engaging with journalists' emotional labour has been carried out drawing on the SPIDER approach and following PRISMA guidelines, with aims to establish the development of literature in terms of publication activity, geographic and phenomenological focus, and methodological approaches. In addition, the analysis aims to synthesize what this body of knowledge has uncovered about the causes and consequences of emotional labour in journalism, as well as the most commonly applied strategies that journalists employ to manage their emotional labour. The initial sample of 296 studies was identified through database searches of the Web of science and ProQuest, as well as a hand search of articles published in three key journals, identified as publications in which the phenomenon was most frequently discussed based on the database searches – Journalism, Journalism studies, and Journalism Practice. Following the elimination of duplicates, the screening process and the full text reviews, 70 studies have been identified as mentioning the concept of emotional labour in the field of journalism, and of these, 23 were original research studies in which emotional labour was the key or one of the most prominent theoretical concepts that the study aimed to research.

The analysis of the larger sample (n = 70) reveals a sharp rise of interest in this practice and area of study since 2020 and the Western-centeredness of the scholarship. Research-focused studies that primarily examine emotional labour in journalism (n = 23) reveal that trauma reporting, experiences of online abuse, challenges of everyday work and working conditions are identified as key triggers, while individual-level processing of emotions is found to be the most frequently employed emotion management strategy. Also, burnout, anxiety, stress, and self-censorship are most commonly reported consequences of emotional labour. The paper ends with the agenda for future research.

PP 0013 Collaborative journalism and cross-border collaborations for newsafety: Navigating security and solidarity mechanisms in cooperative practices in Latin American news media

[Lucia Mesquita](#)¹, [Mathias-Felipe de-Lima-Santos](#)², [Janara Nicoletti](#)³

¹ Universidade Lusófona do Porto, CICANT, Porto, Portugal

² University of Amsterdam, Faculty of Humanities, Amsterdam, Netherlands

³ Ludwig Maximilian University of Munich, Institute of Communication and Media Research, Munich, Germany

Journalism no longer operates within national or cultural boundaries. In an era of globalization where international events garner increased attention in the media, research needs to examine the intricate networks and institutions that produce news in this new, interconnected landscape. Collaborative journalism has played a crucial role in tackling the intricate challenges of a globalized society, facilitating crucial investigations with notable political and professional impact. It serves as a remedy for funding shortages and staffing constraints in journalism. Additionally, it reinforces core journalistic values and motivations while facilitating the creation of in-depth investigative stories. This study explores the transformative impact of collaborative journalism in Latin America, focusing on cross-border alliances and their role in enhancing the safety and solidarity of journalistic endeavors. In Latin America, a region grappling with escalating violence against journalists, collaborative journalism and cross-border investigations take on even greater significance, offering opportunities and posing distinct challenges. While cross-border and collaborative journalism is expanding its role in media systems globally, Latin America has experienced a concerning surge in violence against the media in recent years, encompassing physical attacks, harassment, and killings targeting journalists. This increase in attacks can be attributed to the decline in journalism's reputation, the rise of authoritarian and populist regimes around the globe, and the growing use of social networks. Initiatives like Tierra de Resistentes, Lava Jato, and local teams behind the Panama and Pandora Papers highlight the region's potency of collective journalistic efforts. Despite challenging contexts, such as underdeveloped economies and authoritarian regimes, these collaborations have significantly influenced public discourse, policies, and political change. This research investigates real-world practices of cross-border journalism, examining approaches to journalist security through partnerships, training initiatives, consultancy, and other actions. Our study draws on quantitative and qualitative analysis, including a survey of 75 respondents across 20 Latin American countries and 19 in-depth interviews with media practitioners in 10 countries. Our findings suggest that the success of collaborative journalism hinges on contextual factors and organizational frameworks that prioritize material support, functioning as solidarity and security networks for journalists. In this study, we advocate for a comprehensive news safety approach encompassing multiple dimensions. Prior research identified four principal aspects of news safety. Other researchers highlighted financial risks to journalists and news organizations as a critical dimension. While our research did not fully address these broader, systemic risks in journalism, we posit that collaborative journalism contributes significantly to this comprehensive approach. It amalgamates diverse skills and capacities, enabling organizations to integrate new safety measures effectively. However, the success of this model hinges on media organizations' willingness to engage in genuine collaboration, characterized by shared resources and a community-driven ethos rather than mere cooperation. The study contributes to both literature and practice by highlighting that the empowering potential of collaborative journalism in Latin America is realized through its crucial role in fostering solidarity and implementing news safety measures.

JOS03 Safety I

PP 0015 How contextual factors of media outlets shape journalists' experiences of harassment

[Manuel Menke](#)¹, [Christina Seeger](#)²

¹ University of Copenhagen, Department of Communication, Copenhagen, Denmark

² Alpen-Adria-University Klagenfurt, Department of Media and Communications, Klagenfurt, Austria

Many journalists experience harassment regularly in their everyday work. Audiences in Western democracies have become increasingly aggressive in their communication due to the spread of anti-press sentiments and populist attitudes. The problem is further fueled by technological changes rendering interaction with journalists simple and intrusive. Both the industry and journalism research have been shedding light on this alarming trend as it has introduced detrimental effects on journalists and journalism as an institution upholding truth, free speech, and opinion-making online and offline (Kim & Shin, 2022; Miller, 2022; Waisbord, 2020). For the industry, this means

not only to implement strategies to protect journalists and their work (Holton et al., 2021) but also to contribute to calling out and foiling the normalization of incivility and harassment in today's discourse culture (Meltzer, 2015). Understanding that the reciprocity of today's journalist-audience relationship enabled by online communication not only advances deliberation in democratic discourses but also fosters forms of dark participation is key to interpreting and contextualizing findings about journalists' experiences of harassment (Lewis et al., 2020; Quandt, 2018).

So far, research has found that journalists reporting on specific political topics and embodying particular social identities regarding gender, race, sexuality, and religion are predominately and systematically under threat (Gardiner, 2018; Jamil, 2020; Pain & Chen, 2019). While these individual factors are important to expose the targeting of these journalists, we shift our focus in this presentation to the question of how journalist-audience relationships are differently experienced by journalists depending on the media outlets they work for. In an explorative interview study with 32 German journalists, we analyzed how experiences of harassment are related to the journalist-audience relationships developing in national and local as well as quality, tabloid, constructive, and young audience media.

Our findings indicate that media's contextual conditions determine the composition of the audience, leading to journalists differently assessing closeness or distance in the journalist-audience relationship resulting in dissimilar experiences of harassment. Especially local, constructive, and young audience media allow journalists to forge close relationships with their audience built on direct interaction, a sense of community, as well as shared ideals, norms, and lifeworlds. The findings suggest that establishing an overall respectful journalist-audience relationship is confounded with having a smaller, invested, ideologically homogeneous audience and little circulation of content beyond that targeted community. The analysis also supports that the closeness in the relationship then functions as a buffer for harassment because there are paths for direct conflict-solving. The geographical and/or lifeworld proximity and reciprocal communication seem to lead to more civil interactions and even in critical cases often allow for constructive exchange instead of harassment. According to national journalists, these options are seldom possible with large and heterogeneous audiences because of the volume of harassment and the lack of closeness in the journalist-audience relationship. Our subsequent conclusion is that the closeness or distance in the journalist-audience relationship shapes experiences of harassment, rendering contextual factors facilitating those relationships deserving of further exploration.

JOS04 Boundaries of journalism

PP 0036 How to enter journalism – Obstacles for Up-and-coming journalists with and without diversity features

Mia Grünewald¹, Corinna Lauerer¹

¹ LMU Munich, IfKW, München, Germany

Despite the diversity of news content being at the forefront of journalism studies for decades, the diversity of newsroom staff has increasingly received scholarly attention only in recent years. Raising the diversity of the journalistic workforce is discussed to reduce structures of inequality in newsrooms, to increase the diversity of content through more varied horizons of experience among journalists and, thereby, to achieve a more inclusive approach to a more diverse audience.

The sociology of work reveals gender, ethnic and socio-economic background as vital diversity features in professions (Christina et al. 2006; Guillaume et al. 2014; Harrison & Sin 2006). Despite a growing share of female journalists (ProQuote Medien 2022), journalism in Germany as in many Western media systems is little diverse (Borchardt et al., 2019). The obstacles non-male aspirants with migrant or non-academic family backgrounds may face trying to enter journalism are manifold, for instance, language barriers, tokenism, a lack of role models, or discrimination (Borchardt et al., 2019).

Against that background, we compare the diversity-related access points and hurdles of up-and-coming journalists with and without diversity features (RQ1) and examine how different groups of up-and-coming journalists perceive the diversity status among journalists (RQ2).

To answer these questions, we are conducting 40 qualitative, semi-standardized interviews with up-and-coming journalists in Germany between October 2023 and February 2024. We define up-and-coming journalists as persons older than 18 years with a minimum of 3 months of work experience or enrolled in a journalism school and a maximum of 2 years in regular employment (i.e., journalism students, interns, working students, trainees, up-and-coming freelance journalists, journalists who have recently received a regular position). We analyse the anonymized interview transcripts in a qualitative content analysis with MAXQDA.

Regarding RQ1, our preliminary results indicate that early contact with journalism in the personal network is the crucial entry point for both, up-and-coming journalists with and without diversity features (i.e., through family, friends, teachers). Not only but especially for aspirants with diversity features social support is of particular relevance in order to absorb self-doubts and financial struggles. The impression that one's language skills or education are not sufficient to compete in journalism can be dispelled through contact with established journalists or mentoring programs. The poor payment for up-and-coming journalists raises hurdles, especially for aspirants from financially unstable

backgrounds. These hurdles can be overcome by grants and having media companies refrain from unpaid labour in internships. Regarding RQ2, all interviewees so far perceived newsroom diversity as crucial since it is understood to enhance the variety of perspectives in news. Specifically, the upcoming generation of journalists calls for action to diversify the editorial staff in terms of migration and socio-economic background.

The insights of this study help identifying practical instructions for recruiting a more diverse workforce in journalism. This can contribute to changing the social order via communication: The work of more diverse journalists may result in more diverse news content that attracts more diverse audiences.

JOS04 Boundaries of journalism

PP 0037 Being a token: The work-experience of Israeli women journalists from minority groups

[Einat Lachover](#)¹

¹ Sapir Academic College, Communication, Tel Aviv, Israel

The current transnational movement of people around the globe, with the consequent increase in ethnic minority populations, raises questions of inclusion and exclusion. In order to negotiate and acquire equal rights and civic belonging, ethnic minorities and other marginalized groups, including women, must successfully enter the public sphere. As a result, participation in news-making has been a key concern of ethnic minorities and women—and, more specifically, women of ethnic minorities.

Taking an intersectional approach, my presentation will conceptualize the complex subjectivities of Israeli women journalists from three social minority groups employed in mainstream Israeli journalism: television, radio and digital news. The presentation will focus on both the challenges and the sources of strength in their professional experiences as tokens in a current climate of “managing diversity” within Israeli newsrooms.

The study is based on the following minority groups: (1) Jewish women from Ethiopian origin who experience exclusion based on skin color and have been patronized as immigrants from a their world country; (2) Palestinian women who live in Israel who are discriminated as non-Jewish citizens in terms of their socioeconomic, civil, and political rights; and (3) Russian women who resettled in Israel during the mass wave of immigrations from the Former Soviet Union in the 1990s and have become the target of objectification and symbolic violence. Therefore, all women journalists participated in the study contend with a complex exclusion and discrimination: gendered, racial, ethnic, national or immigration.

The study is based on phenomenological approach and narrative interviews (Gubrium and Holstein, 2002) with 40 women journalists aged 26 to 65, through face to face and through Zoom platform. All interviews were transcribed verbatim and were closely read based on grounded theory (Strauss and Corbin, 1990).

The presentation will present the women journalists’ experiences with their status of being a token, such as: “otherness” as an advantage to getting into the profession; the prices and struggles accompany tokenism and the ways they cope with them; the change over the years in their token status; the dilemmas derived from their token status relating to their role within their community.

In the discussion I will focus on the similarities and differences between the three minority groups and will analyze how each group’s identity and relations with the hegemonic group influence the group’s professional identity. The findings may refine how we understand the challenges and contributions of diversity in journalism and newsrooms.

JOS04 Boundaries of journalism

PP 0038 Exploring audience perceptions of volunteer journalism

[Lene Heiselberg](#)¹, [Nick Matthews](#)²

¹ University of Southern Denmark, Centre for Journalism, Odense, Denmark

² University of Missouri, School of Journalism, Not, USA

In this article, we present an in-depth analysis of audience perceptions of volunteer journalism. Volunteer journalism, defined as the voluntary contribution of time, effort, and expertise by non-professionals in news gathering, reporting, and dissemination (Mathews, Heiselberg, Jadhav & Oduolowu, unpublished manuscript), has been a pivotal part of the media landscape since the 1970s. The study focuses on long-standing volunteer journalism outlets like *HornePosten*, a Danish community magazine in print since 1973, to glean insights into audience engagement with such journalism outlets.

The research aims to uncover the underlying motivations that drive the audience towards volunteer journalism. By analyzing the consumption and perception of these outlets, the study intends to differentiate volunteer journalism from other types of uncompensated journalism, such as citizen journalism (Robinson & Deshano, 2011, Naab & Sehl, 2017) and participatory journalism (Borger et al., 2016). A significant component of this research is the establishment of an analytical framework to assist in this differentiation seen from an audience perspective. Additionally, the study identifies potential critiques of volunteer journalism, thereby enriching our understanding of how audiences use, perceive, and engage with this media form, and it considers the audience's perceptions of the future of volunteer journalism, i.e., whether volunteer journalism serves a potential future for local journalism, as it clings to survival in many places around the world.

Methodologically, the article begins with a comprehensive review of existing research on volunteerism and volunteer journalism. This review sets the stage for presenting the empirical study, which is divided into sections detailing the method, analysis, and discussion of findings. The study employs Online Video Research Interviews (OVRI) (Heiselberg & Stępińska, 2021) as our primary methodological tool. A diverse sample of 30 users of volunteer journalism from varied geographical locations – North America, Denmark, and India – was selected to gather a comprehensive understanding of the global audience's viewpoint. This cross-cultural approach not only adds depth to the study but also allows for a comparative analysis of audience attitudes across different sociopolitical landscapes. We began conducting interviews in December 2023 and will finalize data collection in January 2024. At the ECREA conference, we plan to present the key findings of this research.

In conclusion, this article contributes significantly to journalism studies by offering a perspective on audience perceptions of volunteer journalism. By examining examples from distinct countries and regions, the research provides a holistic understanding of the audience's viewpoint.

JOS04 Boundaries of journalism

PP 0039 Exploring precarity in citizen journalism: A study on the economic conditions of favela-based journalists through journalistic roles and boundaries

[Mariana Gomes](#)¹, [Sandra Banjac](#)¹

¹ University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

Scholarship on alternative news projects for marginalized groups have overwhelmingly focused on journalists' passion and sense of justice driving their work, over the lack of financial security in what has been described as a precarious setting characterized by self-exploited and underpaid labor. Some have argued that a strictly economic perspective would overlook the deep meaning news production holds for community development and self-representation, thereby rationalizing these journalists' involvement in precarious work. However, this study argues that such a rose-tinted approach neglects the reality that even the most engaged journalists must make ends meet. This oversight is tightly linked to journalistic boundaries, emerging from the tension around whether these actors' work is perceived as a profession or a passion that sits on the periphery of the journalistic field. To this extent, scholars not only influence this discourse but also make assumptions when portraying activist-adjacent journalism as oppositional to mainstream without recognizing shared concerns such as living wages. This is perfectly exemplified by favela-based journalists, whom this study investigates. For them, the lines remain blurred between being a "favela resident" and a "journalist", since they are both affected by and report on the social inequalities resulting from state violence. Thus, it is crucial to understand whether they consider themselves as executing a "professional project" for economic rewards (e.g. salary), akin to mainstream journalists, or not. Drawing on nine in-depth interviews with favela-based journalists – employees of news projects and freelancers – from Rio de Janeiro, this study explores: How do favela-based journalists define their roles and construct boundaries within the journalistic field, and how does this shape their perception of their economic conditions?

Contrary to previous literature, findings showed that favela-based journalists' commitment to their role as "micro-watchdogs" alone does not explain their acceptance of precarity. Rather, these actors have internalized job insecurity simply because they have never experienced alternative ways of funding and economic security in the first place. Within this, news project employees hoped for better salaries, considering favela-based journalism a profession vis-à-vis mainstream media. In contrast, freelancers sat outside of the journalistic field and were critical of applying the "logic of the market" to favela-based journalism, perceiving their work as activism. Despite this, news projects have shown signs that they cannot afford to stay outside of the journalistic field, and are focused on ensuring fair compensation – e.g. by collaborating with mainstream media to assert journalistic authority and attract funding. Consequently, journalists would be less likely to quit favela-based journalism, ensuring the sustainability of news production and the promotion of social justice, thus preventing favelas from becoming news deserts, which would be alarming from a democratic standpoint. Current research should account for these efforts and recognize the shift towards viewing favela-based journalism through an economic lens.

JOS04 Boundaries of journalism

PP 0040 The people at the margins of journalism: Peripheral journalists and their (semi-)professional aspirations in eight European countries

Thomas Hanitzsch¹, Andreas A. Riedl¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

For decades, the proper functioning of democracy has been closely tied to professional journalism and its role in creating a space for public debate and thus enabling processes of democratic reasoning (Schudson, 2008). The shifting boundaries of institutional journalism (Carlson & Lewis, 2015) and the emergence of 'new' platforms, actors, and forms of public communication raise questions about how these entrants to the field aim to contribute to the public interest. In the literature, such quasi-journalistic actors are usually conceptualized as peripheral journalists; these actors are seen as populating a periphery around journalism's 'traditional' core (Eldridge, 2019). Core and periphery are demarcated along multiple axes, including the autonomy/heteronomy of actors and their alignment with established institutional norms in a hetero- or orthodox manner (Maares & Hanusch, 2022). Despite these theoretical considerations, it is widely unclear how peripheral journalists conceive their (semi-)professional aspirations compared to traditional journalists. We address this research gap by systematically comparing the attitudes and perceptions of both groups across eight European countries: Austria, Belgium, the Czech Republic, Germany, Ireland, Norway, Spain, and the United Kingdom. The comparative perspective allows us to identify commonalities and differences beyond the constraints of individual media systems. In line with the core vs. periphery concept, we operationalize peripheral journalists into five subgroups, which allows us to compare analogous groups despite the structural differences of the media systems. These subgroups include *political 'alternative' media* proclaiming to represent a necessary corrective towards the 'mainstream' media (Holt et al., 2019), *fact-checkers* embracing traditional journalistic values around factuality (Graves, 2016), *news start-ups* challenging conventional understandings of how news production is organized and funded (Usher, 2017), *corporate journalism* producing journalism-like products on behalf of business enterprises from other sectors (Koch et al., 2023), and *influencers* building personal brands and engaging with a significant number of followers (Borchers, 2019). To assess their contribution to the public interest, we explore the working realities of peripheral journalists, including perceived autonomy and influences on their work and their aspirations, encompassing role orientations, epistemologies, ethics, and political views (Hanitzsch et al., 2019). Empirically, we build our comparison on a recent (2022/23) standardized survey among traditional journalists in the eight countries ($n \geq 5,500$) and an ongoing survey among peripheral journalists, targeting 100 peripheral journalists in each country. The latter survey is completed for the first two countries ($n \approx 80$ and ≈ 100), with data collection ongoing in the others. At the conference, we will be able to present a comprehensive comparison of traditional and peripheral journalists in the selected European countries. Through this study, we hope to enhance our understanding of hybrid media systems' ecology and evaluate the extent to which our theoretical assumptions about peripheral journalism align with the empirical reality.

JOS06 Media trust

PP 0104 (Dis)connection? How the discontented audiences value journalistic trust markers

Renée Van Der Nat¹, Sophie Duvekot¹, Winnifred Wijnker¹, Yael de Haan¹, Koen Turnhout¹, Milou Vollebregt²

¹ University of Applied Science Utrecht, School for Journalism, Utrecht, Netherlands

² University of Applied Sciences Utrecht, Research group for Quality Journalism in Digital Transition, Utrecht, Netherlands

Recent audience studies find news organization fail to accurately portrait people's experience, and people do not recognize themselves in the news (de Haan & Van de Broek, 2023; Costera Meijer, 2021). Specifically, a lack of in-depth reporting and diverse perspectives cause discontent amongst audiences (Costera-Meijer, 2021; Wilner et al., 2021). In a recent study, Arguedas et al. (2022) find that generally people instantly 'know' to trust news they encounter and consequently make a snap decision about the reliability of the news and information encountered. The large amount of information people deal with online affects their evaluation of the credibility of news (Anderson et al., 2021; Lee et al., 2017). When consuming news, people need to rely on textual markers that indicate credibility of both the sender and the information (Van Dalen, 2020). We know little how audiences with low media trust and who feel disconnected from established news media value such textual markers. In this study we want to untangle what trust markers are crucial for building news media trust, and which are perhaps detrimental.

With this aim, we conduct a large-scale *conversational survey* amongst a representative sample of Dutch citizens (Celino & Calegari, 2020). For this method, a conversational AI is trained to ask questions based on a protocol developed by the researchers. The survey then becomes a conversation, rather than a list of questions. Contrary to a conventional survey, a conversational survey is a conversation between an AI-tool and the respondent meaning that the AI 1) can ask more specific questions regarding respondents' motivation when relevant and 2) is able to adjust to the needs of respondents (adjusting the complexity of language, tone-of-voice) thereby making the research more inclusive and accessible.

To reach a diverse and representative sample of Dutch citizen, the survey will be distributed through national, regional and local news sites, and through platforms and social media groups focused on diverse societal issues and locations. We are specifically interested to include people that are typically poorly reached through news media and who are also underrepresented in survey research, for example people who are not very interested in news, have low literacy or a mental disability (Kaun et al., 2016; Swart et al., 2022).

By making the survey a conversation, this method ensures the data more accurately reflects how the public experiences disconnection from the news. Using a conversational survey, which will be distributed in the spring of 2024, we will gain insights in how different social groups value journalistic trust makers and which markers contribute to building trust. This knowledge is indispensable if news organization wish to come to terms with discontentment regarding the news. Moreover, the research contributes to further our understanding of news media trust, specifically how different groups fluctuate in the news media trust.

JOS06 Media trust

PP 0105 Credibility of Liveblogs as genre: Four empirical studies

[Sebastiaan Peter Van Der Lubben](#)¹

¹ University of Applied Sciences, Journalism, Utrecht, Netherlands

Live blogs are a very popular format for journalists and the public alike to report on and follow live events. Live blogs proliferated from sports beats to other beats, now covering a wide array of subjects and themes, like disasters, attacks, debates, COVID-19, or the crisis in Ukraine on a daily, sometimes hourly pace. However, their immediacy can challenge journalistic credibility. This journalistic credibility is central to four empirical studies using genre theory as theoretical framework.

Genre influences and constrains the choice of content and style for makers (Swales, 1990; Miller 1984) and manages expectations by the public. Genres create effects of credibility "which are central to the different ways the world is understood" (Frow, 2015: 20). To understand genre, we must understand what makers do, how their content is presented, and finally evaluated by the public.

First, I analyzed how liveblogs are produced, interviewing journalists interviews concerning routines and conventions used for the production of live blogs. We found a social process of news production, constantly balancing between (ir)relevance and (un)certainly. Journalists covering planned events had a high degree of editorial autonomy but were embedded in a network of knowledge. Unplanned events, like breaking news, is characterized by journalists working together to cover terrorist attacks, or disasters. These routines and conventions suggested a discourse community of live-bloggers: journalists follow same routines and conventions despite their differences in the online news platforms they worked for, or the stories they covered.

Second, I conducted a qualitative content analysis regarding source selection and reported speech. I found that journalists used most of the times (measured in 3000+ sentences) *narration* (their own words, without a source) to cover reality in live blogs. When sources were used, journalists used predominantly *formal* sources. These sources were quoted mostly direct (*ad verbatim*). The choice for predominantly *formal* sources harmed the potential for polyvocality (more and more different sources).

Third, we evaluated live blogs in six focus groups, asking to evaluate the credibility of live blogs. Respondents had concerns regarding source selection, authorship, the use of photo, video and social media. Respondents were aware of the challenges of live blogs, but still highly regarded the certainty (or uncertainty) and relevance (or irrelevance) of the format. They 'repaired' shortcomings by constantly comparing the content of live blogs with knowledge they had by following other media. A survey among respondents using live blogs during the first months of the pandemic further supported this omnivorous news diet of what are called by Broersma & Swart (2022) 'news junkies'.

Based on these four studies, we claim that live blogs are indeed a genre (and not a channel for content), managing discourse production and public expectations alike. Their credibility is the result of these genre conventions followed by journalists, leading to content that is evaluated critically by public that is used to deal with (ir)relevance and (un)certainly. We conclude that these are not challenges that journalists must solve for the format but are regarded as expected (and welcome) challenges by the public.

JOS06 Media trust

PP 0106 Restoring trust in journalism: A multi-country experiment on journalistic repair strategies

[Mark Boukes](#)¹

¹ ASCoR / University of Amsterdam, Communication Science, Amsterdam, Netherlands

Journalism can only fulfill its function as the cornerstone of solid a democracy, when the news media and its coverage are trusted by the public. Without trust in the news, the desired outcomes of journalism's role in society

cannot be achieved: Citizens simply will not consume the news or do not believe the news, and these citizens will thus be unlikely to become informed or engaged by journalistic productions.

The decline of media trust across countries, especially among younger generations and lower-educated citizens, poses a significant threat to the foundational role of journalism in democracy. In response to this challenge, a pioneering experimental study is being developed to explore and validate the impact of journalistic strategies aimed at restoring public trust in the news media. The project seeks to address the critical issue of media trust through an extensive multi-country experiment involving 14 diverse nations, including Argentina, Australia, Brazil, China, Ghana, Greece, India, Netherlands, Nigeria, Philippines, Spain, United Kingdom, and the United States (and more countries if resources allow).

Background and Objectives

The study addresses the fundamental question of how journalistic repair strategies, specifically fact-checking and increased transparency, impact media trust. The research recognizes the importance of understanding the variations in media trust across different nations and aims to develop a culturally-sensitive approach to measuring media trust. By delving into the factors that influence trust, such as press freedom, political polarization, and democratic history, the project strives to provide evidence-based recommendations for the journalism industry.

Methodology

The research comprises two main sub-projects. The first sub-project focuses on developing a comprehensive survey scale to measure media trust in a multidimensional manner. This scale will capture citizens' perceptions and trust in journalism, differentiating between healthy criticism and detrimental cynicism.

The second sub-project involves a pre-registered online experiment, employing a 3 x 2 factorial design to test the impact of journalistic repair strategies. The experiment manipulates conditions by presenting news stories in regular formats vs. fact-checking formats vs. transparency formats, while also varying the topics to ensure the findings' generalizability. The experimental design is not yet set in stone; feedback is very welcome and the purpose of this conference presentation.

Unique Contributions

What sets this research apart is its comparative and experimental approach involving 14 culturally diverse countries, including nations from the Global South. By conducting a multi-level confirmatory factor analysis, the study aims to validate the measurement tool for media trust internationally, offering scholars a valuable resource. Furthermore, the experiment's outcomes will provide actionable insights for journalism professionals, potentially reshaping how news is presented to the public.

Call for Collaboration

The research team actively seeks collaboration from scholars worldwide to enhance the project's impact, which is the second goal of this conference presentation. By leveraging the diverse expertise and local knowledge of collaborators, the study aims to refine its experimental design, measurement tools, and overall methodology. Ultimately, the collaborative effort strives to address the global challenge of declining media trust, ensuring that journalism can continue to fulfill its vital democratic role.

JOS06 Media trust

PP 0107 Values-based polarization in media trust. A longitudinal analysis of socio-cultural values and media trust in Northwestern Europe (1980–2020)

[Arijen van Dalen](#)¹

¹ University of Southern Denmark, Centre for Journalism, Odense, Denmark

Given the democratic importance of the trust in the press, it is surprising that longitudinal trends in media trust have received relatively limited attention, especially beyond the US. People who distrust the media perceive fake news, conspiracy theories and misinformation as more credible than people who trust the media and often have more polarized attitudes. This makes it highly relevant to understand trends in media trust and to study whether societal cleavages in media trust grow over time.

Introducing the Salient Values Similarity perspective (e.g., Poortinga and Pidgeon, 2006) into journalism research, this paper studies whether media trust in Northwestern European countries has polarized over time between progressives and conservatives. Media trust is a relational concept, as the degree of trust in the press is the result of the interplay between the news media (the trustee) and the public (the trustor). The paper expects that in Northwestern European countries with high levels of press freedom and a professional press corps, changes in trust in the press over time reflect changes in cultural values among the public rather than media performance. The Cultural Backlash thesis (Norris and Inglehart, 2019) argues that societal shifts from conservative to progressive values generate feelings of alienation among conservatives, potentially influencing both political and media distrust. Anti-elitist discourse often portrays both politicians and mainstream media as out of touch with the public.

potentially extending perceived value dissimilarity and distrust from political to media institutions. Thus, the paper expects differences in media trust between conservatives and progressives to increase over time.

The paper analyzes five waves of the European Values Study (1980–2020) in 10 Northwestern European countries, which includes measures of media trust, and of the social-cultural values conservatism, political ideology and post-materialism. The central hypothesis was tested using country fixed effects regression analysis. In addition, and following state of the art statistical approaches to studying polarization, change in the overlap coefficient in the distribution between conservatives and progressives is analyzed (e.g. Lelkes, 2016; Park, 2018).

Indeed, the analysis shows that individuals in Northwestern Europe who identify as progressives (those with more liberal or left-leaning political and social views) and conservatives (those with more traditional or right-leaning views) are showing increasingly divergent levels of trust in the media. Circa 1980, materialism, social conservatism, and political ideology had minimal associations with media trust. However, in alignment with the Salient Values Similarity perspective, media trust polarized along value lines between 1980 and 2020. Progressives, left-wing supporters, and postmaterialists exhibited increased confidence in the media, while this is not the case for conservatives, right-wing supporters and people who hold materialist values. This values-based polarization was not present in Southern or Central Europe.

The findings suggest a link between rising trust among progressives in Northwestern Europe and the media's perceived alignment with progressive values and agendas. The implications for attempts to restore media trust among those who distrust the media are discussed.

JOS06 Media trust

PP 0108 Crisis, proximity, and trust: Local journalism in the Age of Social Media

[Luísa Torre](#)¹, Tatiana Dourado¹, Pedro Jerónimo¹, Inês Amaral², Rita Simões²

¹ University of Beira Interior, LabCom – Comunicação e Artes, Covilhã, Portugal

² University of Coimbra- Faculty of Arts and Humanities, Centre for Social Studies, Coimbra, Portugal

Over the past few decades, journalism has been facing multiple crises, affecting its traditional business model, its traditional role as public mediator and the trust the audience attributes to it. As social media platforms arouse a new form of communication and dissemination of information, also draining the publicity money that used to flow to media outlets, the whole media ecosystem changes into a more complex and dynamic setting, in which disinformation finds breeding ground to grow.

Local news outlets have been feeling these crises more acutely, as these organisations are often smaller than the ones in larger cities, and have less human and financial resources. In small places, where the circulation of information is grounded on community ties and the value of proximity, the disconnection between audiences and journalists have also been felt. Distrust have perpetuated in an age characterized by the proliferation of misinformation on social media, while local media outlets close at a fast pace, as small businesses do not offer the financial support they once did.

Drawing of six focus groups held with local audiences and local journalists in Portugal, this paper aims to analyse, from the audiences' perspective, their relationship with local media outlets, how do they feel that the phenomenon of disinformation impacts this relationship, how they verify the information they consume, and which role they think local media outlets have in fighting disinformation. From the local journalists' perspective, the impact of disinformation in their work, the role of local media in spreading disinformation, and the space for fact-checking from a local perspective.

The analysis of the groups' discussions found that the lack of resources is also felt by the audience, as they feel that the stories published by local outlets lack depth and sometimes, listening both sides of the stories. But the proximity is a precious value because it enhances trust in media, as audiences find national news outlets disinformation spreaders that rarely go to the field to find out the facts when it comes to news in the countryside.

Journalists also found that their own peers can be disinformation spreaders, but for different reasons. The pressure to be the first to publish, the publication without verification, the use of sensationalism and clickbait to attract the audiences, and the proliferation of so-called news outlets based on Facebook pages, but made by non-journalists, are some reasons for the whole class to be doomed as the ones that spread disinformation.

As communities grapple with the challenges of a rapidly changing media landscape, this research enhances the understanding of local journalism's crucial role in organizing communication and social (dis)order from a local level.

Keywords: disinformation, local media, trust, local audiences, focus groups

JOS07 International news work

PP 0109 Global narratives (dis)entangled and communicating worlds beyond borders: Insights into news agency foreign correspondents' role (perception) in communicating our world in (dis)order

Jasmin Surm¹

¹ University of Leeds, School of Media and Communication, Leeds, United Kingdom

In our interconnected world that has transformed into a "single place" (Robertson, 1992: 6) shaped by disruption and change across societal, cultural, environmental and cultural dimensions, news agencies, particularly their foreign correspondents, remain pivotal in communicating world affairs. Positioned as essential "agents in a global public sphere" (Hellmueller, 2016), they actively contribute to the "mediated image-building of foreign countries and translating foreign cultures" (Beliveau et al., 2011: 130). Against the backdrop of contemporary global disruptions, they navigate ongoing social, political conflicts and environmental crises by striking a balance between opening up a window on the world and domesticating information for national audiences (Papathanassopoulos and Giannouli, 2015: 1). As the "first important cultural framers of events" (Papathanassopoulos and Giannouli, 2015: 4), foreign correspondents contextualise and frame current global affairs, assisting audiences in comprehending the intricacies of global events (Beliveau et al., 2011: 130). Their (self-)ascribed cultural and professional identities intricately shape their behaviour, news selection, and presentation (Donsbach, 2012: 1), and ultimately, how we as audiences learn to understand distant places, people, and events beyond our direct experience.

The literature suggests that studies on foreign correspondents' role perception seem to lack explicit reference to those working for (European) news agencies. On that account, this proposed paper inserts into this lacuna by focusing specifically on European news agencies' foreign correspondents. It delves into their role perception and, in addition, explores their cultural identity by asking the question, "Who are you?" attempting to uncover potential contradictions and conflicts that may arise between their cultural identities and perceived professional roles.

The research behind this paper stems from the PhD project titled *Mediating – Negotiating – Translating: News Agency Foreign Correspondents' Role in Communicating Culture*, whose overarching aim is to interrogate the dynamics underpinning the mediation, translation, and negotiation of cultures and countries in the realm of global news production. The project explores various dimensions, including the correspondents' nuanced perceptions of their roles, the impact of cultural identity, considerations of their imagined audience, their daily work routine, language skills, and cultural knowledge.

This project utilises semi-structured in-depth interviews supplemented with conclusions drawn from a thematic analysis of foreign correspondents' written work to gain a detailed understanding of how these notions of role perception and cultural identity translate into/shape the global news product(ion processes). Semi-structured in-depth interviews have been conducted with a total of 67 foreign correspondents (status quo) covering six continents – from Africa to South America and countries from Austria to Turkey. The foreign correspondents are working for the European news agencies AFP (France), dpa (Germany) and LUSA (Portugal). Echoing Marschan-Piekkari and Reis (2005: 224) and fellow scholars, the researcher employs a "multilingual approach", conducting the research in five languages (English, Spanish, Portuguese, German and French) in order to enhance the research's international orientation, making it accessible beyond English-speaking audiences and emphasising the project's commitment to understanding the communication of countries and cultures through language, as articulated by Hennink (2008: 25), who aptly stated: "Language is a window into understanding culture."

JOS07 International news work

PP 0110 News agencies and their ambivalent significance for the pluralistic order of media systems: A mixed methods study on the changing role of news agencies in journalism

Holger Sievert¹, Florian Meissner¹, Linards Udris², Daniel Vogler²

¹ Macromedia University GmbH, Faculty "Culture – Media – Psychology", Cologne, Germany

² University of Zurich, Research Center for Public Sphere and Society, Zurich, Switzerland

News agencies are one of the most important sources for journalistic reporting. It is all the more astonishing that, with a few exceptions, agencies still represent a major blind spot within journalism research. Using a mixed method approach of content analysis and qualitative interviews, this paper investigates the current situation and future role of news agencies – in particular regarding the dominance of agencies in many national markets and the chances and risks linked within this for the diversity of opinion.

News agencies play a central role in media systems as suppliers of information for media outlets (Wu, 2000). Following digital transformations, however, the role of news agencies is assessed differently. On the one hand, it is plausible to assume that the demand for ready-made news from agencies will increase (Boumans et al., 2018; Dogruel et al., 2019). On the other hand, the easier availability of information on the internet also means that media editors are turning to more cost-effective sources such as information from governments or companies

(Welbers et al., 2018; Rantanen et al., 2019; Pfaff, 2021). In addition, in several European countries, one single news agency partially or even completely dominates the agency market. This is increasingly being discussed against the background of whether the remaining dominant news agency restricts diversity or makes a basic supply and thus a certain diversity of content possible (Boumans et al. 2018; Welbers et al. 2018; Häuptli & Vogler, 2018).

Using our mixed methods approach, we analysed the current situation in one large German federal state. In order to quantify the significance of agency material we manually analysed the content of 9 online news outlets (n = 1,240 news articles) during a whole week in September 2022. In addition, we conducted 13 semi-structured interviews in autumn 2022 with practitioners from selected news agencies and media outlets.

The quantitative results show the dominant role of a single agency in the analysed national market. On average, 86 percent of all agency articles in the media analysed came from this one agency.

Our interviewees also often focused on the dominant role of the lead agency. For small media outlets, it is typically the only news agency used. Practitioners see the future of news agencies as positive – despite or perhaps because of the economic crisis in journalism, since regional and local media companies are considered to be increasingly dependent on agencies, especially for national and international topics. At the same time, practitioners perceive the dominant news agency as highly independent, with a diversified ownership structure ensuring a high degree of internal diversity and plurality. Nevertheless, this situation requires intensive political and academic observation, as there is a potential for political instrumentalisation in case of changes in ownership and/or the political environment.

PP 0111 News media capitals: International news hubs as spaces for constructing transnational journalistic cultures

[Cecilia Arregui Olivera¹](#)

¹ Aarhus University, Media and Journalism Studies, Aarhus, Denmark

A handful of cities around the world can be considered vibrant hubs of international journalism: Beirut, Mexico City, Hong Kong, London, or Nairobi. These and other metropolises host bureaux of transnational news organisations and gather a range of national and foreign journalists, stringers, freelancers, fixers, and other relevant news production actors that are stationed there to cover entire regions. This paper seeks to define these news media capitals as specific spaces of mediation where these multiple actors interact to shape transnational journalistic cultures with their own logics.

In making this argument, I am inspired by the work of Curtin (2004, p. 273), who argued for the need to study TV production by centring on some cities—media capitals—as “meeting places” and locations “where complex forces and flows interact.” I am further informed by conceptualisations of journalistic cultures (Hanitzsch, 2007) and transnational journalism (e.g., Hellmueller, 2016). Over the last few years, many journalistic processes have moved online, and so research increasingly centres on the digital realm, yet spaces still matter. Accordingly, in this paper, I contend that the interaction between places and spaces plays a central role in shaping journalistic cultures. Whilst place refers to a concrete location, space is a more abstract relational entity that transcends it (e.g., Tuan, 1979). In that sense, hubs in this case can be understood as places in which multiple international or transnational news media connections intersect.

As the starting point of a broader research project, this paper aims to define news media capitals as relational spaces and describe some of the actors, dynamics, and interactions that characterise them. In so doing, I draw on examples from existing research on three cities across continents: Beirut, Mexico City and Nairobi. Moreover, I delve into how this understanding can further upcoming empirical research surrounding foreign news work and offer some methodological reflections on it.

By focusing on the changing spatial dynamics of foreign news production—often in the coverage of conflict, crises, and violence—this paper goes beyond some traditional and outdated binaries between local and foreign, East and West, powerful and powerless that are prevalent in research on foreign correspondence (Blacksin & Mitra, 2023). Finally, in offering theoretical discussion surrounding the role of hubs and space in transnational news production, I supplement the current focus on the digital in journalism studies.

PP 0112 Covering the populist politics of fighting the virus: Journalistic framings of the COVID-19 pandemic in Brazil, Poland, Serbia and the USA

Sabina Mihelj¹, Danilo Rothberg², Paulo Ferracioli², Katarzyna Vanevska³, Ana Stojiljkovic⁴, Stetka Vaclav¹, Kiriukhina Maria⁵

¹ Loughborough University, Department of Communication and Media, Loughborough, United Kingdom

² UNESP – Sao Paulo State University, Department of Human Sciences, Sao Paulo, Brazil

³ Jagiellonian University, Institute of Journalism and Social Communication, Krakow, Poland

⁴ Loughborough University, Communication and Media, Loughborough, United Kingdom

⁵ George Washington University, Institute for European – Russian and Eurasian Studies, Washington – D.C., USA

The success of public health campaigns, especially during a crisis, depends on effective communication. Media can serve as important sources of information, providing timely updates on health threats and preventative measures. The presence of populist leaders can diminish the capacity of media organizations to engage in effective health crisis communication (Hedges and Lasco, 2021). Populism thrives on divisions between 'the people' and 'elites' (Moffitt, 2020) and as such, it may make conflict-centered rather than solution-focused coverage more likely. Such coverage can, in turn, foster anti-elite sentiments and encourage polarized attitudes and distrust of experts.

Research on the coverage of the COVID-19 health crisis has been growing fast, revealing an overwhelming focus on infection rates and death rates at the expense of information on preventative measure, prevalence of political rather than health expert sources, and marked politicization in some countries (Hart, Chinn & Soroka, 2020; Hubner, 2021; Matthews, 2023). However, little is known how these patterns relate to populist politics. Research on the communication strategies of populist leaders during COVID-19 is emerging (Hallin et al., forthcoming; Taraktaş et al., 2022) yet without insight into how these relate to media coverage.

To address this gap, this paper investigates COVID-19 coverage in four countries led by populist politicians at the time: Brazil, Poland, Serbia, and the USA. Qualitative framing analysis was used to analyze 2000 news stories (500 per country) published in 12 different news sources (3 per country) between January 2020 and December 2022. The sample was selected randomly from a larger corpus, extracted using relevant keywords (COVID-19, coronavirus) from Lexis Nexis and Factiva databases, based on the constructed week. The analysis comprised two stages: (1) coding of materials using a list of generic frames; (2) in-depth analysis of each frame, with a focus on key facts and developments reported, the main actors involved, suggested (or implied) causes and solutions, and differences and similarities between outlets and countries.

Five generic frames were identified – attribution of responsibility, socio-economic consequences, science and technology, human interest, and conflict – of which the first two were by far the most common in all countries. This suggests that information about solutions to the crisis was overshadowed by coverage that foregrounded attribution and responsibility, human interest, and conflict, and often focused on electoral disputes and disagreements over preventative strategies. Furthermore, significant differences in the stance to populist leaders emerged between outlets and across countries. In Poland and Serbia, state-controlled public service media praised the populist leader and state authorities, conveyed official positions and arguments, and blamed the opposition for generating discord, while critical reporting was limited to opposition outlets and relatively rare. In Brazil, public service media also conveyed official positions, but less emphatically so than in Poland and Serbia, while commercial outlets were critical of Bolsonaro. In the US, positive Fox TV framed Trump positively, while New York Times and USA Today were critical. These differences are linked to differences in populist approaches to the pandemic and in the extent of populist control over media.

PP 0113 Changing practices: Driving forces and barriers towards collaboration in the European news media landscape

Elvira García De Torres¹, Concepción Edo Bolós², David Parra Valcarlos³, Maria Konow Lund⁴

¹ CEU Cardinal Herrera University, CEU Universities, Journalism, Valencia, Spain

² University Complutense of Madrid, Journalism and Global Communication, Madrid, Spain

³ University Complutense of Madrid, Journalism and New Media, Madrid, Spain

⁴ Oslo Metropolitan University, Journalism and Media Studies, Oslo, Norway

The Panama Papers case unveiled in 2016 more than eleven million files, but also shed light on collaboration, a disruptive trend in the media industry (Carson & Farhal 2018; Konieczna & Graves, 2020; Sambrook 2018; Author, 2016; Authors, 2017). Two years later, Danah Boyd stressed, at the ONA Awards, the importance of "coming up with new ways of taking the news industry into a non-competitive approach" (Bryant, 2018: p4). Media collaboration has important antecedents in the creation of AP (1848), the World War I media coalition or the Pentagon papers in the 70s. But the systematic joint production of projects began in the 1960s with The Arizona Project (Konow-Lund, 2022). In the past decade, the frequency and scope have accelerated, albeit unevenly. Cross-border investigative

journalism has a long tradition in Europe and especially Latin America: collaboration addresses the weakness of small newsrooms and increases their visibility and protection (Mesquita, 2023; Alfter, 2019; Heft, 2021; Deméneck, 2016). Wikileaks initiative led to the uncovering of the Afgan files, followed by the War logs and Cablegate cases -with participation of *The Guardian*, *Le Monde*, *El País* and *Der Spiegel*. Projects such as Farm subsidies, Forbidden Stories, EU4J, EDJNet or The Daphne Projet (Hindman & Thomas, 2013; Becket, 2011; Alfter, 2019; Konow-Lund, 2022). Collaboration has also produced outstanding results in solutions journalism and digital storytelling within the US (Porter & Shapiro, 2022). Our paper aims to deepen the knowledge of European collaborative practices: in spite of an outstanding development and popular awareness of collaboration practices, the scientific community has yet to give an answer to relevant questions such as RQ1 was: What were the drivers of collaboration in the European news landscape? RQ2 What obstacles need to be surmounted to strengthen collaboration in today's European news ecosystem? In order provide the answers, 20 interviews were carried out from June to September 2023 with leading partners and members of collaborative European consortia "Cross-Border Local", "Stars4media NEWS", "Pix.T for News & Photojournalism", "The Circle", "European excellence exchange in journalism (E3J)", "CIJ12" "Collaborative journalism Europe in a global context", "European Focus" and "Media Innovation Europe" as well as initiatives I4EU, European Data Journalism Network and Crossborder Journalism Campus Erasmus+. Findings pointed to the challenging environment of the news sector and the globalization brought about by the new European sphere as two of the main reasons for collaboration and financial resources, networks and training -mainly consultancy- as the means to reinforce it.

PP 0124 News coverage of euthanasia in Portugal and United Kingdom: A comparative study of public issues and argument structures between 2016 and 2024

Bruno Frutuoso Costa¹, Joana Azevedo¹, Sónia F. Bernardes², Iñaki Garcia-Blanco³

¹ Iscte – University Institute of Lisbon, Centre for Research and Studies in Sociology CIES-Iscte, Lisboa, Portugal

² Iscte – University Institute of Lisbon, Centre for Research and Social Intervention CIS-Iscte, Lisboa, Portugal

³ Cardiff University, School of Journalism – Media – and Culture, Cardiff, United Kingdom

As artefacts of mediation, economic activity, and social organisation, newspapers provide individuals with ways of experiencing the lives of others and seeing themselves represented (Deuze, 2014). It is up to journalistic publics to decide how intensely and in what ways they connect to the (hyper)mediation of the shared world (Pasquali et al., 2022). In the new social reality of public death in the media (Sumiala, 2022), the hegemonic values associated with suffering and the politics of mercy are summoned to public negotiations.

The desire for a change in the law to allow access to euthanasia has seen growing public acceptance. Polls carried out in Portugal (Coutinho, 2023) and the UK (Booth, 2023) revealed that 72.5% and 65% of citizens, respectively, are in favour of legalising euthanasia. The Portuguese context is particularly relevant in this regard, given the ongoing process of regulating euthanasia. In 2023, the euthanasia law was passed by confirmation to circumvent the fifth veto by the President of the Portuguese Republic (Lusa and SIC Notícias, 2023). The United Kingdom is still debating the decriminalisation of euthanasia (Booth, 2023).

Although previous studies have examined the issue of euthanasia in the news media, there are currently gaps in the literature that we have attempted to fill with this study. There is no specific focus on the Portuguese context and therefore no comparison with the British scenario, despite both countries having a history of public debate about euthanasia in the media. Furthermore, the existing studies on the British media are mostly from before 2011 and do not consider the evolution of public discussion over the last decade.

The aims of this study were to identify the similarities and differences that characterise the news coverage of euthanasia between 2016 and 2024 in Portugal and the United Kingdom; to analyse how newspapers frame the political, legal, religious, and medical dimensions of the public debate; and to compare the argumentative structures of these nations. To apply a longitudinal comparative statistical analysis, our sample includes journalistic texts published in the digital media of the newspapers Público, Expresso, The Guardian, and The Telegraph.

Quantitative content analysis (Krippendorff, 2019/1980) and argumentative discourse analysis (Hajer, 2006) are combined to obtain the observable patterns of the representations of euthanasia in the texts and to examine the associated argumentative structure. The variables in this study are as follows: (a) date; (b) country; (c) media; (d) author; (e) journalistic genre; (f) length; (g) theme; (h) geographical scope; (i) number of voices; (j) occupation of voices; (k) role played; (l) position adopted in relation to euthanasia; (m) arguments mobilised in favour of euthanasia; (n) arguments mobilised against euthanasia; (o) degree of manifestation of the argument; (p) origin of the argument; (q) level of the argument; (r) scale of evaluation in relation to the argument; (s) who evaluated the argument; (t) specific terminology used; (u) decoding and explanation of the terms; (v) presence of context or background information on the topic. This communication presents the results of this ongoing study.

PP 0125 Discursive constructions of populism in the Spanish and the Italian press through metaphors

Arantxa Capdevila¹, Carlota M. Moragas-Fernández¹, Carlo Berti¹

¹ Universitat Rovira i Virgili, Communication Studies, Tarragona, Spain

In the last decades, Europe and other countries all over the globe have experienced the rise of populist political parties, drawing the attention of academia and the social world into the phenomenon and resulting into a populist 'hype'. According to Brown and Mondon (2021), this can entail serious implications on how we understand the meaning of populism itself and the related phenomena as well. For instance, the label "populism" has been used so far to refer a wide spectrum of circumstances, political actions, ideologies, actors, movements, and parties in a diverse geographic and temporary radius having little or nothing in common (Hunger and Paxton, 2022). Thus, the concept of populism has become distorted to the extent that all is populist and, consequently, nothing is.

The rise of populism in Europe has been accompanied by an increasing use of the term in the media. This has been studied in the European press belonging to the democratic corporatist or liberal media systems, but there is a lack of studies about Southern Europe and the polarized pluralist media system. In this study, we provide insights into how Spanish and Italian newspapers with different editorial policies use the concept of populism. Through an analysis of newspaper articles in Spain and Italy, we aim to accomplish the following objectives: (O1) To detect the metaphors that conceptualize populism in the Spanish and the Italian press, (O2) To identify the source domains referred to the concept of 'populism', and (O3) To establish the narratives derived from the most relevant metaphors in the analyzed news outlets according to their political leaning.

To achieve these objectives, we apply Critical Metaphor Analysis (CMA) to a sample of newspaper articles published in Spain and Italy (n = 455) and we detect the main metaphorical frameworks (n = 234) used for discursively constructing populism in these countries belonging to the polarized pluralist media system. Results show that populism is metaphorized in less than the half of the analyzed items, which shows that, despite the intense use of the term, Spanish and Italian newspapers did not specify the meaning they give to the concept. On the other hand, three common source domains are shared by the news outlets when conceptualizing populism: path/travel/movement, conflict/war/crime and personification. While similar narratives can be drawn from the use of these source domains, different perspectives appear when looking at newspapers' political leaning, which demonstrates how malleable the concept is. This suggests that the Spanish and the Italian news media do also contribute to perpetuate the emptiness of the term and to generate confusion about its meaning.

PP 0126 "Finally, investing money makes for a clear conscience": How the news media deals with greenwashing in the financial sector

Jannis Frech¹, Strauß Nadine², Brüggemann Michael¹

¹ Universität Hamburg, Journalism and Communication Studies, Hamburg, Germany

² University of Zurich, Department of Communication and Media Research, Zürich, Switzerland

Sustainable investments are not just a trendy financial product, they are one of the European Union's key components for transforming society towards climate neutrality and sustainability. Despite its importance, sustainable investments have been criticized for a lack of clear definitions, incoherent measurements, and the limited proof of their impact.

While the news media recognizes the new trend of "sustainable finance", the question arises whether this reporting is also paying sufficient attention to the criticism raised towards it. Previous research has found that all too often, journalists uncritically pass on companies' "green claims". In financial news reporting in particular, there is a lack of distance, depth of research, and often simply of knowledge about financial topics, resulting in the failure of financial journalists enacting their watchdog role.

Thus, our research question reads: How do the news media in Germany report about "green" claims of sustainable finance? We analyzed the content of 248 news articles from various news outlets that reported on five different cases related to sustainable finance. Collaborating with students and practitioners of journalism, we investigated five cases in the field of sustainable finance, where greenwashing could be detected: Start-Ups, Pension Insurance, State Investment Funds, "climate-neutral" banking and Black Rock. For each of these cases, a sample of 50 articles

was selected. In the next step, a category system was developed for the qualitative content analysis using MaxQDA. In addition, the news articles were automatically analyzed for specific key words.

The results paint a mixed picture: Whereas an outstanding critical reporting on the topic of sustainable finance could be detected in national specialist publications (such as *Capital* or *Handelsblatt*), in most cases, the reporting reflects an uncritical and even naive mixture of service, news and PR, right down to crude advertising: "Finally, investing money makes for a clear conscience". Moreover, the coverage of sustainable finance is event-driven by political or corporate agenda. In contrast, more in-depth investigative reporting and critical commentary, such as the questioning of the capitalist growth paradigm, are virtually absent.

Furthermore, media coverage of the financial "green" start-up scene should also be viewed critically. Here, journalistic reporting copies and pastes advertising promises, often mixed with hero narratives, while criticism is mostly focusing on poor financial figures rather than questionable business cases. Local media turn out to deliver particularly weak reporting and turn a blind eye to greenwashing practices by uncritically reprinting green claims from local banks' PR campaigns.

To summarize, this analysis has revealed that German news media fails to enact its watchdog role in unraveling "green claims" by the financial sector to a large extent. The stark contrast between national specialist publications with a few investigative pieces and local news is particularly concerning, and implies that critical reporting is primarily a question of available resources. Implications for news reporting about sustainable finance and dealing with greenwashing are discussed.

JOS08 News reporting I

PP 0127 Reading between the Headlines: Analysing Islam in Belgian News (2013–2023)

[Ans De Nolf](#)¹, Sercan Kiyak¹, Leen d'Haenens¹

¹ KU Leuven, Institute of Media Studies, Leuven, Belgium

This study explores how Belgian news media portray Islam and Muslims, recognizing the media's substantial influence on our perception of reality. Examining this portrayal is crucial as it shapes global perceptions (Gerbner & Gross, 1976; Gamson et al., 1992; Hoewe & Peacock, 2020), often perpetuating negative stereotypes and contributing to biases against Muslim communities worldwide (De Nolf et al., 2023; Rahman & Qamar, 2017). Using a mixed-method approach, we analyse newspaper articles from 2013 to 2023 in the eight most read Flemish and Francophone Belgian media outlets.

This study takes a comprehensive approach by combining both BERTopic and manual framing analysis to offer a nuanced understanding of the portrayal of Islam and Muslims in Belgian news media, examining the prevalent topics and frames used when discussing Islam and Muslims. First, BERTopic, a topic modelling technique developed by Grootendorst (2022), uncovers prevalent themes in articles related to Islam and Muslims within Belgian news media. Our dataset included 41,086 articles that matched our query and the timespan. The algorithm detected the topics of about half of the articles. We further manually analysed the detected topics and categorised them into ten themes: Religious and Cultural Affairs, Political and International Relations, Art & Media Portrayal, Social and Humanitarian Issues, International Politics, Conflict and Crisis, Terrorism and Security, Legal and Judicial Matters, Religious Figures, and Global Health and Pandemic. We analysed and visualised the distribution of these topics based on the newspaper type, language, and time to identify political and temporal dynamics of Muslim representation.

Moreover, our manual framing analysis captures the nuanced aspects of media representation, including its interpretative dimensions and contextual qualities. This analysis was conducted on a subsample of 780 articles, with consideration given to ensuring an equal distribution of articles over time and across various news media sources. This analysis reveals a persistent negative framing of Muslims in Belgian news media, exposing recurrent themes aligned with distinct frames. Among these frames are Hostility and Conflict, where portrayals often emphasize confrontational narratives; Political Dynamics, showcasing the political dimensions of the representation; Security and Threat, focusing on perceived risks and dangers; Cultural and Religious Dynamics, exploring cultural differences and religious aspects; Media and Communication, highlighting the role of media in shaping perceptions; and Economic and Educational Concerns, elucidating portrayals related to Islam within an economic and educational context.

The results of this study indicate a concerning prevalence of negative topics surrounding Islam and Muslims in Belgian news media. Themes related to terrorism, security threats, and cultural differences consistently overshadowed more nuanced aspects. Additionally, the study identifies variations in framing patterns between Flemish and Francophone media outlets, suggesting regional distinctions in media portrayal. By examining a diverse corpus of articles from widely read newspapers, the research provides insights into the evolving discourse surrounding

Islamophobia. The findings emphasize the need for critical examination of news stories to counteract biases and stereotypes, contributing to a deeper understanding of the complex relationship between media portrayals, discrimination, and the experiences of the Muslim community in Belgium.

JOS08 News reporting I

PP 0128 The mediated construction of “woke”: Emerging discourses and primary definers in the Flemish press

[Alexander Dhoest](#)¹, [Steve Paulussen](#)¹

¹ University of Antwerp, Department of Communication Studies, Antwerp, Belgium

The term “woke” rose to prominence in the wake of the BlackLivesMatter movement and particularly the death of George Floyd on 25 May 2020. Until that time, it was hardly used in Flemish (Dutch-language Belgium) public debate. However, from 2021 it quickly became an omnipresent term to frame issues related to diversity and inclusion. In this paper, we explore how the mainstream press contributed to the emergence and construction of discourses on wokeness. First, we aim to answer the question: *How did the topic of “woke” reach the media agenda in Flanders?* Second, we aim to analyze the respective role of journalists and their sources in the construction of the media discourse on “wokeness”, drawing on the notions of “primary” and “secondary definers” (Hall et al. 1978), to answer the question: *How did journalists and news sources co-define the discourse on “woke” in Flemish media?*

Taking an inductive approach, we conducted a Google Search Trend analysis to determine when the interest in woke arose and peaked. This allowed to identify three two-month periods containing one or more events leading to increased search activity. In a next step, we used the Belga.press database to collect all articles mentioning the term “woke” in four newspapers for three two-month periods in 2021, 2022 and 2023, leading to a sample of 226 articles. First, we conducted a preliminary quantitative content analysis to get a sense of the general properties of the reporting. Second, we conducted a more in-depth Critical Discourse Analysis using NVivo. All articles were inductively coded and analysed, aiming to identify the themes and terminology associated with woke as well as the key (journalistic and non-journalistic) actors talking about it. This allowed us to, first, reconstruct a timeline of the emerging discourses on woke; and second, to identify underlying discursive and journalistic patterns and strategies.

The chronological analysis discloses how a few “critical discourse moments” put woke on the media agenda. In each instance, an elite person (respectively in academia, media and politics) created a stir, drawing media attention to the (supposed) threat of “wokeness”. Woke was generally framed in a negative way as a “movement” threatening freedom of speech and it was mostly presented as a homogenous, vague yet extreme “other”. Although journalists aimed to provide a balanced view and many op-eds offered counterarguments, the mainstream press did give a broad platform to actors deliberately instrumentalizing woke for (often political) purposes. On the surface, anti-woke articles only constitute a minority of the sample, counterbalanced by a similar number of articles arguing against anti-woke discourse and a majority articles taking a neutral position. The latter, however, by not taking a side and/or offering arguments for and against “woke” and responding to anti-woke voices, do take over and reconfirm the framing of “woke” as a movement and threat proposed by elite anti-woke voices, which act as primary definers of the topic. Journalists, by taking up their role as neutral, “objective” reporters, contribute to the legitimation of anti-woke discourse, only a few contesting this dominant frame.

JOS09 AI and news work

PP 0206 What prompts journalists to use generative AI in their newswork?

[Edson Tandoc](#)¹, [Matthew Chew](#)¹, [Sofia Tan Contreras](#)¹

¹ Nanyang Technological University, Wee Kim Wee School of Communication and Information, Singapore, Singapore

Newsrooms around the world have embraced automation to increase efficiency and minimise costs across various stages of news production, from collecting and dissecting audience data for decision-making, packaging information into news stories, to writing headlines (Wu, Tandoc & Salmon, 2019; Dörr, 2016; Jones & Jones, 2021). In response, studies have investigated how audiences perceive news that is written by algorithms (Wölker & Powell, 2018; Clerwall, 2014; Wu, 2019) as well as how newsrooms have attempted to integrate automation tools into their work routines (Gutierrez Lopez et al., 2022). But the most contentious aspect of news automation is the use of artificial intelligence (AI) to generate news articles—this has become much easier and more salient with the rise of generative AI (Gen-AI) and Gen-AI-powered chatbots, such as ChatGPT, that can generate articles based on a few prompts and even mimic particular writing styles and formats.

While Gen-AI introduces benefits, such as saving users some time, it also introduces a lot of questions, from issues related to quality to concerns regarding honesty and integrity as well as copyright infringement (Broussard et al., 2019; Helberger et al., 2022). With the popularity of Gen-AI within and outside journalism, such as in the education context, newsrooms face a conundrum: Should they prohibit or promote the use of Gen-AI? Individual journalists also need to navigate between the risks and benefits of using AI. How are newsrooms and journalists navigating the rise of Gen-AI?

This study seeks to shed light on this by focusing on newsrooms in Asia and journalists in Singapore. Through two online surveys, one involving news managers and editors from 50 Asian newsrooms across 15 countries; and another involving 170 individual journalists in Singapore, this study seeks to answer the following research questions:

1. How do journalists perceive the use of generative AI in journalism?
2. What individual and organisational factors affect journalists' use (or non-use) of generative AI in their journalistic work?
3. How are newsrooms and journalists using generative AI in their journalistic work?

This study is guided by the Value-based Adoption Model (VAM), which argues that the individuals decide to adopt new technologies when they perceive the benefits to outweigh the costs (Kim et al., 2007; Sohn & Kwon, 2020). In this study, we expand on the VAM, to also account for the role of organizational and journalistic factors in the adoption and use of Gen-AI. A preliminary analysis of the results suggests that journalists' professional autonomy, perceived influences, and prior technological acceptance can influence their perceived benefits and risks of Gen-AI. These benefits and risks, in turn, affect their perceived value of Gen-AI, which affects their intention to use it in their newswork. An analysis of the participants' qualitative responses also yielded a typology of how Gen-AI is currently used in Asian newsrooms, from cosmetic edits to human-written content (e.g., proofreading, translation) to using the technology to generate articles from press releases.

PP 0207 Exploring collaborative frontiers: AI integration in investigative journalism

Jessy De Cooker¹, Danielle Arets¹, Marius Brugman¹, Bart Wernaart¹, Marieke Van Vliet¹, Tim Van Leeuwen¹

¹ Fontys Hogescholen, Journalism, Tilburg, Netherlands

In contemporary journalism, Artificial Intelligence (AI) has become an important force, influencing tasks ranging from translations to checking headlines. AI techniques are also increasingly used by investigative journalists, but integration of these techniques comes with challenges. Our study delves into the integration of AI in investigative journalism within the Netherlands, using a multimethod research approach. Through semi-structured interviews with 25 national and regional Dutch news media organisations, including newspapers and broadcasters, we identified a notable challenge: shaping an interdisciplinary news environment where AI experts, legal experts, and journalists collaborate.

While AI is cautiously embraced in all studied newsrooms for investigative journalism, a pervasive lack of technological knowledge, ethical guidelines, and resources hinders its integration. Despite the availability of AI training courses, skills and knowledge acquired are often underutilized or lost over time. We came to understand that journalists, apart from a small group of frontrunners, express uncertainty about tool selection and struggle to comprehensively understand AI-driven research, which they deem crucial for validating their work. A pervasive lack of technological knowledge, ethical guidelines and resources hinders AI integration, the interviews show.

The importance of external expertise is underscored by eight interviewees who explicitly acknowledged the value of hiring or collaborating with individuals possessing in-depth technical knowledge. The lack of legal and ethical expertise is also stressed, with case law around AI and investigative journalism scarcely available. Therefore, journalists are falling back on recognized journalistic codes and ethical frameworks yet struggling with accountability of their AI research findings and the need for more external expertise in this realm. This saves time and gives more confidence in the journalistic AI findings.

"I didn't have the luxury of spending a week figuring out how to do this. An experienced programmer would have written this within an hour."

Communication challenges between journalists and AI experts are highlighted, as journalists find it difficult to articulate their needs to IT professionals, citing language barriers. These struggles are further evident in our Research through Design (RtD) process, where the development of AI prototypes revealed difficulties aligning technical work with journalistic inquiries.

Finally, a lack of resources emerges as a significant barrier, with journalists frequently citing constraints in time for deep dives into AI techniques or hiring AI expertise. A shortage of skilled IT professionals in newsrooms and the limited usability of trained AI models exacerbate these challenges, emphasizing a lack of institutional strategy.

"Technicians look through different glasses and speak a different language."

The importance of multidisciplinary teams in journalism is flagged by a growing number of scholars. Our research underscores the imperative for strategic collaboration between journalists, AI experts, and legal professionals. Despite a noticeable inclination toward experimentation and collaboration, a deficit in expertise, AI literacy, mutual understanding, and resources persists within Dutch AI investigative journalism. Our contribution extends beyond the discourse on responsible AI integration, shedding light on the challenges and opportunities inherent in shaping an interdisciplinary practice within investigative journalism.

PP 0208 Emerging journalistic skills in the context of Artificial Intelligence: A study of perceptions among Spanish reporters

[Bertran Salvador-Mata](#)¹, Roger Cuartielles¹

¹ Universitat Pompeu Fabra, Communication, Barcelona, Spain

Artificial Intelligence (AI) is expected to increasingly impact the media context. Some reports suggest that up to 90% of digital content will be synthetically produced by 2026 (Schick, 2020), while researchers in the field identify this transformative vector as key to understanding new media dynamics (Newman, 2024), and approximately 75% of the respondents surveyed by Beckett and Yaseen (2023) use artificial intelligence at some stage of the journalistic value chain. As Newman (2024) points out, media executives from up to 56 countries foresee a growing use of AI, especially for automating news writing, improving and personalizing recommendations, and for other commercial purposes. In this context, it is essential to identify the journalistic skills that professionals must acquire to succeed in the changing landscape. This paper aims to contribute to this debate by clarifying the skills journalists need in relation to AI. To this end, 25 semi-structured in-depth interviews were conducted with active journalists from Spanish media outlets. The selection of media includes local, regional, and national outlets, encompassing press (digital and print), radio, and television. The interviews were conducted in mid-2023, between April and July. The results indicate that the majority of respondents believe that AI is a reality that will impact their professional daily lives in one way or another. When asked what skills or profile journalists should acquire and enhance to adapt to the new context, two main lines are identified: reevaluation of classic skills and the need to acquire specific skills. On the one hand, several interviewees defend the idea that this AI-mediated transition will highlight intrinsic journalistic competencies that should be further trained. These include the ability to be original, to select important topics amid information overload, the competence in data search and acquisition, the importance of physical presence – the ability to travel to events and obtain first-hand data – and the ability to filter and review – gatekeeping. On the other hand, a second group of interviewees considers that there will be an ontological transformation in journalistic work, which will involve acquiring new skills: from technological skills – understanding how and why the algorithm works, how to communicate with it, and how to optimize its use – to changes in journalistic tasks, where competencies associated with reviewing and editing content will prevail over summary, writing or note preparation, implying a new set of skills less focused on writing and production and more attentive to identifying biases, verifying content, and understanding algorithms to ensure their effectiveness. In conclusion, this study has identified two predominant attitude trends among the journalist collective regarding the skills that should be developed in the context of AI. While both seem to differ in some aspects, their combination allows the groundwork to be laid for the future training and education of journalists, both in Europe and around the world.

JOS09 AI and news work

PP 0209 Deepfakes in journalism: Swiss news organizations' evaluations of risks and opportunities

[Patric Raemy](#)¹, Manuel Puppis¹

¹ University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland

Deepfakes are deliberately manipulated audio-visual media created by deep-learning and artificial intelligence techniques (Schapals & Bruns, 2022). This technical evolution of media offers risks and opportunities for news organizations. For example, deepfake technology offers the possibility to enhance personalization, visualization, and immersion in news reporting (Wahl-Jorgensen & Carlson, 2021), as well as to produce content in multiple languages (Diakopoulos & Johnson, 2021). Yet in journalism and journalism studies deepfakes have mainly been considered as a form of disinformation. With deepfakes, disinformation evolved from mostly written articles and comments towards synthetic video and/or audio content. As such manipulations are difficult to identify, deepfakes increase the risk of false or harmful information affecting not only public opinion but also the trust in and the credibility of journalism (Godulla et al., 2021). Moreover, journalists themselves run risk of being affected by slander using deepfakes (e.g., Ayyub, 2018).

Despite the increasing relevance of the topic, there are only a few empirical studies exploring deepfakes in journalism so far. Little is known about how journalists discuss the impact of deepfakes on journalistic work and how they evaluate potential risks and opportunities. Hence, this paper's goal is to shed more light on the impact of deepfakes on journalism based on qualitative interviews with representatives of major Swiss news organizations (Bogner et al., 2009). First, it explores strategies, work processes, and routines that are currently used to identify deepfakes and to verify information. Secondly, it explores evaluations of the impacts, risks, and opportunities of deepfakes for journalistic work. The interviews were conducted between October 2022 and January 2023 and were analysed using inductive qualitative content analysis (Mayring, 2022). The data was then categorized and interpreted for thematic comparison.

Results first indicate that representatives of Swiss news organizations generally perceive deepfakes as a risk, even though actual confrontations with them have been rare so far. Second, basic journalistic norms are crucial for both protecting against the threats and realizing opportunities of deepfakes in journalism. Third, to successfully detect deepfakes, journalists require basic knowledge of forensic research methods (such as open source intelligence) and the support of specialized teams. Finally, raising public awareness about new technologies and their impact as well as promoting media literacy for users to be able to better assess the credibility of information are seen as important. Specifically, journalists emphasize that transparency of news production and knowledge about professional journalistic norms and work processes is essential to battle ill-founded scepticism and foster media trust.

In sum, this study highlights the need for news organizations to deal with deepfakes by enhancing training and education in the media industry and by promoting methods of comprehensively checking complex information. It also supports the long-discussed claim for a slower journalism (see e.g., Mendes & Marinho, 2022) and highlights the importance of evaluating opportunities offered by new technologies such as deepfakes within the framework of journalistic ethics and professional standards.

JOS09 AI and news work

PP 0210 Dealing with biases and hallucinations: The ethical uses of (gen)AI tools in the European news media sector

[Laurence Dierickx](#)¹, [Lindén Carl-Gustav](#)¹

¹ University of Bergen, Information Science and Media Studies, Bergen, Norway

The widespread integration of large language models into journalism has reignited the debate about the ethical implications of using artificial intelligence. Generative AI (GenAI) systems, which have enabled access to AI in newsrooms, have demonstrated their ability to support, augment or take over various tasks, including intellectual activities such as brainstorming and writing. However, the challenge lies in integrating journalistic values, as these systems may rely on biased, unbalanced or copyrighted data during training, which hinders their alignment with ethical journalistic standards. In addition, the tendency of large language models to produce content that does not fit real-world input – the phenomenon of artificial hallucinations – raises concerns about the potential impact on trust in journalism. GenAI systems are also likely to reinforce existing biases or inadvertently spread disinformation, threatening the quality and trustworthiness of news processes.

This research examines how European news media and self-regulatory bodies address ethical challenges related to AI and GenAI in journalism. It seeks to understand how these bodies frame the responsible use of AI and address specific risks such as bias and artificial hallucinations. The methodology involves a qualitative corpus analysis of 42 guidelines published between 2016 and 2023 by 38 organisations in 12 countries. Using natural language processing (NLP) and sentiment analysis methods, we explored key themes, word frequencies, co-occurrences and corpus tonality. Specific details of the NLP algorithms and sentiment analysis tools can be found in the complete analysis, available on a GitHub repository.

The corpus analysis distinguishes two periods of AI integration in journalism: before ChatGPT, when the issue of bias was exclusively related to the quality of data used for news automation and recommendations, and after ChatGPT, when the requirement for transparency became a central and critical issue for AI-driven applications that involve content creation and are likely to have a significant impact on information quality. Seen as a trust lever for building a trustworthy relationship with (Gen)AI-based tools, journalists and audiences, transparency alone does not solve bias-related issues or provide a sufficient level of understandability. However, few news media organisations address this pitfall by acknowledging the need for explainable systems.

The findings underscore the need for careful consideration of the ethical use of AI systems to maintain information diversity and quality. Tasks involving these systems must be carried out under human supervision to maintain journalistic and editorial standards. While openness to innovation is crucial, the guidelines stress the need to be critically aware of the limitations of AI and GenAI systems. As these systems are also being used to create and disseminate fake news and misinformation, setting clear rules can prevent the destabilisation of audiences through confusion and the erosion of their trust in news information. Furthermore, even if humans are ultimately in charge, the question of the ethical use of unfair or biased systems remains wide open.

JOS10 Local media and news deserts: Evidences from a EU wide research

PN 031 Local media in France: a few long-established players not serving the public interest

[Franck Bousquet](#)¹

¹ Université de Toulouse, Département Information-Communication Laboratoire d'Études et de Recherche en Sciences Sociales, Toulouse, France

In France, the social importance of local and regional media is inversely proportional to their symbolic importance. Highly consulted by the population, they are virtually absent from national public debate when it comes to the democratic role of the media. Since 1983, we have seen a succession of laws promoting decentralization and increasing the power of local authorities, but the issue of independent, pluralistic media capable of informing citizens

about the important issues at stake in the areas where they live has been absent from the debate. The result is a worrying situation in which a handful of major regional daily newspapers share the national territory without ever competing with each other. As a result, privately-owned local journalism is in the hands of press groups that are almost universally hegemonic in their territories of distribution. To compound matters, these groups are increasingly dependent on the most powerful local players (major companies, cultural institutions, large associations, local authorities). The latter provide them with "turnkey" information via their communications departments, but they are also their main advertisers and partners in their diversification activities (organization of cultural, sporting or economic events). State subsidies, which are very important in the French media system, only serve to exacerbate this situation. Indeed, the aid system favors the oldest and most established players rather than helping the emergence and development of new media that promote investigation and public debate at local and regional level. Informational diversity, investigation and informed debate on local issues are therefore the main losers in the organization of the local media landscape in France. And while we can't speak of information deserts in the strict sense of the term, as there is media coverage of most of the country's territories, there is on the other hand an information paucity that is highly unfavorable to the proper functioning of local democracy.

JOS10 Local media and news deserts: Evidences from a EU wide research

PN 032 Mapping news deserts in Europe: findings and methodology in a comparative perspective

Sofia Verza¹, Tijana Blagojević¹, Jan Erik Kermer¹, Matteo Trevisan¹, Urbano Reviglio¹, Danielle Borges¹

¹ European University Institute, Robert Schuman Centre for Advanced Studies, Florence, Italy

This paper provides an overview of the methodology developed by the Centre for Media Pluralism and Media Freedom (CMPF-EUI) for the Local media for Democracy project, with the aim of unpacking the multi-dimensional concept of 'local news desert' in the European context, whilst highlighting the main research findings. The latter analysed the risks for local and community media in the EU, with a network of researchers based in each European country. In a departure from most local news deserts' research which has traditionally adopted a quantitative approach – focusing on counting the number of local media outlets in a given country – the CMPF has developed a cutting edge methodology that also includes qualitative aspects such as measuring the degree of local editorial independence, assessing the safety of local journalists, and the extent of social inclusivity in terms of local media content. Moreover, legal and economic aspects have been taken under consideration, to assess the guarantees granted to local and community media as well as their sustainability in the 27 countries under analysis. The results reveal significant variations among EU member states, reflecting the EU-27's marked social, political and economic heterogeneity in terms of the local media offer. Broadly speaking, a heightened risk of news deserts was found particularly in Central and Eastern Europe, but notably, news deserts were also identified in capital cities such as Dublin and Riga. This paper contributes to the ongoing discourse on 'local news deserts' in Europe by deepening our understanding of this complex and multi-faceted concept, while at the same time developing innovative methodological approaches to measure it in a comparative perspective.

JOS10 Local media and news deserts: Evidences from a EU wide research

PN 033 Local journalism in the Netherlands: the need for a specific audience-oriented approach

Yael de Haan¹, Rijk van den Broek¹

¹ University of Applied Sciences Utrecht, Research centre quality journalism in digital transition, Utrecht, Netherlands

Over the past decade, policymakers, academics and journalistic organisations have voiced their concern about the state of local journalism in the Netherlands and concern for the emergence of no-paper cities and even news deserts. While there have been various academic and policy studies on local journalism in the Netherlands, the majority focus on the number of outlets, the organisation of the newsrooms or the content of the journalistic output. So far, no study took a comprehensive approach in studying the state of local journalism, let alone in a comparative perspective. This study is based on data collected for the Local Media For Democracy project. The results show that overall, in the Netherlands, most of the aspects of local journalism score a 'medium risk' level, indicating that there are no severe concerns particularly when compared with other European countries. Specifically, the editorial independence of local newsrooms is well safeguarded through different laws and self-regulating measures. At first sight, there are sufficient local and regional media that people can choose from, and national media are increasingly allocating regional correspondents. However, many local news organisations are struggling financially and have difficulties providing quality journalism. There is a need for professionalisation, particularly in the digital context. Many local news organisations have difficulties in reaching the (especially, online) public, while at the same time, many citizens increasingly feel the need to become informed about their local communities. Many local news organisations have a solely geographically oriented approach, hardly catering to the needs of specific groups such as youth, minorities or specific interest groups in a specific region. Nevertheless, the awareness and knowledge on specific groups is increasing, which has the potential to ameliorate the quality of local journalism and foster a sense of urgency for local journalism in the Netherlands.

JOS10 Local media and news deserts: Evidences from a EU wide research

PN 034 Local media policy, captures or captured within a network of wider interests and calculations – the Slovenian policy experience

Romana Biljak Gerjevič¹, Marko Milosavljević¹

¹ University of Ljubljana, Research Centre for the Terminology of Social Sciences and Journalism, Ljubljana, Slovenia

In the context of wide, national media policies, the aspect of local media policy is, on the one hand, "a statement by the government of what it intends to do" in the sense of law and regulation, or even a lack thereof (Birkland, 2019) like any other. Yet, we approach policymaking as more than just one major decision, but as a "series of decisions or activities resulting from structured and recurrent interactions between different actors" (Knoepfel et al., 2011), and in this regard it is relevant to consider also the local media policy as a final result of several interactions, considerations, interests, and aims.

As policy actors attach meaning, shape discourses, and promote ideas in order to influence the representations of the policy of their interest (Ball, 2005), media emerge as a highly relevant means of communication for policymakers, particularly for local (or regional) organisations and individuals, such as mayors, but also different MPs.

One of the classical layers in understanding the role of the media in policymaking is that the public learns not just about the given issue but also "how much importance to attach to that issue" (McCombs & Shaw, 1972). That is, media actors shape political reality to a great extent by choosing the information that will be presented as news and being given value throughout the process of news-making as the media take the role of an agenda-setting actor (Fawzi, 2018). At the same time, local media themselves are increasingly dependent on local policymakers and their local media policy in the form of potential subsidies, local institutions' advertising, or even ownership (particularly when faced with financial and existential issues).

This complicated multilateral relation between the local media, government at both national and / or regional and local level, unpolitical actors (interest groups), and the public, is situating media in different roles, where the media can affect local media policy, yet they can also be the subject or target of policy agendas (Cohen, 2015; Hurrelman et al., 2009; Korthagen, 2015; Livingston & Soroka et al. 2012).

This presentation will present the local media policy analysis in Slovenia through a prism of different stakeholders and interests where the local media act as typical victims of media capture, caught by small local markets, lack of sufficient market funds, and pressured by political interests; and yet the local media can also act as exploiters of different political dynamics (between local and national politics; between lobbies of local politicians; and using different political tools to adopt and protect profitable and protected position within the national media ecosystem).

The paper, based on the results for Slovenia from the project LM4D, will provide an up-to-date insight into the specifics and results of local media policies, based on analysis of high number of legislation documents, proposals, and statements.

PN 035 Understandings news deserts in Spain: political influences over private and public media

Elena Yeste Piquer¹, Jaume Suau²

¹ Blanquerna School of Communication and International Relations, Ramon Llull University, Blanquerna School of Communications and International Relations, Barcelona, Spain

² Ramon Llull University, Blanquerna School of Communications and International Relations, Barcelona, Spain

This paper assesses the editorial independence from political influences of local media in Spain. The data presented are derived from the findings of the Local Media for Democracy project. The paper aims to elucidate the conditions journalists face while doing their job within the local context. In 2022, only 24% of hired journalists and 22% of freelancers reported no pressure while drafting their reports (Asociación de la Prensa de Madrid). The data shows that 46% of hired professionals and 53% of freelancers have occasionally faced pressures. The prevailing perception in Spain is that the majority of media outlets prioritize their commercial interests (56%) or political interests (53%) over the public interest (Vara Miguel, 2022). Concerning private media, although there is no direct or indirect political ownership of the media at regional and local level, this does not imply the absence of political influence. Such influence can manifest through mechanisms like institutional advertising, subsidies, and the granting of licenses. The legal framework, primarily governed by Law 29/2005, seeks to ensure transparency and objectivity in the allocation of advertising resources for institutional communication and campaigns. However, the absence of specific provisions in Law 19/2014 on Transparency and Good Governance regarding institutional advertising has created a lack of clarity. This opacity raises concerns about transparency and gives rise to allegations of discretionary allocation practices when utilizing public funds for such purposes. This paper will also discuss political influence and editorial independence within the context of the public service media (Corporación de Radio y Televisión Española- RTVE), which sheds light on the differences related to the regional administration in Spain, as well as

the existence of different official languages in the country. In fact, the PSM holds a key role in covering local areas, having venues in all the autonomous communities and broadcasting in different languages (e.g. Catalan, Basque, Galician); however, there is evidence of lack of editorial independence being the PSM influenced by national and local political powers, partially preventing them from fulfilling their public service role towards local communities.

JOS11 Fact checking en disinformation I

PP 0211 Tendencies of Fact-checking. How platform relations shape Fact-checkers' understanding of disinformation

Steen Steensen¹, Lucas Graves²

¹ Oslo Metropolitan University, Department of Journalism and Media Studies, Oslo, Norway

² University of Wisconsin-Madison, School of Journalism and Mass Communication, Madison, USA

Recent years have seen a tremendous growth in fact-checking initiatives world-wide established to combat disinformation (Amazeen, 2020; Graves et al., 2023). These initiatives depend on a multitude of relationships with a wide range of actors and interests in what can be labeled an anti-disinformation industry, involving platform and technology companies, media companies, NGOs, States, governmental institutions, and regulatory bodies (Bélair-Gagnon et al., 2023). These relationships shape what problems related to disinformation the fact-checking initiatives try to solve, how they aim at solving those problems, and, ultimately, how they understand and define disinformation as a societal problem.

This paper will explore how news media professionals, fact-checkers, and other misinformation reporters with fact-checking initiatives define disinformation and their approaches to combating it. We focus on fact-checkers' evolving relationships with major platform companies, examining the dynamics of formal fact-checking partnerships and the trade-offs involved for participants. The paper also investigates the influence these programs have had on the wider fact-checking field, spurring rapid expansion, and offering a new vehicle for impact while also creating funding dependencies and drawing attention away from other forms of fact-checking and disinformation.

Drawing on Gadamer's functional hermeneutics and the concept of "source criticism" (Steensen et al., 2022), we investigate the "tendencies" of different fact-checking actors—the interests, perspectives and socio-cultural "horizons of understanding" that shape their professional practice—in order to understand the visibilities and invisibilities that develop in this corner of the anti-disinformation industry.

Methodologically, the paper is based on data collected through a four-year long international research project on the relationships between journalism/fact-checking, technology, platforms, and disinformation. The empirical material comprises transcripts of qualitative interviews with fact-checkers around the world (n = 53), document analysis of mission statements and fact-checks, and participatory observation at a European fact-checking organization and at the annual Global Fact-Checking conference organized by the International Fact-Checking Network (IFCN).

JOS11 Fact checking en disinformation I

PP 0212 Who checks the fact-checkers? Studying the work of External Assessors behind fact-checking organizations

Ansgard Heinrich¹, Marilia Gehrke¹

¹ University of Groningen, Media Studies and Journalism, Groningen, Netherlands

Fact-checking has emerged as a new style of political news based on truth-seeking and holding public figures accountable (Graves, 2016). Independent fact-checking organizations commonly see it as one of their main tasks to verify or debunk claims *a posteriori*. However, they frequently find themselves accused of being *self-proclaimed arbiters of truth*, particularly (but not only) by populist politicians. In an anecdotal inquiry, people often ask: **who checks the fact-checkers?**

Such accusations seem to suggest that independent fact-checkers operate arbitrarily and overlook that the past years have seen a professionalization of the fact-checking business. These criticisms have also triggered disputes

about truth claims. With more voices adding to information exchange, with (digital) platforms promoting themselves as referees of truth, drawing boundaries between information and disinformation appears to become a struggle over authority and over the question of who determines what is 'true' and 'false.'

This paper attempts to contribute to these debates by investigating accountability operations behind fact-checking organizations. Specifically, we focus on attempts at professionalizing fact-checking by calling on external assessors and installing supervision boards. Organizations such as the International Fact-Checking Network (IFCN) and the European Fact-Checking Standards Network (EFCSN) have developed ethical guidelines and put mechanisms in place to which signatories must comply if they want to receive a stamp of recognition as verified fact-checking organization. Yet, who these assessors are and how they operate is understudied.

Till date, scholars mainly research fact-checkers' work, perceptions, or how they use social media as distribution channels. In addition, researchers have examined the effects of fact-checking on the population, particularly voting behavior. Codes of ethics and conduct have rarely been scrutinized and little attention is given to those who operate *behind the scenes*. In this paper, we thus ask: **How do external assessors and advisory boards assist in establishing credibility around fact-checking operations?** We particularly focus on the following aspects: 1) what expertise do assessors or advisory board members bring to the job, 2) which codes and principles guide them, and 3) how do they perceive their role vis-à-vis the respective fact-checkers.

We are currently conducting 20 in-depth interviews with assessors and advisory board members at the IFCN and EFCSN (or both), who oversee the verification processes for potential members. Interviewees are recruited from Europe, Asia, and South America, in particular Brazil, Germany, the Philippines, and Spain. These nations were selected based on the diversity of political systems and we started the first wave of interviews in November 2023. The interviews provide insights into work practices during the assessment process, shed light on ways in which assessors handle official IFCN and EFCSN protocols and reveal profiles of the 'typical' assessor.

All in all, this study helps enhance knowledge about how fact-checking organizations attempt to build credibility. Ultimately, it draws the curtain to better understand accountability mechanisms at play in the independent fact-checking scene.

JOS11 Fact checking en disinformation I

PP 0213 Establishing the truth: The epistemologies of fact-checkers in Latvia and Estonia

[Janis Bucholtz](#)¹, [Maia Klaassen](#)², [Marju Himma-Kadakas](#)², [Sten Torpan](#)²

¹ Vidzeme University of Applied Sciences, Institute of Social- Economic- and Humanities Research, Valmiera, Latvia

² University of Tartu, Institute of Social Studies, Tartu, Estonia

As a genre of journalism, fact-checking entails examining statements that have been made in public and arriving at conclusions about whether these statements are true or false.

However, previous studies offer conflicting observations about the performance of fact-checkers. For example, in the U.S. context Amazeen (2016) have pointed to the consistency of the assessments by three major fact-checking agencies as evidence of the accuracy of their work, but Lim (2018) has showed that, apart from clear-cut cases, the verdicts by two prominent fact-checking organizations about politicians' statements tended to differ. At times, the methodologies of fact-checkers can be flawed, leading to problematic judgments (Uscinski & Butler, 2013; Nieminen & Sankari, 2021). The prominence of fact-checking in the contemporary media environment merits a closer look into their knowledge production practices.

Drawing on the concept of journalistic epistemology (Ekström & Westlund, 2019; Ekström, 2020), this paper contributes to the understanding of how fact-checkers identify the statements to evaluate, select their sources, and arrive at conclusions. Its data source is 19 semi-structured interviews with fact-checkers from Latvia and Estonia. The interviewees, who work for mass media and NGOs, represent the majority of the fact-checking organizations working in these countries.

The preliminary results show that the selection of statements to check is driven by diverse considerations, including the potential harm, prominence of the source, reach on social media, novelty, the agenda of the fact-checking organization, and fact-checkers' sense of what is relevant and interesting. A number of the interviewed fact-checkers were from organizations that have joined the International Fact-Checking Network (IFCN). Their choices and considerations are shaped by the standards of IFCN that they need to comply with. In addition, since Meta recruits fact-checkers from IFCN to examine content on its social media platforms, the requirements and interests of this corporation also play an important role.

In their selection of sources against which the identified statements are being analyzed, the fact-checkers rely on a range of criteria. The interviewees preferred to consult concrete findings, such as those from statistical databases or scientific studies, which they treated as hard evidence. Information provided by public institutions and sources widely perceived as authoritative were also trusted. However, in the absence of these, many interviewees were willing to settle for more interpretive sources, including expert opinions, and apply fact-checkers' professional judgment to assess the credibility of conflicting claims. They strived to limit the ambiguity and arrive at clear conclusions about the degree of truthfulness of the statement in question. Failure to achieve it could result in abandoning the investigation of a statement.

The variations among fact-checkers in terms of the minimum evidence they require to draw conclusions does not necessarily mean that their conclusions are also different. The nature of the claims they select most often dictates that fact-checkers generally side with state interests (this applies to cases of foreign meddling), public institutions, or mainstream interpretations.

JOS11 Fact checking en disinformation I

PP 0214 Do journalists' ideologies translate into partisan reporting? The limits of bias and the limits of countermechanisms

[Andreas A. Riedl](#)¹, [Stefan Geiss](#)², [Olaf Jandura](#)³, [Melanie Magin](#)², [Birgit Stark](#)⁴

¹ LMU Munich, Department of Media and Communication, Munich, Germany

² NTNU Trondheim, Department of Sociology and Political Science, Trondheim, Norway

³ HSD Düsseldorf, Faculty of Business Studies, Düsseldorf, Germany

⁴ Johannes Gutenberg University Mainz, Department of Communication, Mainz, Germany

News media are normatively expected to deliver impartial, balanced, and unbiased information. They are, however, regularly accused of being biased toward liberal voices, and journalists are particularly defamed as acting as "left-wing political missionaries" (Albæk et al., 2014, p. 167; Hassell et al., 2020). In recent years, political actors have intensively weaponized this accusation to delegitimize unpleasant media (Soontjens et al., 2023). It is based on the over-simplistic assumption that journalists' individual political ideologies directly translate into biased news coverage with no or limited restraint. Despite these alarming dynamics, empirical evidence for or against this hypothesis (e.g., Donsbach & Patterson, 2004; Mothes, 2017; Watson, 2014) is not sufficiently generalizable or lacks external validity (Reinemann & Baugut, 2014) – and has not yet acknowledged the complexity of how journalists' political ideology interacts with organizational and institutional factors in journalism. Therefore, our paper argues under which specific conditions we should theoretically expect journalists' political ideology to translate into bias in news coverage. For that purpose, we understand bias on three levels, namely in terms of subjective evaluations, the representation of political parties, and the distribution of ideological positions within news texts (D'Alessio & Allen, 2000). We discuss how we can expect journalists' ideologies to interact with editorial lines, the professional autonomy journalists enjoy within organizational structures, and their professional role orientations as an expression of the institutional logic of journalism. These dimensions can function as "checks and balances" or as loopholes but might also lead to an overcorrection of ideological biases.

Empirically, our study builds on a quantitative manual content analysis of 3,539 political news items from 12 Austrian media outlets (newspapers, radio, TV, online) published in 2018, in which we measured the dependent variables. We combined it with a subsequent survey of 160 journalists authoring 626 of these items, in which we measured journalists' ideology (on a left-right scale) and the other independent variables. We also added secondary data on the ideological position of political parties. Matching these data sources at the level of the individual news item and individual journalist offers a unique chance to trace the connection between attitudes and content under realistic conditions and beyond selected news events. Our findings suggest that the left-right political ideology of journalists indeed affects news reporting in the expected direction when it comes to ideological positions, but not for subjective evaluations and even in the opposite direction for political parties. In the latter case, journalists seem to over-compensate their individual views. Political ideology interacts with bias-limiting role orientations in the case of political parties, uncovering professional roles as a successful corrective against partisan bias. Ideology also interacts with journalists' autonomy regarding ideological positions in the news, highlighting that acting according to individual dispositions is only feasible for a subset of journalists. We conclude that balancing out ideological biases in the journalistic workforce is a delicate equilibrium utilizing various mechanisms involving organizational and institutional factors. This equilibrium must be continuously renewed in a continuously changing news ecosystem.

JOS11 Fact checking en disinformation I

PP 0215 Decoding correction strategies: How Fact-Checkers Uncover Falsehoods across countries

[Regina Cazzamatta](#)¹

¹ Universität Erfurt, Media and Communication, Erfurt, Germany

Reasoning and Objectivity

In response to rising disinformation and disrupted public discourse, global fact-checking units have surged, with 417 organizations spanning 100 countries (Duke Reporters). Their main roles include verifying political statements (fact-checking) and debunking online falsehoods from anonymous sources. Despite its global relevance, fact-checking research lacks systematic and comprehensive comparative projects, with rare exceptions (Graves & Cherubini, 2016; Humprecht, 2019). Prior studies mainly concentrated on the U.S. (Nieminen & Rapeli, 2019), despite efforts to include other world regions. Comparative studies are vital for understanding the global nature of fact-checking, considering its intricate ties to media and political systems and the varying levels of national disinformation resilience faced by fact-checkers (Humprecht et al., 2020). Thus, **this study proposes a comparative analysis of fact-checking tactics and selection criteria across eight countries and 23 organizations in Europe and Latin America**, aiming to address two primary questions:

RQ1: What are the prevalent debunking tactics across countries and organizations?

RQ2: Which criteria for selecting misinformation are most prominent and transparent in the corrective articles?

Summarized Methods

I manually coded 3,154 verification articles from 23 organizations (independent, media-linked, and global news agencies) in Spain, Portugal, Germany, the UK, Brazil, Argentina, Chile, and Venezuela. European countries were chosen based on diverse media systems—liberal, Mediterranean, and corporatist—while Latin American selections were influenced by varying levels of democracy and disinformation resilience. Links were collected using the Feeder Extension and a 25% stratified sample (n=4th) of articles published in 2022 by each organization was constructed. A preliminary pre-test with 450 articles identified 15 tactics and five selection criteria, which were then operationalized in a traditional quantitative content analysis. Krippendorff's coefficients assessed coding reliability across the language groups, achieving acceptable agreement levels after extensive coding training.

Preliminary Selected Results

Common debunking strategies, regardless of organization or nationality, include documentation (93%), tracing origins (57%), referencing prior debunking (46%), and contacting experts (27%). Additional approaches, such as official statements (13%), questioning dataset quality (7%), and delegitimizing sources (6.2%), are less common. Variations exist; for example, public service broadcasting units in Europe consult experts most frequently. Contacting falsehood authors is mainly used by media organization units. In terms of selection criteria, online virality, prominence of the target, and sources of falsehood predominate. These findings illuminate the types of evidence and strategies employed as empirical evidence against false information. During the presentation, we anticipate providing additional comparative results focusing on types of organizations.

JOS12 Working as a journalist

PP 0231 "The good ones leave". Journalists making an exit

[Jana Rick](#)¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

The number of applications for newsroom jobs is declining (Borchardt et al. 2019) and there is an ongoing discourse concerning the observed trend of an "exodus" of journalists (e.g. Camarotto 2023; Reinardy 2009). This might not come as a surprise since studies have shown that journalism can be a profession of precarity in an industry of volatility (e.g., Gollmitzer 2014; Örnebring 2018). The phenomenon of journalists shifting to other professions should be taken seriously since a journalistic exodus could contribute to a brain drain and deprofessionalization (Matos 2022;

Russ-Mohl 2015). In order to find explanations for the vocational behavior of journalists, this study draws on turnover theories from the sociology of labour (e.g. Lee & Mitchell 1994; Mobley 1977), bridging the gap between journalism research and sociology. The study empirically explores the exit of journalism to understand why journalists give up their profession, how they exit it and it will shed light on the consequences of this decision. An online survey of former journalists in Germany (n = 193) was conducted, followed by 37 problem-centered interviews with selected ex-journalists. Ex-journalists are former professionals who worked in journalism for at least two years and transitioned to a non-journalistic field between 2015 and 2021. Participants were recruited via journalism associations, social and professional networks.

The results show that leaving journalism is a multifaceted and complex phenomenon. The three most frequently selected reasons for leaving journalism are "the transformation in journalism" (57.5%), "the working conditions" (56.5%) and "the low salary" (54.4%). The typical path for journalists takes them into corporate communications, over half of them moved there. Interestingly, almost fifty percent of the respondents still identify as journalists, demonstrating shifting boundaries between journalism and other professions. The vast majority (95.3%) do not regret having left journalism.

As part of the qualitative content analysis of the interview material (Mayring 2014), five types of journalism leavers were identified. The 'disillusioned' represent young professionals exiting journalism early in their career for better working conditions; the 'frustrated' represent experienced journalists feeling embittered due to several different aspects in the journalistic profession; the 'resigned' are forced to leave journalism involuntarily due to precarious work or age discrimination; the 'exhausted' experienced burnout and leave journalism because of health reasons and the 'family-oriented' abandon their dream job for a better work-life balance and job stability.

The investigation provides valuable insights into the challenges that disrupt the established order in the media landscape. Vulnerable groups like freelancers and parents struggle in journalism; not always is the exit a decision of free will. If journalism increasingly becomes an elite profession for the privileged, we will lose diversity and journalistic quality in newsrooms. The findings make clear that the journalistic profession is losing journalists to other sectors – and thus also experiences and knowledge indispensable for democracy. As one ex-journalist describes it: "The good ones leave." This statement should prompt media houses to implement strategies for retaining journalists in their profession.

JOS12 Working as a journalist

PP 0232 The people who still get a job in journalism in Portugal – Who are they and what do they do?

Carla Baptista¹, Jacinto Godinho²

¹ NOVA FCSH/ICNOVA, Communication Sciences Department- Nova University of Lisbon, Lisboa, Portugal

² University Lusófona, Communication Sciences, Lisboa, Portugal

This communication seeks to identify changes in journalistic profiles in Portugal, based on various disruptive processes that have affected several newspaper companies, causing collective redundancies and restructuring plans with a direct impact on recruitment and selection policies. Based on sociological studies and recent surveys of the journalistic community, we will first briefly characterize the landscape of professional journalists, who in Portugal are obliged to hold a title that entitles them to perform professionally – the professional card. Based on this characterization, we will outline the main changes that can be detected in this landscape, using indicators such as gender, age, educational qualifications, training experience and work environment. Next, we will cross-reference this data with other data obtained during an ongoing personal research process, which has been systematically collecting information on the recruitment policies of journalists from the main media outlets in Portugal over the last 3 years (since 2020), identifying the characteristics of the people that companies continue to employ. The general context is characterized by a depressed scenario for the employment of journalists in Portugal and, in recent months, with high levels of labour conflict due to the threat of bankruptcy of a major group (Global Media) on the national scene, with media active on various platforms (press, radio and printing). Finally, we focus on the financial and labour restructuring process still underway at a historical Portuguese sports press title – the newspaper A Bola – which carried out collective redundancies with a major impact on the labour structure, with a view to renewing professional profiles. This set of data is cross-referenced and interpreted with a view to answering the question: from the point of view of employers, what is the most valued journalistic profile in the different areas of the profession, including writing, photojournalism, infographics, research, digital programming, managing communities of readers and users? It is the ambition of this communication to be able to articulate the data for Portugal with other countries, contributing to a critical understanding of the employment policies that are decisively affecting the content produced by journalists and the very definition of the profession.

JOS12 Working as a journalist

PP 0233 Media work life: Freelancers in the tension between autonomy and vulnerability

[Anders Graver Knudsen](#)¹, Birgit Røe Mathisen²

¹ Oslo Metropolitan University, Department of Journalism and Media Studies, Oslo, Norway

² Nord University, Faculty of Social Science / Department of Journalism, Bodø, Norway

The flexibilization of work life is a current general trend towards individualisation and employment insecurity in neo-liberalism, which also affect media work. These trends involve a rising number of short-term contracts, freelancing and project-based work, paralleled with downsizing and cutbacks in the newsrooms. The tension between precarity and autonomy is described as a vital characteristic of the profession of journalism, raising questions regarding de-professionalization or re-professionalization of the occupation. This trend is not exclusive to media work. Many professions, particularly within the creative industries, are witnessing similar evolutions. Within this context, the paper will explore the work life of freelance journalists, by asking the research question: how do freelance journalists experience their working conditions, and how has their job situation changed during the last five years?

Based on two quantitative surveys among union organised freelancers in Norway carried out with five years inter-mediance, we will elaborate how freelancers themselves experience their working conditions related to finance and wages, time pressure, relations to assigners and the work-life balance. The first survey carried out in 2019, suggested that freelancers find themselves in a paradoxical tension between autonomy and high job satisfaction on the one side, and vulnerability and precarity on the other. They reported excitement about their work, and at the same time, they faced low rates and high job pressure. However, since 2019, first the covid-19 pandemic and then the AI emerged as critical junctures altering media work in different ways. The pandemic had implications and led to changes in media use, the way journalists worked, and affected the media economy. The emergence of AI in journalism enables faster and more efficient data analysis and content generation, but also raises critical ethical concerns about authenticity, bias, and the changing role of human journalists in news production and curation. These developments will, not least, affect the work life of freelance journalists. Among others, a vital aspect to explore is whether the availability of assignments becomes more limited. Therefore, we will carry out a new survey during spring 2023, aiming to compare the two studies and explore how the freelance working conditions have developed the last five years.

The study is carried out in Norway, a national context with a strong welfare state as a vital denominator, which also impacts in how the journalistic work is organized. In addition, Norway in line with the other Nordic countries are characterized by high union density in general, and especially in journalism. This context makes the experiences of Norwegian freelancers interesting to explore, and to discuss in relation to other national contexts as well. The paper will be included as a chapter in a forthcoming book (2025) about freelance journalism, discussing various aspects of the professional role and working conditions for freelance journalists.

JOS12 Working as a journalist

PP 0234 Pioneering can break your heart: Trends and developments of entrepreneurial journalism

[Lenka Waschkova Cisarova](#)¹

¹ Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

They are different, but no less important – entrepreneurs among journalists. We can call *journalist-entrepreneurs* those journalists who have started their own media businesses; on the contrary, *entrepreneur-journalists* the entrepreneurs who, after starting or buying media, have also started a journalistic work. The position of entrepreneurs among journalists is discussed because their position complicates the normative assumption of an impenetrable wall which separates the editorial and business sides of the newsroom.

Gradually, however, the criticism was replaced by a conciliatory tone that reflected a growing understanding that entrepreneurial journalism can be the reason for media survival, or the form of empowerment for journalists themselves. Entrepreneurial journalists are sometimes depicted as *pioneer journalists* to stress that they are a recent phenomenon, and they bring up-to-date practices. In fact, the rise of journalist-entrepreneurs is nothing new, but their voices have so far been rather quiet. My aim is to describe the functions and roles of journalist-entrepreneurs and entrepreneur-journalists, trends affecting them and their developments in recent years.

To accomplish my aim, I have been studying the topic of entrepreneurs in journalism longitudinally and I focused on the topic specifically through the lens of peripheral media – local newspapers in the Czech Republic. Their small newsrooms, inhabited mostly by only one or a small group of journalists, provide an ideal space for studying the phenomenon of journalist-entrepreneurs and entrepreneur-journalists. My findings are based on the longitudinal mixed-method research: (1) survey of all the owners of Czech local newspapers in 2009, 2014, 2019 and 2024 (collection currently underway); (2) in-depth interviews with entrepreneurs in local journalism in 2019/2020 and 2024; and (3) participant observations in selected local newsrooms.

In the light of collected data, the position of journalist-entrepreneurs typifies those who work at the local newspapers in the Czech Republic. Journalist-entrepreneurs have ambivalent roles – former journalists who saw entrepreneurship as the only way to keep local newspapers alive; or businessmen who fell in love with journalism. What they have in common, is a strong influence on the shape of journalism, and their roles that have so far been uncharted. Functions and roles described by the interviewees include: the difficulties around the sole responsibility of the individual for the success, failure, and sustainability of the medium and its people; diverse workload which integrates all the duties in a media organisation; problems with the position of a journalist/entrepreneur in the locality stemming from the different power acquired as a journalist and a media owner/businessperson. On top of that, one of the most significant trends influencing the development of the position of the local journalist-entrepreneur/entrepreneur-journalist in recent years is the topic of succession. It is precisely the (in)ability to pass on the medium to the successors or to sell it in a way that it is not absorbed by a media chain, what became the most prominent theme during my interviews. And longitudinally, it turns out that the (in)ability to pass on or sell a medium to a successor is a strong determinant of the medium survival.

JOS13 New interdependencies in journalism

PN 060 Journalism as social epistemology: Journalism studies' fork in the road

Richard Stupart¹

¹ University of Liverpool, Communication and Media, Liverpool, United Kingdom

Journalism is one set of answers to questions around the division of epistemic labour. In abstract terms, it is an answer to social epistemological challenges: an arrangement through which communities are in a relationship with agents who know the world for them and inform them of things that are of value to that community (value being varied: moral value, utility value, etc). Most accounts of journalism have an assumption of this kind underlying them, yet tend to confuse the institutional forms that this social-epistemic relationship takes (e.g. the classic newsroom) with the relationship itself. Using news reporting of the War in Ukraine as an example, I argue that professional journalism is an increasingly marginal element of how the work of knowing distant realities gets done – a view which poses difficult questions for the field of journalism studies. To the extent that journalism studies is interested in organised, social epistemic work and its effects, it must move away from being interested in journalists in particular. To the extent that it is interested in professional journalism as traditionally conceived, it becomes less able to apprehend how (socially) organised epistemic work gets done.

JOS13 New interdependencies in journalism

PN 061 Journalism in therapy: Evaluating journalists' diverse interdependent relationships

Sandra Banjac¹

¹ University of Groningen, Center for Media and Journalism Studies, Groningen, Netherlands

Fellow journalists, editors, sources, audiences, and other extra-institutional actors, each with varied involvement, have a role and interest in co-shaping journalism. In light of digital and economic forces prompting journalism to evolve, however, it has become more important to evaluate the nature or 'health' of these relationships. Here, the audience-journalist relationships has received some attention (e.g., Loosen et al. 2020), showing audiences' wants, needs, perceptions, and experiences of journalism diverge from those journalists perform. This may be one explanation behind the public's declining trust and growing news avoidance (e.g., Skovsgaard and Andersen 2020). So, what makes this and journalism's other relationships (not) work? Drawing on interdependency theory and theoretical perspectives within social psychology and sociology, this paper points to central dimensions (e.g., trust, authenticity, transparency etc.) of relationships that help us evaluate their quality. By locating these within journalism scholarship, the paper points to where journalism's relationships may be breaking down.

JOS13 New interdependencies in journalism

PN 062 [((In)(ter))CO]pendence: Smoothed over complicities in a post-postmodern journalistic field

Scott Eldridge¹

¹ University of Groningen, Center for Journalism and Media Studies, Groningen, Netherlands

When considering journalism's interdependencies, one might take a moment to reflect on the dependencies that have come to define journalism's late-postmodern period. Interdependency suggests mutuality. Dependency, is more 'taking' than giving, with an etymology of hanging and weight (de), drawing and stretching on that which it hangs (pend). So what is journalism weighing on? What is it dependent on? In this paper, dependencies are considered both a troubling and productive way of making sense of the journalistic field. I argue that we need to address how journalism's dependencies work against its claims of autonomy in understudied ways. Dependency complicates journalism's normative claims for independence and autonomy at three levels: information subsidies at the micro level leave journalism vulnerable to willing sources and conflicted institutions. Technological systems at

the meso level force journalism into dependent communicative relationships, and state and political institutions at the macro level leave it vulnerable to ideological whims and destructive politics.

JOS13 New interdependencies in journalism

PN 063 Reconsidering sources for emergent social topics: Indigenous peoples and the climate crisis

[Marilla Gehrke](#)¹

¹ University of Groningen, Center for Journalism and Media Studies, Groningen, Netherlands

Influential scholarship has demonstrated that, despite mutual benefits, political and intellectual elites often make the news and use reporters to deliver information subsidies to influence policymaking. Ephemeral dynamics in news-making incentivize the repetition of an endless cycle: those often heard as sources will receive space repeatedly. Conversely, and at most, 'ordinary citizens' will be called to share their life stories, delivering entertainment rather than information. In this theoretical paper, I aim to demonstrate that the established dynamics between reporters and elite sources are neither sufficient nor proper to cover emergent and critical social issues nowadays. I use the case of the climate crisis, particularly to the extent that it affects the Amazon rainforest, to argue that newspeople must acknowledge and explore new dynamics of interdependencies, which includes listening to and portraying Indigenous peoples as the knowledgeable citizens they are in terms of forest protection and land management. I use decolonial feminism theories and the counter-colonialism grassroots movement to challenge the Eurocentric view of the expected relationship between (official) sources and journalists.

JOS13 New interdependencies in journalism

PP 0300 Making sense of journalism: Potential disparities in perception of journalist professional roles between journalists and audiences in Latvia

[Līga Ozoliņa](#)¹, [Gunta Līdaka](#)¹

¹ Rīga Stradiņš University, Faculty of Communication, Riga, Latvia

Vitality and the future of journalism have been a core discussion in professional forums as well as in academia for the past few decades. Mostly, because journalists and news organizations (in Latvia and elsewhere) are confronted with ongoing unprecedented and multi-faceted crises. In this constantly changing and evolving media landscape, exploring how journalists and their audiences understand professional journalism and see its role(s) in society is paramount. As Palmer et al. have stated, "journalism's viability depends not just on how journalists' approach and execute their work, but also on how members of the public think and feel about journalism" (Palmer et al., 2020, p.4). Therefore, this study mainly will focus on the perception of professional roles of journalism among journalists themselves and their audiences in Latvia.

In Western society and the professional environment, a normative view of journalism has prevailed, however, in recent decades a new view of journalism as a discursive institution has developed (Hanitzsch and Vos, 2017, 2018; Hanitzsch et al., 2019). To use the words of both authors, "journalism and journalistic roles have no 'true' essence; they exist because and as we talk about them" (2017, p.129). Data gathered for the Worlds of Journalism Study over two distinct research periods (2013–2014, N = 340 and 2021, N = 486) provides a longitudinal insight into how journalists in Latvia see themselves. This data shows that journalists see themselves mostly in the domain of political life not in the domain of everyday life and are truthful to the normative professional roles (to inform, to monitor, to educate, etc.). Recently (November–December 2023) qualitative focus group discussions were conducted with Latvian media audiences (N = 42) to study how the audience makes sense of journalism and journalist professional roles. This will add to the existing knowledge on journalist-audience relations and allow us to better understand whether there are notable variations between journalist professional role self-perception and the audience's view on these roles and their expectations towards journalists.

JOS14 Politics and journalism

PP 0301 Journalists as reluctant political prophets

Keren Tenenboim-Weinblatt¹, Tali Aharoni¹, Christian Baden¹

¹ The Hebrew University of Jerusalem, Department of Communication and Journalism, Jerusalem, Israel

The news media not only inform citizens about current events but also serve as a central venue for political projections (Neiger, 2007). The prominence of such projections in the news, particularly during election periods (Tenenboim-Weinblatt, 2018), along with journalism's 'nowness' ethos, which leads to its 'default neglect of temporality' (Zelizer, 2021, p. 1213), creates inherent tensions that have received limited empirical attention. In this study, we focus on political projections from a news production standpoint and ask: How do journalists perceive political forecasting and communicate uncertainties about the future?

To this end, we employed a mixed-method approach, drawing on data from a large study on successive elections in two national contexts: the three rounds of the 2019–2020 Israeli elections and the 2016 and 2020 US elections. First, we conducted in-depth semi-structured interviews with 11 Israeli journalists who played pivotal roles in creating and interpreting projections during the two rounds of the 2019 general elections in Israel. The interviews explored journalists' perspectives on political projections and utilized reconstruction techniques (Reich and Barnoy, 2016) to trace the decision-making processes involved in producing future-oriented discourse. To examine journalists' projection practices on a large scale, we applied computational content analysis to future-oriented discourse in election coverage in both Israel and the US, spanning 30 major news outlets. Specifically, we examined journalists' language use in any future-oriented statements within their election-related coverage, employing multi-lingual dictionaries developed for this purpose. By juxtaposing journalists' views and their discursive practices in the production of news texts, we analyzed how professional norms and perceptions are reflected in mediated political projections.

The analysis demonstrates both journalists' ongoing engagement with and profound ambivalence toward political forecasting. We identified three primary sources of this ambivalence: the inherent risk of making incorrect predictions; the perception of election projections as a form of infotainment; and the conflict with traditional journalistic values that prioritize verifiable facts. This ambivalence is evident in distinctive practices in the produced news texts – notably, journalists' heavy reliance on non-committal language (e.g., 'could', 'possibly') in both Israel and the U.S. Discussing the theoretical and normative implications of these findings, we argue that journalists' consistent impulse to distance themselves from projections limits their capacity to assume a more meaningful role within societies' orientation toward uncertain futures.

⁸ Ben Gurion University of the Negev, Department of Communication Studies, Beer-Sheva, Israel

⁹ Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

¹⁰ University of Santiago, School of Journalism, Santiago, Chile

This paper is part of a large-scale research on how newsrooms are structured today. As an 'epistemic infrastructure' beat mixes predicts content, reflect hidden assumption, and expose the architectonic blueprint behind the news. The project compares the beat mix of leading quality dailies with an online operation, in 13 countries (US, UK,

Germany, France, Greece, Chile, Sweden, Belgium, Mexico, Czech Republic, India and Israel), based on executive interviews and analysis of data of their beat structure.

The following highlights focus on the political beat due to its importance and to our initial stage of data analysis.

- **Human resources:** Political beats maintain their high status: The majority of political coverage in all countries is still done by full-time staff with very few freelancers. The good news: This formerly male-dominated beat (Magin and Maurer, 2019; Van Dalen, 2012) is now balanced between male and female reporters, but males still dominate the more lucrative positions of editors and commentators.
- **Focus:** Political teams are largely geared towards covering the executive branch and in most cases the Politics desk is embedded within the parent National desks.
- **Location:** Unsurprisingly, the politics teams are concentrated in the capital city, where most of the executive power resides. An exception to this case is *Süddeutsche Zeitung* in Germany and *Haaretz* in Israel, where a larger proportion of political journalists are located elsewhere in the country. For comparison, *The Washington Post* only has eight out of its 70-strong force of politics reporters located outside Washington, DC, though it has a separate desk, not specifically political, covering the rest of the nation.
- **Newsroom size:** Some initial analysis of data shows that size of the political beat is not dependent on the size of the media organization. For example, the Guardian's politics team has only seven full time political reporters plus a live politics blogger but in Mexico's *El Universal*, also a relatively large organisation, there are over 30 full time political reporters in the capital, Mexico City.
- **Commentary:** Despite "the interpretive turn" in journalism (Barnhurst, 2014) and the special centrality of sense-making of politics (Arceneaux et al. 2019; Bro, 2012; Salgado et al. 2017) the number of dedicated commentators on politics desks is smaller than reporting teams, but in many cases political reporters and editors regularly write commentary and analysis on topical issues. Mexico has the largest number of political commentators (15) that are attached to a politics desk. Only Greece has a similar number of commentators on the politics desk (11). In comparison, *Dagens Nyheter* (Sweden) and *De Standaard* (Belgium) have only one full-time staff commentator, with separate units for commentary.

According to "new institutionalist" perspective (DiMaggio and Powell 1983), findings show that at least as far as the allocation of political human resources are concerned, newsrooms around the world maintain a similar, "isomorphic" logic, in their political division of labor. And yet, the similar structure affords different approaches to politics, indicated in other comparative studies (Albæk et al. 2014; de Vreese et al. 2017; Nielsen and Kuhn 2014).

JOS14 Politics and journalism

PP 0303 Resistance or rationalisation? Analysing the "hidden transcripts" of media capture

Ricardo Ribeiro Ferreira¹

¹ University of Edinburgh, School of Social and Political Science, Edinburgh, United Kingdom

Several studies argue that journalism can facilitate and shape democratic backsliding when news organisations are captured by business and political elites, developing the concept of media capture (Dragomir and Aslama Horowitz, 2021; Schiffrin, 2021; Selvik and Høigilt, 2023). This scholarship suggests that captured journalists and news outlets will likely fail to hold political actors to account and deliver information essential for public deliberation. These conditions can also lead to unfair representations of political events over time (Ferreira, 2023a). However, media capture research mostly focuses on macro causal factors, such as ownership patterns and networks of influences (Atal, 2017; Márquez-Ramírez and Guerrero, 2017; Stiglitz, 2017), or the perceived effects of editorial outputs (van Dijk, 2017; Araújo and Prior, 2020). Therefore, it tends to efface journalistic agency and sociological aspects crucial to news production. Little is known about how media capture operates inside the newsroom. Moreover, possible forms of resistance are particularly understudied. Yet, news outputs are a result of both the institutional structure (i.e., regulatory framework, market characteristics, professional guidelines, and resources) and the judgment of each journalist (Cook, 1998; Gitlin, 2003; Deuze, 2008), which is influenced by their social background and professional status. As such, news production is a multi-level process of negotiation involving a range of journalists with different attributions, commitments, and levels of decision power (Wright, 2011; Raemy, Hellmueller and Vos, 2023), which could create opportunities for anti-hegemonic practices in captured newsrooms. Using 36 semi-structured qualitative interviews and building on Scott's (1990) concept of "hidden transcripts", this paper uncovers and analyses forms of resistance to media capture in the three major news organisations in Brazil from 2016 to 2021. This is a period of constant decline in the country's quality of democracy and growing political interference in these newsrooms (Ferreira, 2023b, 2023a). Although Scott does not focus on media, the author argues that hegemonic systems such as captured newsrooms could be an appearance ("public transcript"), hiding various forms of disagreeing thoughts and conducts ("hidden transcripts"), carefully kept below the radar by dissenting groups and individuals. The results show three key "hidden transcripts" in Brazilian newsrooms: "stall" (reporters, producers or low-level editors delaying requests from high-level editors or managers conflicting with their perceptions of journalistic standards), "maybe it will pass" (reporters, producers, and low-level editors discreetly including bits of information not aligned

with guidelines determined by the higher-ups), and "secret editing" (small alterations after the news item was approved but before publication to reduce perceived bias or lack of pluralism). However, the analysis also suggests these practices have negligible impact on the public while they become a mechanism of rationalisation among journalists, who are able to justify working for and supporting captured news organisations. Instead of empowering dissent and change, this dynamic normalises and maintains the status quo, challenging the effectiveness of silent resistance in journalism.

JOS14 Politics and journalism

PP 0304 (De)Constructing journalism relevance in a digital age

[Laura Amigo](#)¹, [Nathalie Pignard-Cheynel](#)², [Annik Dubied](#)², [Colin Porlezza](#)¹

¹ Università della Svizzera italiana, Institute of Media and Journalism IMeG, Lugano, Switzerland

² Université de Neuchâtel, Académie du journalisme et des médias, Neuchâtel, Switzerland

The digitization of the public sphere has catalyzed a transformation of journalism (Bell et al., 2017) that can be seen as part of a historical process of journalism change: journalism being defined according to how it engages with technology, politics, and economics over different periods (Conboy, 2004). In today's digital media ecosystem, journalism's ability to deliver on its historical promises of being a predominant sense-making practice is being questioned (Peters & Broesma, 2017), confronted with audience disaffection (Newman, 2022) and stiff competition from alternative actors that overtake the news discourse (Neveu, 2019). With this backdrop, this paper explores:

- How is the relevance of journalism defined in scientific literature?
- Are there indications of a decline of journalism's relevance?
- How could journalism's relevance be fostered?

Methodologically, this article proposes a two-step empirical approach. The first and main step consists in a systematic literature review of 138 scientific studies published between 2013 and 2023, identified using the scholar database Scopus; which was conducted in the context of a research project commissioned by the Swiss Federal Media Commission. We carried out several iterations of searches, expanding the list of keywords with every iteration based on keywords mentioned in the previous papers. From the initial keywords "journalism" AND "relevance", we then also include "accountability", "quality", "authority", "expectations" OR "credibility", queried in the title, abstract or keywords. Based on the abstracts, the database was first coded according to eight research sub-questions. We then conducted a more detailed examination of each text to answer the questions posed and identify (sub) categories of analysis.

Findings allow us to define relevance as the impact journalism exerts on society and individuals, both in the political domain and in everyday life, which is tied to how information is selected, processed, and communicated to audiences, helping them to make sense of what is happening. The literature indicates a decline in journalism's relevance mainly due to insufficient transparency in news-making, understanding of audiences' expectations and (participatory) information practices, and news media's economic issues due to failing business models. The findings from the literature review were then discussed within an exploratory focus group held in October 2023 made of three journalists and a senior manager from news organizations in the Italian-speaking part of Switzerland. Interviewees mainly expressed concern over technological innovations such as artificial intelligence and their consequences for journalism practice, particularly in terms of threats to its creative craft and regarding ethical challenges. For them, journalism's relevance relies on journalists' ability to fact-check and create emotional storytelling. Both literature and interviewees underscore media literacy as a means to strengthen journalism relevance.

Discussions of this paper not only offer insights into the challenged relevance of journalism but also into the way journalists seek to (re)value their profession and work. More broadly, the proposed paper contributes to a better understanding the meaning of journalism, how it may assert a key position and provide a particular form of service to society (including beyond the political realm) in an increasingly messy media ecosystem.

PP 0305 Pointing fingers in the disinformation era: How journalists and politicians perceive each other's role in spreading disinformation and its impact on their relationship

[Emma Van Der Goot](#)¹, [Karolin Soontjens](#)², [Kathleen Beckers](#)¹, [Willem Buyens](#)², [Peter Van Aelst](#)²

¹ University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

² University of Antwerp, Political Science, Antwerp, Belgium

In an era of post-truth and disinformation, the crucial relationship between politicians and journalists, the "fourth power", is under increasing pressure. Some politicians publicly question the media's role in spreading inaccurate

and false information, and journalists have reason to be critical of politicians too. While deception and falsehoods have long been present in politics, it is widely believed that social media provide politicians with new opportunities to strategically create and disseminate false narratives. The extent to which politicians and journalists blame each other for spreading false information may have important implications for their relationship. Mutual distrust might lead journalists to distance themselves from their political sources and evaluate their interactions more critically. This, in turn, could result in more skeptical political coverage, potentially impacting audience trust levels. However, research examining how politicians and journalists perceive each other's roles in the spread of false information and how these perceptions influence their relationship is notably absent from the existing literature. Therefore, this study aims to address two key questions:

RQs: (1) *How do journalists and politicians perceive each other's role in spreading disinformation, and (2) how do these perceptions influence their personal contact?*

To answer these research questions, we conducted a survey with Belgian political journalists (N = 148) in October 2022 and one with local politicians (N = 452) in March 2023. We asked journalists and politicians to indicate on a 7-point scale to what extent they agreed or disagreed that the following actors contributed to the spread of disinformation: (1) Traditional news media; (2) Alternative media; (3) Social media; (4) Politicians in general; (5) Politicians from radical-left parties; (6) Politicians from radical-right parties. In the survey with journalists, we also asked how frequently they had contact and how they evaluated their contact with politicians. Our results indicate that 33 percent of politicians, in particular right-wing politicians, blame journalists for spreading "fake news". Journalists, in turn, are even more critical of politicians: 58 percent of the journalists blame politicians in general, 75 percent blame radical left politicians, and 90 percent blame radical right parties for spreading disinformation. Importantly, journalists' views of politicians' role in spreading disinformation impact their relationship. Although journalists who believe politicians add to the spread of disinformation are not necessarily less likely to interact with politicians, they are significantly more negative about their interactions with politicians. Such perceptions potentially add to the tense relationship between journalists and politicians we are (increasingly) observing and could have important ramifications for political news-making. The adversarial relationship could hinder access to political sources and the sharing of important information, both critical elements for maintaining the quality of news reporting.

PP 0306 The construction of religion in Swiss news media – A longitudinal analysis from 1998 – 2022

Rebekka Rieser¹, Daniel Vogler¹, Mark Eisenegger¹

¹ University of Zürich, Department of Communication and Media Research, Zürich, Switzerland

Issues constantly compete for attention in the public sphere with ongoing societal and political conflicts as important drivers of issue-attention. The issue of religion is no exception. Recent developments show that despite the paradigm of secularism, the issue still receives high attention in news coverage. The salience of issues in news coverage depends on news values such as proximity, negativity, or conflict. Previous studies have shown that religion is more likely to become a media topic when it collides with social standards or common expectations of religious norms or behaviors (Schönhagen & Jecker, 2010; Wyss & Keel, 2009). However, it is also evident that media attention fluctuates over time, and that specific key-events drive the public discourse around religion.

From a constructivist perspective, religion is and was always constructed in diverse arenas and debates over time (Sumiala, Hoover, & Laughling, 2023). How much attention the issue of religion receives in news coverage, as well as which religions and topical focus are prevalent in the coverage, can be considered important factors influencing public's opinion about religion. However, despite the relevance of religion as a media topic, only a few longitudinal studies analyze how salient and in which contexts religion is represented in the news. We address this gap in research and investigate how salient the issue of religion in the coverage of Swiss news media is, how salient different religions are in this debate, and which topics are most prominent. By doing so, we show how religion has been constructed in Swiss newspapers over time. Switzerland provides a compelling example to investigate how media constructs religion as the country has a very internationally oriented media system and is secularized but rooted in Christianity.

We retrieved all articles from three leading Swiss newspapers that were published between 1 January 1998 and 31 December 2022 and mentioned the term religion (n = 28'298 news articles). For our analysis, we developed customized dictionaries to detect the five most relevant religions (Christianity, Islam, Judaism, Hinduism, Buddhism) and combined this with structural topic models (cf. Roberts et al., 2019).

Preliminary results show that the issue of religion receives substantial but cyclical salience in the coverage of Swiss news media. On average 1.1% of all articles in the three analyzed outlets mention religion. Furthermore, we show that even though Christianity is the most covered religion in total, the salience of Islam increased over time and reached a similar level as Christianity around 2015. The topical analysis shows that Islam is often covered in connection with conflict and terrorism (e.g. the proclamation of the Islamic State). The analysis also reveals issues

without references to core religious topics. Instead, they only use metaphors and formulations in areligious contexts and topics such as sport.

PP 0307 Understanding 'femicide' coverage in Italian media: Applying principles of nonviolent communication for social change

[Diana Garrisi](#)¹

¹ Cardiff University, School of Journalism- Media- and Culture, Cardiff, United Kingdom

On 11 November 2023, Giulia Cecchetti, an Italian university student, was murdered by her former boyfriend, Filippo Turetta. Giulia was scheduled to graduate with a degree in Engineering from the University of Padova the week after her death. Her murder sparked national outrage and reignited an ongoing debate about gender-based violence in Italy. Approximately 8,000 people, including government officials, attended Cecchetti's funeral. Shortly afterwards, the Italian Senate approved a bill aimed at preventing violence against women.

The Italian media initially followed a formulaic approach in covering Cecchetti's murder, portraying Giulia as an innocent victim and Turetta as a scheming perpetrator. However, this polarised narrative, which is frequent in the news coverage of domestic violence in Italy (see Bandelli 2017 and Allegri 2021) was challenged by a compassionate eulogy delivered by Giulia's father, Gino, at her funeral. He called for more education and cultural change to prevent such tragedies, rather than focusing on blame or judgment. His words highlighted an empathy-based perspective distinct from the sensationalistic language used by journalists.

This paper applies principles of Nonviolent Communication (NVC) to conduct a rhetorical and stylistic analysis of the news coverage of Giulia Cecchetti's murder in four major Italian newspapers (*Il Corriere della Sera*, *La Repubblica*, *La Stampa*; *Il Sole 24 Ore*) from the initial reporting through the first televised interview with her father, Gino Cecchetti (November–December 2023). NVC is a progressive methodological approach developed by Marshall Rosenberg in the 1960s that employs communication techniques to de-escalate disagreements and increase empathy in situations of human conflict. According to Rosenberg (2015), moralistic judgments, feed a form of communication that drives us away from a sense of human understanding and fosters further violence. There is a mutual relationship between blame and violence: judgmentally targeting a certain group for a negative outcome can create resentment towards the group, producing even more hostility (Armoudian and Milne 2021). Based on the aforementioned premises, this paper aims to address the following research questions:

1. What value judgments did newspapers employ in describing Cecchetti's murder?
2. How did these judgments sensationalise the story in ways counterproductive to social change?
3. How did Gino Cecchetti's rhetoric provide viable alternatives to mainstream coverage, setting a template for future cases?

The objective of this project is to investigate how the incorporation of NVC strategies in news reporting can enhance deeper understanding of people and facts, thereby cultivating a public discourse driven by comprehension, as opposed to blame and judgment. Second, the research will proceed to examine what linguistic and communicative alternatives the NVC model makes available to accurately report on gender-based violence and whether these are applicable within the commercial and political frameworks of the current Italian model of journalism.

PP 0308 Towards a communication history of the Women's World Cup

[Alexis von Mirbach](#)¹, [Lucie Barbier](#)¹, Klaudia Styn¹, Kajal Premnath¹, Nikka Valenzuela¹, Jörg-Uwe Nieland², Uliana Galantseva³, Demi Rothof¹, Diego Valencia¹, Erika Contreras¹

¹ Ludwig-Maximilians-Universität, Department of Media and Communication, München, Germany

² Universität Klagenfurt, Institut für Medien- und Kommunikationswissenschaft, Klagenfurt am Wörthersee, Austria

³ LMU Munich, Department of Communication, Munich, Germany

Football World Cups are not only a trade fair for the game but also a mirror of world history. While the men's tournament has numerous publications spotlighting its sporting aspects, the Women's World Cup lacks coverage, with only one sport's history publication on the Amazon website (authored by FIFA) and none on its social history. To fill this gap, our team from 13 countries will write the 'Communication History of the Women's World Cup'. Modifying the categories of the men's World Cup History of Bowman (2019), we posit:

What is driving the development of the Women's World Cup: professionalisation, genderisation, medialisation, economisation, or politicisation?

Methodology

We have collected data from the *New York Times* equivalents of 17 countries. We are coding all articles concerning the World Cups from 1991 to 2023, each from the opening day to the finals, until the last consecutive follow-up

communication. We used a theoretical framework by Uwe Schimank (1988) to identify the tournament's social functions. The components of the categories are:

- | | |
|------------|--|
| 1 Sports | a = Match reports; b = Feature; c = Tactics |
| 2 Gender | a = Women vs. man; b = Role, identity; c = Intercultural |
| 3 Media | a = Spectators; b = TV, journalism; c = Stories, history |
| 4 Economy | a = FIFA & Associations; b = National Leagues; c = Marketing |
| 5 Politics | a = National identification; b = System competition; c = Symbolic politics |

We have collected the articles in twelve countries since 1991. In five countries, we gathered the later articles due to archive problems. We have completed our coding for the *New York Times* and *Süddeutsche Zeitung*, on which we focus below.

Results

Between 1991 and 1999, China led in terms of coverage of the Women's World Cup. As the U.S. national team grew into a powerhouse, so did the coverage. In Germany, coverage significantly increased when they hosted the games in 2011 but was not sustained in the following games. Interestingly, although they did not advance, Germany's coverage almost tripled in 2023.

Our coding of the *New York Times* and *Süddeutsche Zeitung* showed an increasing tendency to focus on sport, making professionalisation a significant driver of its development. Over the years, the key driver has been changing. Between 1995 and 2015, the competition was a media subject (medialisation), producing iconic pictures and capturing the audience. Simultaneously, starting from 2011, the genderisation of the Women's World Cup grew in relevance. However, its dominance was more prominent in 2019, influenced by the Equal Pay Movement. The 2023 games saw increased politicisation after Luis Rubiales forcibly kissed Jenni Hermoso, sparking discussions on women's societal roles and the violence they endure.

The Women's World Cup reinforces social divisions, through gender separation in sport, but allows to transcend nationalism in gender politics. Before September 2024 we will deepen our understanding of each category through qualitative research. What does the Women's World Cup stand for? Our response so far: it is a global voice as the new international of women's rights.

PP 0309 A content analysis of coverage of terrorist attacks in Western Europe in Austrian and German print media

Brigitte Naderer¹, Thomas Niederkrotenthaler¹, Benedikt Till¹

¹ Medical University of Vienna, Unit Suicide Research & Mental Health Promotion- Department of Social and Preventive Medicine- Center for Public Health, Vienna, Austria

Sensationalist media coverage of terrorist attacks can have a detrimental effect on readers' mental health, contribute to (re)traumatization and increase stigmatization of certain social groups. Furthermore, similar to suicide reporting, sensationalized terrorism reporting may encourage imitative behavior. Based on their prevention expertise, suicide experts have thus developed guidelines for safe reporting of mass shootings based on the recommendations for suicide reporting (see: <https://www.reportingonmassshootings.org/>). The question of whether current terrorism coverage is consistent with these guidelines and in what areas media professionals need to be more sensitized are the primary research interests of this study.

To address these questions, we are conducting a content analysis of coverage of terrorist attacks in Western Europe as defined by the Global Terrorism Database. Only attacks that met the threshold of at least 400 articles published in the five most-read German and the five most-read Austrian newspapers in the seven days following the attack were considered. This resulted in a list of nine attacks and a total of 4,049 relevant articles. We conducted a stratified random sample, stratified by attack, time period, and medium, in order to reduce the number of articles for manual coding. A total of 2,198 articles were included in the analysis. The content analysis is ongoing and will be completed by the time of the conference.

The preliminary results of n = 1,244 articles analyzed to date show that newspapers tend to publish personal information about the attacker and details about the attack: 26% mention the attacker's name; almost 12% publish pictures of the attacker, around 10% quote the attacker; and another 10% quote the extremist group responsible for the attack; 11% provide a detailed description of the method of the attack. All of this is not in line with media guidelines and could have negative effects, such as increasing identification processes with the attacker, which may stimulate imitation. Furthermore, the detailed attack reports can contribute to the (re-)traumatizing of the

audience. We therefore need to discuss how we can disseminate media guidelines for safe reporting in order to avoid negative consequences.

The study is funded by the FWF (Austrian Science Fund, project number: P36029-G; PI: B.T.).

PP 0310 How does local journalism happen when access to the "local" is denied? Reporting during wildfire evacuations in Canada's North

[Tyler Nagel](#)¹

¹ University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

What happens to local journalism when access to the "local" is suddenly denied to both journalists and audiences? This research examines such a situation.

This study considers local journalism in the Canadian North, where vast tracts of wilderness are dotted with small communities separated from one another by hundreds of kilometers. The population of Canada's Northwest Territories (NWT) is sparse, with 45,000 residents living in an area of 1.3 million square kilometers. In the summer of 2023, more than two thirds of the NWT population, residents (including journalists), fled southward because of wildfires. Ultimately, these fires leveled an entire town and burned for days at the boundaries of others. Road access to Yellowknife, the NWT capital, was blocked, forcing a total evacuation by airplane. Displaced community members sought refuge across several Canadian provinces.

The wildfires and evacuation of the territory also meant many NWT towns were devoid of journalists, with only firefighters remaining to safeguard the communities. Despite the absence of reporters in the evacuated regions of the NWT, local journalism persisted.

This paper examines journalism practices at three Yellowknife news outlets: a privately-owned radio station with an active news website, a privately-owned local newspaper with both print and online editions, and the CBC, Canada's public broadcaster (and news website).

This research focuses on journalistic connections to place through interviews with reporters using Reich and Barnoy's reconstruction interview methodology (2016). It presents reflections from reporters on the coverage they created and the process through which they created it. Despite the evacuation of journalists from the NWT, coverage carried on from a distance and with a critical mission: providing essential information on which communities were being evacuated and where residents should flee, as well as keeping the NWT diaspora informed of the state of their now-empty communities.

This study contributes to scholarship that defines local journalism through its connections to a physical place, as well as social place (Hess & Waller, 2016). Though dynamics of spatial-local and social-local can be coincident, they can also exist alone (Ali, 2016). This study offers a fresh perspective on local journalism in the face of unique challenges: as wildfires raged, local journalists and audiences previously tied to a specific geographic location were abruptly relocated. This transition marked a shift from spatial localism to social localism among the same group within a very short period. Though the practice of journalism was different during this shift, the outcome was similar: providing (formerly) local residents with important and relevant information about their local community and place in a timely way.

PP 0413 Outlining a curriculum for beat journalists: The case of military affairs

[Oded Jackman](#)¹, Zvi Reich¹

¹ Ben Gurion University of the Negev, Communication, Beer Sheva, Israel

Despite the consensus among scholars, according to which journalists do not have sufficient knowledge about their fields of coverage (Lippmann, 1922, Paterson, 2013), the question of what might make sufficient knowledge never treated systematically and empirically. This paper tries to test whether journalists' desired knowledge can be mapped based on interviews with senior experts and journalists. The chosen case study is military reporting, due to the challenging and interdisciplinary nature of their knowledge and their vital role in reporting emergencies, risks, terrorism, and wars. Our gallery of experts interviewed during 2022–23 included 30 people, some of the most senior

and experienced Israeli specialists: one former Deputy Chief of Staff, former members of the PM advisory National Security Council, current and former IDF spokesperson, heads and members of the intelligence system, retired generals and scholars of military affairs. From the journalistic side the panel included some of the most senior and awarded reporters and commentators. Interviewees asked the following: if we were to establish a school for military journalists, what would its curriculum look like? Their replies were reflective and informative, encouraging experts and journalists to outline a desired curriculum of expected knowledge that can inspire other beats as well.

Despite their known disagreements, experts and journalists tended to agree on journalists' required knowledge. However, a significant disagreement concerned the configuration of military knowledge and its systematic accumulation. Experts perceived knowledge as more "idealistic", quasi-academic, systematic and flowing top-down from military's seniors. Journalists, on the other hand, expressed a more "realistic" configuration of knowledge that tends to be more eclectic, partial, harnessed to storytelling functions and often flowing bottom-up – from soldiers, parents and civil society.

In the spirit of Schudson's and Anderson's knowledge paradox (2009), expected knowledge of military journalists is simultaneously "grandiose and incredibly modest" (p. 96). While they follow complex moves such as the development of military strategy, tactical moves, and superpowers' interests "like following a musical score or partiture", some shallow levels of knowledge and a respective epistemic humility are inevitable in a field with so many types of forces, units and sub-disciplines.

Military beat requires an exceptional degree of interdisciplinary knowledge. To understand rocket propulsion systems and why they land at a certain angle, one must be familiar with earth sciences, physics and ballistics; to truly understand the controversy surrounding the involvement of women in combat and in fighter pilot tasks, knowledge in the fields of biology and physiology is necessary. While the core remains pure military affairs, it is often traversed by peripheral issues like economics, law and engineering.

JOS16 User-journalist relationship I

PP 0414 Magined audiences taking centre-stage. How journalists envision and negotiate journalistic innovation and change in the digital era

Frank Harbers¹, Sandra Banjac¹

¹ University of Groningen, Media and Journalism Studies, Groningen, Netherlands

This paper asks what role audiences play when journalists consider innovation in relation to journalism's future. Fueled by the ongoing crisis discourse about journalism's sustainability in the digital era, the belief that journalism needs to reinvent itself through innovation is widely embraced (Creech & Nadler, 2017; Bossio & Nelson, 2021). While research into journalistic innovation has grown in the last decade (Bélair-Gagnon & Steinke, 2021), it has tended to ignore the role audiences play in it. Yet, their attitude towards the way journalism innovates can affect the nature, pace, and success of journalistic innovation and change. Recognizing the importance of studying the role of the audience in understanding how innovation and change takes place in journalism, this paper therefore analyses how journalists take audiences into account in the way they envision and (de)legitimize journalistic innovation in regard to the future.

For years, journalists and outlets have been attempting to find ways to re-engage their declining and increasingly fragmented audiences (Steensen et al., 2020). A key way in which journalists attempt to maintain their cultural authority in the eyes of the public is through their collective discourse and performance of journalistic roles (Mellado, 2015; Hanitzsch & Vos, 2017), which has developed in response to pressures to innovate (Witschge & Nygren, 2009). At the same time, audiences' unprecedented ability nowadays to convey their preferences and expectations of journalists through social media, comments or web analytics shapes the way journalists envision innovation and change.

This paper therefore argues that journalism innovation is shaped by an ongoing discursive negotiation of role performance and expectations between journalists and audiences. Drawing on 26 semi-structured interviews with journalists in the Netherlands, we examined how journalists narrate their roles in relation to journalism's future, how they understand and envision innovation, and how this is shaped by the way they imagine their audiences.

Broadly, we found that journalists expressed traditional roles, in which audiences are perceived as both passive citizens needing to be informed, and a source of commercial pressure. Here, roles are constructed independent of audience expectations, and journalists maintain professional autonomy over editorial decisions and work practices.

In that context the discourse on quality over commercial incentives functions as an "effective shield" to ward off innovation and change (Costera Meijer 2020: 2328). However, when our interviewees were asked to discuss innovation and journalism's future, they explicitly embraced an audience-centered perspective. Here, journalists saw innovation not only in techno-centric and market-driven terms for the sake of exploiting technological opportunities or economic advantages, but about how innovation can help journalists to improve journalism's quality, which included catering better to the needs and wants of audiences and reaching them in more effective ways.

Ultimately, our paper demonstrates the vital influence audiences have on the way journalists envision innovation and journalism's future. Moreover, particularly considering audiences' declining news consumption and deteriorating trust in news, it underlines that journalists acknowledge the importance of factoring in audience preferences and expectations in journalistic innovation to successfully safeguard journalism's future.

JOS16 User-journalist relationship I

PP 0415 Using a co-orientation perspective to understand the journalism-audience relationship: A concept paper

Johanna Wolleschensky¹

¹ Catholic University of Eichstätt-Ingolstadt, Department of Journalism, Eichstätt, Germany

The journalism-audience relationship has become a focus of journalism research. Particularly, mutual expectations and the increasing mutual visibility of journalism and audiences in the digital world are analyzed. However, theoretical frameworks for understanding and operationalizing the journalism-audience relationship in the context of masspersonal communication are still lacking.

Based on the argument that journalism in the digital age, especially in the realm of social media, can be characterized as masspersonal communication, and following other scholars who apply interpersonal theories to journalism research accordingly, this paper argues for adopting a co-orientation perspective on the journalism-audience relationship. Specifically, it is proposed to apply McLeod and Chaffee's (1973) interpersonal co-orientation model to mutual expectations in the journalism-audience relationship. Originally developed for dyads, the co-orientation model, based on the principles of symbolic interactionism and Newcomb's A-B-X model, posits that people adapt their behavior based on how they perceive the other's view of an object X.

Within the context of co-orientation, attention is directed towards two individuals or groups, A and B, and their respective attitudes and perceptions towards an object X. In a co-oriented situation, four cognitions emerge (cognitions of A (resp. B) towards X, A's (resp. B's) perception of B's (resp. A's) cognition towards X) from which three relations can be conceptualized: *Agreement* clarifies the extent to which A and B share similar attitudes towards object X. In addition, an intrapersonal relationship, *congruency*, explores the alignment between A's attitudes towards X and A's perception of B's attitudes towards X (and vice versa). *Accuracy*, the third component, is the extent to which A's perception of B's attitude towards X matches B's actual attitude (and vice versa).

The co-orientation model has primarily been used in (interpersonal) family research. A transfer to public communication and organizations has mainly taken place in PR research. The model has been used sporadically in journalism research, but such studies are rare and mostly date from the 1970s – a time when the journalism-audience relationship was predominantly understood as mass communication and characterized by little mutual visibility. Moreover, a theoretical justification for applying the model to the journalism-audience relationship is still lacking.

Therefore, this concept paper argues that the various relations and cognitions can also be transferred to the journalism-audience relationship. The *agreement* relation includes all relationship studies that, for example, compare journalists' role conceptions with citizens' conceptions of journalists. *Congruency* describes the extent to which, for example, journalists' understanding of their roles corresponds to the citizens' anticipated journalistic role image. Finally, *accuracy* deals with the extent to which anticipated audience expectations of journalism (so-called "expectation-expectations") and actual citizens' expectations match.

Overall, the co-orientation model helps to synthesize the existing research and to understand the links between different components of the journalism-audience relationship. In addition, similar to the dynamic-transactional approach, the model points to the reciprocal media effects of journalism and audience. Furthermore, the model offers the opportunity to elaborate different forms of relationships in terms of the agreement and accuracy of expectations of journalism.

JOS16 User-journalist relationship I

PP 0416 Reading below the lines: An eye tracking study on user comments and their effect on journalistic quality perception

Maximilian Eder¹, Katharina Pohl¹, Annika Sehl²

¹ LMU Munich, Media and Communication, Munich, Germany

² Catholic University of Eichstätt-Ingolstadt, Journalism, Eichstätt, Germany

Comment sections have been a well-established part of online news sites for decades. They are interactive spaces for audience engagement and community-building where user comments shape the narrative about issues and have a profound impact on fellow readers' evaluations of news quality (Kümpel & Unkel, 2020; Prochazka et al., 2018; Weber et al., 2019). Consequently, understanding how user comments influence readers' perception of journalistic quality becomes crucial in a digital news environment.

This study delves into the intricate relationship between user comments and readers' assessment of journalistic quality. Building upon previous studies about the influence of user comments on the perception of journalistic quality (Dohle, 2018; Kümpel & Springer, 2016; Prochazka et al., 2018) it is investigated how users comprehend a news article and its accompanying user comments. We hypothesized that 1) readers are more likely to pay attention to negative comments than positive ones, and 2) positive reader comments positively influence the assessment of journalistic quality dimensions. In this context, the use of eye tracking is especially relevant as it allows the validation of users' self-reported cognitive processes.

The 2 x 2 eye tracking experiment accompanied by a survey with 145 participants conducted in 2021 reveals that, on average, participants fixated on high-quality articles longer than on articles of low quality. Furthermore, articles with positive comments posted below were read more intensively. Moreover, negative comments were paid more attention to than positive ones. Overall, comments grab the reader's attention, and negativity addresses the individual's need for orientation, thus acting as an orientation aid. It was also confirmed that positive reader comments affect the assessment of specific quality dimensions. Readers who have seen positive comments evaluate the articles as significantly more transparent and diverse than those who have seen predominantly negative comments.

This study provides insights into the extent to which user comments are paid attention to by using eye movement data and further explores the relationship between the audience's perception of journalistic quality and user comments. Moreover, this research contributes to understanding the subconscious reception of user comments in online journalism and shows that they can have a decisive influence on quality assessment.

JOS16 User-journalist relationship I

PP 0417 Prompting meaning through visuals: Combining image elicitation and open card sorting as a method in journalism research

Phoebe Maeres¹, Kim Löhmann¹, Folker Hanusch¹, Daniel Nölleke²

¹ University of Vienna, Department of Communication, Vienna, Austria

² Deutsche Sporthochschule Köln, Department of Communication and Media Studies, Cologne, Germany

A common methodological difficulty in journalism scholarship is the limitation that traditional in-depth interviews – among the most widely-used methods in the field – have for understanding the underlying beliefs and attitudes that shape journalistic practice. While still useful, interview questions can be too abstract or suggestive and result in learned platitudes or social desirability in responses, especially in relation to journalistic norms and ethics (Irvine et al., 2012).

To address these limitations, we propose a novel methodological approach that combines image elicitation with card sorting in order to facilitate more valid in-depth narratives in journalism research. Image elicitation has been frequently used in anthropology, sociology, psychology, education, and organizational studies (Harper, 2002; Vigurs & Kara, 2016), but in journalism studies it has primarily been employed in audience studies to understand user preferences and evaluations of news (e.g., Swart et al., 2016). The method uses visual cues to start a conversation about certain topics and prompt reflections on more abstract ideas (Parker, 2009). Visuals can thus act as "memory anchors", assisting participants to better reflect and explain their perceptions and experiences (Vigurs & Kara, 2016, p. 514). These visuals can be combined with card sorting to tease out nuances in respondents' views and beliefs. Card sorting asks research participants to sort a given set of stimuli, either open without a defined structure or closed along a set of given categories (Lobinger & Brantner, 2020). It is versatile and provides access to implicit evaluation patterns that lie behind more complex mental categories, while preventing researchers from asking for specific verbal answers.

This paper provides insights from the authors' own use of this method to prompt in-depth narratives around journalistic boundary drawing in both face-to-face and digital settings. We provided 100 traditional and peripheral journalistic actors with 20 cards that represented a wide range of news formats ranging from traditional daily newspapers and newscasts to influencers, podcasters and news start-ups. Each card represented either the front page of a news outlet or a full-screen screenshot of its online presence. Respondents sorted these cards on five concentric circles. They were asked to imagine themselves in the center and to sort the cards according to how similar or different they viewed the other formats from their work. This mapping allowed us to talk about journalistic practices, norms, role perceptions, and audience relationships without ever mentioning the term 'journalism' and elicit discourses around what journalism is and ought to be.

Based on the insights from our study, we offer some further, concrete ideas for future use of the method in journalism studies. These include important considerations of stimuli selection and materiality (e.g., characteristics of the stimuli or the size and shape of the template for sorting), the interview setting (online versus face-to-face), as well as the phrasing of the prompt, and the comparability of the results beyond mere descriptives. Further, we showcase the method's potential in exploring the perception of what constitutes journalism and how boundary work is conducted within and beyond the journalistic field.

JOS17 Knowledge in newsrooms

PP 0418 Platform as the new educators in journalism? Decoding the relation between FJP trainings and journalistic skills

Venetia Papa^{1,2}

¹ University of Cyprus, Department of social and political sciences, Limassol, Cyprus

² Cyprus University of Technology, Department of communication and internet studies, Lemesos, Cyprus

The ongoing discussion about the future of journalism practice has persisted for over a century and in today's rapidly changing landscape, this topic remains vital attracting significant scholarship. The platformization of journalism is seen as a major challenge within journalism studies, with an impact on the technological, economic, and social foundations of journalism modifying journalistic skills and work processes in newsrooms in various ways (Kirchhoff, 2022). This study departs from the findings of a previous socio-technical analysis on the affordances of Facebook Journalism Project (FJP), to understand through the lens of visual and textual analysis the ways the trainings and courses offered by Facebook Journalism Project, strive to enact journalists vis-à-vis their business models by strengthening even more a form of 'platform schooling' (Papa & Kouros, 2023). Platforms through their affordances are initiating a form of platform schooling where each platform has its eco-system presented to journalists as a "one-stop shop," tailored indirectly to serve platforms' economic interests (ibid). Using affordance theory, we argue that the interfaces of technological artifacts are manifestations of their implicit politics and ideology, given that affordances entail normative claims about what journalists should do and how they need to do it. Even though there is ample evidence supporting a shift in newsroom norms based on audience metrics (Hartley et.al, 2023; Mellado, 2021; Truyens & Picone, 2021; Christin, 2020) this article focuses on the understudied another side of the equation, namely the ways the technological infrastructure transposed to journalists indirectly through platforms trainings and courses to trace its role in this shift. The main objective of this study is to uncover the direct interactions between platforms and news organizations via the various trainings suggested as educational materials by FJP encouraging indirectly the affordances of their tools and promoting certain journalistic skills contributing even more to platform schooling (Papa & Kouros, 2023). For this purpose, we first selected nine journalist-oriented tools provided by FJP, by performing a discursive interface analysis, and then collected 541 trainings offered by the tools on their official website. Findings indicate these trainings provided by the platform in question are encouraging specific journalistic norms to emerge, influencing measurable journalism currently in the making. These findings suggest a new form of platform schooling which, in addition to journalism schools and work environments transforms understandings of what is and what is not proper behavior when practicing journalism. This study contributes to journalism practice scholarship by shedding light on the ways journalism education is practiced but also defined -a much debated

issue within digital journalism studies- often pointing to the uncertainties of the field as well as the boundaries of journalism education.

JOS17 Knowledge in newsrooms

PP 0419 Still wanting to make a difference. A study of journalism students' motivation and perception of relevant forms of knowledge

[Nanna Fredheim](#)¹, Gunhild Ring Olsen¹

¹ Kristiania University College, Institute of Communication, Oslo, Norway

In recent decades digitalization and financial disruption in the news media industry have led to a deterioration in working conditions and labor security among reporters. Moreover, journalists face increasing levels of harassment, threats, and violence, and must deal with decreased trust worldwide. In the same period, higher education has undergone key, structural changes. Students today are increasingly recruited from all social levels, resulting in a more diverse student body. Biggs & Tang (2007) suggest that students within higher education now consist of two conceptual types. On the one hand, there is the "traditional", academically motivated student type ("Susan"). On the other, there is a "new", more instrumentally oriented student type ("Robert"), who primarily seeks a formal degree.

Departing from the rapid changes and insecurities within the journalistic practice field, and the structural changes within the education system more generally, the present paper investigates what journalism students perceive as relevant knowledge, and their motivation for undertaking a higher education degree. Previous studies have shown that journalism students appear to be intrinsically motivated in that they seek to communicate, to creatively express themselves, and create change for public betterment (e.g. Carpenter et. al 2014). This contrasts Biggs and Tang (2007), arguing that the student body is becoming more dominated by the instrumental, extrinsically motivated, and practice-oriented "Robert". The question then becomes whether "Robert" also has entered journalism education. As a point of comparison, we include communication students to investigate whether motivation and knowledge views vary between the two student groups.

The paper draws on survey data from undergraduate journalism and communication students (N = 340) within two higher education institutions in Norway – one private and one public. Moreover, 16 in-depth interviews with students and study program managers were conducted.

Preliminary findings show that most students prefer practical knowledge (85% of journalism students and 92% of communication students). However, the academically motivated "Susan" is more strongly represented among the journalism students, of which 37% also prefer theoretical knowledge, compared to 28% of the communication students. Journalism students are also more idealistically motivated than communication students, with 81% seeking a job where they can contribute to the improvement of society (compared to 65% of communication students). Nevertheless, institutional differences matter: journalism students who pay for tuition to a larger extent seek employment with high income (65%), compared to journalism students with free, public tuition (52%).

The findings show that the insecurities within the journalistic practice field don't seem to have altered the motivation of journalism students. However, our data indicates that the conceptual student types needs nuance. Rather than Roberts and Susans, it is the intrinsically motivated and practice-oriented student that dominates journalism education. To educators and future employers, knowledge of students' motivation and knowledge view is necessary to assess their interest in journalism and to what degree curriculum and classes reflect those motivations.

JOS17 Knowledge in newsrooms

PP 0420 Together in the encoding-assemblage: A new materialist framework for examining knowledge production in journalism

[Bissie Anderson](#)¹

¹ Robert Gordon University, Creative and Cultural Business, Aberdeen, United Kingdom

Journalism's broken monopoly over the production of knowledge (Carlson, 2017; Ekström & Westlund, 2019) has led to an erosion of public trust in professional journalism and a general "epistemic crisis" of the present (Steenen, 2019). Pioneer journalism communities around the world have actively sought a redress by transforming journalism's relations with its audiences and the communities it serves, while reimagining journalistic epistemology writ large (Anderson, 2023). Pioneer journalists are the vanguard of journalistic change as they transform journalism and point to its *possible futures* (Hepp & Loosen, 2021). This paper presents a novel analytical framework applied

in a comparative cross-national study of knowledge production in four pioneer journalism communities in Pakistan, Romania, Malaysia, and the UK.

Theoretically, the study is grounded in a new materialist re-reading of the encoding/decoding model (Hall, 1973), arguing that in the networked media ecosystem, the process of knowledge production has become more recursive and relational, where various actors and actants possess agency and “capacity to affect and be affected” (Deleuze, 1988, pp. 127–128). The process of encoding, or knowledge production, in pioneer journalism has been operationalised through the Deleuze-Guattarian concept of “assemblage” – a popular concept in the Digital Journalism literature in the last decade (De Maeyer & Le Cam, 2015; Domingo et al., 2015; Domingo & Wiard, 2016). Scholars have argued for seeing journalism as a series of “assemblages” of social and material artefacts, actors, actants and discourses (Anderson, 2016; Ryfe, 2021).

Thus, this paper will discuss a novel application of a relational, monist analytical framework to the study of knowledge-production in journalism, through the operationalising concept *encoding-assemblage*. Inspired by the Spinozo-Deleuzian ethological approach to data analysis (Fox & Alldred, 2021), the framework has been used to analyse the process of encoding in each of the pioneer journalism communities along four analytical categories:

- 1) the *relations* within the assemblage between various actors and actants (bodies, things, ideas).
- 2) the *affects* created in the encounters between actants and forces.
- 3) the *capacities* to affect and be affected produced by the affective flows within the *encoding-assemblage*.
- 4) the *micropolitics* of the encounters within the *encoding-assemblage*, in terms of the agentic capacities produced in the microprocess of encoding as they materialise in digital story artefacts, and the subsequent capacities to affect that these artefacts can produce in future events – i.e., in (the aftermath of) decoding.

A multi-method qualitative methodology has been applied, drawing from metajournalistic discourse analysis, interviews with 30 pioneer journalists, and multimodal discourse analysis of seven journalism stories, in a multiple case study design.

This relational analytical framework pays attention to the collective production of journalism by a variety of actants, human and nonhuman, physical or abstract (Domingo & Wiard, 2016), recognising and detailing the “plenum of agencies at play”, and drawing the social, the material, and the discursive dimensions together (De Maeyer, 2016, p. 467). It can be applied to studies of knowledge production at either the encoding or decoding end, and epistemic practices in journalism more widely.

PP 0421 Balancing life: Navigating challenges in remote work within the press industry

[Salih Kinsun](#)¹

¹ The University of Essex, Sociology, Colchester, United Kingdom

Our study investigates the myriad challenges faced by local journalists in the UK as they grapple with the transition to remote work and the consequential issues arising from using their homes as primary workplaces. The COVID-19 pandemic has caused a significant shift in the way stories are gathered, news is made, and news is distributed. It has also led to the physical distancing of reporters from the office, making remote work a necessity. This new paradigm is underscored by the participants in this study, who highlighted that this abrupt and somewhat forced shift in the workplace compelled them to rely on their homes as their primary workplaces. The resultant surge in home-based work has sparked extensive discussions within the social science domain, encompassing mental health considerations, difficulties in maintaining work-life balance, the absence of resistance and collaboration, feelings of isolation, intrusion into personal space and privacy, de-professionalisation, additional financial burdens, and heightened job insecurity. Drawing inspiration from these ongoing debates, this study gathers data from 26 local journalists confronting the challenges of remote work, all employed by five monopoly media companies dominating ninety percent of the UK's local journalism landscape. Through in-depth interviews, the collected data is meticulously coded and analysed using thematic analysis techniques. The findings underscore the struggles faced by local journalists, highlighting their difficulties in seamlessly adapting to remote work. Specifically, the study illuminates feelings of loneliness, a lack of resilience and collaboration, heightened stress levels, anxiety disorders, burnout syndrome, and increased job insecurity due to additional financial burdens associated with bills and personal expenses and a shift towards de-unionisation. Situated within the media and communication research framework, this study concludes that journalists working from home encounter many challenges. The surge in remote work, driven primarily by the imperatives of the COVID-19 pandemic, has brought the concept of ‘balancing life and remote work’ to the forefront. Consequently, the home has transformed into a dual-purpose space, acting as both a refuge and a workplace for local journalists in the UK. It is noteworthy that even within the perceived security of their homes, these journalists occupy precarious workplaces, positioning them as marginalised workers in the broader professional journalism landscape.

JOS17 Knowledge in newsrooms

PP 0987 More public money for private media? Understanding audiences' (lack of) support for public subsidies for private news media

Linards Udris¹, Daniel Vogler¹, Jörg Schneider¹

¹ University of Zurich, f0g – Research Center for the Public Sphere and Society / Department of Media and Communication Research, Zurich, Switzerland

Policy proposals for media subsidies depend on the acceptance of voters and media users who inform themselves about such proposals – especially in the case of legally binding referendums. Based on a representative survey of citizens in Switzerland, we examine the voting on the "Media Law" – a law that proposed more than 100 million Swiss francs (~ 100 million €) per year in additional subsidies for private (often commercial) news media but that was ultimately rejected by 55% of voters in February 2022. This case offers a good opportunity to test citizens' and media users' attitudes towards publicly financing an increasingly hybrid media system. First, being put on the ballot in a referendum increases the visibility of media policy and the necessity for citizens to engage with media policy, an issue usually neglected in public (Nielsen, 2014). Second, the law included new, innovative approaches involving digital journalism (direct subsidies for online media and for infrastructure projects) (Puppis et al., 2020; Sjøvaag & Krumsvik, 2018) in addition to traditional forms of media subsidies (indirect subsidies for print plus license fee revenues for regional broadcasters), trying to address the needs of various news media of various types and sizes in a challenging small media market.

In this presentation, we ask how media consumption influences citizens' voting decision. From survey data (n = 3,168), we use pre-registered variables (factors) such as media trust, political self-placement and preference for the right-wing populist party SVP (the party most critical towards news media) in addition to the news use of various media types and channels (13 items). Based on the items on news use, we identified five news repertoires using hierarchical cluster analysis. We use binary logistic regression models to examine the influence of these various factors on voting decisions.

Our results show that the rejection of the proposal is widespread among many sociodemographic groups: age and gender do not matter but education does (higher education = more support). Political attitudes play a larger role: increasing right-wing orientation and increasing preference for the right-wing populist party SVP increases rejection. Similarly, attitudes towards news media are important as well: trust in journalists and in local and regional media goes hand in hand with higher support. As for media use, (non)use of specific channels and media types does not matter when considered in isolation: news repertoires, however, have a certain, albeit limited, influence. People whose news consumption consists predominantly of both public media and regional subscription newspapers are more likely to support the media law than people who can be assigned to one of the other four repertoire types.

Our results speak for an increasing importance of cross-media, news repertoire perspectives (cf. Hasebrink & Hepp, 2017) to explain attitudes and political behavior in the field of media policy. Our results imply that an increasingly digital news consumption without trusted subscription-based private and public service media will make it more difficult to obtain majorities for new subsidies for private media in the future.

JOS18 Journalistic roles

PP 0422 Behind the Byline: Navigating roles in Polish journalism

Kinga Adamczewska¹

¹ Adam Mickiewicz University, Faculty of Political Sciences and Journalism, Poznań, Poland

This presentation focuses on the role performance of Polish journalists. The research problem explores the various roles that journalists assume when creating their publications and examines how these roles coexist based on the covered topics and the type of medium. The study is part of the Journalistic Role Performance project, aiming to comprehend the processes underlying journalistic practices concerning normative expectations in the media environment (e.g., Hallin & Mellado, 2018; Márquez-Ramírez et al., 2020; Mellado, 2017).

The presentation addresses two research questions:

RQ1: What roles do Polish journalists most frequently adopt in their published news materials?

RQ2: Is there a correlation between the journalist's role and the type of medium and topic of the publication?

The sample comprises 6232 of news content from 2020 across four media platforms in Poland: newspapers, television, radio, and online. Two research methods were employed for the study: content analysis and social network analysis. Content analysis allowed to determine how often and with what intensity journalists performed particular roles in their publications, and social network analysis illustrated which roles co-occurred with each other, creating clusters within particular topics.

Preliminary results indicate that journalists commonly assume the roles of watchdog and interventionist, particularly in relation to the covered topics of election campaigns and government activities. However, variations were observed in the roles played by journalists across different media types – on radio, the civic role was more prevalent than on other platforms, whereas in the printed press, the interventionist role dominated.

JOS18 Journalistic roles

PP 0423 Journalistic role conceptions and ideals of social coexistence: Patterns of expectations and attitudes in the German population

Verena Albert¹, Hannah Immler¹

¹ Leibniz-Institute for Media Research – Hans-Bredow-Institut, Journalism Studies, Hamburg, Germany

Mass media and the public spheres they create are pivotal for social cohesion, significantly contributing to individuals' understanding of events and issues beyond their everyday experiences (Hasebrink et al., 2020; Vlasic, 2004). This importance is emphasized during times of socio-political crises and transformational tasks, such as the coronavirus pandemic, European migration debates, and discourses on declining social cohesion in liberal democracies (Fonseca et al., 2019; Weiß/Jandura, 2017).

Journalism is expected to present 'factual' content in a socially comprehensible manner (Potthoff, 2012). However, it has faced criticism for exacerbating societal divisions through sensationalist reporting (Nielsen/Graves, 2017). This criticism highlights the expectation of media and journalism to contribute to social cohesion (Hanitzsch, 2004) and thus the relevance of effectively reaching the audience with their content (Loosen/Schmidt, 2012). Despite existing research on the general expectations of the population towards journalism (Fawzi/Mothes, 2020; Riedl/Eberl, 2020), there is little empirical research on how such expectations relate to social cohesion (Fawzi et al., 2021).

We approach this relationship by examining the correlation between different journalistic role conceptions and ideals of good coexistence as a proxy for social cohesion. Our analysis identifies patterns of role expectations and societal attitudes within the German population and explores their correlation with socio-structural differences.

In a representative population survey in Germany (N = 1,001; 2021), respondents were asked to rate the importance of 25 journalistic tasks (adapted from Hanitzsch et al., 2019) and indicate their level of agreement on a Likert scale with twelve aspects of societal coexistence. To identify empirical correlations between journalistic role expectations and ideals of coexistence in the form of patterns in the population, we conducted a Latent Profile Analysis. In the second step, we examined the resulting profiles according to their socio-demographic composition, information-oriented media use, and perceptions of the state of social cohesion.

The results show that three distinct expectation and attitude profiles can be distinguished. One profile emphasizes classic journalistic tasks such as 'neutral' or 'objective' reporting, combined with individualistic and participatory ideals for society. Another profile shows a higher demand for all journalistic roles, particularly more activist tasks such as 'contribute to social cohesion' and is more oriented towards community-oriented ideals. Higher levels of formal education characterize the first profile, while the second profile is distinguished by diverse media usage. The third profile displays a more nuanced response behavior, with an overall lower assessment of all roles and ideals and a relatively lower rejection of agenda-setting roles, such as 'influence public opinion' and authoritarian ideals. This profile is characterized by lower levels of formal education, less engagement with information-oriented media, and a perception of greater risk to social cohesion.

Our identification and analysis of these three types of value combinations among participants representative for Germany illuminates the alignment of expectations toward journalism with socio-structural categories, reflecting diverse ideals and perceptions regarding society and its social order. This exploration sheds light on the interplay between media, journalism, and societal dynamics, contributing to a comprehensive understanding of the complex relationship between journalism, audience expectations, audience attitudes, and social cohesion.

JOS18 Journalistic roles

PP 0424 Four research methods for studying journalists' knowledge and expertise

Zvi Reich¹, Irit Neumann¹, Oded Jackman¹, Tal Mishaly¹, Liri Blum¹

¹ Ben Gurion University, Communications, Beer Sheva, Israel

The extent to which journalists, especially news beat reporters, know what they are talking about is one of the most fundamental issues in journalism studies, yet it is also highly elusive for empirical exploration. The current paper presents four new research methods that were either developed or adapted for studying different aspects of journalists' knowledge and expertise in a large-scale Israeli research project.

- 1. News sorting.** Pushes journalists outside their comfort zone by asking them to rank a sample of their recent publications. While in the first round the publications are ranked according to subject-matter complexity (e.g. how much economic knowledge is needed to cover a particular item), in the second round they are ranked according to journalistic complexity (how challenging was it to obtain and verify the data). After each round reporters are asked to explain their rankings, describe the challenges of each tier of items and how they addressed them, while drilling down to particular stories. The method yields multi-layered data, including the congruence between both rankings, the reasoning behind ranking and the analysis of the items themselves.
- 2. Delphi panels.** Journalists and experts outline how should the curriculum of journalists' knowledge in a particular field of coverage should look like. First, they offer essential components and standards of knowledge, then they rank how essential each of them is. To avoid biases, both the offering of knowledge items and their rankings are done anonymously, via a digital platform. Panelists were asked: if there was a school for journalists who cover [economics/ politics/ military, etc.], how should its curriculum look like? Data enable both qualitative and quantitative analysis, mapping areas of consensus and dissensus between journalists and experts and detecting internal hierarchies between different components of knowledge.
- 3. WhatsApp micro-diaries.** Allow an unobtrusive long-term tracing of the learning and socialization process of novice beat reporters throughout their first years of the job. The method is used alongside in-depth periodic interviews every six months (including an intake interview as soon as reporters are assigned to the new beat). Reporters receive a bi-weekly WhatsApp questionnaire with several rotating experience-based questions on recent cases of success, failure, insight, and challenge, etc. Data enable the detection of gaps between reporters' plans and actual learning, identify key stages and bottlenecks throughout their socialization and expose some of the strengths and weaknesses of journalists' knowledge in general already at the beginning of their careers.
- 4. Natural Language Processing.** Helps map the emergence of indicators of expertise by analyzing corpora of tens of thousands of news items published by dozens of beat journalists throughout their careers. Data enable to trace the evolution of journalists' expertise based on well-known indexes that are used to measure changes over time in a wide series of linguistic phrases.

Implementing these methods helps mapping three major journalistic aspects: the structure of journalists' subject matter and journalistic expertise, compare their desired expertise and the existing one, and the ways in which journalists in different domains acquire knowledge and expertise.

JOS18 Journalistic roles

PP 0425 Journalists' narrated role performances in time of disruption: Developing resilience strategies in Southern European media systems

Lada Trifonova Price¹, Lambrini Papadopoulou², Theodora Maniou³, Marilyn Clark⁴

¹ Sheffield University, School of Journalism- Media and Communication, Sheffield, United Kingdom

² National and Kapodistrian University of Athens, Department of Media and Communication Studies, Athens, Greece

³ UCY, Department of Social & Political Sciences, Nicosia, Cyprus

⁴ University of Malta, Department of Psychology, Msida, Malta

This study examines journalists' narrated role performances in times of global crisis in four understudied Southern European countries – Bulgaria, Cyprus, Greece and Malta – as well as focusing on resilience strategies that journalists and media organizations develop in order to cope with professional threats that have emerged from or have been exacerbated by the pandemic. A series of recent studies have examined threats and dangers to journalism globally throughout the pandemic and beyond, ranging from the effects of economic adversity and significant loss of advertising revenue (e.g. Hess and Waller, 2021) to restrictions on press freedom aiming to silence critical journalism (e.g. Papadopoulou and Maniou, 2021; Trifonova Price et al., 2023), as well as the impact on the health and wellbeing of journalists worldwide (e.g. Jukes, Fowler-Watt and Rees, 2022; Backholm and Idås, 2022). Dealing effectively with these risks and pressures is of utmost importance for journalists in order to continue providing citizens with accurate and fact-based information and to hold those in power to account. Adapting and surviving entails overcoming challenges that are directly connected with the political, social and economic contexts shaping the

performance of journalistic roles. The unprecedented crisis has demonstrated the extraordinary ability of media professionals to adapt their practice and roles in the face of new challenges (Mellado, 2021). Therefore, it is important for researchers to gain a deeper understanding of the intersections of different roles when journalists cover disruptive events such as COVID-19 that transcend national boundaries.

The findings that will be presented in this paper are based on 32 semi-structured interviews with reporters, editors, and presenters from the main national, independent and public service media outlets in each country, including newspapers/online media outlets and broadcasters who were on the frontline during the height of the crisis and have continued to play a key role in the reporting of the pandemic and beyond. We examine journalists' role performances from two perspectives, namely through a) the relationship between journalism and those in power (e.g. intervention/watchdog and advocacy/loyal facilitator roles) and through b) the relationship between the journalist and the audience (e.g. civic oriented/public service roles) (Mellado, 2015).

Our findings have implications for many media organisations across the world that have experienced disruption brought by a global crisis. They indicate that a crisis of such proportion seems to have strengthened the journalism's perceived watchdog and public roles. Despite the lack of professional support systems, journalists showed remarkable resilience as they turned to their profession's highest values to draw strength and to each other for support. The hardships they faced, both personally and professionally, did not deter them from attempting to fulfil their role conceptions, and essentially fuelled them with persistence and rekindled their faith in journalism as a vocation. These findings are of utmost importance, as we argue for support mechanisms to be embedded in newsrooms that journalists can lean on in times of disruption.

JOS18 Journalistic roles

PP 0426 Paving the way or accompanying visions for a better life? Studying role perceptions of journalists reporting on social disruptions

Marlene Strehler-Schaaf¹, Charlotte Loeb¹

¹ Johannes Gutenberg University Mainz, Department of Communication, Mainz, Germany

Today's recurring societal issues such as climate change, social justice or racism seem to demand journalists to take a stance for social change. New forms of "constructive" or "transformative" journalism within changes in journalistic role perceptions can be seen as an answer to such a demand. While we know a lot about different types of journalistic role perceptions worldwide, we know less on what drives journalists to change their role perceptions in line with such new trends in journalism practice towards social change.

Regarding the research on role perceptions the Worlds of Journalism Study regularly maps the occurrence of role perceptions throughout the world. It became evident that there are not only cross-cultural differences: The individual backgrounds of journalists also shape role perceptions. More recently, studies highlighted that role perceptions might differ depending on the issue journalists report on. Both supports the idea that role perceptions are under constant negotiation. Following this idea we argue that journalists covering protest as a form of social disruptions are more prone to change their role perceptions for at least two reasons: 1) As social disruptions are often controversial, they might foster journalists' engagement with social change on an individual level leading to changes in role perceptions. 2) By nature, protest issues tend to polarize the public, which fosters citizens' expectations of journalists to take a firm stand. Reacting on such presumed expectations might turn journalists to at least consider their current role perception more critically. Based on these assumptions, we aim to deepen our understanding on changes in journalists' role perceptions as a result of covering issues of social disruptions by asking:

1. How do journalists perceive their roles when covering protest?
2. To what extent do they have considerations in mind to change or hold on to their role?
3. Which organizational and individual factors additionally take part in this process?

To answer these questions, we relied on semi-structured interviews of German journalists (N = 38) who did report on protests in recent years. This allowed us to capture diverse role perceptions, as well as explore their underlying interpretation. Our sample contained journalists from different media organizations operating on local, regional as well as national levels. The interviewees were predominantly male (61 %), aged 41 on average. The interviews were conducted between June and August 2023 and structured by a guideline that included questions on role perceptions in general as well as when reporting on protests.

First insights show that while traditional role perceptions such as "watchdog" were salient, they were interpreted according to the specific protest the journalists have been covering. While we are still looking into these individual interpretations of journalistic role perceptions when covering social disruptions and comparing them across media organizations and different target groups, we will be able to present final analyses at conference. As social disruptions are naturally guided by cultural perspectives, we would also like to take the opportunity to discuss changes in role perceptions on a comparative level and enrich our analysis and approach during ECC.

PP 0532 Reordering disrupted realities – Coping at work of war correspondents and photographers in the Russia-Ukraine war 2014–2024

Liia-Maria Raippalinna¹, Suvi Mononen¹, [Turo Uskali](#)², Pasi Ikonen¹, Markus Mykkänen¹, Antero Holmila³

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

² University of Jyväskylä, Department of Language and Communication Studies, Jyväskylän Yliopisto, Finland

³ University of Jyväskylä, Department of History and Ethnology, Jyväskylä, Finland

The Russia Ukraine war – a war in the middle of Europe – has disrupted the European order and self-understanding. Consequently, journalists from all over the continent have been sent to Ukraine to make sense of the war. However, understanding a war is extremely difficult due to various restrictions, disinformation, and propaganda. In addition, it is physically and psychologically demanding work; many war correspondents and photographers face safety threats and post-traumatic stress. While their photographs and news stories explain the realities of war to the audience, journalists also need to restructure and cope with their own experiences of both the realities of war and their own work.

This paper focuses on the coping mechanisms of war correspondents and photographers. The research questions are as follows: 1) What kinds of hardships, both physical and psychological, have contemporary war correspondents and photographers encountered? 2) What coping strategies have they developed? As a case study, we delve to the experiences of Finnish war correspondents and photographers from Russia–Ukraine war (2014–2024) based on qualitative content analysis of in-depth interviews (n = 50) conducted in autumn 2023 and spring 2024.

This paper draws from earlier research literature emphasizing the importance of coping strategies in crisis journalism (Himmelstein & Faithorn 2002; Dworznik 2006; Slavtcheva-Petkova et al. 2023). In addition, the paper recognizes the importance of several organizations in promoting safety issues in the field of crisis journalism. Consistent with previous research, our initial analysis of the interviews conducted by December 2023 (n = 13) shows that war journalists face various hardships, such as physical tiredness and pain, long working hours, sleep deprivation, emotional stress, safety concerns, and traumatic events. Their coping strategies include, for example, rest, humor, social support provided by colleagues/peers and family, and to some extent, professional help provided by employers. However, journalists also find their work in the field exciting, interesting, meaningful, important, and rewarding. Coping seems to result from balancing stress factors with the experience of doing meaningful work.

Conflicting realities constitute a major source of stress. Everyday life at home may seem incompatible with the harsh realities of the war. Particularly, stress relates to the differing realities of the field and the editing office. Journalists may feel their work is not understood and appreciated. In addition, anxieties arise as the platforms, practices and resources delimit what can be told and shown, and whether the story will eventually reach the audience. Work safety issues have improved during the past few years. Otherwise, the support provided to war and crisis journalists by media organizations and editing offices remains limited and unorganized.

There is a need for a more comprehensive understanding of the work and practices of crises journalists to better support them in coping with challenges of reordering the disrupted realities of war.

JOS19 War reporting

PP 0533 How Mariupol's Journalists experienced the Conquest of their City

[Olena Melnykova-Kurhanova](#)¹

¹ National Aviation University, Journalism Chair, Kyiv, Ukraine

Mariupol was under information blockade from March 2 to May 20, 2022. People lacked basic needs like food, water, gas, medicaments, clothes, and, importantly for communication, electricity. Therefore, mobile connectivity was quite limited during this period. In March 2022, all types of connection disappeared.

In times of war, journalists often become “gatekeepers” of news mediating information from the war zone to the public (e.g., Ojala et al. 2018). Providing reliable evidence of the war and uncovering false information became crucial during the Russian invasion of Ukraine given the proliferation of Russian strategic narrative and disinformation in the media before and after February 24, 2022 (e.g., Khaldarova & Pantti, 2016).

Even though there is a stream of the literature on the duties of war correspondents, little is known about the work of local reporters of affected countries and how their roles are being transformed during the war. This proposal is certainly among the earliest studies to investigate how Ukrainian journalists in the territories conquered and occupied by Russia in 2022 experienced and responded to the invasion.

The study aims to identify the peculiarities of journalist work in Mariupol during the siege and Russian interference in the functioning of the city's information space.

This entails the following research questions:

1. How did working conditions of journalists in Mariupol change over the timeframe of the siege?
2. How and through what channels did the Russian pressure increase? What were its effects on journalist work?

These questions are answered through the framework of case study involving several methods, primarily semi-structured qualitative interviews with 22 journalists with different backgrounds who worked in Mariupol during the siege of the city. These results are supplemented with multiple sources of data, particularly, qualitative document analysis (e.g., social media posts, photos, etc.).

The document analysis was based on the convenience sample of all materials available to the researcher, including news media, social media, leaflets, and eyewitness accounts concerning the means of communication in Mariupol in the wartime. This mixed-methods case study approach resulted in multi-perspectival mapping of the media landscape, available news sources and journalist professional routines changed in Mariupol after the beginning of the full-scale Russian invasion of Ukraine.

The key results point out the following: 1) at the beginning of the full-scale invasion, Russia actively attempted to recruit TV journalists offering to cooperate with the media of the annexed self-proclaimed "Donetsk People's Republic"; 2) in early March 2022, journalists largely moved to the popular Telegram messenger as a publishing platform, which allowed to download data quickly; 3) journalists verified and published photos and videos of residents from all over the city. These findings underscore the complex changing professional role of journalists trapped in a war zone, targeted by the enemy, forced to develop new technical skills.

JOS19 War reporting

PP 0534 Norwegian and Swedish television coverage of the Israel-Hamas war in 2023

Kristina Riegert¹, Kristin Skare Orgeret²

¹ Södertörn University, Journalism/School of Social Sciences, Huddinge, Sweden

² Oslo Metropolitan University, Department of Journalism and Media Studies, Oslo, Norway

The latest Israel-Hamas war that erupted on October 7, 2023 has far exceeded the death and destruction of previous hostilities. Despite international diplomatic efforts to secure a ceasefire, success has been limited. The prolonged Israeli siege of Gaza has had a polarizing effect on domestic opinion in Western countries, as evinced by large pro-Palestinian demonstrations, antisemitic attacks, and accusations of Western news bias. Strikingly, the war has taken an unprecedented number of humanitarian workers' and journalists' lives.[1] International law has been invoked from a variety of vantage points: from the right of self-defence and human shields, to collective punishment, violations of the discrimination and proportionality principles, allegations of illegal weapons, to genocide and ethnic cleansing.[2]

Comparative European media research shows that mainstream news coverage of international conflicts aligns with their respective countries' foreign policy traditions, policy stances or journalist cultures, irrespective of direct military involvement (Nohrstedt & Ottosen 2001, 2005; Hafez 2007; Riegert, 2011; Nygren, et. al. 2016). While previous conflicts were domesticated to national frameworks of understanding, the evolving hybrid media ecology merges traditional and social media logic, and may challenge the assumption that long-term national orientations persist in news coverage. Media coverage could reflect more transient and shifting policy stances of governments in specific conflicts, particularly given the growing influence of domestic opinion on foreign policy (Aggestam, Schierenbeck & Wackenhut 2023).

This study aims to ascertain whether the news coverage of the Gaza conflict in the most widely viewed news programmes on Swedish and Norwegian public service television reflects the Norwegian and Swedish policy stances on the Israel-Palestine conflict. The two Nordic countries have similar media systems, but historically different foreign policy traditions and stances. Regarding the Israel-Palestine conflict, while both Norway and Sweden have taken on roles as international mediators and bridgebuilders, Sweden has recognized the state of Palestine, whereas Norway has not. On the other hand, Sweden's relationship with the US has changed after its application to join NATO in 2022.

A quantitative content analysis spanning the initial month of the war (October 7th – November 7th 2023) will ascertain the extent to which Norwegian and Swedish news programmes prioritize the conflict itself, what aspects of the conflict are focused on, what role international organisations and international law have, what kind of sources they rely on and evaluate whether they scrutinise governments and stimulate debate on political and social issues according to their public service mandates (Robertson 2010; Riegert 2011). The study's findings will have a direct bearing on scholarly discussions of the degree to which national orientations persist in mainstream news coverage.

JOS19 War reporting

PP 0535 How the war in Ukraine looks like from 20 FrontPages around the world

[Ioli Campos](#)¹

¹ Católica University of Portugal. CECC- FCH - Media and Journalism, Lisbon, Portugal

People tend to believe in what they see considering an image almost as a proof of what happened. Rarely, do they consider news photos as a matter of opinion (Perlmutter, 1998), even if images are always constructed. Yet, how photos freeze time may influence the audience's perception of events (Zelizer, 2010).

Images of war victims are a form of rhetoric, sustains Susan Sontag (2003). "They reiterate. They simplify. They agitate. They create the illusion of consensus." (p. 8).

Regardless of how pervasive the media effects may be, various stakeholders have tried to use propaganda to manufacture consent and get support (Chomsky & Herman, 2006). Knowledge is often constructed through a relationship between power and dominance (Foucault, 1980). Journalists exert some power selecting what and how to show. Journalists' level of power may vary according to a country's press freedom and political regime. In any case, how newspapers' FrontPages show a war may have an impact on the audience perception of that war.

Various studies have already analysed the visual representation of wars. While studying the photojournalistic coverage of the 1991 Gulf War, Griffin and Lee (1995) concluded that it did not convey all its complexity. It focused mostly on military weaponry and technology imagery. On another study, Nikolaev (2009) concluded that the war on Kosovo was shown differently on news outlets from opposing sides. Nevertheless, there is a gap in the literature about multiple visual media representations of the same war across countries (Keith, Schwalbe, & Silcock, 2010).

That is a gap that this ongoing study intends to fill by examining **how was the war in Ukraine portrayed by journalists from different parts of the globe**. It does so by examining the visual representation of the war during its first month and one year later while comparing the FrontPages of 20 newspapers from all continents, through a quantitative content analysis.

The analysed categories include the presence of non-war or war images, which were coded for their content (Schwalbe & Dougherty, 2015; Schwalbe, Silcock, & Keith, 2008). Other categories included the photo angle and prominent position.

Those visual categories were then analysed in co-relation to the countries' rank in the media freedom index by Reporters without Borders; the countries' geographical distance to the conflict and the countries' alignment through its vote to suspend Russia from the Human Rights Council of the United Nations.

Preliminary findings indicate that countries geographically farther from the epicentre tend to exhibit fewer war images. An exception to that is the United States and, to a lesser extent, Japan, where the war has been extensively covered. This suggests that countries aligned with Ukraine, even when far away from the region, have given more news coverage. Additionally, the visual representation of the war seems to have evolved from a bloodier human interest frame to a more institutionalized and diplomatic one.

Comparing different visual representations of the same war is important because how wars are represented around the world may be related to audiences' perceptions about them.

JOS20 Constructive journalism

PP 0536 The real-world effects of constructive journalism: A field experiment on climate change news coverage

[Morten Skovsgaard](#)¹

¹ University of Southern Denmark, Centre for Journalism, Odense M, Denmark

News coverage tends to focus on problems, conflicts and wrongdoings (Esser et al., 2016; Soroka & McAdams, 2015). Such a negativity bias risks leaving people feeling distressed, disengaged and disempowered (; Boukes & Vliegthart, 2017; McIntyre & Gyldensted, 2018). The news coverage of the climate change issue is also focused on negative events and trends with catastrophic consequences (Hart & Feldman, 2014) risks leaving people feeling helpless and passive (Morton et al., 2011).

Constructive journalism has been proposed as way to increase efficacy and engagement in reducing anthropogenic climate change (EBU, 2023). So far, however, extant research has provided limited evidence for the effects of constructive climate journalism. While results from experiments in which participants are exposure to a single

news story indicate that constructive journalism might have such effects (e.g., Hart & Feldman 2016), it is not clear whether these effects can be sustained in a media environment where people are exposed to a substantial amount of information and news each day.

To establish causal effects in a real-world setting and reduce the external validity problems of the survey experiments in extant research, this study is based on a field experiment. It utilizes a journalistic campaign in which the two dominant regional news organizations on the Danish island Funen, the newspaper *Fyens Stiftstidende* and the television station TV 2 Fyn, during two weeks in May 2023 produced more than 40 constructive news stories on the issue of climate change. These news stories—embedded in the daily news coverage—focused on positive examples and potential solutions to how climate change can be mitigated through changes in food production and individual eating habits.

The study employed a difference in differences design in which a group that is exposed to constructive climate news is compared, both before and after exposure, to a control group that is not exposed to constructive news. In collaboration with the news media conglomerate JFM that publishes a number of regional Danish newspapers, two surveys in March and June 2023 (before and after the constructive climate journalism campaign) were distributed in a user panel with people from Funen who use *Fyens Stiftstidende* and people from Jutland who use another regional newspaper, *Jyske Vestkysten*.

Both surveys measured efficacy, evaluation of climate coverage in their local newspaper, and intentions of increasing climate change mitigating behaviour, and the changes in the treatment group (people exposed to the campaign in Funen, $n = 812$) were compared with the changes in the control group (people in Jutland exposed to regular climate change coverage, $n = 1684$).

The analyses showed statistically significant positive effects of being exposed to constructive climate change news on the evaluation of the climate coverage in the local newspaper and on self-efficacy, but no effects on collective and response efficacy as well as behavioural intentions. These results give one of the strongest indications so far that constructive news has positive effects on important outcomes even when exposure is only a smaller part of the total information people are exposed to in a real world-setting.

JOS20 Constructive journalism

PP 0537 Interconnected Journalism: Fighting against social disorder

[Carla Rodrigues Cardoso](#)¹, [Ana Figueiras](#)¹

¹ Universidade Lusófona de Humanidades e Tecnologias, ECATI - Escola de Comunicação- Arquitetura- Artes e Tecnologias da Informação, Lisboa, Portugal

Recent journalistic trends, such as Constructive Journalism and Solutions Journalism, emphasize the evolving need for journalism to transcend the traditional conflict-oriented news. There is an urge to shift its focus towards exploring viable pathways to overcome problems and actively contribute to the discourse surrounding plausible, actionable solutions. This is not to deny the media's invaluable and unique role as a counterpower, essential to a healthy democracy. Still, journalism must go beyond that to reconnect with people weary of journalism and news centred on negativity.

This paper proposes a novel journalistic model, which we call Interconnected Journalism. This new conceptual framework has the potential to strengthen the role of the media in a democratic society, counteract disinformation and populism, and contribute to greater peace and social order by fostering awareness of individuals' interconnections. We define interconnected journalism as an evolving form of journalism that delves into problems and solutions across borders, rooted in the interconnections of local practices in different communities.

People are not alone, they live in an interconnected world. Local phenomena are part of broader dynamics that extend beyond their immediate surroundings and are common to other communities and/or countries. Interconnected journalism aims to bring people and communities closer together through information that reveals the shared nature of problems perceived as local, emphasizing that these issues are common to various communities within their own countries and/or in other countries. This collective awareness through news goes beyond the recognition of common problems, leading to the exploration of shared solutions, already existing in other communities and applicable elsewhere. In essence, this new type of journalism provides visibility to the interconnections among national and transnational communities, fighting against social disorder by promoting empathy and combating hate speech and social indifference.

Interconnected journalism is more demanding because it pushes reporters to always put the topics they are investigating into perspective, focusing on at least two different communities in a comparative approach centred on what is significant to people's lives. It is a journalism that seeks to reveal what connects people within their country's borders and beyond, applicable on both micro or macro scale. This means that regional media inside one country can address this new form of journalism, as well as an international media network. To illustrate it, we will present an example of an interconnected feature developed by journalism students through an academia-media

partnership and will explain how different topics can be covered by this new form of journalism. Finally, we will outline the elements of interconnected journalism and the steps to develop an interconnected feature, offering a globally applicable framework suitable for inclusion in journalism programs at both academic and professional levels.

JOS20 Constructive journalism

PP 0538 "Happy news" initiatives as a response to "news-is-too-negative" perceptions: A content analysis of BBC's The Happy Pod

Ruth Palmer¹

¹ IE University, Communication and Digital Media, Madrid, Spain

Increased competition for audiences and advertisers in the digital environment has put more pressure on news organizations to respond to the widespread perception that news is too depressing. One option is constructive journalism. Proponents of constructive journalism insist it is not simply "good" or "positive" news about one-off events or individual heroic acts, but nuanced reporting about responses to social issues that retains traditional journalistic values (Aitamurto & Varma, 2018; Constructive Institute). In other words, it preserves what is presumably the unique value proposition of journalism, but frames stories to highlight scalable solutions rather than intractable social problems.

However, it is not clear that constructive journalism is, itself, scalable. It has been likened to investigative journalism and is similarly resource-intensive (McIntyre and Lough, 2021). Moreover, evidence is mixed about whether constructive stories get more attention and engagement than traditional news stories (Constructive Institute), raising serious questions about whether it is worth the investment.

Meanwhile, some legacy news organizations are experimenting with less resource-intensive ways to address the perception that news is too negative. On the surface, these "happy news" initiatives appear to be producing exactly the kind of news that advocates of constructive journalism dismiss as trivial: news that is "just" positive (Baden et al., 2019). And yet, some of these initiatives are produced by highly respected legacy news institutions and, in theory, they could address some of the main drawbacks to constructive journalism, namely how resource intensive it is.

So far, these happy news initiatives have received little scholarly attention, so this paper begins to address that gap by providing a quantitative and qualitative content analysis of one of them: the BBC's *Happy Pod*, a weekly episode of its flagship *Global News Podcast* that focuses entirely on upbeat stories. The main questions we address are: What kinds of stories are covered in the *Happy Pod*? Do they apply traditional news values and, if so, which ones? Alternatively, do they apply a different set of "joyful" news values (Parks, 2021)? Initial findings show clear patterns in the types of stories covered, which often do not apply traditional news values but do apply a consistent set of alternative criteria. In the discussion, we reflect on the prospects of such initiatives to address waning interest in news and growing news avoidance.

JOS20 Constructive journalism

PP 0540 Constructive journalism in the Netherlands: An overview of the last 20 years

Rolien Duiven¹, Tineke Prins¹

¹ Windesheim University of Applied Sciences, Research group Valuable Journalism, Zwolle, Netherlands

The future of journalism is under pressure and (re)connecting with the audience's needs has become more relevant than ever. The potential of news media is to provide something substantial to a democratic society: 'independent, reliable, accurate and comprehensive information that citizens require in order to make sense of the world around them' (Kovach and Rosenstiel, 2021: xxi). This potential might be limited by the negative side effects of news consumption, such as people feeling less positive, disinterested and powerlessness (Aitamurto and Varma, 2018; Newman et al., 2017, 2019).

One of the public-oriented journalistic approaches that focuses beyond the conflict or problem and tries to overcome the negative side effects of news consumption is constructive journalism (Hermans, 2022; Lough & McIntyre,

2021). The emergence of constructive journalism took place in the mid-2010s, and it aims to produce news that is more accurate and engaging while still meeting the core values of journalism.

As previous research mainly focused on the processes, the products, and the effects of constructive journalism, there is still a lack of knowledge about the actual use of constructive elements in news reporting (Lough and McIntyre, 2021). Therefore, the aim of the current study was to gain insight whether the use of constructive elements in news reporting in the Netherlands has changed over the last twenty years.

A content analysis was used to code a sample of articles from three Dutch regional newspapers from 2002 to 2022. Three key elements of constructive journalism were investigated. First, the degree of solution orientation in the news article. Second, the kind of solution mentioned – future-oriented, perspective for action, other solution – was coded. Lastly, whether a more public-oriented approach was used over the years was coded by looking at the diversity and perspectives of sources mentioned in the news articles.

Preliminary results of the last ten years (2013–2022) show that the degree of solution-orientation in news articles changes: while the percentage of news articles with no solution mentioned at all decreases, the percentage of news articles with a solution-oriented approach slowly increases over the years. Although orientation towards the future in news articles shows no change over the last ten years, the percentage of news articles containing action-oriented information increases. A more public-oriented approach becomes visible in the perspectives of sources mentioned in the news articles: especially from 2018 a greater diversity of perspectives is used.

During the conference, we will elaborate on these results and further discuss the role of news topic and news genre in the use of constructive elements in journalistic reporting. For now, these preliminary results show small changes towards a more constructive-oriented approach in news reporting in the Netherlands.

JOS21 News consumption

PP 0541 News satiation – Understanding audiences' experiences of temporary news avoidance

Brita Ytre-Arne¹, Hallvard Moe¹

¹ University of Bergen, Department of Information Science and Media Studies, Bergen, Norway

This paper analyses why and how people temporarily avoid news, introducing the novel concept *news satiation* to understand a central aspect of the relationship between journalism and its audiences.

In a world situation with wars, climate change and political disruption, and news as part of the attention economy across datafied platforms, news could easily be experienced as demanding. An influx of studies during the COVID-19 pandemic documented information overload and shifting levels of news use (de Bruin et al., 2021; Groot Kormelink and Klein Gunnewiek, 2021), including reconfigurations of habits and repertoires (Broersma and Swart, 2021; Vandenplas et al., 2021). Our study builds on this literature to go beyond the pandemic situation, providing journalism studies with a novel concept to understand temporary avoidance of news.

Our research question is: Which characteristics of the news environment contribute to experiences of overload, and how is temporary avoidance part of news user practices?

Methodologically, we draw on a qualitative study conducted in Norway in 2022/23, with 30 informants diverse in age, gender, occupations and rural/urban backgrounds. Informants participated in in-depth interviews about their everyday lives and news habits, including topics such as the war in Ukraine, energy prices, the climate crisis and local issues. We contextualize our qualitative analysis in light of findings from the Norwegian data from the Reuters Digital News Report.

Our findings show that experiences of overload were widespread, also amongst regular news users. Informants described distress at unsettling events, tiredness of prolonged debates without resolutions, or criticisms of sensationalism or polarization, often mixed with struggles to prioritize and find news relevant to everyday life. We systematize such reactions through the categories "too much", "too dark", "too silly", "too biased" and "too distant", underlining how these interlink. Our analysis outlines cycles of feeling overwhelmed by news – but still needing to return to news again later, which we conceptualize as *news satiation* (the tipping point of feeling overwhelmed) and relatedly *news satiety* (the state immediately thereafter).

By launching the concept of news satiation, we decouple the widespread practice of temporary news abstention from prolonged habitual low levels of news use. This is a timely intervention in the field of research on news avoidance (Skovsgaard and Andersen, 2019), where studies of these phenomena are sometimes mixed together, although they have different implications for journalism and society (Toff et al., 2023). Our study seeks to facilitate a informed discussion of when and how different kinds of avoidance could be problematic for democracy.

PP 0542 Data donations: A mixed-methods approach

[Tim Groot Kormelink](#)¹

¹ Vrije Universiteit Amsterdam, Faculty of Humanities, Amsterdam, Netherlands

In a digital media landscape that is characterized by audience fragmentation and algorithmically curated feeds, it has become increasingly challenging to study how users engage with news on social media platforms. A new method of digital data collection that shows great promise in this area is data donation. Data donation refers to the tools and processes through which individuals make available for academic research the data that digital platforms (e.g. Google, Facebook, TikTok, LinkedIn) have collected about them (Araujo et al. 2020). This study uses an infrastructure that was designed to guide users willing to donate their data for academic research through the process of requesting their data from platforms and donating these to research.

Combining data donations with think-aloud protocols and in-depth interviews, this mixed-methods study has two key aims. First, methodologically, it explores how research participants experience and understand the data donation process. In addition to the data from the data donation itself, the key method in this first part is the think-aloud protocol. Participants will be asked to verbalize their thoughts and actions as they go through two stages of the data donation process: 1) requesting their data packages from the digital platforms; and 2) uploading and donating their data.

Second, substantively, this study explores how people engage with news and information on different online platforms, and what (relative) role these platforms play in their overall information repertoire. From their data donations, consisting – depending on the platform – e.g. of viewed posts, likes, and comments, it will be possible to tease out where and how news plays a role. However, since participants may have their own understanding of what news is, findings and excerpts from data donation will also be discussed with each participant in a final in-depth interview. During this interview, participants will also be asked about their overall news use practices, so as to be able to determine how their news use on digital platforms fits into their overall information repertoire.

The data collection will take place in the Netherlands between January and February 2024. 20 participants will be selected via snowball sampling. While studies using data donation have so far typically focused on one platform, this innovative pilot study includes seven platforms: Google, YouTube, Facebook, Twitter (X), Instagram, LinkedIn, TikTok. The project is user-centered, in the sense that the data donation will focus on those platforms that each participant in question predominantly uses. For instance, if participant A uses Google, Twitter, and TikTok, they will be assisted to request and donate the data from these specific platforms. Overall, this study hopes to generate a more detailed, nuanced understanding of the role digital platforms play in people's news use.

PP 0543 Constructing boundaries: Exploring perspectives on the role of public service media among journalists, audiences, and politicians in the Czech Republic

[Klára Smejkal](#)¹, [Iveta Jansová](#)¹, [Marína Urbániková](#)¹

¹ Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

Although public service media (PSM) have a strong position in most European countries and are perceived as the most trusted source of information (Eurobarometer, 2023), they currently face two major challenges. First, the fragmentation of the media landscape causes an outflow of audiences to the online environment where the role of PSM is not that strong (Donders, 2021). The second challenge is the increasing politicization, which is rooted in attacks by populist politicians who label them as mouthpieces of biased elites (Holtz-Bacha, 2021). These challenges have the potential to shape how the role of PSM and its boundaries are perceived by its three key stakeholders (the public, politicians, and journalists) and to challenge the social consensus on what role PSM should take on in society. This is where this study steps in, asking how the public (audiences), journalists and PSM managers, and politicians construct the boundary of the role of PSM and where their perspectives diverge and overlap.

Our research builds on two streams of literature: the studies that explore how journalists define the boundaries of their work (e.g. Carlson & Lewis, 2015; Hanitzsch & Vos, 2018; Hanusch & Hanitzsch, 2013; Örnebring, 2013) and the research focusing on audience expectations of the news media (e.g. Banjac, 2022; Banjac & Hanusch, 2020; Loosen, Reimer & Hölig, 2020; Riedl & Eberl, 2020; Tandoc, Duffy & Li, 2016; Vos, Eichholz & Karalióva, 2019).

Despite this rich literature, only a limited number of studies have examined how audiences (e.g. Campos-Rueda, 2023; Campos-Rueda & Goyanes, 2022; Just, Büchi & Latzer, 2017) and journalists (Urbániková, 2023) perceive the role of PSM which, in addition to producing quality news, are tasked with creating educational and entertainment content and bringing society together (Syvertsen, 2003). At the same time, to the best of our knowledge, no study has examined how politicians perceive the role of PSM. This is particularly relevant as politicians set the regulatory framework for the operation of PSM, including their oversight and funding (Lowe & Berg, 2013). The Czech Republic serves as a suitable case for this study because it combines low general trust in the news media with high trust in the PSM (Newman, 2023). Moreover, the Czech Republic currently finds itself in the midst of a discussion about the change in the financing of PSM, which is closely linked to debates on defining the mission and remit.

To bridge these gaps, our study utilizes empirical data from 10 focus groups with the public (N = 60), 23 interviews with journalists and PSM managers, and 11 interviews with politicians (MP's from opposition and government parties). Employing principles of thematic analysis (Braun & Clarke, 2022), the research aims to provide a comprehensive understanding of how these three stakeholder groups construct the boundaries of PSM's role, identifying areas of convergence and divergence in their perspectives.

PP 0544 Mimetic isomorphism at public service media: Knowledge transfer between a traditional and a youth-centric public service media organisation in Germany

Lea Sophia Lehner¹, Annika Sehl¹

¹ Catholic University of Eichstätt-Ingolstadt, Department of Journalism, Eichstätt, Germany

In today's rapidly evolving media landscape, public service media (PSM) encounter the challenge of adapting to digital advancements and changing media consumption patterns to fulfil their mission. The concept of isomorphism, especially mimetic isomorphism, derived from organisational sociology, posits that in the face of uncertainty, organisations tend to imitate perceived successful companies and trends. This imitation is driven by the desire to enhance success and establish legitimacy (DiMaggio & Powell, 1983, pp. 150–154; Lowrey & Woo, 2010).

We argue that today, the interplay between established media organisations and innovative newcomers becomes crucial for PSM to adapt to the needs of diverse audiences. Therefore, this research explores knowledge transfer between two German PSM organisations, ZDF (Zweites Deutsches Fernsehen), a traditional broadcaster, and funk, a youthful and start-up-like online-only entity, founded in 2016, catering to individuals aged 14–29.

Despite the growing significance of this topic, research using the theoretical lens of mimetic isomorphism on innovation and change in PSM is rare. However, the approach has been used in PSM in the realm of digital project and product development, demonstrating that exchange is strongest among PSM, but digital-born media are perceived as most successful in attracting younger audiences (Sehl & Cornia, 2021, p. 1482). Our research builds upon this foundation, investigating isomorphism tendencies between traditional and youth-centric digital-born PSM, by asking the following research question: *How does the transfer of knowledge between German traditional (ZDF) and youth-centred PSM (funk) influence their innovative capacity and adaptability?* The study is based on 17 semi-structured qualitative interviews with key stakeholders in ZDF and funk in December 2023 and January 2024. The interviews focused on four main aspects: structural organisation, product management, format development, and audience metrics.

The study reveals a reciprocal influence between funk's innovative management approaches and ZDF's established structures. Despite differences in age demographics and organisational culture, ZDF adapts and integrates new structural paradigms introduced by funk, reflecting the principles of mimetic isomorphism. This adaptation is not merely a one-way street; funk, in turn, benefits from the experience and stability provided by ZDF's longstanding organisational frameworks.

Format development emerges as a key area where collaboration proves fruitful, with funk's nimbleness leading to faster development of innovative and trendsetting content. Surprisingly, some formats from funk eventually find their way into ZDF's programming after a few years, demonstrating a bidirectional flow of creativity influenced by mimetic isomorphism dynamics.

Audience research is crucial in both media houses. Funk's integration of audience metrics, particularly sentiment analysis, allows to indicate shifts in public sentiment, controversies, or resonance and aids in the proactive management of any communication (dis)orders that may arise. ZDF's comprehensive media research section focuses on understanding audience behaviours, reflecting a shared commitment to data-driven decision-making.

This study significantly contributes to understanding knowledge transfer in the media field, emphasizing collaboration and mimetic isomorphism tendencies between traditional and new PSM. As media landscapes worldwide grapple with generational shifts and technological advancements, the results provide implications for fostering collaboration and adaptability in an era of rapid change.

PP 0545 Understanding the interaction of content, situatedness, and user practices in everyday experiences with news

Marianne Borchgrevink-Brækhus¹

¹ University of Bergen, Department of Information Science and Media Studies, Bergen, Norway

This study explores how people experience news in everyday life, contributing with a holistic perspective to understanding the interaction between news content, situatedness, and user practices. Following the audience turn in journalism, much attention has been paid to understanding the complexities of people's news use. The challenges of declining revenues have also forced news professionals to become more responsive to why people (do not) invest time, money, and attention in news and what these practices mean from an audience perspective. Consequently, journalism studies have increasingly focused on examining how journalistic content is received and made sense of (e.g., Bengtsson, 2023; Schrøder, 2015; Toff & Nielsen, 2022), what people's user practices may imply (e.g., Costera Meijer & Groot Kormelink, 2021), or how spatiotemporal aspects matter for news and media consumption (e.g., Broersma & Swart, 2022).

Yet, these valuable contributions often tend to focus on individual platforms or news formats, particular user practices and habits, or the situatedness surrounding people's news use. We know less about how the experiential aspects of content, situatedness, and user practices *resonate and interact* in the setting of everyday life. Rather than approaching these three dimensions individually, this study suggests a more holistic approach to understanding the complex dynamics shaping individuals' experiences by asking: *How does the interaction between content, situatedness, and user practices resonate with experiences of news in everyday life?*

Drawing on a three-step data collection with Norwegian news users, combining recurring interviews, media diaries, and video ethnography grounded in people's media experiences (N = 14X2), the study provides an audience-centered and experiential approach to understanding news use. Results identify six key experiences with news: 1) Reassurance, 2) control, 3) connection, 4) relaxation, 5) diversion, and 6) news as a negative constant creating stress, all in which content, situatedness, and user practices resonate differently.

The paper makes several contributions to the fields of journalism studies. Empirically, the study demonstrates the significance of linking multiple dimensions of news use to advance our conceptions of the multidimensionality of people's media experiences. Methodologically, the paper illustrates how a data collection combining different data points grounded in people's everyday lives can yield a deeper understanding of experiences with news. Conceptually, the paper bridges theories of content, situatedness, and user practices structured through a matrix of six key experiences with news.

PN 084 Trick-or-treat: how will European public service media navigate platformisation?

[Dragomir Marius](#)¹, [Marta Rodríguez Castro](#)¹

¹ University of Santiago de Compostela, Communication Sciences, Santiago de Compostela, Spain

In the past decade, Public Service Media (PSM) have been faced with numerous challenges as the rise of the platformised economy has fundamentally changed the structure of media markets and the nature of audience engagement. As commercial players are adjusting to the new platform-shaped logic, PSM are grappling with a slew of problems. These include mandate-related limitations to fully embracing the platformised media model and internal operational issues, such as the resistance of staff to change, and the difficulties of reforming such large organizations designed for and born in the analogue era. This paper will map and analyse the main challenges that public service media face in four key areas: their mandate and governance, funding models, audience strategies, content production and professional development, with a view to understanding how the values of PSM – universality, independence, excellence, diversity, accountability, and innovation – are being safeguarded during this transformation. The analysis seeks to add to the expanding body of research on the future of PSM in the post-platform era. Using a normative and empirical framework created by the authors, the article emphasizes the vulnerability of independence, diversity, and excellence to mounting challenges and attacks. Among the four aspects discussed in the article, it appears that funding alterations will present the greatest obstacles for PSM moving forward. This is partly because of tensions between the principles of PSM funding and the trends triggered by platformisation. But attacks from political parties and politicians seeking to destabilise PSM have also targeted the funding models of PSM particularly those anchored in contributions from the public (i.e., license fees), which tend to secure the highest level of independence from the government.

JOS22 Navigating stormy waters: A comparative analysis of public service media

PN 085 When trust and tradition are not enough: commercial and political pressures on Nordic PSM

[Minna Horowitz](#)¹

¹ University of Helsinki, Social Studies, Vantaa, Finland

The Nordic countries have been labeled as “Media Welfare States” (Syvertsen et al. 2014), characterized, among other things, by the legacy of strong national mixed media systems in which public service broadcasters (PSBs) play a crucial role. PSB organizations have also been at the forefront of digitalization and, early on, have become, de facto, public service media (PSM) that offer a variety of content and services in different formats and platforms, including on social media. Still, in recent years, many Nordic PSMs have faced strong opposition from their national commercial counterparts and populist right-wing politicians. Commercial media, worried about their future in the era of platformisation (see Dragomir and Castro’s contribution), argue that PSM has an undue advantage in the domestic news and entertainment market and that PSM offerings should be significantly reduced to “fill in the gap” by mostly providing genres that are not commercially viable and by offering content for audiences not addressed by commercial media (e.g., language minorities). The rise of populist politics in the Nordics, as in many other countries, coupled with austerity policies, has additionally heightened the claims in the political debates that PSM are over-funded – and possibly politically biased. The case of the Nordics is especially interesting in that trust in PSM is extraordinarily high compared to many other countries, and even if they do not feel PSM are significant in their media diet, Nordic audiences consider PSM as highly important to society as a whole (e.g., Horowitz et al. 2023; Nielsen and Newman 2023). In addition, Nordic policy-makers and media literacy experts see PSM as essential in combating communication disorders in today’s multi-crisis environment (Karell and Horowitz 2022). Drawing from audience analyses (Horowitz et al. 2023), interviews of PSM professionals and stakeholders (Karell and Horowitz, 2022), and country-specific cases of policy-making (e.g., Ala-Fossi et al. 2024 forthcoming), this contribution discusses the paradoxical role of PSM in the Nordics with the focus on largest countries Denmark, Finland, Norway, and Sweden: the arguments contra PSM, the actions against PSM – as well as existing and emerging opposite developments and actions to strengthen the role of PSM.

JOS22 Navigating stormy waters: A comparative analysis of public service media

PN 086 From “Cheap Worn-out Prostitutes” to a “Greek Scenario”

[Marko Milosavljević](#)¹

¹ University of Ljubljana Faculty of Social Sciences, Social Sciences, Ljubljana, Slovenia

A rhetoric of crisis now dominates the debate about Public Service Media (PSM) in Slovenia, which has arisen from a combination of societal, technological, and political processes over the last decade. PSM, both as a concept and as specific organisations, are said to be eroding, collapsing, vanishing, under pressure, in flux, in trouble, and under threat (Chivers & Allan 2022; Horowitz 2015; Lowe & Steemers 2012). Historically, Slovenian PSM were seen as

some of the more stable in Central and Eastern Europe, and particularly within the Western Balkans (Milosavljević & Poler 2018) where PSM are often under government control (Splichal 1993; Jakubowicz 2012). Indeed, PSM in the Western Balkans are “often understood as an instrument of the state” (Malović 2017). However, the last five years have proved that even in Slovenia, PSM can be extremely fragile. Using document analysis, this paper will identify the sources – and explain the nature – of political and economic attacks on Slovenian PSM between 2019 and 2024. It will argue that Slovenia has experienced a political shift similar to the one in the USA under Trump, in Hungary under Orbán, and in Serbia under Vučić. The previous Prime Minister, Janez Janša (2020–2022), and his SDP party (2020–2022) urged citizens to stop paying the obligatory licence fee, and gathered signatures for a referendum to end the licence fee altogether. Janša, also sought to intervene in the staffing of Slovenian PSM. He insulted female PSM journalists, calling them “cheap worn-out prostitutes”. Personnel with direct political links to the government were also appointed to senior positions, the General Manager of RTV Slovenia was appointed (twice) illegally, and the TV manager was illegally removed, before being replaced by a pro-government appointee (for the context see Poler & Milosavljević, 2020). Although a new coalition government was formed in 2022, at the time of writing in December 2023, a solution to the political and economic challenges faced by Slovenian PSM had yet to be found. In particular, RTV Slovenija faces the hardest economic situation in the last decade, with some calling for a so-called “Greek scenario,” involving the demolition of RTV Slovenia as it used to be.

JOS22 Navigating stormy waters: A comparative analysis of public service media

PN 087 Why populist-nationalist governments try to capture international public media

Kate Wright¹, Martin Scott², Mel Bunce³

¹ University of Edinburgh, Politics and IR, Edinburgh, United Kingdom

² University of East Anglia, International Development, Norwich, United Kingdom

³ City University of London, Journalism, London, United Kingdom

We know that capturing national Public Service Media (PSM) can help governments with authoritarian leanings tilt the electoral playing field in their favour – and may even serve as a stepping stone to capturing the entire national media system (Dragomir and Horowitz 2021). But why do some populist-nationalist governments put so much effort into capturing international PSM? Is this purely driven by diplomatic considerations, or does it have implications for domestic politics as well? This paper takes the vision outlined in Project 2025 as its starting point: this is a detailed plan to expand executive authority over US federal agencies and employees, following a conservative victory in the next US elections. We argue that the Project 2025 report (Dans and Groves 2023) shows that some Trump allies view extending government control over US-funded international media networks as crucial in a broader partisan project to Make America Great Again. We then explain how this vision emerged, drawing from a new study about the politicisation of the largest US-funded international network, the Voice of America, that took place under Trump appointees between June 2020 and January 2021 (Wright et al. in print). This book is the first study of the government capture of a PSM network “from the inside”: using rare interviews with journalists and news managers, as well as 15,000 pages of documents, including private correspondence and internal documents obtained from Freedom of Information archives. However, the paper resists US-centrism by comparing this case to previous instances of the government capture of international PSM in Turkey (e.g., Elswah and Howard 2022) and Japan (e.g., Laurence 2023). In all three countries, mediated discourse about the government control of international public service media—circulated via domestic news and social media—helped further a populist-nationalist agenda within broader “culture wars.” This mediated discourse often involved government appointees’ nostalgic allusions to a lost period of power, glory, and international influence, robbed from a “pure” people by internal and external enemies. A key issue in such forms of politicisation was the minimisation—or outright denial—of state responsibility for atrocities carried out against women, minority groups, and other countries. Journalists who challenged this discourse risked having their statutory obligations used against them, in the form of disciplinary investigations into “bias.” We therefore conclude that researchers interested in government attacks on public media should pay more attention to international public media. But in so doing, they need to disregard the traditional scholarly boundary between Politics and International Relations. Instead, they should examine why and how the government capture of international public service media harms democratic practice, as well as public diplomacy.

JOS23 AI and audiences

PP 0642 How audiences evaluate the effects of generative AI on news quality

Daniel Vogler¹, Mark Eisenegger², Silke Fürst², Linards Udris², Mike S. Schäfer², Quirin Ryffel²

¹ University of Zurich, Research Center for the Public Sphere and Society, Zürich, Switzerland

² University of Zurich, Department of Communication and Media Research, Zürich, Switzerland

Artificial intelligence (AI) has emerged as one of the most transformative technologies in the news industry. The advent of advanced large language models (LLMs) such as ChatGPT or Bard has sparked widespread discussions on utilizing generative AI for news content production.

State of research

The integration of AI in generating journalistic content presents opportunities and risks, often discussed regarding the actual content. The use of AI is believed to enhance the quality of journalistic content, for instance, by reducing mistakes and personalizing content to interests and cognitive abilities of readers (Waddell, 2019; Wu, 2020). Also, concerns arise regarding algorithmic bias or reduced readability. However, some research highlights the importance of audience evaluations. Indeed, studies show deficits in the perceived quality and credibility of AI-generated content among audiences (Clerwall, 2014; Graefe et al., 2018; Kieslich et al., 2021; Tandoc et al., 2020; Wölker & Powell, 2021). This leads to the important question of whether or not audiences accept AI in news production, as (non-)acceptance will determine, among other factors, whether such content is used or paid for.

A survey conducted in Germany revealed that a small percentage of media users believe AI will enhance news quality (Kieslich et al., 2021). Experimental studies indicate that altering the authorship of the same news article between AI and a human journalist influences readers' quality evaluations, with participants who received the AI-labeled version rating the articles less favorable than participants who read the human-labeled version (Haim & Graefe, 2017; Jang et al., 2022; Jung et al., 2017; Toff & Simon, 2023). These quality evaluations prevail even though studies show that readers are no longer able to differentiate AI-generated from human-written news articles.

Gap in research and method

Despite growing evidence that audiences are skeptical about the use of AI in news content production, we still know little about the underlying factors driving these assessments. Our preregistered study investigates if and how attitudes towards AI, exposure to the technology and sociodemographic factors like gender, age, and education are correlated with participants' evaluation of the impact of AI on news quality, which was measured with nine items related to different dimensions of journalistic quality (e.g., diversity, relevance, factuality). The investigation is based on a representative online survey ($n = 1254$, aged 16 to 74) conducted in July 2023 in Switzerland.

Results

A linear regression model shows that positive attitudes toward AI in general are correlated with a more favorable evaluation of the effects of AI on news quality. A high self-reported exposure to AI-generated news content tends to correlate with a less positive evaluation of the impact of AI on news quality. This evaluation is more positive, the more an individual supports implementing AI in news production. High willingness to consume and pay for AI journalism are both positively correlated with a positive evaluation of the effect of AI on news quality. Our findings also indicate that younger and less educated individuals tend to view AI's influence on news quality more positively.

JOS23 AI and audiences

PP 0643 Audiences and algorithmic diversity: On the relationship between news exposure diversity and preferences for news recommender systems

Pascal Schneiders¹, Andreas Riedl², Birgit Stark¹

¹ Johannes Gutenberg University Mainz, Department of Communication, Mainz, Germany

² Ludwig-Maximilians-Universität Munich, Department of Media and Communication, Munich, Germany

Which news we receive online is shaped by news recommender systems (NRS) (Knudsen, 2023). Such algorithms filter, suggest, and prioritize certain content according to specific rules (Mitova et al., 2023). So far, news outlets mainly use collaborative, personalized-similar or popular NRS: Collaborative filtering utilizes data from similar users, personalized-similar recommends content that users have previously preferred and popular recommendations suggest the most widely used content (Karimi et al., 2018; Wieland et al., 2021). The potential of NRS does, however, not only lie in the adaption to information needs of users (personalization), but also in reducing dangers of ideological homogenization and ensuring "exposure diversity" (Elahi et al., 2022; Helberger, 2011; Mattis et al., 2022): *Diversity-oriented* NRS can "nudge" recipients to consume overlooked and disregarded topics or opposing opinions (Jesse & Jannach, 2021). This can increase tolerance towards other opinions and social groups and, thus, positively influence democratic reasoning (van der Wurff, 2011). Therefore, acceptance towards diversity-oriented NRS is desirable especially among those with ideologically one-sided consumption patterns. Otherwise, there is the danger of a Matthew effect, according to which especially those with already high news exposure diversity appreciate diverse NRS. In this case, diversity-oriented NRS could even widen the gap between users of diverse versus one-sided information. Previous studies in this context show that user attitudes towards NRS depend on news information overload, technology optimism (Joris et al., 2021) and trust in algorithmic systems (Araujo et al., 2020; Shin, 2020; Wieland et al., 2021). However, the role of news exposure diversity has not yet been investigated. We assume that the higher the exposure diversity of respondents, the higher their preference for diverse news recommender systems; and the lower their exposure diversity, the higher their preference for other types of NRS. To address this research gap, we conducted an online survey with quotas based on online users in Germany aged 18 and above ($n = 997$; age: $M = 46.43$; $SD = 14.45$; 50% female; 37% with high school diploma). As dependent variables, we incorporated the support for a) NRS in general, b) diversity-oriented, b) personalized-similar, c)

collaborative, and for d) popular NRS. As independent variables, we measured news information overload, technology optimism, and media trust based on established research (e.g., Joris et al., 2021). For assessing news exposure diversity, we modified approaches from Fletcher & Nielsen (2018) and Zerback & Kobilke (2022), cumulating the absolute differences in ideological positions (from left to right) between respondents and the target audience of news outlets they frequently consume (*variety*), weighting it according to whether respondents used exclusively more liberal or conservative outlets or both (*balance*). Regression analyses show a significant relationship between exposure diversity and preferences for NRS across all models, even after accounting for relevant variables from previous research. It explains preferences for diverse NRS, supporting the presence of a dilemmatic Matthew effect. However, it also explains preferences for other algorithmic solutions, suggesting that supporters of non-diverse NRS receive above-average news diversity, mitigating concerns about widening diversity gaps through such algorithms.

JOS23 AI and audiences

PP 0644 Patterns of (Dis-)Trust in human and AI-generated journalism. Changes and continuities of the perception of bias among young Austrians users

Gisela Reiter¹, Andreas Hess¹, Marian Adolf¹

¹ FH Wien University of Applied Sciences of WKW, Department of Communication, Vienna, Austria

Individualization and emotionalization of information are integral components of an increasing fragmentation of the public sphere. The discourse surrounding the digital transformation in journalism (Neuberger 2022) and the handling of convergent media worlds (Krotz & Hepp 2010) has been further intensified by the possibility of using Artificial Intelligence (AI) for news production and distribution. Greater levels of trust are closely linked to ritualization of usage and traditional media (Schranz, Schneider & Eisenegger 2018). But increasing media coverage is accompanied by a significant erosion of the collective foundation of trust and fundamental issues of transparency, traceability and accountability need to be (re)negotiated (Porlezza & Eberwein 2022). Furthermore, the audience expectation of journalism is influenced by the political attitudes of media users (Riedl & Eberl 2021) but also dependent on new developments – like generative AI and its disruptive impact on journalism.

Considering these developments, we pose the following research questions:

RQ1: What patterns of (dis-)trustworthiness are associated with AI in journalism?

RQ2: What changes and continuities in perception of bias in reporting are associated with generative AI and (automated) journalism?

In our study we conducted 24 qualitative interviews with participants who differ in gender and educational level in the age group of 18 to 30 years in Austria. They can be classified as young average media users with no connection to journalism or communication as their study area or part of their workplace. The interviews took place from October 2023 to January 2024 and are analyzed with MAXQDA (Kuckartz 2018).

Here are some preliminary findings: Media coverage provided by generative AI is seen as more reliable and trustworthy. Additionally, participants suspect more bias in reporting produced by humans rather than in the material generated by AI. Moreover, the participants seem to accept the use of certain filters and AI editing in visual communication without affecting trust. Especially for automated journalism e.g. in sports coverage, advantages are suspected and the task for journalists is merely to provide "quality control" [IP 19].

PP 0645 Tracing the trajectories of public discourses on AI: A multilingual, longitudinal study of news coverage in China, Germany, and the US

Jing Zeng¹, Daniela Mahl², Saba R. Brause², Mike S. Schäfer²

¹ Utrecht University, Department of Media and Culture, Utrecht, Netherlands

² University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Background

Artificial Intelligence (AI) is becoming an integral part of modern societies, with the potential to transform sectors like economics, education, and healthcare. Against this backdrop, discussions about its potential risks and benefits are growing, with the news media playing a crucial role in shaping these debates. While the trajectories of discourses on AI vary across different cultural, political, and social contexts, previous research has predominantly focused on individual countries, primarily in the Global (English-speaking) North (Brause et al., 2023). This study takes a *cross-national comparative approach* to map media constructions of AI through news coverage in China, Germany, and the United States (U.S.)—three countries that are key to the future global development of AI—over a ten-year period (2012–2021).

Conceptual framework

This study builds on the concept of *sociotechnical imaginaries*, which refers to “collectively imagined forms of social life and social order reflected in the design and fulfillment of nation-specific scientific and/or technological projects” (Jasanoff & Kim, 2009: 120). Using sociotechnical imaginaries as a theoretical lens allows us to comparatively assess the specificities of national and transnational discursive constructions of AI in a longitudinal research design. Guided by this conceptual framework, we propose the following research questions (RQ):

RQ1: How does the discursive construction of AI in the news media differ between China, Germany, and the U.S.? How does this change over time?

RQ2: To what extent do these three countries project different or similar imaginaries of AI through news reporting? Who contributes to the construction of these imaginaries?

Research design

This study draws on a dataset of over 9,000 articles published in 15 leading national newspapers in China, Germany, and the U.S. To identify *cross-lingual topic patterns*, we performed multilingual topic modeling using BERTopic (Grootendorst, 2022). Time series and sentiment analysis are used to compare the *salience* and *tensity* of public discourses across the three regions over time (**RQ1**). A qualitative deductive-inductive thematic analysis (Fereday & Muir-Cochrane, 2006) of publicly shared imaginaries of AI complements these analyses (**RQ2**).

Preliminary findings

Our findings reveal significant differences in the prevalence of AI-related topics in China, Germany, and the U.S., with China receiving the most coverage, followed by Germany and the U.S. In China, health, policy, and technology are at the forefront, while German and U.S. media emphasize societal impacts and risks. Over time and across regions, societal impacts receive less attention, while regulatory issues gain prominence. Sentiment analysis reveals generally positive coverage of AI in the U.S., contrasting with more negative sentiment in German media, particularly regarding societal impacts and risks. Chinese media maintain a comparatively neutral stance on the identified topic groups.

The qualitative analysis demonstrates that even within topics, crucial differences in AI-related imaginaries can be found across countries. For example, in the healthcare context, AI is imagined to improve healthcare provision in all three countries. While U.S. coverage emphasized the health-related visions of private sector tech companies, Chinese newspapers focused more on speakers from the public sector, and German newspapers included the imaginaries of patients and NGOs.

PP 0646 What is a deepfake? Comparing a conceptual typology and journalists' perceptions of deepfakes and their implications for journalistic practice

Daniel Seibert¹, Patric Raemy², Hannah Lea Ötting³, Alexander Godulla¹, Christian Pieter Hoffmann¹, Manuel Puppis²

¹ Leipzig University, Institute for Communication and Media Studies, Leipzig, Germany

² University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland

³ University of Münster, Institute for Communication Science, Münster, Germany

Deepfakes are gaining increasing attention in research and practice. However, to date, the definition of “deepfake” still lacks clarity. The term goes back to the account name of a Reddit user’s forum for spreading pornographic content created using deep-learning technology (Somers, 2020). Ever since, public discourse focuses on the use of

synthetic media for misleading and manipulative purposes – including media manipulations such as cheap or shallow fakes (McCammon, 2021; Westerlund, 2019). Often, Deepfakes are seen as a technological disruption, posing challenges for media organizations and journalistic practice: If journalists fall for deepfakes and become ensnared in disinformation campaigns, this may damage their own credibility and negatively impact the media-audience relationship and journalism as a democratic institution (Citron & Chesney, 2018). In academic discourse and in journalism practice, there is a clear emphasis on the risks associated with deepfakes in journalism, rather than exploring their potential benefits (Authors, 2021). However, it is unclear if “deepfakes” are synonymous with synthetic media and generative AI, and whether concerns relate specifically to deepfakes or to synthetic media, in general. Hence, the ambiguous nature of the term “deepfake” might affect the debate in journalism research and practice. This study’s goal is twofold: First, it aims at examining how deepfakes and related forms of media are defined in the literature (RQ1). Secondly, it investigates what representatives of media organizations understand as deepfakes and how they evaluate the technology’s implications for journalistic work (RQ2). Interviews among 30 journalists and innovation experts in Germany and Switzerland were carried out (conducted between 09/2022–05/2023). The analysis and interpretation of the interviews followed the process of the qualitative content analysis according to Mayring (2015).

A typology of deepfakes and AI-generated media is derived from a literature analysis. This typology is subsequently contrasted with the views expressed by journalists and experts. Based on our findings, we propose a differentiated typology of deepfakes that considers aspects such as their production, their quality, their authenticity, the degree of their manipulation, the type of copy, their purpose, a possible intention to deceive, the media genre, the motif depicted and a possible labeling. However, results also show that in practice, the terms deepfakes and synthetic media are often used synonymously as there is no consensus as to their definition. While some interviewees describe deepfakes in very general terms as audiovisual AI-based content which also offers potential for journalism (e.g., content generation and personalization, new formats and products), others see deepfakes as a form of deception and disinformation which has no place in journalism. The conceptual typology therefore allows for a more objective theoretical foundation for research and practice. It enables an examination of both potentials and risks of deepfake technology for journalism and journalistic practice, and thus to develop strategic approaches for handling beneficial as well as harmful implications of the technology.

PP 0647 Effects of newspaper publishers’ paywall strategies on whether online visitors start and finish the subscription journey

Neil Thurman¹, Zhengyi Xu¹, Ole Fehling², Julia Berhami¹, Clara Strasser³, Bartosz Wilczek¹, Maximilian Weigert³

¹ LMU Munich, Department of Media and Communication, Munich, Germany

² Schickler Unternehmensberatung GmbH, Data Science, Hamburg, Germany

³ LMU Munich, Statistical Consulting Unit StaBLab - Department of Statistics, Munich, Germany

Newspaper brands are increasingly implementing paywalls to generate much-needed revenue from readers. Given the significance of news for democracy, understanding the factors that influence online news subscription decisions is relevant to both news publishers and society. Prior studies have mostly focused on user-level and news product-level factors. Our study investigates the influence of paywall strategies.

When non-subscribing visitors view a paywalled article, publishers may show various combinations of “teaser” elements in addition to the headline, such as a picture, standfirst, introductory paragraph, and a blurred preview of the article’s full length. We investigate the influence of these “teaser strategies” on whether visitors start the subscription journey by clicking the “subscribe now” button.

If visitors click that button, they are often taken to another page showing specific subscription offers, pricing, trials, discounts, and promotions. We also investigate the influence of these factors on whether visitors finish the subscription journey and actually subscribe.

We coded the paywall strategies of 21 German and Austrian news websites in May and August 2022. This data provided our independent variables. We used website visitors’ actual behaviour as the dependent variables, i.e. whether they clicked on the “subscribe now” button when they hit a paywalled article and whether they paid for a subscription. Tracking data came from the DRIVE project, which records visitor behaviour at those 21 news websites.

For the first decision point, 3,518,822 individual-level cases were involved, and for the second decision point, 28,506. We used aggregated data at the website level, treating each website’s data within each data collection period as one website-level case. Analysis was done using logistic regression with weights.

The results indicate that showing a picture, standfirst, or introductory paragraph reduced the odds of visitors clicking the “subscribe now” button. A possible reason is that these teaser elements provide additional information (on top of the headline, which was always present). Visitors may believe that they have gathered enough information about

the article from these teaser elements and decide not to subscribe to read further. Showing a blurred preview of the article's full length also reduced the odds of clicking the "subscribe now" button. A reason may be because on pages without a blurred preview visitors can only choose to leave the page or to click the button, whereas with a blurred preview visitors have one more possibility—scrolling up and down to see the blurred preview of the full length of the article.

Regarding finishing the subscription journey, results show that offering an ePaper increased the odds of people paying for subscription as did offering discounts or smart devices. Previous studies revealed higher willingness to pay for printed rather than online newspapers. This may explain why ePapers, which are a digital replica of the print newspaper, have a positive effect. A higher price reduced the odds of people subscribing as did charging for trials. This may be explained by people's "free" mentality. The length of the trial and the offering of small gifts had no significant influence on visitors' subscription decisions.

PP 0648 How native are native ads? A multi-country study on the similarity of native ads to editorial content based on markers of traditional journalism

[Sofia Contreras-Yap](#)¹

¹ Nanyang Technological University Singapore, Wee Kim Wee School of Communication and Information, Singapore, Singapore

Due to declining print ad revenues caused by the move of audiences to online sources, news organizations are increasingly turning to native advertising to improve profitability. Native ads are, in the context of news media, full-length articles that mimic editorial content. Scholars have raised concerns about the disappearing divide between journalism and advertising due to news organizations' production of commercial content in-house. Levi (2015) calls journalism's involvement with native advertising a possible "Faustian bargain" (p. 651) because while news organizations achieve financial security, they may be trading away their hard-won credibility.

While the similarity of native ads to editorial content is touted to be the key factor that makes it a highly effective, and deceptive, form of advertising, similarity has just been casually assumed, and no study has yet directly compared a news organization's native ads to its editorial content. The majority of native advertising research focus on form, e.g., formatting, layout, and disclosure presence (Amazeen & Wojdyski, 2020; Jiang et al., 2017). So far, Li's (2019) study on the role performance of native ads in U.S. news sites is the only one that has focused on content, though no comparison between native ads with actual editorial content was made. Thus, this study investigated similarity by directly comparing native ads and editorial content in terms of markers that delineate traditional journalism's boundaries, like routines (topic, story structure), norms (objectivity, transparency), and roles (civic, service, infotainment) (Hallin & Mancini, 2004; Mellado, 2015; Tandoc & Oh, 2017).

The results of the preliminary content analysis of 24 (out of 240) native ads and news articles from six news organizations (Brunei's "The Scoop," Hong Kong's "South China Morning Post," India's "The Hindustan Times," Pakistan's "Dawn," The Philippines' "Rappler," and Singapore's "Channel News Asia"):

Routines. 50% of news articles were about technology. All but one native ad was about technology. 62.5% of news articles had an inverted pyramid structure. Native ads were split evenly between having a narrative and an inverted pyramid structure.

Norms. All news articles are objective (absence of author's opinion). Only one native ad was not objective. 100% of news articles and native ads were transparent, containing links to sources or explanations.

Roles. 100% of the native ads performed the service role, specifically the consumer advice dimension. 75% of news articles performed the infotainment role, specifically the sensationalism dimension.

Native ads exhibited the most similarity to editorial content under the norms of objectivity and transparency. They were the most dissimilar under journalistic roles and the journalistic routine of topic.

CNA and SCMP both had the highest similarity between their native ads and editorial content. Both news organizations have been described as highly influenced by the government, and this may affect the roles or norms adhered to by their journalistic content. CNA is state-owned (Wu, 2018), while SCMP has recently been bought by Alibaba, a company that has strong ties to the Chinese Communist Party, with the aims of "directly reshap[ing] global news coverage of China" (Buckley & Perlez, 2015, p. 1).

PP 0649 "Why news media collect user data?" Folk theories of news users' data utilisation in journalism

[Liisa Ovaska](#)¹

¹ Tampere university, Faculty of Information Technology and Communication Sciences, Tampere, Finland

Although social media giants have gained notoriety over collecting and exploiting user data, in the meantime, much less concern is voiced against news organisations data collection. With the help of audience metrics, the

newsrooms collect information on news users' demographics and news consumption to plan and update their content production and learn more about the audience's interests. Even though these data practices are integrated into journalistic work, much less is known about how news users make sense or understand the role of data analytics in journalism. To tackle this issue, I use the framework of folk theories, which is an approach to studying how people draw understandings of everyday life (Ytre-Arne and Moe, 2020), for instance, make sense of journalism's functions (Nielsen, 2016) or in this case of data utilisation in journalism.

The presentation's empirical analysis is predominantly based on qualitative data collected through group interviews and one-week-long instant messaging group chat interviews with 21 readers of the Finnish tabloid *Ilta-Sanomat* discussing the role of user data in news media. This dataset is combined with an open-ended survey addressing 385 readers' answers to the question 'How has news media changed in the past five years?'

The findings suggest that the participants have noted many user-data-related changes in the news media in the past years. By analysing participants' sense-making of these changes, three folk theories were detected. 1) Data is mainly collected for commercial purposes. They reasoned that user data is mainly collected for advertisement pricing purposes, and their data works as currency for receiving free content for exchange. They saw that data is either capital or commodity (e.g. Sadowski, 2019) and that commercial reasons motivate data utilisation in the news media. 2) News media utilise data similarly to other datafied platforms online, for instance, by collecting detailed information and utilising data to create personalised front pages like social media or streaming services. 3) Commercial motivation of data utilisation influences journalistic outputs. They saw that commercial reasons motivate news media to develop data-related technologies, such as frontpage personalisation or headline testing algorithms, and to publish 'supplementary stories', such as stories without clear news value or information. These would make news users spend more time on the site and therefore be more profitable for the news media.

As many of the participants were unfamiliar with the news media's data practices, they constructed folk theories by drawing from past experiences with other datafied systems, such as with social media or streaming services. They found it difficult to find any 'societal' or 'journalistic' reasoning in user data utilisation, even though they understood that journalism is not merely a business but has the role of a watchdog and a task to inform citizens.

PP 0650 Collaborative innovation grants in journalism: An effective path towards digital transformation or an occasion for opportunistic funding tactics? The case of Flanders

[Giordano Zambelli](#)¹

¹ Vrije Universiteit Brussel, Department of communication sciences, Brussels, Belgium

In recent years, significant developments in news consumption, news production, news distribution and business models have further accelerated the digital transformation of the journalism sector. While news organizations are becoming increasingly aware of the imperative to formulate adaptation strategies for navigating a rapidly changing environment, policymakers are concurrently recognizing the journalistic domain as a critical battleground for preserving the democratic health of European democracies. At a policy level, in Europe, next to the simplistic inclination towards leveraging on the adoption of emerging technologies as drivers of innovation (Creech&Nadler, 2018), public initiatives have also embraced the possibility of supporting, through innovation grants, interdisciplinary collaborative projects, to help the sector advance.

Prior research has revealed how collaborations can possibly support news organizations in various contexts, such as cross-border investigations, local journalism projects seeking to 'achieve more with less', and politically pressured media companies. When it comes to collaborative innovation, however, a critical mismatch between how news organizations articulate discursively their involvement in such collaborations and the tangible strategies they employ has been highlighted (Slot, 2021). The concept of collaborative innovation is often used by journalistic organizations as a discursive practice to position themselves in the field and draw lines, without necessarily addressing the competitive dimension inherent in such a challenging endeavor.

Given the under-explored tension surrounding the utilization of collaborative innovation grants, I entertain the possibility that news organizations may tactically use such grants as opportunities to secure additional funding and gain competitive advantages towards their competitors. This stands in contrast to committing to a trajectory of collaboration and sector integration, as typically expected by policymakers. The Flemish 'Relanceplan' launched in 2023 with a budget of 12 million euros, offers an ideal setup for examining this scenario. This fund supports eighteen

collaborative projects involving major Flemish news organizations over a two-year period, which is a unique opportunity to conduct empirical research on ongoing collaborative projects. Following a round of twenty semi-structured interviews, this paper aims to investigate, through a thematic analysis, how news executives navigate the establishment and implementation of collaborative partnerships while preserving the specific interests of their respective companies.

Preliminary results from the ongoing data collection phase show that policymakers may need to consider a series of caveats when contemplating the provision of public funding for collaborative innovation projects. In some collaborations there is a high degree of inter-disciplinary integration, knowledge exchange, as well as alignment in terms of results' exploitation. In most cases, however, competitive obstacles are strong, and the partners are reluctant to share respective knowledge assets and contribute to common progress. This study will contribute to understanding how collaborative innovation grants could serve as valuable opportunities for news organizations while also establishing their justification as an effective use of public funds.

PP 0651 Platforming the audience-journalist relationship. Micro-funding as economic engagement with the news

Raul Ferrer Conill¹, Luise Salte¹

¹ University of Stavanger, Media and Social Sciences, Stavanger, Norway

This study investigates how new forms of audience patronage establish and reconfigure the relationship between journalists and news audiences while commodifying the interaction. Of particular interest is the range of incentives for journalists to join platforms like Patreon and the type of exclusivity they offer to their "fans", a term used to define the relationship on the platform. While research on news media's business models is thorough (Croteau and Hoynes, 2005; Levy and Nielsen, 2010), the interactional dynamics between journalists and news audiences that ignite and result from micro-funding schemes remain overlooked, particularly with regard to patronage (Jian and Usher, 2014). We argue that beyond requesting direct financial support from individuals, these patronage arrangements have the potential to create a sense that transactional and relational dynamics shape news content. Also, close encounters that promise monthly micro-donations in exchange for exclusivity raise questions about audience influence and the price of journalistic independence, desirability, and worth of a news experience, as well as the monetization of engagement.

Theoretically, we engage with three strands of scholarship. First, we look into the multi-business model of news media. As a response to the decline of traditional revenue, news organizations have opted for alternative multi-business models for funding their operations. Among the most innovative and relevant alternatives are nonprofit organizations and community-funded platforms (Carvajal, García-Avilés, and González, 2012). Second, we adopt the notion of 'relational labor' as the 'ongoing communication with audiences over time to build social relationships that foster paid work' (Baym, 2015: 16) to analyze a subset of audience engagement with the news, namely micro-funding. In the case of journalism, this has conceptual and practical implications on journalistic independence and audience experience with the news. And third, we thus problematize close instances of monetary support in exchange for access through the lens of the 'news gap' (Boczkowski and Mitchelstein, 2013) and journalistic independence (Karpinen and Moe, 2016).

Using purposive sampling, we conducted semi-structured interviews with twelve journalists using the platform Patreon. We have also made a content analysis of their profiles and more concretely the content they distribute on the platforms, and the perks they give to their audience in exchange for continued financial support.

The preliminary results show that while most journalists claim they would not compromise their journalistic integrity to keep the audience content, by giving audiences access to exclusive content, community, and insight into the journalistic, creative process, journalists might feel the pressure to accommodate the audiences' requests. Platforms like Patreon create a space in which individual users provide monetary support to content creators. For small-scale journalistic ventures, these alternative audience-supported funding schemes may be the only way to keep their operations afloat. This implies that, while journalists perceive a greater connection with the audience through transactional and relational dynamics, journalistic autonomy quivers. Such findings have implications for understanding audience engagement within particular funding settings and how particular business models can affect journalistic independence.

PP 0731 Can constructive news counter news avoidance? An experimental test of audience behavior as a response to (non-)constructive news frames

Erik Knudsen¹, Morten Skovsgaard², Nini Lykke Susanne Aandahl Berge³, Agnes Stenbom⁴

¹ University of Bergen, Department of Information Science and Media Studies, Bergen, Norway

² University of Southern Denmark, Centre for Journalism-, Odense, Denmark

³ Bergens Tidende, Bergens Tidende, Bergen, Norway

⁴ Department of Industrial Economics and Management-, KTH Royal Institute of Technology, Stockholm, Sweden

Scope and Theoretical Motivation

The recent increase in news avoidance, often linked to the dominance of negative news in mainstream media, has become a significant phenomenon (Newman et al., 2023). Constructive journalism, characterized by its solutions-oriented approach, is suggested to mitigate this trend (Overgaard, 2023; Skovsgaard & Andersen, 2020).

In this study, we develop and test the argument that exposure to constructive news can override news avoidance behavior. We conceptualize news avoidance from a motivational perspective (e.g., Villi, et al. 2022), in which audiences can be temporarily motivated to either seek out or avoid certain news items – based on their immediate state of mind – when browsing news online. We consider how the framing of news – constructive or non-constructive – affects the likelihood of audiences avoiding news based on their immediate state of mind.

Methods

We used a 2 x 2 between-subject survey experimental design with a probability-based sample of 2270 Norwegian adults. Participants were first randomly induced into a “news seeking” or “news avoiding” state of mind using the Autobiographical Emotional Memory Task (Mills & D’Mello, 2014), then randomized into two groups to browse a manipulated news site presenting 17 authentic articles. The treatments differed in whether respondents saw constructive or non-constructive framings of three articles on topics that were high on the agenda in Norway at the time. The constructive articles emphasized solutions, while non-constructive ones highlighted problems.

Participants navigated the site freely, and we unobtrusively tracked participants’ interactions. To ensure high ecological validity, professional journalists manipulated authentic articles, and the site’s design mirrored a popular Norwegian news site.

Analysis Plan

While the data is collected, we have yet to conduct the analysis. The study will be preregistered before we conduct any analyses and the results of the preregistered analysis will be presented at the conference, in line with the preregistration.

Because we have data for clicking behavior and reading time for each of the 17 articles separately, we will be able to rearrange the data, so that we have multiple observations per respondent. We will use multilevel GLM (logistic, Bernoulli) models, as we will have several observations of article clicks nested within each respondent. The key dependent variable will be article click, but we will also conduct supplementary analyses on time spent per article.

PP 0732 At the crossroads: The professional identity of right-wing news journalists

Ane Mestvedthagen¹, Jenny Wiik¹

¹ University of Gothenburg, Institution of journalism – media – and communication, Göteborg, Sweden

Recent years have seen a surge in attention toward right-wing media due to its contentious role in public debates and unconventional journalism methods (Cushion, 2023). This blending of political viewpoints with journalistic

practices challenges traditional ideas about journalism. Scholars and media practitioners have been trying to understand this phenomenon by examining the relationship between right-wing news outlets and journalism from a normative standpoint (Klawier et al., 2022). However, little research has been conducted on how the right-wing media considers themselves – and how they relate their own identity and work to journalism.

Interviews with prominent persona within Swedish right-wing media explores reasons behind establishment of the right-wing media site (Holt, 2016). Building on these interviews, Holt (2020) has later expanded on this research to answer why people choose to express their views publicly via right-wing media sites and how it changes the media ecology. We intend to continue this exploration. Based on semi-structured interviews, this study aims to examine the dynamics of right-wing news media from the perspective of the newsroom itself. We do this by addressing the research question: *How do right-wing news journalists understand their professional identity and their relation to journalism?*

Studies on right-wing news media bear significant societal value as well as academic. As right-wing news media gain a stronghold in societies with increasingly polarized discourses, their voices contribute towards their audience's knowledge and perception of information about events. By understanding right-wing news media's self-perception, we further our understanding of how the media aims to contribute towards the shaping of public discourses.

The study is theoretically conceptualized by professional discourse and identity. While the professional autonomy and standards of some right-wing news media may be disputed, this approach is an attempt to explore the facets of journalism as it takes new paths beyond the regular field and create further understanding of its similarities and deviations in relation to mainstream journalism.

The proposed study is conducted through semi-structured interviews with journalists and editors-in-chief from Scandinavian right-wing news sites self-identifying as journalistic – whether implicit or explicit. Interviews are conducted spring/summer of 2024. Interviewees will be asked about their perception of what journalism entails, self-perception of their own work, and how the two factors are intertwined.

The study is part of PhD project *Placing Right-Wing News Media within Journalism*, launched in January 2023 at the University of Gothenburg. Its immediate objective is to explore the identity formation within right-wing news media in relation to journalistic practice. Furthermore, results from the study provide useful context for the PhD project's follow-up ethnographic studies on authority-building within right-wing newsrooms.

JOS25 Alternative media I

PP 0733 "One cannot remain silent". Journalistic reactions to the social media-based rule-breaking communicative strategies of the Italian radical right

Emma Bonutti D'agostini¹

¹ CREST Institut Polytechnique de Paris – médiab Sciences Po Paris, Department of Sociology, Palaiseau, France

A central development in the recent history of Western democracies is the rise of radical right parties (RRP; Mudde 2007). RRP's political repertoires combine ethnocentric nationalism with a conservative stance over gender issues (Wodak and Khosravini 2013). These illiberal motives, often conveyed in "rule-breaking" ways (Bracciale and Martella 2017), constitute a focal site of the dialectic between RRP and journalism, understood as an enterprise for the discursive representation and delimitation of political reality (Hallin 1989).

To explore the tensions that arise around this confrontation, I analyze an important event that took place at the outset of the 2022 Italian election campaign. In August 2022, Giorgia Meloni, president of the far-right party Fratelli d'Italia, shared on Twitter the video of a Ukrainian woman being raped by a Guinean asylum seeker in the streets of Piacenza (Italy) to convey a securitarian and anti-immigrant message. This incident illustrates how the ideological strongholds of RRP jointly materialize in their political discourse and action. It also demonstrates how the well-documented elective affinity between RRP and social media can alter the dynamics of political and electoral communication (Blassnig et al. 2019; Bracciale, Andretta, and Martella 2021; Waisbord, Tucker, and Lichtenheld 2018), with consequences that extend onto the broader mediated public sphere and question the professional practices and socio-political role of legacy journalism.

Indeed, the episode was widely covered by the Italian press. Journalists compactly engaged in exposing the illiberal nature of Meloni's action, while reaffirming the boundary of the legitimate election debate – which, it was argued,

she had crossed. However, media narratives often ended up mainstreaming rather than debunking Meloni's argument. Anti-immigrant and gender-conservative biases shone through several instances of journalistic coverage of the controversy. Many articles foregrounded information concerning the immigrant background of the perpetrator; they further exposed the victim through the re-circulation and re-evocation of the video; they finally were more likely to personally attack Meloni rather than to reflect on causes and implications of women's and migrants' vulnerability, which would have contributed to situating Meloni's claim more objectively.

In this paper, I combine a qualitative analysis of controversy-related Twitter and news content and 20 interviews with Italian political journalists to document and contextualize these outcome-level trends while identifying relevant process-level mechanisms. Specifically, I discuss which factors obstructed journalistic compliance with the profession's deontological stance, both overarching (journalists as custodians of liberal democratic debate: Alexander 2015; Waisbord 2018) and issue-specific (the Venice Manifesto on reporting about gender violence: 2017). First, the fact that Meloni's campaign act had been staged on social media challenged journalists' gatekeeping position and editorial control over the discursive representation of the controversy (Waisbord, Tucker, and Lichtenheld 2018). Second, audience-oriented logics incentivized journalists to capitalize on the controversial and triggering nature of the issue (Ekström, Patrona, and Thornborrow 2022; Waisbord 2018). Throughout my analysis, I detail how these elements risk bringing legacy journalism to function not as a boundary-maintaining mechanism, but as a potential sounding board, in the face of the illiberal tendencies expressed by RRP political discourse.

JOS25 Alternative media I

PP 0734 Alternative epistemic authorities – A mixed methods approach to referencing practices of users in alternative online publics

Said Unger¹, Johanna Klapproth¹, Svenja Boberg¹, Thorsten Quandt¹

¹ Westfälische-Wilhelms-Universität Münster, Department of Communication, Münster, Germany

The epistemic process of gathering and verifying information is central to journalism, and sources are an integral part of this process (Zamith & Westlund, 2022). With the changes that the internet and especially social media platforms brought to the media landscape, alternative epistemic processes and authorities have also been popularized (Neuberger et al., 2023). Journalism's gatekeeping function for audiences' epistemic processes has since been circumvented or expanded by blogs, social media and alternative news media. Especially in alternative publics that see themselves in opposition to mainstream opinions, we can expect alternative epistemic processes that draw on alternative authorities and come to alternative conclusions.

While there are studies on referencing practices in alternative media or on how alternative and mainstream media are referenced by alternative publics, referencing practices among social media users are under-researched. We want to contribute to the understanding of referencing practices of users in alternative online publics by analyzing sources that are referenced on social media and ask the research questions who and what are epistemic sources in alternative online publics?

We draw on a large corpus of Telegram messages from the German Querdenken community. This originally anti-lockdown movement has pivoted to general anti-government and pro-Russia stances. The movement integrates a broad ideological spectrum ranging from neo-nazis over esoteric and religious groups, hippies and far-left USSR nostalgics which makes it especially interesting for analyzing a wide variety of potential sources.

We combine named entity recognition to extract mentions of persons or organizations and a deep-learning classification algorithm trained on an annotated subset of the data to detect references in Telegram messages. After identifying the referenced epistemic authorities, we qualitatively evaluate referencing practices. Preliminary results show that referencing happens only in a fraction of messages (about 19%). As can be expected from such a diverse movement, we find a multitude of referenced authorities, such as influencers, individual representatives of the movement, extremist politicians and pseudo scientists, but also spiritual authorities like gurus and mediums. We of course also find mainstream and alternative news media references, eg. as individual journalists or outlets.

It becomes clear that news media sources are by far not the only authorities drawn upon in alternative communities. We believe that further investigating references to and even trust in alternative epistemic authorities is an important step in understanding the epistemic crisis in journalism as well as alternative online communities in general.

JOS25 Alternative media I

PP 0735 Beyond boundaries: Vlaams Belang's parasitic news and its integration across diverse media landscapes

Priscilla Hau¹, Steve Paulussen¹, Pieter Maesele¹

¹ University of Antwerp, Communication science, Antwerpen, Belgium

In today's hybrid media system, political parties navigate a diverse array of communication channels, each with unique characteristics and affordances (Van Aelst et al., 2017). As a result, in contemporary politics, social and digital media platforms play a major role in political communication strategies (Stieglitz & Dang-Xuan, 2013). The hybrid media system allows political parties to create and promote their own digital content alongside journalistic earned media coverage. Casero-Ripollés et al. (2016) identify this as 'hybrid logic' wherein online and offline tools merge, expanding traditional strategies with the possibilities of digital media.

This study delves into the specific case of Vlaams Belang, a far-right political party in Flanders. As an opposition party, Vlaams Belang receives less legacy news media (mainstream media) coverage compared to governing parties (Bennett, 1990; Cook, 2012; Van Aelst et al., 2022). As a result, Vlaams Belang has strategically invested in a wide array of new technologies, as to not only rely on traditional journalistic gatekeepers. In this regard, this political party strategically creates and disseminates quasi-journalistic content, referred to as "parasitic news" (Ekman and Widholm, 2022). Parasitic news embodies a political communication style, strategically leveraging established journalistic formats and genres to disseminate politically motivated information.

Our preceding ongoing study on Vlaams Belang's content marketing mix reveals their ability to amplify specific themes and political figures through their owned media channels, including parasitic news articles on their official party website and V-News, an external website in which Vlaams Belang is involved. This preliminary investigation underscores the prevalence of Vlaams Belang's parasitic news, disseminated through their social media channels. Additionally, their parasitic news on the official party website achieves visibility on Google News. Thus, the boundaries between traditional journalism and political party communication have become increasingly blurred in this dynamic landscape.

Expanding on these findings, this paper undertakes a follow-up study through qualitative content analysis, exploring the adoption and presentation of the content of Vlaams Belang's parasitic news across legacy and alternative media platforms. Data are collected from the parasitic news articles on the official party website and V-News two months before the June 9, 2024 elections in Belgium. During this period, the sample will also contain all articles mentioning Vlaams Belang from eight Flemish legacy news media and three Flemish right-leaning alternative media outlets. We will examine whether and how these outlets reproduce ideas, quotes, terminologies, headlines, visual elements, ... from the content of Vlaams Belang's parasitic news. This investigation aims to unravel whether and how the parasitic news content of Vlaams Belang is presented in these diverse media spheres.

By investigating the adoption and dissemination patterns of Vlaams Belang's parasitic news through legacy and alternative media, this study contributes to understanding how the Flemish far-right party Vlaams Belang operates and how legacy and right-leaning alternative media outlets interact with the content produced by this far-right party. The findings offer insights into political communication strategies in digital contexts, highlighting the strategic use of parasitic news and its implications for media convergence within the political and journalistic domain.

PP 0736 Distributed and platformized journalism: Digital native media in social media platforms

Beatriz Gutiérrez Caneda¹, María-Cruz Negreira-Rey¹, Jorge Vázquez-Herrero¹

¹ Universidade de Santiago de Compostela, Communication Sciences Department, Santiago de Compostela, Spain

This paper presents the results of an exploratory analysis of the presence of digital native media in social networking sites. We refer to media that were originally born in the Internet and for the Internet. This condition makes digital social networks natural habitats for these news media outlets and for their audiences, especially the youth.

After 20 years since the birth of Facebook, it is said that we are facing the death of social media as they were known. Media industry reports have been arguing for years that it is changing access to online information to such an extent that news media are in a situation of dependency on third-party platforms for news distribution (Ekström & Westlund, 2019).

Platformization has been reflected in the dissemination and distributed consumption of news, mainly through social media, which are the main access point to online news (Newman et al., 2023). At the same time, the traffic directed from these platforms to media websites is decreasing (Fisher, 2023), so it can be seen that news consumption occurs on the same platforms. Digital native media have explored functionalities, formats and strategies that fit the logic of each platform (Tsuruel et al., 2021; Van Dijk & Poell, 2013), to make their brand present and reach new audiences (Hase, Boczek & Scharrow, 2023; Vázquez-Herrero, Negreira-Rey & Sixto-García, 2022).

With a sample of 19 digital native media and 5 legacy media, an exploratory study was conducted based on an analysis sheet with quantitative parameters to identify presence, identification, functionalities, formats and traffic redirection. The social platforms analyzed are X, Facebook, Instagram, TikTok, YouTube, Twitch, WhatsApp and Telegram.

The results indicate that digital native media are, in general, present on several social media platforms, with an advanced degree of adaptation. News media outlets have assumed the need to be constant posting content on their social profiles, but also to do so with specific strategies according to the logic, trends and usage habits of each platform. In addition to remaining present and active on the most established platforms, such as Facebook, X or YouTube, digital native media have landed on networks such as Instagram or TikTok, where they experiment with new formats in search of younger audiences, some explore the opportunities of Twitch, and others take advantage of the possibilities of instant messaging.

JOS26 Social media and journalism

PP 0737 Spilling the tea or spilling polarization? Intermedia agenda-setting between Twitter/X and news media on disruptive climate protests in Germany

Louisa Prösche¹, Hendrik Meyer¹, Michael Brueggemann¹

¹ University of Hamburg, Journalism and Communication Studies, Hamburg, Germany

Since early 2022, the German climate movement "Die Letzte Generation" ("The Last Generation") has been staging a series of contentious climate protests. These forms of "disruptive" protests (Shuman et al., 2021) are employed to generate attention from the public and the media, both online and offline.

Scholars have identified reciprocal effects of intermedia agenda-setting between social media debates, political actors, and news coverage (Gilardi et al., 2022; Su & Borah, 2019; Rogstad, 2016). The results are, however, mixed when it comes to the question of who sets the agenda and when. This dynamic is particularly relevant in the context of protest actions. In the age of "social media activism" (González-Bailón, 2015), digital media platforms enable activists to communicate their message beyond the digital sphere (Poell & van Dijck, 2015; Boulianne, 2020). However, a recent study analyzing the Twitter debate (now known as "X") on the "last generation" has illustrated high levels of discursive polarization (Meyer et al., 2023). It remains an open question whether the highly-polarized online attention is connected to more polarized debates in the overall journalistic media debate.

Thus, our study seeks to answer whether the highly polarized online discourse surrounding the "Last Generation" exhibits spill-over effects into news coverage or vice versa.

We collected ~5.000 German newspaper articles and ~5.000.000 (re-)tweets mentioning the movement (January 2022–May 2023; article database consisting of mainstream and fringe media). Deploying automated network and content analyses, we first focus on the two main ideological clusters within the Twitter discourse: one aligned with the political left and another with conservatives and the political right. Using a dictionary-based, automated word pattern analysis, our study then examines whether supportive frames or extreme anti-frames, used by the right-leaning cluster in the Twittersphere (e.g., 'terrorists,' 'murderers,' or 'sectarians'), can be found in the news media coverage.

Our results uncover an interplay between the use of negative frames by Twitter users and the subsequent publication of articles employing the same language shortly after. Furthermore, we observed an ideological bias in media reporting, wherein news outlets with right-wing and conservative leanings replicating negative online frames more frequently. On a short-term scale, it was observed that Twitter posts almost invariably preceded reporting, thereby appearing to predict or establish the newsrooms' agenda. However, our analysis showed that all frames that appeared to precede the newspaper coverage were originally published in the news during the movement's first

protests in early 2022. We thus demonstrate that such extreme frames were originally fed into the general discourse by journalism long before they were reproduced online.

Additionally, we uncovered a shift over time. Until October 2022, reporting was polarized along newsroom ideology, mirroring the dichotomous division of the two online network clusters: While right-leaning newspapers had established extreme depictions, more moderate or left-leaning newspapers refrained from using such frames. Following an incident in October 2022, where a cyclist in Berlin lost her life in a street accident during a protest, all outlets shifted towards a more negative portrayal of the protest group.

JOS26 Social media and journalism

PP 0738 Journalism on TikTok: A paradigm shift in news values?

[Jonathan Hendrickx](#)¹, [Anna-Theresa Mayer](#)², [Wedel Lion](#)²

¹ University of Vienna, Department of Communication, Vienna, Austria

² Weizenbaum Institut, Digital News Dynamics, Berlin, Germany

TikTok is rapidly emerging as one of the key social media platforms for encountering and consuming news content (Newman et al., 2023). Legacy news outlets experiment with the platform to attract younger audiences, which are typically more difficult to attain using traditional media outlets (De Marez et al., 2023). Scholarship is rapidly following suit, with the changing relationship between social media platforms and journalism, constituting a viable new study focus (Anter, 2023). However, and keeping in mind the potential of TikTok's platform architecture in disrupting previous experiences stemming from other social media platforms such as Facebook (e.g., Hase et al., 2022, pp. 1500–1503), research on what legacy news outlets share to TikTok is still lacking (but see e.g. Negreira-Rey et al., 2022).

Conceptually, we adhere to the dislocation of news and journalism (Ekström & Westlund, 2019) as well as to gauging whether a traditionally pivotal theoretical framework such as news value theory (Harcup, 2023; Harcup & O'Neill, 2017) stands the test of time when applied to TikTok. This is of particular relevance considering that news values "were developed when journalists had limited direct contact with their audiences" (Peterson-Salahuddin, 2023, p. 3), with this relationship effectively upended in the social media era (Salonen et al., 2022). As previous content analyses of journalistic TikTok videos have found that only "almost half of all posts were news and public service information" (Vázquez-Herrero et al., 2022, p. 1727), we seek to investigate to what extent German-speaking European news outlets adhere to traditional news values in their TikTok content and whether the existing set of news values suffices to study it. We aim to explore what (news) values and content categories constitute news on TikTok, or succinctly: what is news on TikTok?

To this aim, we are conducting a content analysis of 9,222 TikTok videos posted in 2023 by 20 German-speaking news outlets from Germany, Austria and Switzerland and combining qualitative and quantitative approaches in a codebook. This contains previously established categories with regard to topic and news values as well as open categories for the qualitative exploration of emergent news values in journalistic content on TikTok. Following manually coding ten percent of the data, we upscale the coded data based on supervised machine learning approaches.

Our study is closely tied to the ECREA 2024 conference theme "Communication & social (dis)order" as it furthers the ontological and societal debates on the value of news as an essential commodity to guarantee a well-informed citizenry in a democratic society within the realm of social media platforms such as TikTok.

PP 0739 Uncovering the left: Professional identities of alternative left-wing news editors in Scandinavia

[Viljami Vaarala](#)¹

¹ University of Helsinki, Swedish School of Social Science, Helsinki, Finland

This paper investigates the professional identity of peripheral left-wing news editors in the Nordic countries, a relatively underexplored area compared to the extensive focus on right-wing peripheral media in previous research. Based on in-depth interviews with editors in Sweden, Norway and Denmark, the study examines how these editors construct their professional roles, values, and practices within a media environment where mainstream

narratives predominate. The analysis reveals how the editors' educational and professional backgrounds, personal histories, and ideological commitments shape their approaches to journalism, their perceived responsibilities, and their positioning in relation to mainstream media. Contrary to the traditional notion of objectivity often upheld by conventional journalism, they emphasize advocacy, balance and ideological transparency as core tenets of their work. The paper also discusses the challenges they encounter in maintaining credibility while trying to advance social and political change. By shifting the focus to left-wing peripheral media, this study contributes to a more comprehensive understanding of the diversity of peripheral media actors in the Nordic countries and their role in shaping public discourse.

JOS26 Social media and journalism

PP 0740 From the streets to social media. Investigating social media's role in journalistic perceptions of public opinion

[Kathleen Beckers](#)¹, [Strikovic Dina](#)¹

¹ University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

Whereas traditionally, public opinion was associated with polls, various sources beyond polls are employed by elites like journalists and politicians, to grasp citizens' sentiments (Walgrave & Soontjens, 2023). The advent of social media and its easily accessible data have disrupted traditional practices of reading and representing public opinion. 'What's going on on Twitter' has become a standard question at editorial meetings (Beckers et al., 2019). While social media have changed how journalists think about and measure public opinion, the actual impact on their perceptions and judgments remains unclear.

While journalists widely use social media as a source of information (Broersma & Graham, 2013), and its role in news reporting is well-documented (Oschatz et al., 2022), the full impact on their perceptions remains unclear. Social media, while imperfect in reflecting the general public, holds democratizing potential by enabling diverse voices in public discourse (Lee et al., 2014). However, challenges arise as social media users often differ from the general population in politically relevant dimensions, such as vote choice, turnout, and education, leading to more extreme and polarized opinions (Mellon & Prosser, 2017). Understanding how journalists are influenced by this information is crucial, as it can shape the content they produce (Hoewe, 2016; McGregor, 2019). There's a risk of journalists mistaking these "loud" opinions for true public sentiment, potentially influencing people's judgments on those issues (Mutz, 1992).

In an experiment with 143 Flemish political journalists, we examined how social media depictions of public opinion influence journalists' perceptions on various topics. The study investigated the impact of news topic (hard or soft news), public opinion information type (poll or vox pops), and source (Twitter or traditional). Journalists were randomly assigned to eight conditions and exposed to articles on the price of service vouchers or changes to Miss Belgium competition rules, incorporating different manipulations of public opinion displays. Subsequently, journalists were surveyed to assess the article's effectiveness in representing public opinion and to capture their actual perceptions of public opinion.

We find that journalists rated traditional vox pops as the least representative, traditional polls as the most representative, and social media fell somewhere in between. Generally, journalists perceived public opinion to align with the information presented in the articles. However, we do find that while there is only a small difference between social media poll data and traditional polls in how strongly they influence journalists' public opinion perceptions, social media vox pops influence journalists' public opinion perceptions more strongly as compared to traditional vox pops. Social media vox pops seem to be particularly influential in shaping journalists' public opinion perceptions. In the soft news condition, journalists were more likely to think that public opinion backed the article's direction in the vox pop conditions, whereas traditional polls had a stronger impact in the context of hard news.

Given the potential pitfalls associated with social media representations, such as the risk of mistaking extreme and non-representative opinions for public opinion, this potentially has implications for how journalists report public opinion and how audiences are influenced by it.

JOS27 Transparency

PP 0741 To disclose or not to disclose: A large-scale multidimensional analysis into the product transparency on Dutch news websites

[Roeland Dub el](#)¹, [Mark Boukes](#)¹, [Damian Trilling](#)¹

¹ University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

Introduction

An increasing part of the public is distrustful towards journalism. One way to counter this trend could be increased transparency. If journalists are more open about how the news is created, readers can judge whether it was created properly. Therefore, the question arises to what extent transparency is implemented by news outlets.

In our attempt to answer this question, we add to previous work in three ways. First, previous studies analyzed one specific dimension of transparency, although transparency in one dimension does not guarantee transparency in another. Other studies investigate transparency multidimensionally but in small samples only. Yet, some routines are rare and require a larger sample to detect. To solve this, we conduct a large-scale multidimensional analysis using computational methods. Second, another stream of literature examined how online articles are updated or looked at the presence of change cues, such as last updated timestamps. We link both and assess whether changes are accompanied by change cues. Third, previously, transparency was only compared between outlets, while we also assessed whether transparency differs for items within outlets.

We hypothesized that digital-native media would be more transparent in their news coverage, since they use digital features more that enable transparency, such as hyperlinking. We also predicted public and quality media as well as hard news items to be relatively more transparent, because of their alleged higher standards of news production.

Data and Methods

To achieve maximum variety in outlet characteristics six popular Dutch news websites were selected: two legacy popular and quality outlets each, the public broadcaster and a digital-native outlet. For each outlet, a random sample of 5,000 articles from the year 2023 was scraped, leading to a final sample of 27,096 valid articles.

To detect the presence of sources, the explicitness of sources used and the disclosure of background information about news production, we trained machine learning classifiers on 2,000 manually annotated sentences. Indices were calculated based on transparency indicators for the studied dimensions: author, changes, sources and production transparency. These were then predicted through OLS regressions based on outlet and item features.

Results and conclusions

Author transparency happened mainly in quality media and hard news, but less in public and digital-native media. This was indicated, in part, because the latter media were less likely to share an author's full name. Particularly, it was public and digital-native media that were open about changes, but not quality media and hard news. Changes could be identified by checking the `dateModified` tag in the HTML file, which indicates whether a page has been modified. For source transparency, indeed public, digital-native and quality media and hard news were more transparent. This was reflected, for instance, in the number of hyperlinks. Production transparency occurred mostly in digital-native and quality media and hard news items, but less so in public media.

Although outlets rarely abstained from transparency routines, no outlet was fully transparent in every dimension. It shows that the implementation of transparency is a complex process which depends on the outlet, article, and transparency dimension of focus.

JOS27 Transparency

PP 0742 Transitioning to Transparency: Footnote journalism as a novel journalistic practice

Lars-Ole Wehden¹, Bernadette Uth¹, Kathrine M. Engelke¹, Lea von den Driesch¹, Nina Springer¹

¹ University of Münster, Department of Communication, Münster, Germany

Modern societies are more critical of knowledge-generating institutions and their normative authority—one of which is journalism. The ideal of objectivity that has long guided the profession is under scrutiny (Anderson & Schudson, 2019)¹, leading to a disruption of professional norms. One of the norms that can replace objectivity as a guiding principle is transparency. Transparency is hailed as a remedy for the much-discussed loss of trust and while empirical evidence shows mixed results (Curry & Stroud, 2021)², recipients state the importance of transparency regarding sources for journalistic quality and trust in journalism (Winterlin et al., 2020)³. For instance, it has been shown that the availability of in-text hyperlinks increases recipients' perceived message credibility (Borah, 2014)⁴. While such research on audience perceptions is extensive, less is known about journalists' transparency practices and how they are embedded in journalistic content.

This study investigates a novel transparency practice in journalism that we term *footnote journalism*: the use of scholarly referencing practices that substantiate news content by providing audiences with a listing of used sources. These sources are presented as visually emphasized footnote-style scientific citations (e.g., next to or below the article text or in the corner of the video screen). Footnote journalism can empower the audience to explore the journalists' sources further themselves and simultaneously support interpretative journalistic statements. In terms of quality improvements, footnote journalism can be measured against scholarly standards, such as whether peer-reviewed scientific evidence is referenced and whether the works cited are publicly available. Furthermore, footnote journalism can be used to address criticism of oversimplified news and for journalists to uphold their authority in comparison to alternative communicators of news-like content.

In an exploratory content analysis we investigated what types of sources are used (RQ_1), what types of statements are substantiated (RQ_2) and whether topics make a difference (RQ_3) when journalists use footnote journalism.

We sampled three different German outlets known to use footnote journalism: the science TV show *MaiThink X* ($n = 24$ episodes)⁵, the science-focused print magazine *Katapult* ($n = 47$ articles)⁶, and the online science journalism format *Quarks* ($n = 56$ articles)⁷; with a combined $N = 2,588$ footnote references (intercoder reliability: .761–.964, average: .870).

Regarding RQ_1 , most sources used were found to be peer-reviewed scientific articles ($n = 714$) or other scientific publications ($n = 375$). News articles ($n = 329$), official statistics ($n = 560$) and private sources ($n = 593$) were less frequently used, showing a solid understanding of scientific rigor. Most of the references were traceable (88%) and publicly available (81%). Regarding RQ_2 , most footnoted statements were event- or case-based statements ($n = 581$), substantiating non-numerical claims about real events. References to specific ($n = 347$) or unspecific numerical data ($n = 204$) were less prevalent, as were theoretical statements ($n = 79$) and sources for quotes ($n = 241$). Differentiated by topic (RQ_3), social issues and health were disproportionately often backed by peer-reviewed scientific works, while for foreign politics, crime, and culture, journalistic content was referred to more prominently ($\chi^2(44)=521.03, p<.001$, Cramer's $V = .23$). Footnote journalism seems to adhere to scientific standards, yet to be topically quite narrow. We hope to discuss the study's implications at ECREA.

JOS27 Transparency

PP 0743 What's in a journalistic fact-check? Investigating the effectiveness of source transparency

Kim Verhoeven¹, Gert-Jan De Bruijn¹, Steve Paulussen¹

¹ Universiteit Antwerpen, Communication Sciences, Antwerpen, Belgium

Introduction

Fact-checking is a potential new form of journalism to combat online misinformation. Experimental research primarily investigated if or what fact checks are effective in correcting misinformation (Walter et al., 2020; Walter et al., 2021). However, even though providing transparency is a key guideline outlined by the International Fact-Checking Network in journalistic fact-checking (IFCN, 2023), experimental research on the effectiveness of transparency within journalistic fact-checks is scarce (Citation Omitted). More specifically, most research related to transparency in fact-checking focuses on the transparency of the sender of the fact-check, showing that fact-checks by experts are more effective than those by non-experts in reducing beliefs in misinformation (Liu et al., 2023).

However, research on the effectiveness of (the presence of) source transparency about the actors used within a journalistic fact-check to support the fact-check's final judgment is lacking. Nevertheless, it is important to fill this research gap, especially since journalistic fact-checkers use diverse practices to align with the IFCN transparency-related guidelines (Citation Omitted). Therefore, we are conducting an experiment in which one specific source transparency element (i.e., the use of (different types of) actors (i.e., an expert, an involved person, a famous person, or no actor)) is experimentally manipulated to assess its effect on the fact-check's credibility and participants' beliefs accuracy, to be able to investigate our general research question: How does a) transparency about and b) the type of source used within the fact-check affect c) the credibility of the fact-check and d) belief accuracy about the fact-checked claim?

Method

We have been conducting a 2 x 4 between-subjects experiment in December 2023 and January 2024. Participants should be Flemish residents aged 18 or above. Participants are randomly assigned to either a fact-check in which an expert is cited to support the fact-checked claim, a fact-check in which an involved citizen is cited, a fact-check in which a (well-known and uncontroversial, i.e., pre-tested) famous person is cited, or a control condition in which no actor is cited. Participants are exposed to only one fact-check on one specific health topic (i.e., corrected misinformation on (1) Alzheimer's disease or (2) the stimulation of bowel movements). We selected existing health-related fact-checked claims due to the growing problem of health-related misinformation, which is problematic for public and personal health (Tully et al., 2020). Using two unrelated health claims, we can compare the results across topics and explore the generalizability of our results in health-related journalistic fact-checks. After exposure, participants complete measures of the actor's credibility, fact-check credibility, and belief accuracy.

Through this experiment, we aim to assess how source transparency influences the perceived reliability of the fact-check and belief accuracy in journalistic fact-checking. Ultimately, we aim to understand the impact of citing

(specific types of) actors in a health-related fact-check on a) the fact-check's credibility and b) belief accuracy. By doing so, we provide journalistic fact-checkers insights on creating fact-checking formats that most effectively counter incorrect health-related information.

JOS27 Transparency

PP 0744 "It's unsettling, but it's crucial for you to understand the details": Legitimizing press ethical choices when liveblogging from a murder trial

Maria Bendix Wittchen¹

¹ Roskilde University, Journalism - Department of Communication and Arts, Roskilde, Denmark

News media increasingly opt for live-blogging as a genre, especially when covering trials of public interest (Flower 2023; Knight 2017), including high-profile cases with inherent ethical dilemmas (Wittchen 2023). The study investigates how court reporters directly and indirectly communicate with readers when liveblogging, disclosing their choices to include or omit details or information that may be perceived as unethical or offensive in relation to press ethical guidelines.

Building upon previous research into the ethical negotiations of trial coverage and labeling this form of metacommunication as 'ethical rituals 2.0' (Wittchen 2023), this paper shows how such rituals unfold during live coverage, exploring gaps between sound press ethics and journalistic practice.

Methodologically, the study utilizes narrative textual analysis to examine written live coverage of a singular murder trial across various Danish media outlets, including two tabloids, two public service media, two national dailies, and one local media outlet specifically chosen for its proximity to the crime scene. The written content is chosen due to the restriction on courtroom filming, making written live coverage the most prevalent method in a Danish context.

Specifically, the selected case study involves a high-profile murder trial, rape, and dismemberment of a woman (Mia Skadhauge Stevn) in Denmark, unfolding in 2023 and attracting substantial media attention. This media scrutiny has engendered ongoing discussions and criticism concerning the press's handling of delicate details pertaining to the victim's behavior prior to her demise and the specifics of the dismemberment process.

The study unveils how journalists wield transparency to elucidate and justify their ethical decisions to the audience, skillfully navigating ethical quandaries in real-time coverage. Additionally, the study discusses the interpretation of key press ethical rules from Danish sound press ethics, such as the following: "Victims of crimes or accidents shall be paid the greatest possible regard," and "Information which may violate the sanctity of private life shall be avoided unless an obvious public interest requires public coverage" (Pressenævnet, 2013).

Hence, this research contributes to a deeper understanding of how trial reporters negotiates ethical considerations with its audience and substantiates its decisions in reporting on trials of substantial public concern, thus legitimizing its practices when doing rapid live reporting. Exploring these legitimization rituals is pertinent as the media maneuvers through complex ethical terrain.

PP 0745 Media critique, transparency, and trust

Lisbeth Morlandstø¹, Birgit Røe Mathisen¹

¹ Nord University, Social Science, Bodø, Norway

Media critique is regarded important in a democratic society, as news media facilitates public discourse and contribute to opinion-making and political debate. This is particularly important in times with social and communicative (dis)order. Media critique can be found both from outside and inside the newsrooms. However, news media is often criticized for sin of omission, being reluctant to carry out critical investigation towards one's own colleagues. As Wyatt (2007) states, shedding critical light upon one's own peers might be challenging and media critics might be accused of disloyalty. A wide range of studies are concerned with media critique from the outside, such as from

audiences and bloggers, while little research has addressed the topic of self-criticism from within the newsrooms. This paper seeks to explore this gap, based on an in-depth qualitative interview study. We have interviewed seven Norwegian columnists, who produce media critical texts, published regularly in legacy news media. The research questions asked is twofold: *How do media critical columnist understand their professional role, and how do they handle the challenge of shedding a critical light towards peers and colleges?*

In a former study (author, submitted 2024), we found that the media critique is moving close to journalism, with a clear normative anchoring in the Code of Ethics. However, the systemic critique is rare in the published columns, and the columnists are rarely addressing questions regarding the more overarching structural framework affecting journalistic work, such as economy, ownership and media policy. This former study was based on text analysis. Thus, in this paper, which is work in progress, our aim is to further elaborate how media critics themselves perceive their professional role. A preliminary finding indicates that criticizing one's own colleagues is not necessarily perceived as challenging as the theory of press criticism suggest (Wyatt 2007), which makes it interesting to further elaborate. Being a democratic-corporatist media system, characterized by strong journalistic professionalism and autonomy, as well as high levels of trust in societal institutions, Norway constitute an interesting context to explore media critique within, with transferable relevance to other national contexts. Theoretically, this study is anchored in institutional theory, supported by Wyatts theory of press criticism. Within the perspective of journalism as a societal institution, our ambition is to scrutinize the role and practices of columnists as media critical actors. Further, our ambition is to examine the legitimacy of media critique in relation to transparency and trust. An open public and mediated discourse about media itself will contribute to the societal credibility and trust that journalism depends upon.

PP 0844 Evaluative standards as basis for comparative analyses of conflict coverage

Marc Jungblut¹

¹ Ludwig-Maximilians-University Munich, Department of Communication Studies and Media Research, Munich, Germany

Due to their newsworthiness, conflicts play a central role in news coverage (Jungblut, 2020). They can be defined as struggles between actors competing over resources (e.g., money, territory, power, values or ideological superiority; Meyer, Baden & Frère, 2018). Conflicts can be differentiated based the level of violence (from protests to war), the issue of dispute (autonomy, ideology, territory etc.) or the involved actors (state, non-state, HIIK, 2019).

There is concern that public debates on conflicts increasingly align with ideological lines, reflecting growing societal polarization and contributing to what has been labeled an epistemic crisis of public discourses (Jacoby, 2014; Neuberger et al., 2023). Despite extensive research on how individual conflicts are portrayed in the media, systematic exploration of trends in conflict reporting remains limited (Baden & Tenenboim-Weinblatt, 2018). This is because most studies follow the framing paradigm and either confound frames and topics by measuring generic frames (e.g., Carpenter, 2007) or capture issue-specific frames too specific to be applied to other conflicts (e.g., Jungblut & Zakareviciute, 2019).

This project proposes a novel conceptual approach for the analysis of conflict discourses across various conflicts, countries, and media outlets. Following Boltanski and Thévenot's (1999), we suggest that conflict positions can be differentiated through interpretative repertoires, expressing "coherent ways of interpreting and talking about the world" (Baden & Springer, 2017, p. 181). These repertoires contain an observable evaluative standard by which a conflict is defined (Baden & Springer, 2017). Following Boltanski and Thévenot (2006), the variety of possible evaluative standards can be reduced to seven basic types: popular ("good" is what is popular), moral, civic, economic, functional, inspired and ecological. Each of those evaluative standards express a perspective through which a conflict and its potential solution can be portrayed.

The project aims to identify evaluation standards in conflict coverage (RQ1) over different types of conflicts (RQ2) and media outlets (RQ3) as well as to identify recurring patterns and dynamic developments in conflict discourses over time (RQ4).

We plan to conduct automated content analyses using a custom-made dictionary currently comprising 104 English search terms each indicating the emphasis on one of the evaluative standards. A first version was created through an annotated corpus of conflict coverage and extended with the help of the INFOCORE-dictionary (Baden et al., 2018) and suggestions from ChatGPT. We will validate the dictionary and if necessary expand it, before translating it to French, German and Spanish.

For preliminary results, we retrieved data from the Guardian API on the Russian invasion of Ukraine (24.02.22–28.12.23, n = 15.938) and societal debates on protective measures against COVID (01.03.20–31.08.20, n = 4.921) and the useNews repository (Daily Mail coverage of COVID, n = 3.422, Puschmann & Haim, 2020).

Initial findings on the Russian invasion of Ukraine indicate a consistent emphasis of moral, economic, and civic values in the Guardian's discourse. A Comparison of COVID discussions in the Guardian and the Daily Mail reflects distinct editorial lines. The conservative Daily Mail emphasizes economic, civic, and popular values, aligning with conservative viewpoints. In contrast, the Guardian presents a more balanced coverage, contrasting economic and moral values.

JOS28 Journalistic values I

PP 0845 Cross-platform crisis reporting: An analysis of British broadcasters' coverage of the Israel-Palestine conflict

Maria Kyriakidou¹

¹ Cardiff University, School of Journalism- Media and Culture, Cardiff, United Kingdom

The Israeli-Palestinian conflict has dominated the attention of the global news media since the Hamas attack on October 7, 2023. This extensive coverage has reinvigorated long-held debates about media bias in the framing of the conflict. Previous research has highlighted the lack of impartiality and pro-Israeli bias in similar media coverage in the UK, through the use of sources and the adoption of specific perspectives and explanations of the conflict (Gaber et al., 2009; Philo & Berry, 2004, 2007; Thomas, 2011). However, the reporting landscape has since evolved, incorporating broadcasters' social media accounts, which engage with diverse audiences in various ways. In the UK, public service broadcasters maintain a presence on platforms like Facebook, Twitter, YouTube, and Instagram. These platforms share short video clips from TV news and web content, often tailored to each platform's unique characteristics. Additionally, original content is crafted with specific platforms and audiences in mind. This evolution raises questions about the types of stories being selected and the different types of witnessing enabled on different media platforms.

This paper aims to answer these questions by conducting a systematic thematic analysis of news coverage of the conflict across multiple media platforms. These include BBC News at 10, @BBCWorld on Twitter, @bbcnews on Instagram, Channel 4 News, @Channel4News on Twitter, and @channel4news on Instagram. Methodologically, the paper employs the thematic analysis developed by the Glasgow Media Group and utilized by Greg Philo and Mike Berry in their examination of previous Israeli-Palestinian conflicts (Philo & Berry, 2004, 2007). This method operates under the assumption that in contentious areas, there exist competing narratives for describing events and their historical context (Philo & Berry, 2007, p. 174).

The paper, therefore, will illustrate how the themes, visuals and perspectives of coverage differ on the various platforms, as well as the understandings of the conflict that are enabled through the different modalities of the coverage. It thus contributes to ongoing debates on the mediation of war and conflict and its evolution. It also offers an updated perspective on the coverage of the Israeli-Palestinian conflict, shedding light on questions of impartiality, as well as potential shifts in reporting patterns, driven not only by contemporary political developments but also the changing media landscape.

PP 0846 Assessing the impact of journalistic news media on an informed citizenry: Framework and measurement of a news media impact score

Philipp Bachmann¹, Sonja Heller¹, Diana Ingenhoff²

¹ Lucerne University of Applied Sciences and Arts, Lucerne School of Business, Lucerne, Switzerland

² University of Fribourg, Department of Communication and Media Research, Fribourg, Switzerland

Journalistic news media outlets are essential for an informed citizenry. However, with the advent of digitization, their societal significance is increasingly challenged. This study explores a pertinent question: How can the impact of news media outlets on an informed citizenry be measured comprehensively? This paper aims to introduce a framework to evaluate the influence of journalistic news media on an informed citizenry. Our theoretical part aims to integrate various strands of research cohesively. Our main argument is that the impact of journalistic news media outlets hinges on four pivotal elements: their reach and frequency of use, perceived quality, and efficacy in enhancing citizens' understanding of societal issues. Therefore, we encompass research on communication controlling, audience outreach, news quality evaluations, and media effects analyses regarding how news media

shapes knowledge and comprehension of relevant topics. Following concepts from communication controlling, there are four stages: input, output, outcome, and outflow. The *input* pertains to the expenses associated with news production. It encompasses both human and financial resources. These expenditures can be precisely evaluated using traditional accounting techniques. The *output* considers tangible and intangible elements. Tangible elements include easily quantifiable aspects like the number of published articles or broadcasted segments. On the intangible side, metrics like audience reach and usage come into play (Napoli, 2011). The *outcome* concerns audiences' perceptions and attitudes toward the news sources and content. For instance, a media outlet's overall perceived quality can be an indicator at this level (Bachmann et al., 2021). The *outflow* evaluates news media's broader societal value in the final stage. This is the essence of the "media performance" or "public value" concepts" of how well the media fulfills its societal functions (e.g., Collins, 2007; Humprecht, 2016). This four-stage framework enables us to conceptualize news media impact as the ripple effect created by journalistic actors (like media outlets or brands) by allocating human and financial resources (*input*) to produce and disseminate sources (like newspapers or news websites) and content (such as articles or broadcast pieces) (*output*), thereby shaping audience perceptions and regarding these sources and content (*outcome*), culminating better-informed citizenry in terms of a heightened public awareness, knowledge and understanding of current affairs (*outflow*). Moreover, the paper outlines an empirical method for its operationalization and measurement, using Switzerland as a case study. We conducted a representative survey of 3,630 individuals, evaluating the impact of 55 Swiss news media outlets. The findings underscore the relevance of public service media in Switzerland. Seven of the top ten most influential outlets belong to this category, highlighting the critical role of public broadcasting in shaping an informed citizenry. Additionally, the findings reveal a marked preference for audiovisual media, particularly television, regarding reach and impact. Beyond Switzerland, the framework and method can significantly impact media policy discourses on the role of news media outlets in today's high-choice media environment.

PP 0847 The operationalisation of impartiality within Public Service Media newsrooms. Comparing practices in a cross-media environment at VRT and RAI

Michael Pakvis¹, Tim Raats¹, Catalina-Mihaela Iordache¹

¹ Vrije Universiteit Brussel, imec-SMIT-VUB, Ixelles, Belgium

Impartiality is clearly stipulated as a core editorial principle of Public Service Media (PSM). Across European PSM, its role is interlinked with the necessity to maintain independence from both political and commercial interests. Nonetheless, the lack of a clear definition in policy documents and editorial guidelines has resulted in impartiality being criticised by audiences and politicians who accuse news reporting of bias and of reinforcing establishment ideas. This criticism is detrimental to PSM, whose editorial principles underpin their public remit and by extension, their legitimacy. Existing assessments of impartiality focus on its presence in news content, its definition in policy documents, or its perception by audiences. However, in doing so, not much is known about how impartiality is operationalised within newsrooms. To address this gap, this study relies on the value of newsroom studies in providing a grounded and corrective approach to generalising research. Therefore, it draws inspiration from previous studies concerning values such as objectivity and universality.

This research answers the following research question: "How do PSM editorial staff operationalise impartiality in daily newsroom routines?" To this end, the study employs a comparative case study of two PSM organisations: the RAI in Italy and the VRT in Flanders (Belgium), based on two main shared characteristics: (1) the relevance of impartiality to their public remit and the presence of dedicated commissioned assessment reports on the concept; and (2) an increasing societal polarisation and scrutiny of impartiality in news coverage from both politicians and society. As the study compares internal processes of the two PSM, an added benefit is the possibility to analyse and compare the concrete influence on practices aimed at reaching impartiality by external (political) pressures.

The comparative case study analysis builds on approximately a total of 36 semi-structured interviews with editorial staff across PSM (approx. 18 interviews each), including experienced and junior journalists, editors, presenters, and staff involved in writing editorial documents. This combination of perspectives and experiences provides valuable insight into the role that impartiality plays in processes across different newsrooms at the two PSM organisations. Specifically, the analysis focuses on (1) how journalists themselves define impartiality, (2) the concrete practices and routines that editorial staff employ to ensure impartiality, and (3) the constraints of ensuring impartiality within different platforms on which the two PSM are active.

Preliminary findings show nuances in the definition of impartiality by staff, that does not necessarily coincide with the definition presented in official documents. Findings also show that, at both organisations, practices employed by journalists to ensure impartiality depend on the platform they work on. Thus, the choice of phrasing, terminology and images in online news articles differs from the considerations given to the selection of topics and participants in current affairs programmes on television. Finally, the two most poignant constraints in ensuring impartiality according to editorial staff are (1) the speed at which news is published and (2) retaining viewership/readership across

news items. These highlight how practical concerns impact considerations on impartiality, such as the selection of experts and viewpoints.

PP 0848 Exploring risk and uncertainty in journalism: A comparative study of Romania and Moldova using findings from the World Journalism Study 2021–2023

[Natalia Vasilendiuc](#)¹, [Anghel Gheorghe](#)¹, [Bardan Alexandra](#)¹, [Fiscutean Andrada](#)¹, [Ionescu Carmen](#)¹, [Matei Antonia](#)¹, [Oprea Bogdan](#)¹, [Șuțu Rodica Melinda](#)¹

¹ University of Bucharest, Journalism, Bucharest, Romania

The World Journalism Studies 2021–2023 project examines the challenges faced by journalists worldwide and makes an important contribution to our understanding of adaptation strategies in journalism in different contexts. Based on a solid theoretical framework, the World Journalism Studies (WJS) project systematically assesses perceptions in critical journalistic dimensions, including editorial autonomy, influences on journalism, journalistic roles, epistemology, ethics, safety, resilience, and working conditions.

This abstract highlights the comparative aspect of the WJS 2021–2023 project, focusing on the study of the Moldovan and Romanian media landscapes. The study, which involved almost 740 participants from different media outlets, provides a nuanced picture of journalism in both countries, covering national dailies, weeklies, news outlets, TV and radio channels, online media and emerging start-ups.

Crucially, the study includes a comparative analysis that systematically examines the common and different characteristics of journalistic practices in Moldova and Romania. It explores similarities and differences in editorial autonomy, influences on journalism, journalistic roles, epistemologies, professional ethics, safety, resilience, and working conditions, and provides a comprehensive understanding of the comparative dynamics at play.

The findings highlight the nuanced nature of risk in both Moldova and Romania and offer insights into the challenges faced by journalists and news organizations in these regions. A comparative analysis with data from previous surveys (2016–2016) shows that the perceptions of journalists in both countries have changed significantly over time.

A particularly noteworthy discovery is the identification of determinants influencing cross-national differences in the way journalists conceptualize and manage risk and uncertainty between Moldova and Romania. The study highlights the evolving dimensions of the media landscape in both countries and offers insights into the professional orientations of journalists and the contextual structures that influence their work.

Methodologically, the research team followed a geographically distributed approach by stationing its members in the main cities of Moldova and Romania. This approach ensures a nuanced understanding of media dynamics in both countries, with local collaborators providing invaluable insights and overviews.

The collected data set forms a solid infrastructure for sustainable comparative research on journalism and risk in Moldova and Romania. The findings provide an up-to-date snapshot of the state of journalism in a dynamically evolving global context and offer actionable insights for practitioners, policymakers and academics. This comparative discourse fosters an informed dialogue about the complex challenges and opportunities shaping the media landscapes of Moldova and Romania in the context of the Worlds of Journalism Study.

JOS29 News avoidance

PP 0849 “Too much and always the same”: Textual characteristics of news articles that people intentionally avoid

[Dominika Betakova](#)¹, [Hajo Boomgaarden](#)¹, [Sophie Lecheler](#)¹

¹ University of Vienna, Department of Communication, Vienna, Austria

Intentional news avoidance, a deliberate decision to refrain from news consumption, is associated with holding misbeliefs and lower political knowledge. This is worrying given that the results of a large-scale international survey show an increase from an average of 29 % of people reporting sometimes or often actively avoiding the news in 2017 to 38 % in 2022. The concept of intentional news avoidance also encompasses selective news avoidance, a behavior of avoiding only very specific news contents or topics. Most mentioned reasons for such avoidance behaviors include perceived news negativity, news overload, or repetitiveness of certain topics, such as COVID-19 or politics. Interestingly, these reasons fall under content-level factors of selective news avoidance. For instance, if many news avoiders opt out of news due to its negativity and impact on their mood and mental health, it is most probably due to the news focusing predominantly on negative events. Thus, it is plausible to assume that news content characteristics influence news avoidance and its occurrence can partially be explained by looking at the content of news coverage. Therefore, this study explores the nature of intentionally avoided news content guided by a cross-sectional survey of a quota-based sample of Austrian citizens (n = 473; age: M = 40.78; gender: 49.26 % women; net available household income in the range from 2,200 to 2,700 Euros and 16.91 % with a college

degree) who indicated their news consumption along with news topics they intentionally avoided and why. The survey was conducted from mid-June to mid-July 2021 and the preliminary findings based on close-ended questions identify COVID-19 ($M = 4.35$; $SD = 2.18$), European integration ($M = 3.62$; $SD = 2.00$), corruption ($M = 3.47$, $SD = 1.99$), economic policy ($M = 3.47$; $SD = 2.01$) and migration ($M = 3.44$, $SD = 2.00$) as the most avoided news topics (scale from 1 to 7). In the second step, the study analyzes Austrian news articles from eight major news outlets ($n = 109,548$) during the survey's period. The news outlets were: ORF 2 (transcripts of television news by public broadcaster; $n = 1,990$), Heute (print: $n = 3,121$; online: $n = 4,621$), Kleine Zeitung (print: $n = 15,688$; online: $n = 8,551$), Kronen Zeitung (print: $n = 21,834$; online: $n = 15,603$), Kurier (print: $n = 11,614$; online: $n = 5,211$), Die Presse (print: $n = 4,685$; online: $n = 3,887$), Der Standard (print: $n = 3,796$; online: $n = 4,220$) and Salzburger Nachrichten (print: $n = 4,727$). The work in progress inspects differences in articles' textual properties, negativity, usage of alarm words and language intensifiers, complexity and salience via dictionary methods, sentiment analysis and methods measuring syntactic and semantic complexity. The aim is to build an analysis pipeline integrating news avoidance content indicators and considers their individual and interactive presence in the news. Upon completion, the study will enhance the understanding of selective news avoidance as a reaction to news content, contributing to the solutions-oriented discourse surrounding news avoidance. In addition, validated dictionaries in German language will be published on the OSF platform.

JOS29 News avoidance

PP 0850 How infrequent news users keep up to date about current affairs

Pauljan Truyens¹, Sien Van de Wouwer¹, Ike Picone¹

¹ VUB-SMIT, Communication Sciences, Brussels, Belgium

Existing research into news audiences suggests that news makes up a relatively small part of most users' media repertoires (e.g., Authors, 2021a) and that even within news repertoires, only a minority of users feature an omnivorous news repertoire (Authors, 2021b). A growing part of media users stumble upon news incidentally, avoid news, or do not include news content in their media habits (Villi et al., 2021), all this leading us to wonder how media users with limited news repertoires keep up to date about current affairs?

To investigate this, we take a non-news centric approach (Swart et al., 2022) and opt to combine a mix of data-gathering methods. First, based on a survey of a representative sample of Belgian media users ($N = 2309$), we identify six distinct media repertoires by performing a Latent Class Analysis (LCA) based on sources, platforms, and devices to use media. Second, we analyse 47 in-depth interviews with Belgian users featuring one of these media repertoires. An inductive thematic analysis (Corbin and Strauss, 2015) of these interviews focussing on ways they use news and why they do or do not use news is operationalized to identify overarching themes.

The quantitative analysis of the six media repertoires confirms that news use is not central in most media repertoires; only 'News omnivores' feature a media repertoire in which news content is prominent. The other media repertoires, therefore, can be described as limited news repertoires. The qualitative interviews both reinforced and nuanced the quantitative findings. Although most Belgian media users mentioned that they tried to follow the news, respondents rarely remembered the last news item they had consumed. When asked which media type they could not miss, almost none of the respondents discussed their news uses. However, most respondents kept themselves up to date about significant news events in alternative ways, such as via knowledgeable friends and acquaintances and/or via non-news types of media (e.g., entertainment programs).

We conclude by reflecting on how our findings contribute to a deepened understanding of the 'news-find-me' principle (Gil de Zúñiga et al., 2017) and what this means for professional news media's role in people's media repertoire.

JOS29 News avoidance

PP 0851 News discouragement discourses in mental health texts: When news consumption becomes a problem

[Matt Carlson](#)¹

¹ University of Minnesota, Hubbard School of Journalism and Mass Communication, Minneapolis, USA

Examples of social disorder feature prominently in the news as audiences face a never ending onslaught of present tragedies and future concerns. Following the news, even when it is persistently disheartening, is an obligation tied to norms of citizenship and democratic participation. Yet there are also calls for not following the news bound up in a growing cultural imperative to minimize negativity as a means of individualized self-protection. At a time when both concern over news avoidance and the need for collective action to address pressing problems are simultaneously high, more attention is needed to how people are told not to use the news.

The research problem this study addresses is to understand how discourses on the relationship between news and individual wellbeing recommend or validate news avoidance on the grounds that news consumption has negative consequences for individual mental health. Taking up this topic helps illuminate larger social and cultural factors that shape news consumption (or non-consumption) patterns, perceptions of news and its societal value, and attitudes toward individual civic responsibility.

Methodologically, this paper uses textual analysis to analyze discourses discouraging news use for the preservation of mental health and well-being. Public texts are examined, ranging from prominent news outlets to texts geared toward mental health professionals to the popular self-help literature. The study uses a qualitative approach that is attuned to both the characteristics of the discourse – i.e., what is said about the detrimental effects of news on mental health – and the context of the discourse – i.e., who is speaking, where are they speaking, and whom are they speaking to. This qualitative approach is necessary for the exploration of the shape of these discourses; it is focused on the production and circulation of meaning, with careful consideration of the power dynamics inherent in speaking about which behaviors are appropriate/healthy and which ones are not.

The findings, which are still progress, show a pervasive concern that the negativity of news – both in what stories are covered and how journalists tell these stories – is detrimental to mental health to the point of justifying limiting or eliminating individual news consumption. This purposive shift away from news is frequently validated through discourses of individual well-being and self-protection that connect to broader concerns about a widespread mental health crisis. The findings raise crucial questions about the balance between individual and collective responsibility.

The implications of these findings speak to the heart of this year's ECREA theme. If increased communication is part of addressing social disorder, we must also examine how barriers to communication – such as news discouragement – are a limiting factor. We must recognize how individuals confront the blurry line between a commitment to collective participation and a need for self-preservation. Additionally, at a time when professional journalists are concerned about their authority amid dwindling audiences and competing mediated voices, we should ask whether traditional journalistic storytelling and epistemological practices require a more radical shift to match the cultural turn toward prioritizing and addressing individual mental health.

JOS30 User-journalist relationship II

PP 0853 News media platform dependency: Challenges and opportunities in different media systems

Nicholas Nicolì¹, Theodora Maniou², Dimitrios Giomelakis²

¹ University of Nicosia, Communication, Nicosia, Cyprus

² University of Cyprus, Journalism, Nicosia, Cyprus

The platformisation of the internet has transformed powerful digital platforms into intermediaries between news production and news distribution. This decoupling establishes a platform dependency model of news media that encumbers news organisations from fulfilling journalistic obligations. However, not all news organisations are equally dependent on digital platforms (Nicolì and Iosifidis, 2023). Reputation and size can influence the level of dependency in different ways as well as other factors related to media systems' characteristics.

In recent years research on media systems has shown that media systems are not static – they tend to undergo several changes (e.g. Hallin and Mancini, 2017; Bruggemann et al., 2014). Especially Liberal and Mediterranean media systems seem to be going through significant changes (e.g., Maniou, 2022; Humprecht et al., 2022; Maniou and Moutselos, 2023).

This study explores platform dependency of news media within the context of media systems rather than reputation and size. Based on an analysis of a comparative study of the UK as a Liberal media system, and Greece as a Mediterranean Polarised/pluralist media system, our findings contribute to the scholarship on the platformisation of the internet as well as shedding light on recent understandings of media systems in a changing digital landscape.

The two countries under study were selected as typical examples of the media systems they represent in the European continent. Following a qualitative method of study, we draw on in-depth interviews with news media professionals from the liberal media system of the UK and the Mediterranean media system of Greece. Although this is not the immediate target of this work, we also test the validity of the 'national media-system' hypothesis, and in particular the hypothesised characteristics of the different media systems in the countries under study.

JOS30 User-journalist relationship II

PP 0854 Feeling the audience: Exploring the affective dimension of journalists' relationships to users

Julius Reimer¹

¹ Leibniz Institute for Media Research – Hans Bredow Institute, Journalism research, Hamburg, Germany

With the 'emotional turn', the affective aspects of news use and newswork are becoming a central topic in journalism studies. This is also reflected in the strand of research on journalists' audience-relationships. Here, however, studies have so far predominantly dealt with related 'negative' aspects, e.g. the emotional work and stress caused by online harassment and hate speech from users. 'Neutral' or even 'positive' audience-related emotions, on the other hand, have seldomly been the focus.

Against this background, I explore the affective dimension of journalists' audience-relationships more holistically, based on 52 in-depth interviews with German journalists from various areas of the field.

In the on-going analysis which will be finished by the time of the conference I have so far identified more than 40 different emotions:

- 'positive' ones from joy to gratitude to a sense of belonging;
- 'negative' ones from anger to loneliness to anxiety; and
- rather 'neutral' ones from surprise to curiosity to indifference.

I show how these feelings

- are connected to different subgroups of or roles ascribed to audiences (from citizens to troublemakers to fans) (contact specificity);
- are elicited by particular practices (from monitoring metrics to direct messaging with users to interacting with audiences at live events) (referentiality);
- evoke, and are themselves reinforced by, corresponding practices and emotions displayed by the audience (e.g., when audiences give emotional feedback, journalists react visibly emotionally to it, and this in turn leads to a further emotionalisation of their relationship) (reflexivity);
- differ depending on journalists' personality and organisational context (i.e. media brand, journalistic genre, newsroom structure, routines, and resources) (variety and contingency);
- can be combined and even contradictory (e.g., when audience praise not only make journalists proud but also leads to worries about whether they can live up to the audience's expectations in the long run) (combinability and potential ambivalence);
- can, to a certain extent, be controlled (e.g., through avoiding, or turning towards, their cause and other coping techniques) (limited controllability);
- have certain effects on journalists and their work (from gratification and motivation to covering certain topics in a certain way to an altered understanding of journalism in general) (consequentiality).

In sum, the findings suggest that journalists' audience-related emotions increasingly shape their audience-relationships and newswork in general, especially in new media organizations. It becomes clear how this development is interrelated with journalism's multiple crises of reach, revenue, and trust and the hybrid media environment with its intensifying competition (also with non-journalistic content) for the attention and loyalty of audiences; its 'pivot to community', memberships and subscriptions; as well as the increasing emotionalisation, 'interpersonalisation', datafication, and platformisation of journalism and public communication in general.

This highlights the increasing importance of journalists' reflection on and competence in dealing with emotions in order to cope with 'negative' feelings as well as gain gratification from and motivation for their work. On a more theoretical level, it indicates emotions' role in structuring the social – (even) in a domain often associated with 'unemotional' neutrality, objectivity, and the aim to inform 'rational' debates.

PP 0855 "I don't think people realize what is journalistic and what is interest-driven content": Imagined audiences as a boundary marker in journalism

Folker Hanusch¹, Phoebe Maares¹, Kim Löhmann¹, Daniel Nölleke²

¹ University of Vienna, Department of Communication, Vienna, Austria

² Deutsche Sporthochschule Köln, Department of Communication and Media Studies, Cologne, Germany

Digital transformations have contributed substantially to the emergence of non-traditional, peripheral actors in journalism, challenging the authority of established news media. These peripheral actors include organizations, networks, and individuals who, often in niche areas, disseminate journalistic or semi-journalistic content on web pages or social media, contributing to a plurality of topics and perspectives in the public sphere. Journalism research has studied these peripheral actors vis-à-vis traditional journalism through the concept of boundary work (Gieryn, 1983), identifying how peripheral actors claim membership to the journalistic field, and how traditional journalists either protect or expand the boundaries of the field. Here, research has identified several boundary markers, like autonomy (Carlson, 2017), journalistic norms (Singer, 2015), and ethical conduct (Karlsson et al., 2023), as well as professional role perceptions and journalistic practices (Maares & Hanusch, 2020).

However, only a few studies consider actors' imagined audiences in this context, despite their increasing relevance for journalistic boundary work (Tandoc & Jenkins, 2018). While scholarship has turned to audiences to understand where they draw the line and understand their definition of news and journalism (Banjac & Hanusch, 2022; Swart & Broersma, 2023), little is known about how (semi-)journalistic actors think of their audiences vis-à-vis those of other actors. We also have an incomplete understanding of the extent to which traditional and peripheral actors' imagined audiences may differ. This, however, might have implications for understanding how (semi-)journalistic actors view their unique contribution to society and claim legitimacy in a crowded field. Therefore, we ask the following questions:

RQ1: How do traditional and peripheral journalistic actors imagine their audiences?

RQ2: How do these actors use imagined audiences as markers to distinguish themselves from other (semi-)journalistic actors?

To answer these questions, we draw on 100 semi-structured interviews with established and peripheral actors in Austria, conducted from May 2023 to January 2024. Actors were sampled across four specializations (political, lifestyle, sport, and economic) and several media types. We asked them how they imagined their audiences, what their relationship was with their audiences, and what they thought their audiences expected from their work compared with other formats. Interviews were recorded, transcribed, and subsequently examined using thematic analysis (Braun & Clark, 2006). Preliminary findings indicate that reaching an audience is an important boundary marker for all respondents. Yet, while most actors have access to some web metrics as concrete measures of their audience, only few have specific audience imaginations for their own outlet or their competition. As regards their own outlet, journalists believe their audiences seek out information based on their interests, while they believe competing outlets' audiences are more interested in being entertained. Particularly traditional journalists think audiences need to be educated about the interest-driven agenda of some peripheral outlets. By examining peripheral and traditional journalists' imagined audiences, this study contributes to a better understanding of the neglected role of audiences in journalistic boundary work. It further indicates which audiences might be underserved even with the increasing variety of peripheral actors.

JOS30 User-journalist relationship II

PP 0856 Expectations of reciprocal interaction: A Q-sort study with journalists and audience members

Bernadette Uth¹, Helena Stehle¹, Hanne Detel², Nicole Podschuweitz³, Isabell Klawitter²

¹ University of Münster, Department of Communication, Münster, Germany

² University of Applied Sciences Kempten, Faculty of Social Affairs and Health, Kempten, Germany

³ University of Erfurt, Department of Media and Communication Studies, Erfurt, Germany

Mutual expectations structure and shape the journalist-audience relationship and interaction (authors_anonymized; Loosen & Schmidt, 2012¹). Transformations of the relationship context, conditions, and modes that are caused by digitalization, such as heightened mutual visibility and expanded possibilities for interaction between journalists and the public, resulted in altered expectations within the journalist-audience relationship (Wilhelm et al., 2021²). Key examples of these altered expectations on both sides include new norms regarding transparency and audience

participation (Loosen et al., 2020³). While there is a substantial body of research analyzing the expectations that journalists have toward their own roles and work, there is only little research regarding the audience's expectations toward journalists (e.g., Heise et al., 2014⁴; Loosen et al., 2020³). This is also true of journalists' expectations of audiences and the mutual expectations between journalists and their audiences, particularly with regard to the aforementioned interaction (Wilhelm & Detel, 2023⁵). It is these expectations that we aim to examine in more detail: *What expectations do journalists and audience members have about interacting with each other? Where do they differ and where do they overlap?*

To answer these questions, we have conducted two Q-sort studies, one with journalists (n = 19) and one with audience members (n = 21) in Germany, which we compare in the proposed presentation. We used a balanced-block design to ensure maximum heterogeneity. In the two Q-sort studies, the participants were given a set of cards, each with an interaction expectation, which they had to sort into a pyramid grid according to their individual assessments. By applying correlation, factor, and regression analysis procedures to the results of each individual sorting process (Watts & Stenner, 2012⁶), the Q method produces a typology with different expectation types that illustrate the diverse subjective viewpoints of journalists and audience members regarding what is important in journalist-audience interactions. The qualitative interviews, into which the sorting procedure was embedded, provide further information on why these expectation types emerged and which aspects influence expectations of journalist-audience interactions.

The field phase of the two Q-sort studies has just been completed and the data is currently being analyzed, revealing different expectation types in the journalist-audience relationship. At the conference, we will present and discuss the results of our completed analysis, highlight its implications and limitations, and identify open questions for future research.

In doing so, the proposed presentation aims to contribute to journalism and audience research by, firstly, providing further insights into what journalists and audience members expect from their interaction with each other. Secondly, our study allows for a comparison of the two sides of the journalist-audience relationship and helps to shed light on where not only similarities, but also differences in mutual expectations prevail.

JOS31 Alternative media II

PP 0943 Locate alternative media in the digital news ecosystem: A cross-country comparative study of alternative-mainstream audience overlap networks

Qinfeng Zhu¹, Fan Liang², Miao "Gabriel" Li³

¹ University of Groningen, Center for Media and Journalism Studies, Groningen, Netherlands

² Duke Kunshan University, Division of Social Sciences, Suzhou, China

³ Chapman University, School of Communication, Orange- California, USA

Alternative media position themselves as counter-hegemonic correctives of what they perceive to be a media and political mainstream. Relying primarily on digital platforms to produce and disseminate news, they have become increasingly important information sources in today's high-choice media environment. Many thus worry that the proliferation of alternative media outlets will divide audiences into ideologically segregated and radicalized clusters and aggravate polarization of society. Therefore, this study seeks to locate and contextualize alternative media within the news ecosystem.

To do so, we take the audience overlap network approach to examine whether and how alternative and mainstream media outlets share audiences in six European countries, namely Norway, Sweden, Austria, Germany, France, and Spain. We ask the following research questions: To what extent do audiences overlap between alternative and mainstream media outlets? What positions do alternative media outlets occupy in the audience overlap networks vis-à-vis their mainstream counterparts? How do they vary across countries? To answer the questions, we adopt a cross-country comparative design to examine how contextual attributes of the media and political systems influence the audience overlap networks. Specifically, we focus on two factors which constitute the opportunity structure for news production and consumption (Brüggemann et al., 2014; Humprrecht et al., 2022), including 1) media systems and 2) alternative political actors' institutionalized access to the public discourse.

To build the audience overlap networks in the six countries, we used the survey data from the Reuters Institute Digital News Report 2020 regarding news media outlets participants reported to use for getting news (N = 12,161).

Following that, we applied the backbone extraction approach to filter out statistically non-significant audience overlap (Majó-Vázquez et al., 2019). Building on the existing literature (Cushion et al., 2021; Heft et al., 2020; Holt et al., 2019), we operationalized the concept of alternative media and conducted content analysis, which identified 39 alternative media sites from the 257 obtained media outlets from the survey data.

Overall, the network structures suggest a rather fragmented media environment where most of the alternative outlets are consumed in isolation. Nevertheless, we observe significant cross-country differences. First, in countries where alternative political actors have institutionalized access to the public discourse (e.g., a far-right party being part of a governing coalition), alternative and mainstream media outlets are more likely to share audiences. This is arguably because such environments may engender a more blurred line between "alternativeness" and "establishment". Second, comparing network centralities across media systems, we find alternative media to occupy a more central network position in the Nordic-type media system where professional journalism is the strongest (Sweden, Norway), compared to those in the Central (Germany, Austria) and Southern models (France, Spain). Particularly, in Sweden where alternative political actors are comparatively marginalized, we observe an isolated, dense, and active alternative media enclave. Our findings shed light on the extent to which alternative media actually breed ideologically segregated clusters and highlight that the distance between alternative and mainstream media in audiences' news diets is a product of the political information environment.

JOS31 Alternative media II

PP 0944 Media systems beyond journalism: Placing peripheral newsmaking on the map

Christian Pentzold¹, [Aljoshka Karim Schapals](#)²

¹ Leipzig University, Institute for Communication and Media Studies, Leipzig, Germany

² Queensland University of Technology, School of Communication, Brisbane, Australia

There is a remarkable blind spot in our understanding of media systems: the absence of novel forms of newsmaking that happen *outside* of veteran institutions and *beyond* established actors (Deuze & Witschge, 2020; Schapals, 2022). These practices and so-called interlopers (Eldridge, 2017) profoundly transform the relationship between media and politics. And yet, neither do they feature in conceptualizations of media systems, nor are they made an element of more rigorous, comparative analyses. In this paper, we take issue with this shortcoming.

To a considerable extent, international comparative research into the intertwining of public communication and politics relies on conceptions of media systems. In that respect, Hallin and Mancini's (2004) contribution has proven instrumental by providing a basic framework for classification. It considers the degree of political parallelism, professionalization of journalism, the role of the state in regulating media systems, and the structure of media markets.

Despite its popularity and widespread use, this concept has been challenged from the outset. Major points of critique concern the significance of parameters and their measurement, their status between empirical categories and ideal types, a preference for structures rather than processes, a pronounced Eurocentrism, the exclusion of digital networked technologies, as well as a lack of a transnational perspective (Hallin & Mancini, 2017; Norris, 2009). In response, several attempts have been made to revise models along non-Western sensibilities (Echeverria et al., 2022; Mutsvairo et al., 2021), define robust indicators and draw out systematic studies (Brüggemann et al., 2014; Büchel et al., 2016; Marques & Vos, 2023), transfer it to other regions (Herrero et al., 2017; Peruško et al., 2021; Richter & Kozman, 2021), and account for changing media environments (Mancini, 2020; Mattoni & Ceccobelli, 2018).

Our endeavor to place peripheral newsmaking on the map proceeds as follows: First, we draw together existing evidence on the significance and state of newsmaking beyond legacy journalism across countries. This is based on 45 country reports that stem from an international research project. Second, we formulate variables that help to assess the extent to which peripheral newsmaking is redefining the media systems framework through (a) shifting professional rules and levels of autonomy, (b) the pluralization of voices and increased partisanship, and (c) changing media market structures with the demise of traditional institutions and shifting audience relations.

Overall, our study adds nuance to the idea of hybrid media systems where rigid structures vanish and give way to overlapping and dynamically unfolding relationships between newsmaking and politics. At the same time, it helps us identify drivers of transformation that accrue from within but have the potential to shake up existing media systems constellations more broadly.

JOS31 Alternative media II

PP 0945 "At that moment, I started losing confidence in mainstream media" – Epistemic understanding of knowledge in counter-hegemonial positions in Finland

[Salla Tuomola](#)¹

¹ Tampere University, Communication Sciences Unit, Tampere, Finland

Trust and credibility constitute a solid ground for media users' epistemic understanding impacting how they navigate the media landscape and assess the veracity and legitimacy of news producers (Schwarzenegger et al., 2020).

Some scholars have estimated that low media trust and turning to alternative information sources can undermine the shared perception of reality leading to an *epistemic crisis* (Andersen et al., 2021; Dahlgren, 2018). It means that there is a risk that people no longer share a common understanding on what trustworthy information is (van Dalen, 2020) and how it is produced, consumed and corrected.

Epistemology can be broadly understood as the things that members of the democratic public accept as true in political and social life, that is, the work of legitimising certain types of information as knowledge relative to others (Kreiss, 2019; Lewis & Westlund, 2015). Traditionally, journalistic media have held the authoritative position in an epistemic system of providing information that the public finds legitimate and credible (Goldman, 2011; Kreiss, 2019). However, recent studies suggest that cultural and social identity, especially partisan affiliation in various contexts, shape what people account as a fact and thus basically question the basis of democratic order (Kreiss, 2019; also Flynn et al., 2017; Hersh & Goldenberg, 2016).

In this study, I examine the perceptions of reliable knowledge construction, production and distribution of so-called counter-authorities' and alternative voices taking place primarily in the online environment.

I ask:

RQ1: How do counter-authorities define and understand what is reliable knowledge and from where it can be reached? RQ2: How does counter-authorities' understanding of knowledge challenge the hegemonial epistemology of knowledge and what ramifications it can entail?

To observe these deviant knowledge and truth perceptions, I am conducting 20–25 semi-structured theme interviews among counter-authorities who are active online/offline and have a remarkable number of followers (several thousands). Seven interviews have been conducted so far, most of them face to face. The interviewees come from various backgrounds but the common nominator for them is that everyone could point out a clear occasion or observation when they started to question the trustworthiness of information delivered by mainstream media and began to use other sources. To some extent, the interviewees have been publicly known in Finland but have become *persona non grata* in mainstream media after beginning to openly challenge the hegemonial truth and epistemic knowledge perceptions.

JOS31 Alternative media II

PP 0946 Articulations, alliances and responses: A strategic action field approach to media criticism

Tine Ustad Figenschou¹, Karoline Andrea Ihlebæk¹

¹ Oslo Metropolitan University, Journalism and Media Studies, Oslo, Norway

Journalism and criticism of journalism are fundamental parts of well-functioning and informed democracies. As a powerful societal institution, journalism should be scrutinized and held accountable for its practices and priorities (Holt and von Krogh 2010; Stiernstedt 2014; Wyatt 2007). Recent studies have demonstrated how media criticism today, is vocal and omnipresent, but also increasingly politicized and weaponized by both democratic and non-democratic actors, often combining media criticism with cynicism (Tsfati 2003), anti-press rhetoric (Roberts & Wahl-Jorgensen 2020), and digital harassment (Cheruiyot 2018). Particularly right-wing populist politicians, alternative media and pressure groups have become persistent media critics over the last decades – delegitimizing 'mainstream media' (Van Dalen 2021; Liminga & Strömbäck 2023; Nawzi 2020). A key question is how journalism should meet media criticism protecting its authority and societal relevance (Figenschou & Ihlebæk 2019; Carlson 2017; Cheruiyot 2022).

The present paper applies a *strategic action field approach* (Ihlebak & Figenschou 2023; Fligstein & McAdam 2011, 2012) to explore media criticism from a relational, holistic perspective. It encompasses the perspectives of incumbents (established news media organizations), governance units (media authorities, foundations, and associations), and challengers (alternative media). The meso-level, actor-centered analytical approach allows for an in-depth analysis of how *core* and *peripheral* actors talk about each other and considers how alternative and established news media can both be the *senders* and the *receivers* of media criticism. Building on 45 qualitative

elite interviews with news editors in established and alternative media, as well as institutional representatives and back-players, the study brings insights into how criticism is communicated, interpreted, and used both as a field resource and as a challenge that must be tackled.

First, the analysis shows a high degree of support for core journalistic values and journalism's democratic purpose, but a mutual skepticism towards how journalism is performed. While established news media criticize the political bias, lack of source criticism, epistemological foundations, and antagonism of alternative media, alternative media actors point to false performance of objectivity, arrogance, and elitism by the mainstream press. Second, incumbents and governance units are deeply ambivalent to whether alternative media actors, positioned on the periphery of professional journalism, are legitimate media critics. This field perception and ambivalence impacts on how they understand and respond to the antagonistic media critique in several ways: It makes incumbents and governance units reluctant to publicly address the criticism or to openly change practices, to avoid validating the voice and position alternative media actors. Further, the boundaries between legitimate criticism, harassment and hate are seen as intertwined, and established actors thus prioritize protecting staff rather than responding to the critique. Alternative media actors, on the other hand, generally resist the criticism of the powerful core, sometimes using it strategically and displaying it to strengthen their position as a challenger by being the underdog, the victim and the less privileged. However, their response must also be understood in terms of what alternative media actors aim to achieve, and their ambition to access symbolic and material resources protected by field insiders (community, subsidies, membership).

JOS32 Fact checking and disinformation II

PP 0947 Comparing fact-checking cultures across nations: A process of divergence or mimetic isomorphism?

Daniela Mahl¹, Jing Zeng², Mike S. Schäfer¹, Fernando Antonio Egert³, Thaiane Oliveira³

¹ University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

² Utrecht University, Department of Media and Culture, Utrecht, Netherlands

³ Federal Fluminense University, Media Studies Department, Rio de Janeiro, Brazil

Background

Over the past decade, there has been growing concern among citizens, policymakers, journalists, and academics about (political) misinformation and its adverse impact on trust in democratic institutions and societal polarization (Bennett & Livingston, 2020). Against this backdrop, fact-checking organizations aimed at verifying the accuracy of publicly disseminated (mis)information have flourished worldwide (Stencel et al., 2023). However, existing research is still dominated by case studies from Western regions (Nieminen & Rapeli, 2019); little is known about the work of fact-checkers in non-English-speaking or "Global South" countries, and even fewer studies employ comparative designs. To address this gap, we (1) introduce a *conceptual framework* for comparing fact-checking cultures and (2) illustrate the application of the framework in a *cross-national research design*.

Conceptual framework

We define *fact-checking cultures* as the collective set of practices and norms surrounding the processes of *issue selection* and *information verification* that are shaped by the *organizational roots* of fact-checking units.

The first dimension, *organizational roots*, assesses how fact-checking organizations are entangled with different sectors of society, such as academia, news media, or politics. This entanglement can take different shapes, with authoritarian regimes using fact-checking as a tool of political control (Zeng et al., 2017), while civil society plays a central role in other contexts (Cheruiyot & Ferrer-Conill, 2018). The second dimension, *issue selection*, provides important insights into the landscape of misinformation in a given region and the agenda-setting practices of fact-checkers (Vargo et al., 2018), with previous research revealing potential biases (Dobbs, 2012). The third dimension, *information verification*, is an important means of asserting epistemic authority. This includes how fact-checkers determine whether claims are factual and how transparent they are about the fact-checking process (Humphrecht, 2020).

Empirical case study

We chose to compare Brazil and Germany, two countries with different socio-political environments and levels of exposure to online misinformation. Employing a *mixed-methods research design*, we integrate automated, qualitative, and quantitative content analysis of 11 fact-checking organizations and 13,498 fact-checking articles over an 11-year period (2013–2023) and conduct qualitative semi-structured interviews with fact-checkers ($N = 10$).

Preliminary findings reveal several areas of *divergence*. We found that Brazilian fact-checkers are either affiliated with large advertisement-funded media conglomerates or independent start-ups with diversified revenue models. In contrast, German fact-checkers are affiliated with non-profit independent organizations, public broadcasters, or press agencies. Moreover, while Brazilian fact-checkers focus primarily on political misinformation, emphasizing national controversies, the agenda of their German counterparts is characterized by a variety of topics, with a focus on both national and international issues.

Our comparison also reveals *areas of convergence*, including a dominant focus on verifying online misinformation and the strategies and criteria used to monitor, select, and verify claims. Challenges such as high levels of emotional distress or experienced harassment and a lack of institutionalized support structures are evident across countries and organizations.

In sum, our findings suggest that fact-checking cultures can transcend national and organizational boundaries, which can be interpreted as an indicator of *mimetic isomorphism*, where organizations adopt the practices of established peers (Lowrey, 2017).

JOS32 Fact checking and disinformation II

PP 0948 The war in Ukraine through the prism of visual disinformation and the limits of specialized fact-checking. A case-study at Le Monde

[Pauline Zecchinon](#)¹, Olivier Standaert¹

¹ Université catholique de Louvain, ORM – Observatoire de Recherche sur les Médias et le journalisme, Louvain-la-Neuve, Belgium

The Russian invasion of Ukraine in February 2022 led to a flood of disinformation circulating online. Two elements stand out: the nature of the false information disseminated (many visuals) as well as its quantity, making fact-checking crucial for the coverage of the conflict. Based on a double framework of five semi-structured interviews coupled with an analysis of 48 debunkings published between February and October 2022, this communication analyzes how Les Décodeurs, the fact-checking unit of the French daily newspaper Le Monde, responded to the flow of visual disinformation surrounding the conflict. We study 1) to what extent the specific context of disinformation surrounding the war in Ukraine led to new forms of visual disinformation and 2) how did fact-checkers select the content to verify and how did they conduct these verifications. These questions enable a better understanding of the discursive positions that specialized fact-checkers develop about the function of fact-checking in the context of the war and in the broader context stated by previous research. This study focuses on visual disinformation leveraging existing categories of disinformation (Tandoc et al., 2018; Wardle, 2018) while considering the visual aspect within a multimodal approach (Hameleers et al., 2020).

The digitalization of news, combined with the rise of citizen journalism, or citizen witnessing (Allan, 2013), the democratization of photography (Ritchin, 2013) and the emergence of platforms on which to disseminate various forms of contents, has increased tenfold the means to contribute to the informational disorder. The huge number of visuals created daily leads journalists to make choices among the content to fact-check. Gatekeeping in journalism shifts from traditional fact-checking to retroactive “gatebouncing” due to online content creation and circulation (Vos, 2019; Singer, 2023). Verification practices face challenges in the continuous (dis)information flow, with image-based disinformation requiring a mix of automated and manual strategies (Thomson et al., 2022). Journalists sometimes lack standardized guidelines for verification, relying on traditional methods and external fact-checking teams (Brandtzaeg et al., 2016; Saldaña & Vu, 2022).

Findings show that fact-checkers only debunk the most visible pieces of disinformation on social networks and these pieces focus on authentic images with misleading captions, rather than sophisticated manipulation. Therefore, previous categorizations still prove their ability to describe the 48 pieces of visual disinformation but we suggest a more refined approach by considering visual disinformation as mainly multimodal. The study uncovers the fact-checkers' role as gatekeepers filtering content gaining visibility through social networks and addressing the challenge of countering viral disinformation while avoiding unintended amplification. It also identifies a blend of shared and individual practices among fact-checking journalists. This includes both manual, pre-digital methods and more sophisticated tools. Finally, interviews reveal limitations in the performance of the gatebouncing function (Vos, 2019). Reconciling reactive and adaptive practices of fact-checking with mid and long-term editorial considerations in a rapidly evolving leads to undiscussed, or “default choices”, while disinformation and propaganda about the war in Ukraine will more than likely not have died down by the fall of 2022.

JOS32 Fact checking and disinformation II

PP 0949 Filling the gap? When non-journalists produce and fact-check

[Aline Grupillo](#)¹, Joaquim Paulo Serra¹

¹ Beira Interior University, Social Communication, Covilhã, Portugal

Every day, important facts come to public for the active participation of non-journalists in the production and transmission of journalistic content through a certain App Culture (Rublescki, Barichello & Dutra, 2013). Using the app “Onde Tem Tiroteio” (OTT) as case study, this work aims to discuss the role of the public as the main agent to produce reliable information in territories where journalists cannot cover or do not report.

The app, used by five million people, was developed in Brazil to share information about conflicted territories where journalists are unable to provide a proper journalistic coverage due to violence and the presence of paramilitary groups (Nunes, 2017). In these areas, there is a collaborative activity of a journalistic nature carried out by citizens

for citizens (Reis & Serra, 2021). They verify the information and build something that resembles news stories. They are the ones who validate the relevance of the information, which is later appropriated by the traditional media. These seek to obscure the authorship of the content, making this not a collaboration relationship, but a dependency relationship.

Among the citizens who use the app, the confidence is formed by strong bonds, built by the feeling of responsibility and the desire to share reliable information, collaboratively verified, aiming at the common good. Between journalists and OTT, however, trust takes on an ambiguous form: journalists tend to trust the content provided by the app, because OTT is where journalists are not, but they try not to assume who creates the content as a co-creator.

This study is part of a PhD thesis, guided by the assumptions of virtual ethnography (Hine, 2000), we investigated the dynamics of posts during six consecutive months in 2020. We analyze 2,607 alerts that resulted in 46,395 reactions from users and 3,834 comments. The study was complemented with 13 in-depth interviews (Duarte, 2005) with journalists from different Brazilian media outlets.

⁶ University of Helsinki, Swedish School of Social Science, Helsinki, Finland

⁷ Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

Journalism is an important source of environmental information to the public as well as a central arena for public debate on environmental issues. The roles of environmental journalists, i.e. the roles they are expected to fill and the roles they perceive as important and possible, shape environmental reporting.

Research on the roles of environmental journalists in the Nordic countries remains scarce so far. To produce novel insights into this topic, this paper examines what the perceived journalistic roles are for those who engage in the mediated knowledge production on environmental issues.

The countries covered are Iceland, Norway, Sweden and Finland. The data gathered for the study consists of 20 semi-structured qualitative interviews with professional journalists, five from each country.

Four journalistic roles were identified in the interviews through qualitative text analysis: (1) the role of the objective news provider, (2) the critical watchdog, (3) the sense-maker and educator, and (4) the environmental advocate.

Within the role of the objective news provider, the importance of being neutral and balanced and accurately presenting scientific facts is being highlighted. In the role of the critical watchdog, the responsibility of journalists to be critical of those in power is represented as central. As for the role of the sense-maker and educator, journalists position themselves responsible for their audience, functioning as clarifying and sense-making mediators of environmental issues. Lastly, the role of an environmental advocate includes taking a stance for common good.

The results of this study show that although these roles overlap and are interconnected – meaning the journalists methods and ethics remain the same for all roles – the perceptions of the aims of reporting differ.

Aspects that set environmental journalism apart from other journalistic beats are the level of conflict in the issues, the complexity of climate change, and the scale and gravity of the issues. This do not only impact the environmental reporting, but also have consequences for how journalists perceive their role. It is of essence for the place of media and communication in today's globalized society.

JOS32 Fact checking and disinformation II

PP 0951 Correction of news stories following retraction of scientific papers

[Auste Valinciute](#)¹

¹ Radboud University, Institute for Science in Society, Nijmegen, Netherlands

Retractions are a formal practice applied by scholarly journals to withdraw published papers for reasons ranging from non-intentional computational errors to discoveries of fraudulent research. In recent years the rate of retractions across scholarly journals has undergone a rapid pace of acceleration (Van Noorden, 2023).

Because questionable or poor-quality research affects the epistemic reliability of the scientific record, retractions work by flagging problematic papers, with the goal of limiting the circulation of scientific misinformation in academic literature.

However, research has shown that problematic research papers sometimes spread beyond the academic community *before* they are retracted via the media (Serghiou et al., 2021). This poses a question – how should the media, more specifically journalists, deal with retractions of scientific research?

This study addresses the challenges that increasing rates of retractions pose to science journalism and, consequently, public understanding of science. Instead of investigating retractions as a topic of news, we performed a mixed-methods content analysis of media mentions featuring retracted scientific publications on COVID-19 ($n = 945$) to explore if and how media platforms correct news stories in which the retracted papers previously appeared.

Results show that some media platforms (8%) update or edit news stories, once the scientific publications they feature are retracted, although correction practices are still rare. Media platforms that correct published news stories are mostly the known mainstream news organizations and their affiliates, and popular specialty sites. Yet even among these media platforms, the practice is not consistent. The most common presentation of corrections are top-line statements, notifying readers that the featured scientific publication has been retracted. Media platforms usually inform readers why a retraction took place, but don't always provide clear explanations how exactly the retraction influences the claims presented in the news article.

This talk will question the need of (new) journalism practices that respond to rising rates of retractions in scientific research and enable the public to better understand the causes, meaning and implications of retractions in academic literature.

JOS33 Youth audience research

PP 0952 Exploring young audience's perceptions of AI-recommended news formats

Selma Martheda¹, Lene Heiselberg¹, Hannes Cools¹

¹ University of Southern Denmark, Digital Democracy Center, Odense M, Denmark

News recommendation systems (NRS) have become a crucial part of modern news delivery (Beckett & Yaseen 2023), as it has become increasingly necessary for news organizations to capture and retain audience attention by tailoring content to individual interests, topics and preferences (Raza & Ding 2021; Helberger 2019). However, NRS comes with advantages as well as challenges. NRS is an effective way to capture an audience's attention by matching their news interest and engaging audiences in news (Møller 2022). However, NRS has also faced criticism for potentially creating polarization (Ludwig, Grote & Müller 2023) and limiting news diversity (Karimi, Jannach & Jugovac 2018).

To adapt to the evolving media landscape, news organizations have not only personalized news feeds based on audience content preferences, but they have also diversified news formats, incorporating e.g., podcasts, photo series, explainer videos, reels, summaries, shorter articles, and long reads (Ferne 2017). Much scholarly attention has been given to research on content based NRS (Bastian et al. 2021; van Drunen 2019; Möller et al. 2018). However, very limited attention has been given to understanding how audiences, particularly younger demographics, respond to AI-recommended news formats. News stories might seem appealing to consumers because of the content but the way it is presented also plays an important role (Kulkarni et al. 2022; Kilby 2018).

Our study seeks to address this gap by focusing on AI-recommended news formats, exploring how young people perceive formats customized to align with individual preferences. By emphasizing the audience's perspective, our research aims to uncover insights into the preferences and considerations of personalized news formats compared to personalized news content while also including ethical considerations of audiences.

In December 2023, we conducted 24 qualitative online video research interviews (OVRI) (Heiselberg & Stępińska 2022) interviews with young Danish news consumers aged 18–30. The length of the interviews was approximately 40 minutes, and the sample consisted of bachelor students from various fields at University of Southern Denmark.

In the qualitative data analysis, we examine how this group perceives AI-recommended news formats through thematic analysis. We focus on four different news formats from Danish news organizations: photo series, video, podcast and long read within three different contemporary topics. As part of the qualitative data analysis, we examine the role news formats play in the decision-making around news consumption, and we explore the ethical concerns arising from the recommendation of news formats based on digital patterns and preferences.

The interview data provide insights into whether young audiences perceive AI-recommended news formats as a motivating factor for consuming news and how they view them compared to content-based recommender

systems. In conclusion, we argue that this paper contributes to a crucial understanding of how young news consumers navigate today's complex high-choice media environment.

PP 0953 How exciting does it have to be? Young citizens and the interplay between emotional responses and quality assessments of news

[Kristoffer Holt](#)¹, [Ari Nykvist](#)¹, [Mahitab Ezz El Din](#)¹, [Wahlberg Mats](#)¹, [Peter Dahlen](#)¹

¹ Linnaeus university, Department of Media and Journalism, Kalmar, Sweden

Despite boasting strong performance in global democracy rankings, Sweden grapples with impending challenges to its democratic fabric (Lührmann et al., 2019). The escalating prevalence of disinformation within an increasingly polarized media landscape has gained notable attention, spurring a proliferation of research studies and fact-checking initiatives to fortify the democratic society against such threats (Bakir & McStay, 2017; Holt, 2019; Waisbord, 2018; Allcott & Gentzkow, 2021). Simultaneously, young adults (18–25 years) seem to be progressively distancing themselves from conventional news outlets, choosing instead platforms where emotional narratives reign supreme and adherence to journalistic standards is not necessarily a given (Newman et al. 2023). Given the divergent media consumption patterns of young citizens compared to older generations (Boczkowski et al., 2018; Newman et al., 2020), it is crucial to understand this demographic's conception of news quality. Moreover, the disinformation conundrum is intrinsically linked with contemporary research on democratic innovation, the evolution of representative democracy, and the enhancement of civic practices and forums (Norris, 2011). The challenge of integrating the younger generation into these discussions is a pivotal concern in this discourse. This paper investigates how young citizens construe quality of news and the factors that influence their perceptions of news quality. Despite the abundance of news sources available, young citizens may struggle to distinguish between high-quality news and misinformation. Through qualitative interviews with young citizens (ages 18–25), combined with analysis of biometric lab data (eye-tracking and GSR), we explore the interplay between actual and measurable reactions to pieces of news and stated quality assessments, highlighting key factors that shape their perceptions of news quality, including trust and source credibility, relevance, and format. We find that these factors interact, at times paradoxically, with one another to influence young citizens' judgments about the quality of news. Our results show that news items that cause more emotional engagement are not necessarily ranked higher in quality than less engaging news items. Our results have implications for news organizations and media literacy education programs, and we suggest areas for future research on news consumption and young citizens.

JOS33 Youth audience research

PP 0954 Tradition meets innovation: Youth news consumption in the era of influencers, celebrities and ordinary people as news providers

[Maximilian Klesl](#)¹, [Desirée Schmuck](#)¹

¹ University of Vienna, Department of Communication, Vienna, Austria

For young people, social media has become one of the main sources for consuming news (Newman et al., 2023), where content produced by social media personalities (SMPs) such as influencers, celebrities or ordinary people complements or even replaces traditional journalistic sources (Molitorisz, 2020; Newman et al., 2023). SMPs have been linked with lacking transparency and professionalism but also with empowering capabilities to promote political participation and interest (Borchers & Enke, 2022; Schmuck et al., 2022; Shehata & Amnå, 2019). Yet, there are significant research gaps left in this field: First, while SMPs can address both formal and lifestyle-related political topics (Gonzalez et al., 2023), we do not know for which topics young people prefer which sources. Second, it remains unclear how much trust youth still places in legacy media like newspapers or TV news in comparison to modern sources like SMPs. Third, we lack knowledge about how they encounter news by these different sources. Drawing from the PINE model (Matthes et al., 2020), we distinguish in this study between first- (encountering and not further engaging) and second- (encountering and further engaging) level incidental news exposure.

Method and Results

An IRB-approved quota-based cross-sectional survey was conducted in Austria. ($N = 569$, age 16 to 25 years, 49.6% female). Participants responded on 6-point Likert scales. Ordinary people ($M = 3.85$, $SD = 1.72$), influencers ($M = 3.55$, $SD = 1.75$) and daily newspapers ($M = 3.46$, $SD = 1.69$) were the most popular news sources among youth. Overall, SMPs ($M = 3.54$, $SD = 1.45$) were used more frequently ($p < .001$) than traditional media (TM) ($M = 2.79$, $SD = 1.06$). However, TM enjoyed significantly ($p < .001$) higher trust levels ($M = 3.31$, $SD = 0.82$) than SMPs ($M = 2.95$, $SD = 0.98$). "Hard" news consumption (e.g. politics, economics) was predicted strongly ($Beta = .467$, $p < .001$) by TM use but also to a weaker degree ($Beta = .084$, $p = .018$) by SMP use. "Soft" news consumption (e.g. sports, technology) was predicted more strongly ($Beta = .365$, $p < .001$) by SMP use than by TM use ($Beta = .240$, $p < .001$). Regarding usage motives, intended social/political engagement ($Beta = .163$, $p < .001$) and habit ($Beta = .087$, $p = .043$) predicted

TM use, while receiving modern ($Beta = .139, p = .003$) and opinionated content ($Beta = .134, p = .004$) as well as habitual use ($Beta = .123, p = .009$) predicted SMP usage. Second-level incidental exposure was the most common way to receive news on social media among youth ($M = 3.54, SD = 1.27$). It was predicted significantly by SMP usage ($Beta = .147, p = .002$), while first-level incidental exposure was predicted by TM usage on social media ($Beta = .276, p < .001$). Intentional news consumption was predicted by both T(Social)M ($Beta = .270, p < .001$) and SMP ($Beta = .099, p = .015$) usage.

Implications

We show for the first time that SMPs as a news source for youth are more frequently used in comparison to traditional channels although legacy news sources still enjoy more trust than SMPs, thereby creating a usage-trust gap (Swart & Broersma, 2022). Our findings suggest that a preference for opinionated and modern content as well as for soft news may explain this gap. For democracy at large it raises concerns that TM is linked to encountering news incidentally but subsequently not further engaging with it, as this behavior can have detrimental consequences for political participation (Nanz & Matthes, 2022).

PP 0955 Exploring young media users' understandings and origins of media trust. Evidence from qualitative interviews with German adolescents

Nayla Fawzi¹, Obermaier Magdalena², Dohle Marco³, Steindl Nina², Arlt Dorothee⁴, Schweiger Wolfgang⁵, Ziegele Marc³, Tilman Klawier⁶, Henriette Pohle⁷, Fabian Prochazka⁸

¹ Johannes Gutenberg University Mainz, Department of Communication, Mainz, Germany

² LMU Munich, Department of Communication and Media, Munich, Germany

³ Heinrich Heine University Düsseldorf, Department of Social Sciences, Düsseldorf, Germany

⁴ TU Ilmenau, Department of Media and Communication, Ilmenau, Germany

⁵ University of Hohenheim, Department of Communication, Hohenheim, Germany

⁶ University of Hohenheim, Institute of Communication Science, Stuttgart, Germany

⁷ University of Erfurt, Department of Communication, Erfurt, Germany

⁸ University of Erfurt, Department of Media and Communication, Erfurt, Germany

While research on the socio-political causes of media trust and the role of media use is already thorough, research on how trust and distrust in news media are developing in the socialization process and which aspects are decisive during this process is still in its early stages. Adolescence is a particularly relevant phase of political socialization, and it is plausible that the link between media (dis)trust and other politically relevant attitudes starts here. Today's adolescents consume news in a very specific way – they almost exclusively rely on online media with a wide range of information, from legacy media to individual influencers (Hasebrink et al., 2021). A news-find-me perception and news snacking characterize their everyday media use (Gil de Zúñiga et al., 2017).

Against this background, we analyze the following research questions: 1) What do adolescents understand by media trust? 2) Which heuristics are used by adolescents to assess the credibility of news media content? 3) How do adolescents' individual characteristics as well as their perceptions of and experiences with the media shape their media trust?

To address the need for a deeper understanding of what media trust means to young adults, our study is based on qualitative guided interviews (Garusi & Splendore, 2023), including a think-aloud section, with 50 young people aged 14 to 19 in Germany. Recruitment was carried out by a market research institute which drew a Germany-wide sample with quotas regarding education, gender, and place of residence. The sample consisted of 24 male and 26 female adolescents. Five research assistants who had received intensive training conducted the interviews via Zoom in July/August 2022. They lasted between 21 and 60 minutes (average: 38 minutes). The university of [anonymous] ethics committee reviewed the study design and gave a positive vote. The transcripts of the interviews were analyzed with qualitative content-structuring analysis and software assistance of MAXQDA (Kuckartz & Rädiker, 2023).

The results show among others that heuristics for assessing the credibility of media content and, consequently, media trust or distrust, can be systematized on two different levels. Firstly, respondents name some of the established quality criteria known from journalism research such as factuality, diversity or balance. However, they also mention other criteria that primarily lead to distrust, such as data breaches, striving for profit, clickbait, and paid content. Secondly, personal experiences with media reporting and perceived media representation play a role, such as a discrepancy perceived by the adolescents between their own experience and how an issue is portrayed in the media.

The understandings of media trust heuristics differ significantly among the adolescents surveyed. While some adolescents make very well-founded arguments, others draw on more superficial heuristics which are therefore more prone to flaws (e.g. blue verification mark or popularity cues such as a wide reach as indicators of trustworthy content/sources). The presentation will compare these different types of young media users in terms of their trust and distrust characteristics.

JOS34 Journalistic values II

PP 1038 Less of the same? Long-term analysis of topic diversity in Swiss News Media Reporting

[Dario Siegen](#)¹, Daniel Vogler¹, Mark Eisenegger¹, Mike S. Schäfer¹

¹ University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Despite massive structural changes in the public sphere, journalism still plays an essential role in democratic societies. By covering a broad spectrum of topics, the media enable citizens to inform themselves about a plurality of relevant events and thus participate in political life. Even though any one person or organization can communicate to the public on social media and potentially reach a large audience, legacy news media still play a significant role and hold substantial gatekeeping power when it comes to bringing issues into the public sphere and on the political agenda (Harder, Sevenans & Van Aelst, 2017).

Nonetheless, journalism faces enormous challenges in the digital era, as advertising revenues diminish and willingness to pay for news remains low. These developments have exerted considerable economic pressure on news outlets, increasing audience orientation while simultaneously leading to a growing market consolidation and a reduction of journalistic output (Costerá Meijer, 2020). These trends might impact not only the extent, but also the diversity of reporting – including the number and diversity of topics covered in news media. There are clear indications that crises like the COVID-19 pandemic put additional strain on topic diversity in news media following a strong focus on few crisis topics.

Topic diversity is considered a key element of journalistic quality, which in turn is viewed as fundamental to the functioning of democracies. Therefore, diversity in news media reporting is a typical concern of media policy and regulation. Understanding the long-term effects of dwindling resources and societal crises, like the COVID-19 pandemic, on the diversity of topics in news coverage is essential for experts and policymakers in the field of media and communication.

But research on long-term trends in the development of topic diversity is scarce. Therefore, this study aims to assess the long-term trajectory of topic diversity in three major Swiss newspapers between 1998 and 2022, covering approx. 2.5 million articles. Building on previous studies that captured topics computationally, we applied the BERTopic natural language processing technique for topic modeling across our dataset. We conducted 18 separate model runs, each with a varying total number of topics ranging between around 1'700 and 26'000 topics. Using established measures for diversity and concentration (Herfindahl-Hirschman index and Shannon entropy), we assess the number and diversity of topics in the news over the period of 25 years.

Our findings show that the absolute number of topics covered in a given outlet per month has decreased substantially over time, but that topic diversity relative to the number of articles published had stayed moderately stable up until the disruptions of the COVID-19 pandemic. The loss in topic diversity during the pandemic was unprecedented in scale and duration. These findings underscore the importance of understanding the long-term effects of resource constraints and societal crises on topic diversity in news media reporting.

JOS34 Journalistic values II

PP 1039 Metajournalistic discourse on sports journalism: Sports media reporting on sexual and gender-based harassment

[Veera Ehrén](#)¹

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylän yliopisto, Finland

Sports journalism has long held the reputation as the toy department of media houses for not taking up the role of a critical watchdog (Rojas-Torrijos & Nölleke, 2023). The practiced criticism in sports journalism has mainly been directed at the sporting performance itself, which has led to the reproduction of capitalist values and the maintenance of status quo on sports politics and power positions (Numerato, 2023). However, global reporting on events such as the FIFA World Cup Qatar in 2022 indicate that critical journalism directed to socio-political and human-rights issues surrounding the sports and done by sports departments of media houses is an internationally emerging phenomenon.

Also, in Finland sports journalists have increasingly taken an active role in reporting about societal problems through sports. One of the most reported issues by sports journalists during the past five years has been sexual and gender-based harassment and the structures and cultures that perpetuate in sports. This study examines the metajournalistic discourse on the work processes of reporting harassment cases and thus contributes to the understanding of the ongoing change in sports journalism. Metajournalistic discourse, that is journalistic talk about journalistic processes, provides a framework for examining how journalists define the boundaries of their work.

ground their expertise and justify their place in the dispersed media world (Carlson, 2016). Moreover, research on metajournalistic discourse allows to increase the understanding of how journalists evaluate news production processes and their related practices (Carlson, 2014).

Data for this study was obtained through expert interviews with 16 Finnish sports journalists who had reported on harassment between the years 2018 and 2022. The interviewees, half of whom identified as female and half as male, represented six national and regional news media. The research data was analysed with the means of applied thematic analysis (Guest et al., 2012). The interviews showed that reporting harassment incidents requires a considerable amount resources, mental capacity and emotional support from the surrounding work community. The work processes described by journalists related to encounters with the victims of harassment, information gathering and source evaluation, internal editorial processes, personal and communal debriefing and feedback processing. In the processual description, the discussion often turned to journalistic ethics and legalities well as journalists' objectivity and subjectivity.

The study concludes that sports journalists use professionalism as a discourse to secure their legitimacy and authority in the increased competition for the public's attention with other media actors (see Weisbord, 2013). Additionally, the study indicates that in their ambition to move from entertainment and performance reporting to socio-political critical journalism, sports journalists engage in paradigm repair in their metajournalistic discourse (see Hindman, 2005; McEnnis, 2023). However, this ambition does not seem to be fully shared as the responsibility for reporting on harassment is not evenly distributed but remains on the shoulders of certain journalists. This causes internal friction in sports media departments and contradictions in sports media's intention of rebuilding their reputation.

JOS34 Journalistic values II

PP 1040 The many faces of subjectivity in journalism: A multidisciplinary discourse analysis using linguistics and machine learning

Louis Escoufflaire¹, Antonin Descampe¹, Cédric Fairon²

¹ ILC, ORM – Observatory for Research on Media and Journalism, Louvain-la-Neuve, Belgium

² ILC, Center for Natural Language Processing, Louvain-la-Neuve, Belgium

To mitigate the inherent subjectivity of the news-making process, journalists use several writing techniques. This "strategic ritual of objectivity" is realized through a range of neutralizing mechanisms designed to mask the journalist's personal opinions in the content of the text. In the digital era, understanding how to measure how much a press article is influenced by its author's personal opinions and emotions is an important matter (Wahl-Jorgensen, 2020): the dynamics of subjectivity in press discourse not only impact the credibility and trustworthiness of news sources but also have far-reaching implications for media literacy, shaping how readers interpret and engage with the information they encounter (Ojala, 2021). Disambiguating facts from opinions online is becoming more complex inside the informational disorder induced by the growing presence of AI-generated articles, fake news, and polarized content on social media.

We employ various methodologies to enhance our understanding of the mechanisms underlying subjectivity in press discourse, and we refine automated tools for classifying news and opinion texts. This research is set at the crossroads of journalism studies and natural language processing, and focuses on French language. Our corpus consists of 80,000 articles identified by their authors as news or opinion pieces and published by four Belgian and four Canadian media.

First, we draw up a state of the question of opinion classification with linguistic methods. Then, using statistical models for text classification, we measure the predictive power of 30 state-of-the-art linguistic features of subjectivity for identifying news and opinion articles. We find that some features, such as the overall concreteness of the text or the ratio of negations, have more weight than others in predicting the class of an article.

In parallel, we fine-tune the transformer model CamemBERT, pre-trained on French data, for classifying news vs. opinion articles. The accuracy of this model is higher than the statistical feature-based model, but its overall computational cost is higher. Using attention-based explainability methods, we explore which textual elements have the most influence on the transformer model's decisions. Among other features, discourse markers and deictic (context-related) words are elements to which this large language model grants much attention for our classification task.

The observations made through those experiments are then confronted with the results of a qualitative experiment involving thirty-six annotators tasked with highlighting markers of subjectivity in press articles. The results show that human readers are particularly influenced by the presence of expressive punctuation and modal verbs in assessing the overall subjectivity of an article.

Our findings contribute to a better understanding of the many ways in which subjectivity may be constructed and perceived at the textual level in French-written journalistic discourse.

JOS34 Journalistic values II

PP 1041 An experimental study on the potential of discursive journalism to mitigate polarization

Luisa Wilczek¹, Rebecca Strohmeier², Annika Sehl², Sonja Kretzschmar¹

¹ University of the Bundeswehr Munich, Journalism, Munich, Germany

² Catholic University of Eichstätt – Ingolstadt, Journalism, Eichstätt, Germany

Democratic societies face growing societal polarization (e.g., Carothers & O'Donohue, 2019) – especially regarding conflict-related topics, i.e., controversially negotiated topics that are linked to wider, e.g., political, ecological, or economic (intra-)societal conflicts. Considering the media's important role in shaping societal debates, more research is required on how media coverage can be used as a tool to minimize polarization (e.g., Kubin & von Sikorski, 2021). We address this research gap and argue that, to mitigate polarization in its different forms (*ideological*, *affective*, and *perceived*, e.g., Lelkes, 2016), reporting on conflict-related topics requires a journalistic approach that goes beyond a neutral-objective presentation and focusses on contextualizing and evaluating the available information. Hereby, the normative concept of *discursive journalism* (Brosda, 2008), which applies the principles of Habermas' (1984, 1987) theory of communicative action to journalism, offers great potential. Discursive journalism is grounded in three pivotal implications (Brosda, 2008): *Multi-Perspectivity*, *Rationality* and *The Journalist as Advocate of Discourse*. Latter assigns journalists a dual role in discourse representing both a disseminator of information and an active discourse participant (Brosda, 2008).

Despite its potential for addressing conflict-related topics, the concept has so far only been considered theoretically. Therefore, this study aims to examine, to which extent discursive journalism can contribute to mediation between conflict parties and mitigate polarization tendencies (RQ).

We conduct an online survey (N = 2500) in experimental design using video stimuli targeting the audience. We have developed a first operationalization proposal for practical application of discursive journalism considering the implications separately in YouTube and Instagram layout. The study involves 12 videos on a conflict-related topic, presented in talk-show (*Advocate of Discourse*) and news-report format (*Multi-Perspectivity*, *Rationality*). The objective is to measure, among other aspects, potential changes in attitudes regarding the topic. To operationalize *Multi-Perspectivity*, the experimental group (EG) report includes different perspectives depicting that all affected by the topic are participating. *Rationality* in the EG report is operationalized with a strong focus on facts and references. The journalist as *Advocate of Discourse* in the EG video actively controls the course of debate by providing background information and contextualizing the participants' statements.

This study is still work-in-progress, but findings will be available for presentation at the conference. Apart from understanding how journalism can mitigate polarization, the study creates an impact by operationalizing and experimentally testing a normative theoretical concept in practice.

PP 1042 Courage and Resilience as journalistic values under Authoritarianism: Carl von Ossietzky and his journalism during the 1920s Weimar Republic

Antje Glück¹

¹ Bournemouth University- FMC, Communication and Journalism, Poole, United Kingdom

The autonomy of journalists and media freedom is increasingly under threat. The latest report by Reporters without Borders (2023) shows a noticeable decrease in global media freedom. The number of countries classified as

favourable environment for journalism has dropped to merely 8 out of 180 countries. Worryingly, this trend can be observed in many countries previously considered as stable and liberal democracies with functioning critical media systems such as Hungary and Poland (Gajlewicz-Korab and Szurmiński 2022, Schimpfössl and Yablokov 2020), and even the United Kingdom (Guardian, 8 November 2022).

Holtz-Bacha (2022: 46) reminds us that "press freedom can never be considered secure, and it is vulnerable even in established democracies". The relevance of critical and courageous journalism remains undisputed and reflects in the awarding of the Noble Peace Prize to journalists such as Maria Ressa of the Philippines and Dmitry Muratov of Russia in 2021.

Following this line of thought, this project aims to identify the capacity of journalism to operate under changing circumstances of increasingly right-wing and/or authoritarian tendencies within democratic countries – or how do journalists retain independent critical voices when facing threats of oppression?

I explore this pertinent issue through a study of the life and works of German journalist Carl von Ossietzky (1889–1938). Despite having been awarded the Nobel Peace Prize in 1935, little is known about Ossietzky in the English language. As editor-in-chief of German-language *Die Weltbühne* during the Weimar Republic in the 1920s, Ossietzky was a vocal critic of Hitler's rise to power. This ultimately led to his death at the hands of the Nazi regime.

The paper presents findings of the archival work in Germany, employing close reading techniques, to examine his contributions and political relevance as a journalist operating under increasingly threatening conditions.

In doing so, this paper will focus on the role of immaterial values in journalism such as resilience and courage – and how they matter within the journalistic profession. While work on journalistic resilience are gaining track (Relly and Waisbord, 2022), courage as intrinsic and idealistic journalistic quality can be understood as "taking risks [as] part of the job" (McCaffrey, 2019, : 220).

In this sense, the paper will engage with the concept of "moral courage" proposed recently by Feinstein (2023), who argues from a psycho-analytical perspective what motivation journalists display to explain their rationales for their work under difficult circumstances and, often, authoritarian conditions.

Alongside this it raises the question of how journalistic role understandings might change in face of authoritarian menaces, proposing that presenting facts alone is not sufficient, but that truth needs to be advocated.

This will help to identify lessons around resistance and courage of journalists working under authoritarian/totalitarian regimes.

PP 1043 "It really depends on how tired and stressed you are when it happens..." – A diary-interview study on harassment and intimidation of journalists

Ilmari Hiltunen¹, Reeta Pöyhtäri¹, Kaarina Nikunen¹

¹ Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

Harassment and intimidation perpetrated by organisational outsiders has been increasingly recognised as a significant stress factor and a risk to contemporary journalists' wellbeing. Rapid changes in modern communication environment combined with growing political polarisation and media hostility have accentuated these harmful phenomena, resulting in mounting concerns regarding the long-term effects on journalists and press freedom.

While there is a growing base of empirical research exploring the effects of harassment and intimidation targeting journalists, majority of this data has been collected using surveys or one-off individual interviews. This research seeks to expand this knowledge and widen the methodological scope by combining solicited research diaries and recurring interviews to explore how these behaviours both online and offline are experienced, reflected, and negotiated by journalists over extended period of time. The approach enables exploring the emotional and psychological reactions and stress related to harassment and intimidation, but also makes it possible to identify factors that sustain and enhance journalists' resilience.

The sample comprises of 19 Finnish professional journalists. To obtain distinct perspectives, journalists with varying demographic backgrounds who specialise in topic areas previously identified as prone to harassment and intimidation were selected. The research data consists of diary entries and supplemental material provided by participants during period of six months (January 2023–June 2023) complemented with three semi-structured interviews with each participant. The interviews took place in the beginning, middle and the end of the data collection, which allowed us to revisit and elaborate on experiences and reflections contained within the diary entries.

The data was analysed using qualitative thematic analysis. The findings demonstrate that there is very significant individual variation related to how harassing and intimidating behaviours and their implications are experienced by journalists. The results indicate that these experiences are shaped and influenced by plethora of interconnected factors ranging from individual's personality and conceptions of professionalism to perceived organisational, collegial, and societal support. Additionally, these experiences and their implications are not fixed and steady but rather they accumulate, develop, and transform over time. Exposure to harassment and intimidation can, therefore, lead to multiple effects and outcomes that extend from frustration and anger to anxiety, fear, and self-censorship, and to increased resilience and determination. Moreover, these sentiments can spread in work communities through social ripple effects.

This research provides further evidence that harassment and intimidation do not target or affect all journalists equally, but particular combinations of individual and professional factors make certain journalists more vulnerable to detrimental effects. Besides offering an empirical contribution to the field of harassment research, the findings can help newsrooms organise their support measures strategically. By providing special attention and support to at risk journalists, journalistic organisations can seek to mitigate negative implications and detrimental ripple effects of harassment and intimidation more effectively.

PP 1044 Pre-empting normative failure? Journalism students' concerns about social media spaces

Dawn Wheatley¹

¹ Dublin City University, School of Communications, Dublin, Ireland

Appropriate conduct and profile-building on social media are one of the many challenges with which journalism students in the digital, networked era must grapple. Journalists' concerns around the "emotional labour" of having an online presence (Miller & Lewis 2020) coupled with risks of fatigue and burnout (Holton et al 2021) means social media can be an additional strain in an already demanding job. This study, based on focus groups with 40 students from three Irish universities, explores how young journalists interpret the risks and pressures associated with establishing an open, public-facing social media presence.

The students' concerns manifested in five key areas. Firstly, they were becoming familiar with anti-journalist sentiment which was confronting, as the critical perception of their profession clashed with their idealistic motivations for studying journalism. Secondly, the actual demands of dealing with negative content were offputting, with many fearful of what threats lay ahead and how to overcome criticism; students were also witnessing what established, high-profile journalists encountered, something that normalised attacks on journalists' character. Thirdly, students were grappling with a lack of civility and rationality in public discourse online: as one said, "there's always some kind of response that is uninformed ... the way that people can kind of gang up together on you. It's like a pack mentality". Next, there were apprehensions about who was 'watching' them online, and the need to self-censor, because of various fears: around their safety if they reveal too much personal information; around 'cancel culture' if they make mistakes; and around potential employers' perception of their conduct. This last point is pertinent for students given the pressure to find work and be 'employable'. Finally, the work-life balance and labour implications of being 'always on' was a stressful prospect: participants feared addiction, as well as burnout amid blurred working hours and the potential inability to switch off.

We suggest that these concerns undermine how students feel about their potential to successfully achieve their professional goals. It is conceived of as "pre-emptive normative failure" and may lead to a desire to leave journalism before they have even begun their careers. This feeling of being unable to achieve professional ambitions has been documented elsewhere among working journalists (Siegelbaum & Thomas 2016:387), described as a "deep commitment to the normative functions of journalism but a growing realisation that external pressures are contributing to 'normative failure' – the fear of inability to execute these functions". However, the prospect of this normative failure being present among those who have not yet properly started work is worrying for the sector's sustainability. PP 1045 Individual skills and impractical IT structures: How journalists in Germany counter digital security threats

[Viviane Schönbachler](#)¹, Jannis Frech¹, Volker Lilienthal¹

¹ Universität Hamburg, Journalism and Communication Research, Hamburg, Germany

Surveillance, cyberattacks and doxing: journalists' sensitive data is at great risk. Digital security is thus one of the most important skills and heightened awareness and effective prevention measures are needed. This study takes stock of these skills and supportive infrastructures in German media companies.

Since Edward Snowden, journalism research has increasingly focused on digital security and possibilities of ubiquitous surveillance (Bell & Owen 2017). Organizations concerned with press freedom have compiled guidelines on digital security. However, excess of information, tools and sometimes contradictory recommendations can confuse journalists rather than help (Berdan 2021).

Two major discourses have emerged: deterrence effects ("chilling effects") of surveillance (Eide 2019) and technological responses to cyber security threats (Henrichsen 2020). So far, there are still many research gaps in this area and only few studies focus on journalism in Germany.

In our study, we examine the German status quo using qualitative and quantitative methods. The study is based on a theoretically guided, diverse selection of 21 media companies that were offered free workshops on digital security (plus two sessions for freelance journalists). At the end 230 journalists participated. The mixed methods approach is based on an online survey and participant observations during the training sessions.

The initial results from the survey show a rather diffuse awareness of digital security risks. Participants state that they are aware of risks, while at the same time remain uncertain in how to respond. The vast majority of respondents is "unsure" about their employer's measures and expressed a desire for further training and more practice-oriented IT departments.

The often-cited "chilling effect" (Penney 2017) seems ambiguous: respondents often state that other journalists are likely to avoid publication due to surveillance or threats. However, when it comes to their own behaviour, they tend not to believe that they would withhold anything. On the contrary, respondents state frequently that they would initiate new investigations, use new technologies and learn new skills because of digital threats. These results reinforce critical voices from surveillance studies that criticize the blanket assumption of "chilling effects". Journalists are not limited to silence and hiding, but can use their skills strategically.

However, this requires appropriate digital skills and practice-oriented infrastructures. The next step of our research project will be to identify and constructively develop these in dialog with the media companies involved in the research.

PP 1046 Contours of uncertainty: Experiences of journalistic precarity in Serbia's postsocialist capitalism

[Igor Išpanović](#)¹, Čedomir Markov¹

¹ University of Belgrade, Institute for Philosophy and Social Theory, Belgrade, Serbia

Precarity has become a dominant condition of the contemporary neoliberal labor market due to the increasing flexibilization of working arrangements. Contrary to standard employment relationships, precarious work is characterized by financial uncertainty, job insecurity and limited access to social benefits and protections. Journalism is not immune to this trend: the profession's declining working conditions are marked by reduced incomes, widespread layoffs, diminishing advertising revenues, and weakened union presence.

Despite the growing body of literature, the perceptions of journalistic precarity in non-Western political economies and media systems remain largely unexamined. The aim of this paper is to explore how journalists experience precarity within the unique framework of postsocialist capitalism (Bandelj, 2016), prevalent in former socialist countries of Eastern Europe. We focus on Serbia, a nation undergoing decades of economic transition, accompanied

by rampant political polarization. The processes of privatization, deregulation and globalization resulted in the politicization of the economy and the rise of informal institutions, which continue to shape the living and working conditions of journalists today.

We explore the experiences of journalistic precarity in Serbia through the lens of Rick and Hanitzsch's (2023) theoretical model on journalists' perceptions of precarity. Our primary interest lies in understanding how objective conditions and individuals' experiences of work and uncertainty vary considering the distinct and divided political and economic configurations of the Serbian media market. Our methodology involves conducting semi-structured, in-depth interviews with 25 journalists. Participants will be selected to reflect the diversity of political and economic factors theorized to shape perceived precarity in journalism. This particularly refers to the ownership structure and the business model of the media, i.e., whether it is privately, publicly, or state-owned. In the case of privately-owned media, we distinguish between for-profit enterprises and civil society or community media, as this distinction, beyond business orientation and organization size, bears significant implications on journalistic work. In addressing the political factors, we situate the selection process within the polarized Serbian environment and, as such, include media that report in favor of the government and those that are critical. On an individual level, we differentiate between the type of contract journalists have, i.e., permanent, part-time, piece work, etc. Finally, our selection will also be sensitized to encompass experiences across age and gender spectrum within the profession.

This research underscores the need for contextualizing journalistic precarity, particularly concerning variations in political economy and governance. By doing so, it contributes to a more nuanced understanding of precarity in diverse capitalist systems, highlighting the specific challenges faced by journalists in postsocialist countries.

JOS36 Data journalism

PP 1047 Shifting epistemologies of data journalism and the audience turn: A systematic literature review

Christoph Raetzsch¹, [Franziska Garms](mailto:franziska.garms@aarhusu.dk)¹

¹ Aarhus University, Department of Media and Journalism Studies, Aarhus, Denmark

Research on data journalism is mostly focused on the production of data-driven news by news organisations or collaborative teams. Its core questions often relate to organisational setups (Stalph, 2020), new demands for technical skills (Schaez, Lischka & Laugwitz, 2023), software and tools, or access to data (Bounegru & Gray, 2021). Data journalism allows new ways of knowledge creation and storytelling (Coddington, 2015), and thus changes professional routines as well as news consumption patterns on the audience side – as public discussions of COVID-19-related data during the pandemic have shown (Bisiani et al., 2023). These shifts in the epistemology of journalism through data-based practices of investigation and analysis became more prominent in journalism studies, and increasingly consider the broader ecosystem of practitioners in data-driven knowledge creation (Morini, 2023; Ramsälv et al., 2023). However, broader calls for an 'audience turn' (Swart et al., 2022) in journalism research have not yet resonated in data journalism research, apart from some first interventions in this direction (Stalph, Thurman & Thäsler-Kordonouri, 2023). This paper seeks to map possible directions of future research in this domain, based on a systematic literature review of data journalism research published between 2018 and 2023 in international journals.

Drawing from a body of over 120 articles, we created a thematic sample of 38 articles in which shifts in epistemologies of data journalism are directly or indirectly addressed. Through open and selective coding, we identify four main themes of shifts in data journalism epistemology, to answer our research question: *Under which themes are shifts in the epistemology of data journalism addressed in research literature between 2018 to 2023?* These four themes include I) the theory of journalistic knowledge creation, II) practices of data journalism and their relation as well as challenges for traditional professional journalistic practices, III) modalities of participation in the creation and interpretation of data journalism, and, to a lesser degree, IV) issues of perception and engagement with data journalism from an audience perspective. In our discussion, we relate these findings to a) the audiences of data journalistic products, and b) the potential of data journalism for cross-sector collaboration with other stakeholders in society. We identify a research gap on audiences' perception of data-driven news. In addition, participation in different phases of data-driven journalism production (Appelgren & Jönsson, 2021; Hamm, 2022; Palomo et al., 2019) relates data journalistic practices to other domains of professional data work such as civic tech, citizen science, or smart city developments (Author, 2023; Baack, 2018). In this broader ecosystem of practitioners, audiences of data journalism include not only citizens but other (local) actors who use journalistic data sources for their own objectives and purposes (e.g. NGO's or municipal authorities). Our paper thus proposes that shifts in epistemologies of data

journalism allow for an 'audience turn' in research that addresses how knowledge created through data journalism is used for, interpreted in, and transposed to policy, civil or other knowledge domains, thus realising the democratic function of journalism through new kinds of data-driven knowledge practices across sectors.

JOS36 Data journalism

PP 1048 Exploring the infrastructure of news online: The significance of metadata for journalism

[Lisa Merete Kristensen](#)¹

¹ Roskilde University, Department of Communication and Arts, Roskilde, Denmark

News has always been categorized in terms of genre and topic, and in terms of hard or soft news, to name a few labels. For example, from 1851 onward the index staff at the New York Times manually kept a record of what was printed in the news. Today, the file cabinets are largely obsolete for daily use, but categorization and classification of news is as important as ever. From the 1990's and on, the media industry began to rely on metadata, sometimes explained as "data about data", as a means to describe news content online using new or existing taxonomies of content, often in combination. Metadata are added in the HTML source code of a webpage and serve multiple functions. First, they describe what each news article is about and how topics and themes relate to each other, making metadata standards essential to preserving news reports for historical reference and for re-purposing elements of previous stories in current news production. The structure that metadata provide also makes website content adapt to different screens and in news distribution, for example via voice assistants. Metadata are an indispensable basis for recommender systems, and they are a prerequisite for web crawlers to index news to appear in social media newsfeeds and in search results. Metadata taxonomies are often developed and maintained in collaboration with entities outside the news industry, e.g. tech companies, highlighting the importance of scrutinizing dynamics of power in deciding what is most significant in the news, e.g., which events are worthy of being labeled and distributed, and how these labels are operationalized across the larger infrastructure of the web. This research argues that studying metadata taxonomies and the actors involved in developing and maintaining them is an empirical gateway to understanding the infrastructure of news in its most granular form. It asks: Which taxonomies are in use for structuring news content, and which entities govern the most widely used taxonomies for structuring news content? Finally, the research discusses the implications this has for journalism. To do this, the research employs thematic analysis to analyze software documentation, publisher guidelines, taxonomies, and official communication from entities involved in developing and maintaining these taxonomies. These underexplored empirical resources can further our understanding of not only practices behind developing digital infrastructures, but also what follows in terms of what media organizations can do with their local infrastructure affecting the distribution and reach of journalistic content.

JOS36 Data journalism

PP 1049 Diversity as capital: Exploring intersectional diversity in data journalism

[Laura Laugwitz](#)¹, Juliane A. Lischka¹

¹ Universität Hamburg, Journalism and Communication, Hamburg, Germany

The role of diversity in journalism has been framed as a normative imperative aimed at representing a variety of voices and perspectives (Napoli, 1999). There is a growing understanding that diversity in journalism is also a matter of diversity in the workforce.

Data journalism, a data-driven subfield of computational journalism (D'Ignazio, 2021), brings forward novel opportunities for understanding the potential of diversity in journalistic workforce. Although data journalism has been described as predominantly white and male (D'Ignazio, 2021), female data journalists possess cultural capital that compensates for a lack of social capital (Vuyst, 2018). Beyond gender, individuals possess multiple interconnected social identities that overlap and interact to influence their experiences of oppression and privilege (Crenshaw, 1991). Researching intersectional diversity acknowledges these unique experiences from all intersections of society. Therefore, the present study aims to enhancing the understanding about the influence of an array of individual diversity characteristics on capital forms, as conceptualized in Bourdieu's field theory (1983, 2018), and thus power structures in data journalism. We pose the research question:

How do intersectional diversity characteristics of gender, migration background, and social background influence capital and power structures in data journalism?

Empirically, we conduct in-depth interviews with n = 13 data journalists with diversity characteristics in German public-service broadcasters, daily newspapers, research networks, and online news outlets. Germany represents a nation with ongoing gender equality efforts, yet with disparities remaining in the representation of diverse groups in journalism.

Findings show that female and male data journalists have similar skill levels, indicating similar cultural capital. However, male data journalists tend to receive more recognition and encouragement. Female gender was perceived as a potential advantage in certain situations, such as playing the "diversity card" for career opportunities. Female gender can both hinder and facilitate economic and social capital acquisition.

Migration experiences also reveal a paradox relation to capital acquisition. Individuals with a migration background reported challenges in fitting into the cultural norms of journalism, but also highlighted unique perspectives and expertise they bring to the field.

Social background plays a significant role in capital acquisition for data journalists. Privileged social backgrounds facilitate the acquisition of cultural capital in form of higher education. In contrast, economic constraints impede the ability to take on unpaid or low-paid internships, which limits access to data journalism for people from disadvantaged backgrounds. This cultural-capital entry barrier explains a homogeneous academic education of data journalists.

The findings highlight the paradoxical interplay between social background, gender, and migration for capital acquisition in data journalism. Individuals may simultaneously experience both advantages and disadvantages based on their intersecting identities. Our study emphasizes the importance to investigate how gendered expectations, norms, and biases shape the ways in which individuals perceive themselves, their capabilities, and their opportunities within the field.

Regarding implications for journalism practice, promoting inclusivity and diversity within data journalism requires efforts at the entry level. Providing equal opportunities for individuals from diverse backgrounds would include to lower the educational barrier, which is reported to be irrelevant anyways, and focus on qualities such as data curiosity.

JOS36 Data journalism

PP 1050 Building data confidence: Impact of academia on journalistic practice

Liis Auväär¹

¹ University of Tartu, Institute of Social Studies, Tallinn, Estonia

For several years COVID-19 was the main topic in news. Reporters had to up their data skills to analyze the spread of the virus, daily death numbers, the progress of vaccinations etc. It is safe to claim, that the pandemic assisted an ongoing change in newsrooms worldwide: the need for updated journalistic skill-sets due to datafication. This change, in progress for already decades, has been also labelled a "quantitative turn" (Coddington, 2015), a "computational turn" (Loosen et al., 2015) and the "expansion of open data movement and of data-driven journalism" (Engebretsen et al., 2017). Not only is the logic of newsrooms changing, but also the skills expected by the industry and offered through journalistic education. Multi-skilling is a term often used here (Beckett & Deuze, 2016; Himmakadakas & Palmiste, 2019; Larrondo et al., 2016; Örnebring, 2010; Örnebring & Mellado, 2018).

Ongoing datafication has kept researchers debating questions like whether or not journalists should add coding to their set of skills (Foust & Bradshaw, 2020; Thurman et al., 2017) and if universities should rethink their "traditional trade school focus on interviewing and storytelling skills" (Nisbet & Fahy, 2015: 232). The study at hand contributes to the discussion of whether universities – and other institutions offering journalistic education – meet the current needs of professional journalism. It does so, focusing on data skills of Estonian journalists in a post-COVID-19 pandemic setting.

The paper is based on both quantitative and qualitative research. First, an extensive survey – data collected in Estonia late 2022/early 2023 for the global Worlds of Journalism study. The Estonian national block of this study was designed to ask journalists themselves to evaluate their skills. A representative sample (n = 226) of media professionals across public and private media sectors – print, television, radio and web – was reached. Preliminary results show a difference in how confidently the journalists rate their data skills, which correlates with their background – specifically journalistic education or the lack of it. But what is also visible, is that more advanced data skills like writing code or even visualizing data were rated poorly (f.e less than 1% claiming to be very good at coding).

The survey is followed up with semi-structured interviews with journalists (n = 8). Focusing on a selection of journalists, who evaluate their data skills to be good, the goal of the interviews is to get insight into how they obtain(ed) these skills. Does a difference emerge between journalists who have academic journalistic education and those who do not?

Since the skills of Estonian journalists have been studied in the pre-COVID era (Himmakadakas & Palmiste, 2019; Köuts-Klemm, 2019; Örnebring & Mellado, 2018), this offers an additional chance for this paper to map and analyze any differences. From what is visible so far, the results would step into dialogue with Wihbey (2017) concluding, that journalists with a higher degree of academic preparation and statistical literacy were more likely to engage with research. But also agreeing, that data confidence is something that requires lifelong and self-directed learning (Bobkowski & Etheridge, 2023).

PP 1051 Novel Epistemic Systems in Journalism: Merging Bellingcat and Military intelligence practices for coverage of visual imagery from Ukraine and Gaza

Ståle Grut¹

¹ University of Oslo, Department of Media and Communication, Oslo, Norway

For outside spectators, the Russian invasion of Ukraine happened at an unprecedented level of transparency. The Russo-Ukrainian War is one of the most visually documented conflicts in history. Digital cameras, operational images and other visual sensorial data are through the internet made available to outside spectators. It has changed and challenged how the media reports the conflict. Through participant observation and interviews with 13 participants of a special Norwegian fact-checking unit, Faktisk Verifiserbar – created to investigate visual imagery from Ukraine (and later Gaza) on behalf of Norwegian media outlets shortly after the invasion in February 2022 – this article identifies the methodological inspiration for Faktisk Verifiserbar's verification of visual material, as well as the challenges or concerns do they encounter in their process.

According to The Economist (2022), the Russian manoeuvres leading up to the invasion represented "a coming-out party for open-source intelligence", as a swelling community of enthusiasts and professionals dabbling in Open Source Intelligence-style analysis (OSINT) tracked the build-up of forces near the border, through satellite imagery and various open sources of information. The public was simultaneously privy to declassified intelligence reports from multiple countries. Prior to the invasion, the US president directed the country's intelligence services to "strategically downgrade intelligence to warn Ukraine and the world about Russia's plans", ensuring the publication of a steady stream of detailed intelligence assessments relating to Russia's next moves (Barnes & Entous, 2023; Holmgren, 2023; Strobel, 2022; Zegart, 2022). Similarly, the UK's defence ministry started to publish "intelligence updates" to the public via tweets multiple times a day (Adam, 2022; Lawless & Madhani, 2022). These developments set the scene for two dominant actors in the information space of the war in Ukraine: the online OSINT community and the established intelligence community. In Norway, these actors proved central to the coverage from the specialised newsroom Faktisk Verifiserbar.

This study finds that rather than working with established press practices from organisations such as the BBC, AP and NYT, epistemic practices and training from actors outside the traditional realm of journalism, specifically Bellingcat and the Norwegian Military Intelligence services, were adopted for journalistic purposes. One reason is that the complexities of the verification work did not square well with the traditional binary epistemology of journalism (e.g., real/fake, trustworthy/untrustworthy) (Steensen et al., 2022). Because the verification procedure often rendered the team convinced about some factual aspects of the material (typically where) but uncertain about others (typically when), such uncertainty left the material "stuck" in a state somewhere between verified and unverified. This frustrated the Norwegian media organisations who were supposed to make use of the visual material in their coverage, sometimes leading to them skipping verification entirely, by rather publishing the content alongside a disclaimer about its origin, veracity or representability. The study finds that Faktisk Verifiserbar sought epistemic practices outside journalism to mitigate epistemic gaps that can often occur when the press seeks to make binary truth claims from a broad range of visual imagery of unclear and speculative origin.

MIP01 New challenges for media industries

PP 0084 The dynamics of datafied employee evaluation in media work

Rasa Jämsen¹, Mikko Villi¹, Anu Sivunen¹, Ward van Zoonen²

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

² University of Jyväskylä, School of Business and Economics, Jyväskylä, Finland

In recent years, datafication has become an increasingly prevalent part of everyday life. Datafication is referred to as collecting, storing and visualizing data for strategic purposes. Data gathering permeates most digital spheres of society. In media organizations, datafication has commonly led to following audiences and journalistic products through analytics, thereby also turning qualitative work processes and media workers into quantifiable metrics. When data becomes the instrument for assessing the performance of media workers, datafication can potentially lead to dehumanizing work experiences. The aim of this study is to understand the dynamics of manager-subordinate relationships in datafied work in media organizations through perceptions regarding evaluating and being evaluated through analytics.

We draw on in-depth interviews with 25 employees of a public-funded, Nordic broadcasting company that relies heavily on audience metrics in decision-making and evaluation of employees. We interviewed both employees without managerial duties (N = 17) and employees whose position included managing or supervising others' performance (N = 8), allowing us to understand the perceptions and dynamics around datafication through the experiences of both managers and subordinates.

The findings show that while the ways of using audience analytics for evaluation varied from formal, organization-wide rewarding systems to individual team leaders' feedback practices, data was overall a crucial tool for media management. The perceptions of datafied evaluation practices varied and oftentimes even conflicted between the informants. Many managers and subordinates aligned with the perception that audience metrics system was an easy tool of evaluation, as it was anyway present in everyone's daily work. Data even appeared as an "incorruptible" way of assessing the performance of media workers. At the same time, using data for evaluation was perceived as too simplistic and pressuring. Especially informants in subordinate positions expressed finding data-based evaluation neglecting their professional skills by highlighting simply the popular content topics and obscuring the amount of work put on making stories. Additionally, certain data-based incentives were perceived to be applicable only to journalists, which was perceived as unfair by those in other roles in media work, such as producers and those in charge of the layout of the online news page. Interestingly, informants in managerial positions described themselves as carefully planning and carrying out evaluation so that data would not be the only method of assessment, but informants in subordinate positions described data as the only measure of their performance. This finding indicates that the role and importance of data in evaluation is understood differently at different levels of the organization, which can lead to challenges in organizing feedback and managing well-being at work.

Overall, the findings of this study shed light on the dynamics of data-driven management of media work by showing how datafication plays a dominant role in management practices of media organizations, while the experiences related to evaluation through data are multidimensional and often conflicting. This study develops actionable insights for media management, although the contributions can also be applied more broadly to data-driven monitoring and quantitative evaluation of work.

MIP01 New challenges for media industries

PP 0085 Paper and screens: Negotiating value between "old" and "new" educational media at industry fairs

Saga Hansén¹

¹ Södertörn University, Department of Media and Communication Studies, Huddinge, Sweden

Digitization is changing education. Politics and innovation drives schools to implement and educate in and through digital technologies. This affects not only education itself, but the production of *educational media*. Traditionally books, produced by publishers and distributed by book retailers and libraries, digitization enables a wider range of formats and actors that can create them.

Digital media's role in education is a subject of debate. Some argue school children learning about and through digital media is not only inevitable, but something that could revolutionizing learning, making it more efficient, personalized and motivating for pupils. Others warn about digital development, meaning that traditional, usually printed educational media is the optimal medium used for learning and that too vast or fast implementations of digital media in schools could be harmful for education.

Most research on digital educational media, as well as common debates on the topic, focuses on implementation and use of educational media, the content that is mediated or the ("proven" or imagined) "effects" or affordances digital educational media has for teaching and learning, often compared to traditional print media. A perspective that is seldom taken is that educational media is a type of *media*, produced in a field of media production with its

own actors, stakes and value practices. What happens when established actors in the field of publishing need to adapt their production to a digitized climate? What happens when the dominance of established actors can be challenged by global "big tech" companies or local start-ups? What happens to the value of printed schoolbooks when new, digitized formats enter the field? Studies have examined how the book publishing industry is affected by digitization (Bhaskar, 2013; Bergström et al., 2017; Thompson, 2020) but the specific subfield of educational media is often forgotten about.

This paper examines how the value of digital versus printed educational media is negotiated through industry actors in the field of production. It does so by looking at a specific *industry events* – the Gothenburg Book Fair, the "largest cultural event in the Nordics" and the SETT Fair, the "Nordic leading meeting place in innovative learning". Fairs are here considered as *tournament of values* (Moeran & Strandgaard, 2011) or *instances of consecration* (Broady, 2002), arenas where *valuation practices* in forms of contestation, justification and negotiation of value takes place. Based on field notes, transcribed stage talks and marketing material from event participants, the study will contribute to new insights on values and power struggles in a specific field bordering the field of media production and education.

MIP01 New challenges for media industries

PP 0086 The Toon Gaze disorder: A content and transmedia analysis of children's animated series in Italy

Silvia Leonzi¹, Giovanni Ciofalo¹, Fabio Ciammella¹, Michele Balducci¹

¹ Sapienza Università di Roma, Comunicazione e ricerca sociale, Roma, Italy

The contemporary hybrid media context (Chadwick, 2017) is daily redefined by the systemic, infrastructural, and transmedia impact of platforms (van Dijck et al. 2018; Hepp, 2020; Leonzi, Marinelli 2022).

The paper presents the results of a four-year research whose purpose is to describe the formation of a dominant production frame, defined in the terms of a "Toon Gaze effect", capable of influencing the modes of representations within animated series available on major platforms SVOD.

The research aimed first at analyzing the ethical-behavioral and aesthetic traits and the narrative dimension and character system of the animated series considered to check the potential generation of forms of cross-stereotyping and hypersimplification (Krijnen, van Bauwel, 2022; Streicher, 1974; Walsh, Leaper, 2020).

In this perspective, the proposed concept of "Toon Gaze" has been defined as a potential media dis-order resulting from predominant production logics that can influence the processes involved in creating, spreading, and consolidating media representations of reality.

To this purpose, first an analysis of a textual corpus of over 300 episodes belonging to 12 animated series (six aimed at preschool-aged children, six intended for higher-aged audiences between 6 to 12 years old) was conducted through a content analysis as an inquiry (Krippendorff 2018), conducted at multiple levels of detail. Secondly, a possible transmedia map was reconstructed for each of the 12 series considered, which led to the analysis, in consideration of a transmedia logic based on spreadability and extractability, of delivery and ancillary products such as toys, merchandising, clothing, school products, and other forms of co-branding (e.g., in food).

Through analyzing media content and streaming platforms as well as conducting transmedia analysis, interesting results emerged. One noteworthy trend is the apparent contradiction between the incorporation of creative and productive logics of the media industries by the toon gaze to ensure greater accessibility, visibility, and recognition, and the proliferation of stereotypes in the representation of series dynamics. These same logics have also led to the affirmation of particular commercial logics from a transmedia perspective, which permit to define the toon gaze as a effectively media, cultural, and social disorder.

MIP01 New challenges for media industries

PP 0087 Illiberalism and popular culture – Netflix's "The Witcher" in the CEE periphery

Sylwia Szostak¹

¹ SWPS University, Department of Cultural and Media Studies, Warszawa, Poland

The media landscape in the east of Europe is riven with contradiction: illiberal, populist governments and parties have promoted ultra-nationalist, anti-globalization and anti-EU agendas and have made significant efforts to centralize the media industries under direct government control or government-friendly oligarchic ownership. At the same time, these states have aggressively courted and nourished global media and technology investment as a key component of their brand and own economic viability. Budapest and Warsaw have grown into media production centers with state-of-the-art studios and postproduction facilities to provide services to runaway productions eager to take advantage of high tax rebates, a skilled labor force and low labor and environmental regulations. While the Polish, and Hungarian governments overtly position themselves against the ethos of (neo) liberalism, global capitalism, consumerism, gender equality and racial diversity that giant OTT platforms represent

and overtly embrace, they also court and rely on the financial investment, job opportunities and soft power these media companies contribute to state economies and nation brands.

This paper unpacks the economic, political and cultural implications of these apparent contradictions. Unlike the Anglo-American context, research in television, media and creative industries in Central and Eastern Europe has been scarce and has not scrutinized the dynamic changes to industrial strategies and business practices enabled by runaway service industries and collaboration with global entertainment giants, such as Netflix. On the other hand, research on the politics of media governance and political illiberalism has focused on the news media, revolved around freedom of expression related to populism and has evaded entertainment media and popular culture altogether. To investigate this unspoken economically-driven alliance between postsocialist right-wing states and global streaming services, I use the case study of Netflix's series *The Witcher*, based on Polish fantasy writer Andrzej Sapkowski's book series and previously adapted into a popular video game, and filmed almost entirely in Hungary. Against the broader ideological and historical context outlined above, I explore the series' transmedial, international production history and cross-platform marketing strategies in the context of the local Polish and Hungarian service industries' operations, as well as state policies and European Union regulations. The production context for *The Witcher* demonstrates that illiberal politics can easily go hand-in-hand with neoliberal order in the domain of entertainment. The paper goes on to discuss the long-term implications of Netflix's local disruption into Eastern-European media industries.

MIP01 New challenges for media industries

PP 0088 Assessing COVID-19's impact on media industries: The case of Austria

Denise Voci¹, Sandra Förster², Sonja Luef², Andy Kaltenbrunner³, Matthias Karmasin⁴

¹ University of Klagenfurt, Media and Communication Studies, Klagenfurt, Austria

² Austrian Academy of Science, Institute for Comparative Media and Communication Studies, Vienna, Austria

³ Medienhaus Wien, Research and Education, Vienna, Austria

⁴ University of Klagenfurt/ Austrian Academy of Science, Media and Communications Studies, Klagenfurt/Vienna, Austria

The COVID-19 pandemic has been a catalyst for widespread uncertainty and significant shifts across multiple spheres of life, highlighting the media industry's dual role as a communicator of crises and a sector profoundly affected by financial consequences. Every part of the media, from content creation to dissemination, faced disruptions due to halted productions, declining ad revenues, and continuous cost reductions. Austria's media landscape, already facing challenges like revenue decline, reduced print readership, fragmented TV consumption, and a shift towards digital advertising platforms, encountered intensified difficulties during the pandemic, pushing the industry towards rapid transformation – or perhaps not?

This research aims to comprehensively document, analyze, and compare the transformational impact driven by COVID-19 within the Austrian media industry. It focuses on two core questions: *What changes did the pandemic drive in Austria's media landscape? And how does the Austrian population evaluate the development and quality of media coverage during and post-pandemic?*

Accordingly, the study adopts a combination of qualitative and quantitative methodologies. Firstly, it undertakes document analysis, conducting an extensive literature review (n = 325) encompassing scientific journal articles and international market and industry reports. This examination enables a detailed comprehension of the COVID-19-related transformative processes within the media industry on an international level, highlighting local responses. Secondly, it employs quantitative surveys across fourteen waves from 2020 to 2023 (n = 1000 per wave), focusing on various aspects of media consumption during the pandemic, media reporting, trust in established media as vehicles for social discourse, and the overall dissemination of COVID-19-related information.

Results, structured within Bleyen et al.'s (2014) innovation framework, reveal that COVID-19 primarily induced transformations at the process level of the media industry. These changes spanned the entire value chain, affecting content creation, production, and distribution (e.g., data-, solution and service journalism; glocalization vs. hyperlocal focus; "digital first" mindset; news automation; AI and robotics), as well as financing and business models (e.g., entrepreneurial journalism, platformization, membership, donations, franchising); consumption (news diet, media fatigue); and working environments (virtual newsroom; technologization; communities of practice). However, the pandemic's transformative impact on content level was relatively limited, prompting inquiries into the innovative capabilities of content-driven businesses and the primary drivers of innovation within the media industry.

Regarding media coverage, the picture is rather gloomy: 46% of respondents express dissatisfaction with coronavirus coverage. Additionally, double the number of individuals still believe that the media contributed to crisis escalation (30%) compared to those who believe it helped contain it. This aligns with persistent news avoidance rates (35% in November 2020, 40% in early 2022, and 37% in November 2023) and declining trust in both media (-28%) and journalists (-26%).

Combining these methodologies offers an initial overview of COVID-19's impact on the media industry, while spurring valuable discussion on comparability and generalizability of results (globally vs. smaller markets vs. local

specifics), and learnings useful for managing other crisis and preparing for future ones. This dialogue would enrich the study's outcomes and contribute to a deeper understanding of the media industry's adaptive mechanisms in times of crisis.

MIP02 Time in media industries – Production processes, time management, and continuity

PN 027 Patterns of Continuity and Change in Media Industry Digitalization

Terje Colbjørnsen¹

¹ Norwegian Business School, Department of Communication and Culture, Oslo, Norway

Time passes fast, is a common perception of the impact of digitalization on the media industries (Thorburn, Jenkins, & Seawell, 2003). As new technologies for production, distribution and consumption make their entry, predictions of disruptive change tend to dominate. Notions of "shocks to the system" or "punctuated equilibrium" (Ryfe, 2006) suggests that changes in technology come in the shape of external forces that have a sudden and unexpected impact. While change is without a doubt a big part of digitalization, lines of continuity also mark the same processes of transition, not least because media industry digitalization remains embedded in institutionalized structures and conventionalized practices (Colbjørnsen, 2015; Herbert, Lotz, & Marshall, 2018). According to political science scholar Kathleen Thelen, institutional change takes the form of "shifts that are gradual and incremental, though cumulatively transformative" (Thelen, 2010, p. 45). As such, even potentially disruptive technologies such as streaming and generative artificial intelligence will need to find their place within certain established structures. In this perspective, time, in fact, passes slowly, as industrial structures and conventions, along with traditions and habits in user groups and audiences contribute to slowing down the pace of change. This presentation deals with patterns of continuity and change, exemplified by developments over the past 20 years in the media industries for music, books and video games. Drawing on concepts from organizational and institutional theory, such as "incremental change" (Thelen, 2010), "path dependency" (Arthur, 1994) and "embeddedness" (Granovetter, 1985), an argument is put forth about media industry change which is less technology-centric and more attuned to economic, social, cultural and political forces. As such, this is also a call to look critically at predictions of tech-driven communication disorder, in relation to this year's conference theme, and for communication and media scholars to continue focussing on how dominant structures and relations are maintained in times of change. In the presentation, I revisit discourses of change and disruption in the three industries, exemplified by research and trade press articles, paying specific attention to the phenomena of streaming (Spilker & Colbjørnsen, 2020) and artificial intelligence (Jin, 2021).

MIP02 Time in media industries – Production processes, time management, and continuity

PN 028 'There is Never Enough' – Time as an Economic Resource in Factual TV Production

Anna Zoellner¹

¹ University of Leeds, School of Media and Communication, Leeds, United Kingdom

The aphorism 'time is money', commonly ascribed to Benjamin Franklin (Labaree 1961), dominates most commercial production processes in capitalist societies. Television is no exception. In a marketised and highly competitive industry, economic considerations take priority in decisions about what content to produce and how to realise it. In this context, time is perceived as an economic resource with measurable financial implications. However, not everybody's time is worth the same and the financial value of time differs according to type of activity and the nature and number of resources (including people) involved. Based on an interview study with workers in unscripted factual television in the UK, this paper explores the impact of managerial conceptions of time as an economic resource on television production processes and conditions. In particular, the paper considers the impact of cost rationalisation measures, aiming to produce more content in less time and to be less dependent on individuals. This includes a shift in the production process of serial factual programmes from a single linear 'auteur' model to a multi-linear mode of production, where production stages are not being completed subsequently but in parallel. Related to this development is a transformation in division of labour and occupational profiles between production departments. The paper discusses the consequences of these shifts for the work of self-shooting producer/directors in British television. Self-shooters in factual television are expected to singlehandedly, and often simultaneously, carry out the work of previously separate jobs during location filming, such as camera operator, sound recordist, director and producer. These additional responsibilities have severe implications for time in the production process. The paper explores how time-related pressures exacerbate the challenges of working on location, compromising worker wellbeing and production standards. This includes extremely long workdays and poor work-life-balance, a lack of managerial and inter-departmental understanding of time requirements when shooting on location, and insufficient time scheduled to complete work tasks and carry them out safely and to high standard. The paper highlights how time is valued differently in this context as 'working time' comes into conflict with time needed for worker wellbeing, health and safety and meeting professional production standards. Labaree, L. (ed.) (1961) *The Papers of Benjamin Franklin*, vol. 3, January 1, 1745, through June 30, 1750. New Haven: Yale University Press.

MIP02 Time in media industries – Production processes, time management, and continuity

PN 030 Production Time, Motivations, and Mindsets in Two Different Media Industries

Mads Møller Tommerup Andersen¹

¹ University of Copenhagen, Department of Communication, København S, Denmark

Despite many new studies of media industries during the latest 10–15 years, much is still unknown about certain aspects of media production. Because most production studies tend to only focus on one single media industry, there is especially a lack of comparative studies (Herbert, Lotz, & Marshall, 2019; Sundet & Colbjørnsen, 2021) that address the differences and similarities between these industries. In particular, we know from singular studies of each media industry that there are fundamental differences in their production processes, especially in terms of “production time”, defined as the time it takes to make a typical product in that industry. Some media products take many years to produce (e.g., a video game) while others take only a day or a week to make (e.g., a podcast). In order to better understand the consequences of these differences, I have conceptualised a study that goes to two opposite ends of these industries and compares video game production with podcast production to answer the following research question: How do practitioners in these two industries understand and manage production time? Using a maximum variation sampling strategy (Neergaard, 2007), I have chosen these two industries as well as two cases in each industry that comprise a varied sample of different sizes (small vs. large organisations), maturities (new vs. established), geographical locations (Copenhagen vs. Aarhus), and content genres (e.g. comedy vs. historical content). I have studied these four cases and their production processes by conducting observations and interviews with podcasters and video game developers in 2022–23. The findings demonstrate that while the podcasters’ quick processes give them little time to reflect on their finished (or even failed) programmes, the video game developers describe a need for “time to grieve” over failed projects and this shows how production time can lead to very different mindsets. However, practitioners in both industries distinguish between two ways of working that relate to time management: “Passion projects” that they give more time, effort, and emotional investment vs. “bread and butter work”, which they want to finish quickly and for which they have lower expectations. Similarly, they all describe spending more time on products that they feel motivated to make but that they also assess their products’ value based on how much time they spent on it. These findings indicate that production time is connected to their motivations and mindsets and that the length of the production time can generally affect their emotional investment in that product. Subsequently, the longer they spend making a product, the higher their expectations and eventual feelings of success and disappointment can be. This relates to theories from psychology about motivations (Amabile, 1996; Eisenberger & Shanock, 2003; Ryan & Deci, 2000), while studies of podcasters suggest that their motivation can be intrinsic but also connected to personal prestige (Heeremans, 2018; Markman, 2012). Therefore, by studying cases from two opposite ends of the media industries, this paper contributes with a new framework for understanding media production using the connections between production time, motivations, and mindsets.

MIP03 Infrastructures and distribution

PP 0281 The geopolitics of submarine data cables: A network analysis of landing points and cable connections

Sofie Flensburg¹, Signe Sophus Lai¹

¹ University of Copenhagen, Department of Communication, Copenhagen S, Denmark

The great firewall of China, Russia’s ban on Western platforms, and other state-enforced examples of censorship, network shutdowns, and cyber-warfare all testify to a growing fragmentation of the global network of networks known as the Internet. Scholars increasingly enquire into geopolitical conflicts over the Internet, suggesting that “the web seems to be returning to its roots in conflict and nation-state rivalries” (Malcomson, 2016, p. 11). That is, visions of a universally connected “global village” (McLuhan & Fiore, 1968) are increasingly being disrupted and replaced with concerns over processes of “Balkanization” (Hill, 2012) and the emergence of distinct – and often conflicting – Internet regimes (O’Hara et al., 2021). In this paper we argue that the fragmentation of the Internet appears not only in the state-enforced blocking of domains, control of data flows, and recurrent shutdowns of the Internet in particular regions (Björkstén, 2022). It is also manifested in the physical cable connections – or lack thereof – between different geopolitical contexts.

Building on existing research into submarine cables (Malecki & Wei, 2009), landing points (Xie & Wang, 2023), and ownership structures (Winseck, 2019), we test the hypothesis that geopolitical interests, alliances, and conflicts shape the connections (not) made. Through a network analysis of global submarine cable routes, we analyze 1) the most central and peripheral countries, their interdependencies, and geopolitical clusters; 2) cable owners and suppliers across contexts; and 3) the historical evolution of submarine networks and their political economies. Through this empirical study, we identify several networks in the network, reflecting ongoing geopolitical tensions, commercial and political partnerships, and historical shifts in the ownership and control of submarine data infrastructure.

We, specifically, find that historical and colonial power structures continue to shape the architecture of the Internet backbone with the US, France, Portugal, and UK being the most central nodes in the submarine cable network. We also find that American, European, and Chinese submarine cable owners and suppliers are currently competing for future control of the global seabed. And finally, we find a shift in ownership structures – from national legacy telecommunication companies collaborating in large consortia to a handful of global Big Tech corporations extending their power across the digital value chain and solidifying future ventures in artificial intelligence, Internet of things, and other high-capacity services.

MIP03 Infrastructures and distribution

PP 0282 Infrastructures at Scale: Directions for political economist studies of data infrastructure

[Signe Sophus Lai](#)¹, [Sofie Flensburg](#)¹

¹ University of Copenhagen, Department of Communication, Copenhagen S, Denmark

Phenomena like the increasing datafication of all parts of social life, the surge of surveillance capitalism, and on-going geopolitical conflicts over Internet traffic have revealed an urgent need for critical analyses of the societal organisation and control of data infrastructures. Providing a map for navigating this complex, multifaceted, and largely unknown territory, the paper follows the paths of infrastructure researchers before us (Bowker et al., 2009; Parks et al., 2015; Plantin & Punathambekar, 2019) to identify different scholarly entry points with varying epistemic underpinnings, strengths, and limitations. More specifically, we argue that ongoing conflicts around the concept of “infrastructure” (Lee & Schmidt, 2018) reflect deeper discrepancies in epistemic practices that start before and go well beyond what or when infrastructures are – touching upon basic problems concerning the research questions, we ask and how we answer them.

In exploring these contemporary avenues of infrastructure research, we argue that researchers within the field need to be more explicit about the analytical scales of their studies and consider what types of knowledge different epistemic entry points can – and cannot – generate. More specifically, we find that established and prevailing conceptualisations building on the tradition of Science and Technology studies (STS) have led researchers to favour micro- and meso-scale studies, while broader macro-scale studies need theoretical, methodological, and empirical development. As also argued by Hesmondhalgh (2021), a (re)turn to classic political economy (Garnham, 2011; Mosco, 2009) offers a valuable way forward for infrastructure researchers. Scaling up from classic ethnographic sites (Star, 1999), a political economy perspective allows us to address pertinent questions of infrastructural power and technological disruption, and to compare different types of Internet regimes over space and time.

Operationalising this emerging conceptualisation of infrastructure as physical resources that are mutually dependent on – but analytically separate from – institutional arrangements, we propose and discuss empirical strategies for monitoring and comparing the political economies of data infrastructures across geopolitical contexts. Identifying key material components that translate into societal goods and commercial assets, this entails a narrower definition of infrastructures, distinguishing between the physical resources, the actors that supply them, and the regulatory mechanisms surrounding them. This more conventional conceptualisation allows for studies to broaden their analytical scope beyond particular contexts, processes, or sectoral entities.

Illustrating the potentials of the approach, we provide empirical examples from a series of comparative studies of digital infrastructures and their political economies, spanning highly developed contexts in Northern Europe and infrastructurally vulnerable societies in Southeast Asia, East Africa, and the Middle East. By mapping and comparing key technologies that support network connectivity and how they relate to market arrangements and political regulation, we show how political economist approaches to studying digital infrastructure at scale provide a promising outset for empirically analysing and identifying emerging Internet regimes (O’Hara et al., 2021).

MIP03 Infrastructures and distribution

PP 0283 Decoding AI rationality: Comparative analysis of news similarity algorithms

[Kasper Lindskow](#)¹, [Arni Einarsson](#)²

¹ Copenhagen Business School, Management- Society and Communication MSC, Copenhagen, Denmark

² University of Copenhagen, Department of Communication, Copenhagen, Denmark

Fundamental disruptions are expected in extant social, political, and economic systems, as the emergence of artificial intelligence drive automation of decisions that used to be the domain of humans. However, the rationalities that drive machine learning algorithms differ in substantial and often opaque ways from those of humans making the consequences of the transition to AI-driven decision making hard to discern. The consequences are commonly ascribed to imprecision, bias, or “error” in cases where AI systems deviate from human rationality. However, as stated by Amoore (2020), the behavior of an algorithm that we commonly perceive to be erroneous or “mad” is in fact an expression of its specific type of rationality and of specific instances where that rationality deviates from expectations, from common human rationality.

Our paper introduces a methodological approach which operationalizes the erroneous deviations between models and human decision as windows into the rationalities of AI systems. Using this methodological approach, a comparative analysis of the algorithmic models used to predict "relatedness" or "similarity" between news stories by a major Danish news publisher. Similarity scoring has consequences for which stories are exposed to news readers but it is also a complex, subjective, and context-dependent form of classification (Goldstone, 1994) and thus also a rich case for exploring the differences between human and non-human classification. Our analysis compares three distinct machine learning models to a baseline of human annotations: 1) A doc2vec model trained on the publisher's own data, 2) a model constructed with contrastive learning of a pretrained transformer trained on the publisher's own data, and 3) a proprietary and widely used model produced by OpenAI (Ada002). These types of models are central to discovering related news articles as well as a core component in the widely used retrieval augmented generation (RAG) method which power applications of generative AI such as generative search implemented in service such as Microsoft's Bing and Google's Search Generative Experience (SGE).

Our data analysis includes quantitative comparison of the models' predictions and qualitative analysis the critical incidences that display differences between the scoring made by algorithmic models and human annotators. That reveals differences in the estimation of similarity by human and algorithmic models as well as between the different models. The findings are discussed in relation to concrete consequences they have on what news readers are served. Also, as the analyzed models are fundamental for generative AI systems such a retrieval augmented generation, we reflect on the consequences in relation the broader introduction of generative AI systems across societal sectors.

PP 0284 The Messenger is the Medium: Newspaper carriers, union struggles, and newspaper development in Sweden during the 20th century

Fredrik Stiernstedt¹, Anne Kaun¹

¹ Södertörn university, Culture and Education, Huddinge, Sweden

In this paper we explore the history of Swedish newspaper carriers through the lens of the union struggles within the Swedish Transport Workers' union. This focus allows us to make visible the influence of a profession that has largely been overlooked in media history and in media industries studies. Mobilizing around working conditions, the workers put pressure on the newspapers in terms of the size and weight of the papers with consequences for the editorial work. There was also a strong stance against commercial advertising and additional supplements that had consequences for the financial situation of newspapers. Hence, through their union struggles newspaper carriers directly influenced the outlook of newspapers in Sweden in the post-war era. In extension we consider newspaper carriers as soft media infrastructures that had a crucial role and influence on the formation of the mediated Swedish public sphere.

The paper contributes to a broader understanding of the processes that form the media, by looking beyond the much-chronicled editorial processes and journalistic profession, to work done "below the line" (Mayer 2011) to better understand the history of the press. In media studies in general distribution and more specifically newspaper distribution—particularly the work of distributing newspapers—has not gained much attention. Distribution matters have often been treated as part of the media economy and thus discussed on an overarching and structural level while focusing on costs, market structures, and the regulation surrounding distribution. Here we treat distribution as a form of media work and analyses the union struggles and conflicts that shaped this work during the 20th century in Sweden. In doing so, we ask three overarching questions: How was newspaper distribution organized in Sweden during the 20th century? What conflicts and struggles played out between distribution employers and workers? How did the struggles and conflicts between this organization and the associated union affect the form and content of the newspapers being distributed?

Our analysis presents two distinct cases that demonstrate the main argument of the paper: namely, that the routine distribution work of newspaper carriers and their union struggles have affected the development of newspapers in Sweden. The first of these two cases concern the struggles over the size and weight of newspapers and the second encompasses the so-called "war on commercials."

MIP04 Influencers and social media

PP 0395 Social media disruptions in contemporary cultural industries: The case of erotic content creation in Brazil

[Lorena Rubia Pereira Caminhas](#)¹

¹ University of Amsterdam, Media Studies, Amsterdam, Netherlands

This paper examines the role of social media in erotic content creation, questioning how they have disrupted this segment of contemporary cultural production. I contend that erotic content creation is a specific form of content production with working logic and practices similar to the creators' industry (Drenten et al., 2018). The focus is on the thriving Brazilian erotic content creation industry, a microcosm for exploring the role of social media for erotic creators.

The extant literature has addressed the changes in cultural production brought about by social media. On one hand, social media (re)organise cultural production by creating a distinct workplace that shapes working practices to its infrastructures (Poell et al., 2021). On the other hand, they disrupt cultural production through their governance models, establishing opaque guidelines for cultural producers and their content (Are & Briggs, 2023). Nevertheless, these disruptions are to be analysed in the case of erotic content creation.

Social media have always been important for erotic content creation. With the proliferation of fan-based, paywalled platforms among erotic creators, social media became indispensable for building audiences and driving traffic to creators' paid profiles (Easterbrook-Smith, 2023). This dependence has implications for the role of social media in this form of cultural production, which requires further analysis.

This paper is based on broader ethnographic research on Brazilian platform-based erotic content creation and 16 in-depth interviews with erotic creators. Results come from the interviews, conducted between May and June 2022. Respondents were selected by gender identification through social media and snowball sampling. Six were cisgender women, seven cisgender men and three transgender women. Ten were white, three brown, two black and one Caboclo (a Brazilian ethnic/racial identity based on the miscegenation of white and Indigenous people). Interviews lasted one to two hours, and questions revolved around three axes: personal and professional trajectories, work dynamics, and paywalled platforms and social media as workplaces. They were transcribed verbatim and analysed using reflexive thematic analysis.

Findings point to the constitution of social media ecosystems as a workplace for erotic content creation. Due to their dependence on various social media platforms, creators develop shared patterns of use to combine them in specific ways, creating functional differentiation and a rationale for the ecosystem. For instance, while Instagram and Twitter are used to share content previews and build audiences, Telegram and WhatsApp are used to consolidate audiences through explicit content and interaction. Thus, social media promotes more than just cross-platform work, expanding the boundaries of the workplace and demanding practices to suit each platform. In addition, working in an ecosystem requires erotic creators to navigate multiple governance regimes and develop strategies for posting content that is less likely to be banned. However, it is a challenge as erotic work is marginalised and stigmatised, and the governance rules tend to be stricter towards it. Ultimately, social media disrupt both the workplace and the guidelines of erotic content creation, changing where and how it is performed. In doing so, they became key players in shaping the conditions of existence of erotic content creation.

MIP04 Influencers and social media

PP 0396 "Ignore the algorithm, because it could eat you alive": Influencer precarity in the hustling culture

[Tinca Lukan](#)¹, Jožica Čehovin Zajc¹

¹ University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

As social media influencing enters its second decade, there are a growing number of studies on the precarious nature of this work. Most studies establish a link between precarious working conditions and platform governance, examining the lived experience of being governed by algorithmic systems. Scholars have coined spectacular terms such as visibility game (Cotter, 2019), algorithmic precarity (Duffy, 2020) and algorithmic discrimination (Glatt, 2021) to highlight the precarity of influencers' work. They also find evidence of influencers organising against platforms in the form of algorithmic gossip (Bishop, 2019) and engagement pods (O'Meara, 2019). The role of platforms in influencer precarity cannot be gainsaid. Still, a lacuna in this literature has been attention to how the digital intersects with the analogue as worker precarity is refracted through local forms of social, political and cultural organisation (Qadri, 2021). This study examines the working conditions of social media influencers in Slovenia. Drawing on over 50 in-depth interviews with influencers, their social ties and agency representatives the study reveals that being an influencer is one of many hustles people pursue and uncovers the important role that family members and oft-mocked "Instagram husbands" play in the success of the influencer business. The study also shows that influencer income is used to support social reproduction, and maps vibrant gift-giving networks within families. Herein, precarity is alleviated less with platform-centric practices like algorithmic gossip or engagement pods, but

by relational work connecting intimate relations with economic transactions. As a result, influencers in Slovenia have a different attitude toward platform metrics and algorithms, which they view with indifference and abdication, conceptualised as "platform lethargy". This condition was also noted by representatives of influencer agencies, who complained that influencers were unresponsive and often "ghosted" them. We conceptualise platform lethargy as a reaction to the governance of social media platforms, where complementors are aware from the outset that they do not have agency over platforms, and therefore act according to "I do not want what does not want me" and become indifferent. By mapping collective hustles and collaborative practices between influencers and their household members, this study departs from the notion of influencing as individualised labour and shows how precarity is refracted through the local economy and culture. It also shows how platforms intervene not only in the labour process but also in labour reproduction. Finally, it offers insight into how the business model of social media platforms on the periphery is piggybacked on exploiting the local conditions of social reproduction, with platforms free-riding on influencers' social capital. The study is germane to the de-westernisation of cultural production studies and highlights much missed varieties in platform capitalism.

MIP04 Influencers and social media

PP 0397 "I'm an e-commercer streamer, not Wanghong" – The logistical struggle for performing authenticity

Shichang Duan¹

¹ University of Amsterdam, Anthropology Department, Amsterdam, China

While scholarship on the platformization of cultural production (Poell et al. 2022) mainly investigate the labor figures such as digital influencers (Abidin, 2015), entrepreneurs (Duffy, 2017), Wanghong (Cunningham & Craig, 2017), artist (Bishop, 2023) and other micro-celebrities in cultural industry, the platform workers in different social context is undertheorized, such as the e-commerce streamers in China (Duan et al. 2023). This labor figure is born from the business model called content-ecommerce, invented by Douyin, this business model will promote audience to purchase the real authentic products by streaming the authentic scene, which requires that streamers should handle both content creation and logistical matters (Douyin, 2013). For example, rural residents could sell authentic products through streaming how they labor in the field, which makes them e-commerce streamers. How do they perform authenticity in e-commerce streaming industry? This case will contribute to a typology of platform labor and global perspective on platformization.

Theoretically, I draw on platform labor studies (van Doorn, 2017; Poell et al., 2022; Zhang, 2021) to analyze how e-commerce streamers navigate the tension between platform technicity and dwelling environment to present authenticity online, which is defined as the logistical struggle. I argue their logistical struggle help the e-commerce streaming business reproduce rather than improve the structural marginalization of rural China, because it highlights the economic value of calibrated authenticity.

I conducted one-year ethnography work in four e-commerce teams selling authentic agricultural products. These teams are selected based on their size, location, working experience.

To perform authentic rurality, streamers develop strategies to handle the disparities between platform interfaces and the dwelling environment.

Firstly, entrepreneurs learn how to curate rural life as the gatekeepers according to the technological orientation (Crary 1993). For instance, one team selling garlic, recruits and trains good-looking ladies to perform farm work slowly and elegantly in front of delicately set cameras and lights to claim authenticity, while the real, dirty, and shabby production scene and sweaty farmers are hidden from the streaming.

Secondly, entrepreneurs invest labor to maintain local infrastructure networks (Larkin, 2013). For example, breakdowns of power network happen a lot in the rural areas. Streamers are devoted to creating an isolated space for streaming online, with portable generating machine, spare mobile phones, and mobile wifi.

Finally, these streamers carefully select products according to the platforms' data metrics (Nieborg and Poell, 2018). One long-term dilemma for the commodification of agricultural products is that their quality, like size and flavor, is usually uncertain and unpredictable. The audience always become angry and leave low ratings after they receive the not-so-good products, leading to the shadow ban on entrepreneurs. Therefore, entrepreneurs set strict standards and clear categories for the products from farmers. These entrepreneurs also must change their contents and cooperate with another supply chain as the season changes, to always offer the best products and maintain a high ranking and ratings, which also facilitates the penetration of platform logic into rural areas.

MIP04 Influencers and social media

PP 0398 What room is there for policy in personalised media industries?

Vilde Schanke Sundet¹, Kari Steen-Johnsen²

¹ Oslo Metropolitan University OsloMet, Department of Journalism and Media Studies, Oslo, Norway

² Institute for Social Research, Institute for Social Research, Oslo, Norway

Despite cross-national variations in goals and instruments, traditional media policies focus on institutions and formalised organisations as targets of regulation and public support (Donders et al 2014). In the past two decades, digitalisation and the emergence of global platforms as new infrastructures for disseminating media content have challenged these premises by introducing institutions that are less governable from a national standpoint (van Dijck et al 2018, Poell et al 2022). This paper zooms in on a different aspect of digitalisation and its implications for the room for policymaking in media industries: the emergence of influencers as powerful content providers with a strong appeal among young people. Influencers are people commodifying an authentic lifestyle, presenting themselves as public 'personas' to be consumed by others, and using intimacy to appeal to followers and fans (Marwick 2016, Duffy 2017). Based on an extensive empirical study from Norway, we explore the potential role of politics within a transformed, personalised media industry. A total of 28 interviews were conducted with centrally placed influencers (9), agencies specialised in managing the careers of influencers (9), and representatives of legacy media charged with strategy and content production directed towards youth, often involving the use of influencers (10). In addition, we examined Norwegian policy documents in the ten formative years from 2015 to 2024 to identify elements of policy directed at influencers, either as part of media policies, marketing policies or others. Finally, we analyse examples of more comprehensive influencer policies from other national contexts in Europe.

Using the Media Policy Field approach (Steen-Johnsen et al 2019) as a theoretical starting point, we ask which frames are produced by influencers about their roles and status in national media industries and how these frames potentially transform power structures in the media field as seen by different actors' point of view. An overarching hypothesis is that influencers seek to define themselves as individuals and not as formal, professional entities or institutions, even though the most successful influencers are significant enterprises in themselves and reach more youth on any average day than most legacy media institutions. If successful, this framing strategy may complicate any regulation attempt and make power structures in the field less clear. Using the existing bits of Norwegian policy and international examples as a sounding board, we finally discuss the room for policy in the new personalised media industries.

MIP05 Work environments in media and cultural industries

PP 0511 Coping with precarity: Journalists' strategies to find ease in a professionally vulnerable situation

Nina Springer¹, Jana Rick²

¹ University of Münster, Department of Communication, Münster, Germany

² LMU Munich, Department of Media and Communication, Munich, Germany

As a creative craft, journalism has always been vulnerable to precarious forms of employment (Cohen et al. 2019¹), but with the digitalization of news, the journalistic labor market has experienced tremendous disruption (Örnebring 2018²). Today's news media largely operate as cross-media organizations, which is why there is growing concern about the sociopolitical effects of journalistic precarity on the quality of journalistic products and the fulfillment of journalism's public service. Because job satisfaction among journalists has traditionally always been high (Marin-Sanchiz et al., 2023³), the journalistic labor market is still far from collapsing. However, since journalists are important actors in coping with this systemic crisis, we have investigated the (moral) stress and survival tactics of precariously employed journalists in order to provide impulses for journalism education that support the development of resilience.

We draw on the transactional theory of stress and coping (Lazarus & Folkman, 1987⁴). The theory posits that if individuals assess a situation as personally relevant yet taxing, they perceive this person-environment relation as

stressful. A threatened livelihood must represent a relevant and threatening situation for the person concerned. In order to cope with this situation, ameliorative measures must be taken, which can be either short-term or long-term, emotion- or problem-oriented, and adaptive/functional or maladaptive/dysfunctional. Our work also introduces the concept of moral stress to journalism research. Moral stress occurs when individual and organizational ethics diverge and can negatively impact job performance, moral awareness, reasoning, and behavior (Reynolds et al., 2012⁵).

Between March and May 2022, we interviewed 27 German journalists (with different contractual relationships in various media) who described their work situation as precarious. The interview guide addressed the journalists' appraisal of what makes their professional situation precarious, individual and journalism-related consequences, as well as experiences of associated moral stress and strategies for coping with the challenges. The transcripts were analyzed in MAXQDA using deductive and inductive categories.

We found that the journalists applied both emotion- and problem-focused strategies to cope: Emotion-focused strategies encompass ignoring and suppressing worries or seeking support such as therapy. Problem-focused strategies encompass seeking off-the-job training, e.g., to learn about entrepreneurial skills, adapting one's own lifestyle to reduce living costs, or sustaining the journalistic job with personal savings, but even taking the final decision to exit the profession. We found particularly worrisome long-term maladaptive strategies such as paying with one's own lifetime and mental health to ensure that the journalistic product matches the personal quality standards. In the words of one of our interviewees: "...I try to keep in mind that I might need to kill myself. I must work until I drop dead."

Our work will provide knowledge to journalism education—with the idea that the more future professionals know about constructive coping strategies, the more resilient they will become. However, we will also discuss the concept of resilience with its ideological (neoliberal) baggage (Tierney, 2015⁶). Furthermore, the findings will be fruitful for professional advocacy to bring about change in a volatile media system.

MIP05 Work environments in media and cultural industries

PP 0512 Multiple modes of hoping and persisting for good work despite corporate and governmental pressures in Turkish drama production

Ergin Bulut¹

¹ Goldsmiths College, MCCA, London, Turkey

With their reception and visibility across the globe, Turkish dramas have disrupted the geography of television production in the last decade. Globally the fifth largest program exporter, Turkish TV industry brings in 350 million USD and 500 million viewers spanning Latin America, Middle East, North Africa, South Asia, and parts of Europe (Kaptan and Algan, 2020: 3). Yet, behind this market success lies the creative disappointment and bodily pains of a volatile workforce. Specifically, the industry's precarious workers must produce their two-hour-long weekly episodes with hectic schedules, across tough geographies, and without sound legal protections (Author, 2022). In an industry that has long suffered from the dual disorder regimes of political-economy and authoritarianism, the advent of global digital platforms have been breathers for the workers. Corporate entities such as the global streaming platform Netflix or the national BluTV promise hopeful spaces of employment, entrepreneurialism, and creative storytelling outside the scope of the industry's gatekeepers and the state's disciplinary gaze. Based on ethnographic research and interviews with Turkey's creative drama workers, I mobilize the concept of hope (Alacovska, 2018; Hage, 2003; Miyazaki, 2004; Zigon, 2009) and examine the extent to which processes of platformization have healed the multiple forms of disorders (e.g. bodily precarity, legal precarity, and censorship) within this industry. I ask: When, why, and in what ways do hopes flourish? How and when do hopes collapse? How do creative drama workers hope as they persist in producing creative work despite corporate and political pressures (Baker and Hesmondhalgh, 2013; Banks, 2017)? Investigating what hope does, for whom, and under what circumstances, I diagnose two different modes of hoping: pragmatist and critical. Based on the findings from the field, I call for grasping hope as a present-oriented and ordinary notion as opposed to its futuristic and grandiose connotations or its definitions as an internal trait and wishful thinking against the odds. Reframing hope in more modest and ambivalent terms where it can be both co-opted and transformative in creative production, I aim to dewesternize hope within the highly Euro-American field of media industry studies.

MIP05 Work environments in media and cultural industries

PP 0513 Beyond #MeToo: Navigating solutions for safer work environments in cultural and media industries

[Aljoscha Paulus](#)¹, [Christine E. Meltzer](#)¹

¹ University of Music- Drama and Media Hanover, Department of Journalism and Communication studies, Hanover, Germany

In recent years, high-profile cases such as the #MeToo movement, revelations surrounding Julian Reichelt's "Boys Club" at Axel Springer company, or the alleged misconduct of Till Lindemann have reignited critical discussions on working conditions within the media and cultural sectors. The susceptibility of the media and culture industry to power abuse and sexual discrimination is rooted in various factors, both theoretically and empirically substantiated. Industry-specific aspects contributing to this vulnerability include precarious employment conditions, such as widespread self-employment, and limited labor protections (Menger, 2006; Loacker, 2010). The prevalent acceptance of precarity, often driven by a pervasive "be there at any cost" mentality, further exacerbates the situation (Manske, 2016; Norz, 2016; Coleman, 2023). Research further highlights the media and culture industry's characteristic "Superstar Economy," wherein a select few, (predominantly white) males, benefit from specific structural advantages, leaving the majority of workers to endure varying degrees of adversity (Kassa, et al., 2019; Prommer & Loist, 2019; Menzel, 2021). While all of these factors are well known (sometimes for years), less research has been done on possible solutions for the media and cultural industries. This is where the present research project comes in. It delves into the complex dynamics of the media and culture realm and aims not only to further unravel the root causes of toxic work environments but to explore potential solutions for the problem.

To this end, qualitative guided interviews are conducted with experts from five regulatory levels in the German music and film industry: Politics and administration, interest groups (associations, unions, and organizations combating discrimination and violence in the industry), funding entities, corporations in the industries, and individual media and culture workers. The project's methodology revolves around five interconnected dimensions, each serving a distinct purpose in unraveling the complexities of the media and culture industry. The first dimension, problem perception, delves into stakeholders' diverse perspectives on the nature and extent of the problem. The second dimension, responsibilities, explores how stakeholders attribute these issues. It investigates whether responsibilities are seen as internal, external, or a combination of both. Simultaneously, it sheds light on who stakeholders believe should take charge in implementing effective solutions. The third dimension, existing measures, scrutinizes the current policies, practices, and initiatives in place to combat the identified challenges. Building on this, the fourth dimension, effectiveness assessment, delves into stakeholders' perceptions of the impact of existing measures. By understanding the strengths and weaknesses of current approaches, the project can guide the formulation of evidence-based interventions that address the industry's specific needs and challenges. Finally, the fifth dimension, desired/additional measures, explores stakeholders' aspirations for the future to combat toxic work environments, violence, and discrimination. In summary, this project not only contributes to academic discourse but also serves as a catalyst for transformative change, encouraging collaborative efforts across diverse stakeholders to reshape the landscape of the media and culture industry.

This ongoing research initiative is currently underway, with all interviews scheduled for completion in March 2024. Results and their implications will be ready for presentation in timely for ECREA 2024.

MIP05 Work environments in media and cultural industries

PP 0514 Data analytics and AI affecting creative control in screenwriting and production decisions

[Anne Soronen](#)¹, [Saara-Majja Kallio](#)¹, [Eliisa Vainikka](#)¹

¹ Tampere University, Communication Sciences, Tampere, Finland

Platformization and data-driven decision-making have become essential elements of production processes in the film and television industry (e.g. Navar-Gill 2020; Behrens et al., 2021). Data analytics are used in many phases of decision-making, for example for assessing series' opportunities for success in the future based on the user data of streaming services. Further, generative artificial intelligence and script analysis tools are increasingly used in development stages of scripts and synopses. While struggles over control typically define authorship in film and television productions (Caldwell 2008), it is not clear how AI-driven and datafied practices currently reorient these struggles.

In our ongoing study, we explore Finnish screenwriters and other television professionals' stances to data analytics and generative AI in the context of screenwriting. Our data involves two data sets. First, we conducted 32 focused interviews from April to December in 2023. The biggest occupational group (14 interviewees) consisted of screenwriters (including producer-screenwriters and actor-screenwriters). Most interviews were based on a visual elicitation method in which the participants were shown visualized scenarios depicting how data and artificial intelligence might be used in television productions. Second, the data includes ethnographic field work in the two television productions in Finland during spring and summer 2023. The analysis is based on close reading of the

interview data from the perspective of creative control and authorship in media work as well as questions of data asymmetry in production practices.

Our main goal is to examine how sense-making of AI and data analytics produce and orient notions of creative control (see Siciliano 2021, 3–4) and authorship in television production processes. Particularly, we focus on screenwriting with the following research questions:

RQ1: How do perceptions of potentialities and flaws of AI tools support or complicate human creativity and capacities in screenwriting?

RQ2: How does varying access to user data affect television professionals' decision-making on scripts?

The tentative results indicate that data analytics and AI tools may blur some dimensions of creative control and make decision-making partly non-transparent in production processes. While Finnish screenwriters and producers emphasized the protection of human authorship and control against the AI-made content's predictable or schematic quality, many of them were ready to use AI tools in the generation of new ideas. A restricted and controlled availability of user data of streaming platforms and television networks may decrease screenwriters and producers' sense of control towards their own products. However, screenwriters highlighted that data can't disregard the importance of human experience and interpretation in their work. Interestingly, commissioners and executives often emphasized the importance of human collaboration and interpersonal negotiations in decision-making regardless of their regular access to user data, which devalued to some extent the significance of data analytics in production processes. Based on our data, it seems that the rapidly generalized but mostly undetermined uses of data analytics and AI would need more open discussion in the field in order to prevent the future prospect in which experiences of diminished creative control or non-transparent ways of knowing will gain ground across television productions.

MIP05 Work environments in media and cultural industries

PP 0515 Fortnite's cultural impact: Examining epic games' marketing strategies and social dynamics in gamer communities

Rut Martínez Borda¹, Pilar Lacasa², Mitsuko Matsumoto³

¹ University of Alcalá, Filología-Domunicación & Documentación, Madrid, Spain

² University of Alcalá / University of La Rioja, Philology – Communication and Documentatio / CITEI, Alcalá de Henares, Spain

³ Universidad Internacional de la Rioja, Educación, Madrid, Spain

This presentation delves into the digital gamer communities where the video game Fortnite is shared and re-constructed through digital conversations within entertainment contexts. Fortnite, a social game, competes with social networks, particularly among the younger demographic. The analysis explores the cultural industry of Epic Games and examines the company's role along with its marketing strategies (Hesmondhalgh, 2019). We consider the messages originating from the game distributor in Spain and those from Fortnite gamers engaging on social networks.

The study focuses on the significance of Epic Games' marketing strategies when viewed through the lens of the cultural industry and fandom (Sandvoss, 2015; Lacasa, 2020). These strategies, centered around monetization and their impact on the fan community through specific messaging, can potentially influence the gaming community's social dynamics, order, or disorder. While gamers may perceive themselves as acting independently, the study reveals the asymmetric role of the company in guiding their conversational activities.

Considering methodology, the study employs a mixed-method approach to analyze digital texts and Spanish conversations surrounding the Fortnite video game. Specifically, it combines data science (Dimas et al., 2023; Sivarajah et al., 2017) and thematic analysis (Braun & Clarke, 2021)

The data collection period spanned from May 18 to July 5, 2021. A total of 71,526 unique users, referred to as message senders, were included in the analysis. Moreover, 435,365 mentions (posts) were analyzed using big data scraping techniques to classify and describe their evolution over time, complemented by conventional qualitative analysis methods. We defined 49 categories, which were further grouped into eight thematic cores.

The findings will be presented based on the research questions that guided this study. First, the conversation content is examined to understand the extent to which both the industry and influential users use the social and personal context of the game and other dimensions to engage with gaming communities. Second, we study the trends in the number of mentions over time to identify critical events in the game's production context that shaped the role of Epic Games and sure followers in driving these conversations. Last, specific conversations are explored to gain insights into the values and objectives of Epic Games and prominent users in the community. These results show how the industry maintains an asymmetric position relative to other users, influencing the direction of digital conversations about the game related to its marketing strategies.

About the implications, the study will interest professionals and academics dealing with the video game and cultural industry because it shows the role of digital conversations in analyzing gamer engagement with the community and the role of prominent users, both gamers and the industry voice. The results may help optimize the cultural

industry marketing strategies. Focusing on the implications for the gamers who participate in the community, findings the need for strategies from formal or informal education contribute to creating a critical consciousness of the messages of the cultural industry.

MIP06 Film, theatre and music production

PP 0623 Tracking small-country films across international festivals: A big-data approach

Vejune Zemaityte¹, Ulrike Rohn¹, Indrek Ibrus¹

¹ Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia

Small countries produce increasingly more films as their audiovisual industries expand, especially across Europe (Ibrus & Rohn, 2019). However, these countries face challenges in distributing their films internationally, often leading to limited, primarily domestic, exposure for their productions (Hjort, 2007). One potential solution to this problem could be utilising film festivals as a platform for showcasing small-country films to international audiences and securing distribution deals. The sub-industry of film festivals shapes film marketing and distribution processes and can offer a way for small country productions to gain wider recognition and reach a broader audience beyond their domestic market (Czach, 2004).

We analysed data from the Cinando database operated by the Cannes Film Market (Marché du Film) to understand better the extent of film festival participation for films from countries of different sizes and income levels and the origin diversity of the film festival circuit. Cinando is a leading online platform that supports hundreds of film festivals and markets and provides film professionals with services for rights sales, investments, and business-to-business video on demand, as well as a wide range of relevant information on industry contacts, films, festivals, and markets. Our analysis included 26,240 unique films showcased at 578 festivals from 2009 to 2021, representing 170 film origin countries and 40 festival host countries across all continents. We categorised film production countries by size based on population (Puppis, 2009) and by income based on gross national income (GNI) per capita. We also divided events into two categories: competitive A-list and other festivals based on the International Federation of Film Producers Associations (FIAPF) accreditation system.

Our research has revealed that festival participation of small-country films has increased gradually over time. However, this increase is only seen for productions from small countries with high incomes outside the competitive A-list festivals. Notably, cinema from small nations with lower income levels is still underrepresented in the festival circuit. Nevertheless, we have observed that the programming of competitive A-list festivals has become more diverse regarding the income levels of film-origin countries.

According to our results, film festivals are not successful in facilitating the internationalisation and export efforts of small film production nations and their respective film industries despite being typically supported by public funds and having the objective of promoting diverse international film flows.

PP 0624 (Un)profitable memory curation through publicly funded historical films: Lithuanian case

Brigita Valantinaficiute¹

¹ Loughborough, Media and Communication, Loughborough, United Kingdom

This presentation is based on the analysis of the film collection #FreedomFilms published by the Lithuanian Public Broadcaster LRT in response to the Russian invasion in Ukraine and aimed at representing the past and remobilising the national past for Lithuanian audiences. The majority of the films in the collection received funding from the Lithuanian Ministry of Culture (LMC). Therefore, the presentation also draws on five interviews with officials from the LMC and the Lithuanian Film Centre, focusing on funding and curating films related to the past, visions of the past these films seek to convey and the remobilisation of national memories during a crisis such as the war in Ukraine.

This presentation will argue that, in Lithuania, the connection between representations of the past and film is intertwined into a complex fabric of socio-economic forces. Established methodologies, such as the invented traditions

approach (Hobsbawm and Ranger, 1983), along with more recent research on Baltic neoliberalism and memory multiscalarity, can aid in unravelling these intricate dynamics, providing insights into historical film dynamics in Lithuania and the broader region.

For instance, interviews with the Lithuanian Ministry of Culture reveal a tendency towards adherence to market logics and liberal democracy in the realm of national film production, including the films representing the past. However, this approach is not without its own fractures, giving rise to tensions regarding the promotion of diversity in representing the past. The majority of films predominantly focus on the late socialism period, portraying society within homogeneous narrative frames. These processes, to some extent, contribute to reinforcing a nuanced yet direct relationship between Lithuanian nationalism and film. Given the relatively small size of the film industry, the prevalent practice involves appropriating old content during significant periods for the country's self-identification, as exemplified in this study by the war in Ukraine. Consequently, not only historical content but also nationalism, collective memory dynamics, and homogenous representations undergo multiple rounds of appropriation.

MIP06 Film, theatre and music production

PP 0625 Recycling content in the age of streaming cinema: The cases of Netflix, Disney+, Amazon Prime Video, Apple TV and their "original" films

[Eduard Cuelenaere](#)¹

¹ Ghent University, Communication Sciences, Ghent, Belgium

In this paper, I examine Netflix's recycling content strategies (i.e., remakes, sequels, spin-offs, ...) in the era of streaming films. More specifically, the paper initiates with the premise that due to the distinct institutional logic (cfr. Haveman and Gualtieri (2017) within the realm of SVODs, the affordances associated with recycled content might not yield the same level of effectiveness or necessity as observed in Hollywood (Stelmach et al., 2022). Given that streaming services prioritize subscriber acquisition over box office success, one could argue that they are liberated from many of the conventional strategies employed by Hollywood studios—consider factors such as celebrity endorsements, blockbuster productions, intensive advertising campaigns, and indeed, content recycling. In other words, leveraging their consistent consumer base, overarching market influence, and robust cash flow, streaming platforms possess a heightened flexibility to invest in original content that is not necessarily bound by or exclusively aligned with mainstream conventions. This newfound freedom allows for increased experimentation and innovation, as discussed by Hadida et al. (2021) and Lotz (2022). For this study, I employed a database-centric methodology, scrutinizing 658 films categorized as "Netflix Originals". I found that over the span of 2015 to 2022, Netflix introduced 440 Originals that were not recycled, underscoring a steadfast commitment to providing a substantial array of specialized films. Yet, my dataset also reveals a consistent upward trajectory in the proportion of recycled films (33%), indicating the enduring prevalence of conservative content strategies. Notably, (re-)adaptations constitute the largest share of recycled content (68%), offering the streaming platform a swift means to augment its catalog with reusable intellectual property. Netflix's emphasis on sequels (16%), spin-offs (6%), and prequels (2%) aligns with its overarching strategy of sequelization, strategically leveraging its proprietary intellectual property. Remakes (8%) play a comparatively smaller role, likely attributed to the relatively youthful age of Netflix's content library. In conclusion, my findings suggest that Netflix may not be as disruptive to the film industry in terms of content diversity, potentially fostering a continued reliance on recycling existing properties.

PP 0626 Online theatre performance beyond the pandemic disruption: The case of Residenze Digitali

[Laura Gemini](#)¹, [Stefano Brilli](#)¹, [Francesca Giuliani](#)¹, [Chiara Spaggiari](#)¹

¹ Università di Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies, Urbino, Italy

For many months, during the pandemic, internet and social media became the only interfaces between the theatre sector and its audience. The dynamics of mediatization of performing arts become visible to a broad and non-specialist audience (Gemini et al., 2020) as digital performance leapt from niche artistic consumption to the

mainstream. This situation immediately gave rise to a debate among scholars and artists as to whether this would lead to a revolution in the role of digital technologies in performing arts or whether it would only be a "temporary disruption" (Hylland, 2022).

On the one hand, these experiences have made it possible to establish new knowledge and relationships between artists (Brilli et al., 2022) and have stimulated the creation of best practices and guidelines on the use of digital tools for theatre (Aebischer & Nicholas, 2020). On the other, most theatre companies, organisations and festivals that developed innovative experiences in digital spaces, stopped experimenting in this direction after the pandemic.

Our study tackles the post-pandemic life of digital performance and the changing role of online spaces for performing arts by asking: what meanings and expectations theatre artists, organisers and spectators associate to online performances in the post-pandemic period?

To answer this research question, we analysed the case of *Residenze Digitali* (RD). Launched in April 2020, RD has now reached its fourth edition and it's a rare example (in the Italian context) of a digital residency programme that came into being during Covid and is continuing today, and it thus makes it possible to study the longitudinal transformation of digital theatre practices. RD selects and funds each year about six online performance projects by artists or companies from the contemporary theatre scene. Along the four years, however, the initial strong interest waned, especially in terms of audience. The research compares three years: 2021 (when some restrictions on theatres were still in place), 2022 and 2023. All the stages of the project were followed, by participating as observers in organisational meetings, tutoring meetings with the artists, and meetings with the audience. We then carried out 25 interviews and two focus groups with spectators, 12 interviews with participating artists and 7 interviews with organisers.

The case shows that pandemic digital theatre has not revolutionised the relationship between the Internet and performing arts. Nor, in fact, is there a complete return to the previous stage. Although digital performance has not established itself as an autonomous and continuous field of cultural production, digital liveness (Auslander, 2012; Gemini & Brilli, 2023) continues to function as a place of confrontation and experimentation that dialogues with contemporary theatre more than in the past. Moreover, whereas in the first phase, the dominant logic was that of the digital reproduction of the offline event, now digital performance is understood as more *trans-medial* (conceived as networks of multiple media and platforms), *trans-material* (digital projects subsequently branch out into physical spaces) and *trans-temporal* (greater extension in pre- and post-performance time).

MIP07 Comparative approaches to public service media disruption: The transformation of values, norms and prevailing structures in the age of platforms

PN 107 Navigating dilemmas and striking a balance: PSM VODs and personalisation practices in five markets

Hanne Bruun¹, [Julie Lassen](#)¹

¹ Aarhus University, Department of Media and Journalism Studies, Aarhus, Denmark

The development of inhouse video-on-demand services (VoD) is part of the way European public service media (PSM) are adapting to the growing competition with international subscription VoD services and social media. The strategic aim is to transform PSM into online PSM to attract and retain the audience (Bruun 2023; Donders 2021). In this transformation process the editorial practices of multi-channel television publishing are changing and putting traditional public service values up for renewed discussion. Of particular interest in PSM research is currently the appropriation of AI driven personalization via recommender systems by PSM on their inhouse VoD services (Hutchinson 2023, Hildén 2022; Helberger 2015). How the 'translation', or renewal, of core public service values are developing in the context of these new editorial practices of publishing calls for a basic research effort. So far, there has nevertheless been limited empirical research done on the actual appropriation of personalization in the publishing practices of the inhouse VoDs offered by European PSM. This paper contributes to this emerging research from a user perspective. It presents the main results from an ongoing comparative study of the personalization practices on the VoDs from PSM companies across four European countries: UK, Belgium, Italy, and Denmark. The study applies a distant reading approach to the data based on an elaborated methodological set up of three single genre accounts on each VoD and a neutral account. The purpose was to flesh out the kind and level of personalization practices at work on the VoDs. The paper continues with presenting the main findings. First, our comparison shows there are huge differences between the VoDs regarding the layout of the interfaces, the content availability, and degree of personalization. Second, the findings bear witness to issues of availability of content in the VoD catalogues and intellectual property rights. Finally, the paper discusses the dilemmas of online PSM and the challenges of striking a balance between editorial curation, personalization and public service core values. The market position, track record, and corporate strategy of the individual PSM influence this balance along with the local interpretation of universality and diversity in the age of platformisation (Poell et al. 2022).

MIP07 Comparative approaches to public service media disruption: The transformation of values, norms and prevailing structures in the age of platforms

PN 108 Balancing the scales between public service algorithms and editorial curation

[Catalina Iordache](#)¹, Catherine Johnson²

¹ Vrije Universiteit Brussel, imec-SMIT, Brussels, Belgium

² University of Leeds, School of Media and Communication, Leeds, United Kingdom

The public service media (PSM) shift to digital-first strategies raises challenges for reaching public remits, and particularly principles of universality, accountability, and diversity. As personalisation through recommender systems is increasingly popularised by commercial streaming services, PSM are faced with a trying balancing act between audience reach and public responsibility (Sørensen & Hutchinson, 2018; van Es & Poell, 2020). To this end, PSM organisations have been developing so-called ‘public service algorithms’ aimed at countering threats of polarisation and the creation of filter bubbles, while engaging with audiences. This contribution provides evidence from Belgium and the UK through a comparative analysis of three PSM organisations: BBC (UK), RTBF (Wallonia), and VRT (Flanders). Although significantly different as media markets, Belgium and the UK share a strong PSM presence, with relatively high reach and levels of audience trust. In recent years, all three organisations have been committed to strengthening their online presence through VOD portals, and specifically, to developing public service algorithms. VRT has been implementing a ‘taste-broadening algorithm’ which aims to increase discoverability, serendipity and diversity, by suggesting content identified by PSM editors to be in the public interest. RTBF is currently designing its public service algorithm, which aims to support plurality and diversity, while complementing editorial curation, but not replacing it. BBC R&D have been developing public service algorithms designed to support public values and work alongside human curation. Despite this, initial analysis of the VOD interfaces of BBC iPlayer, RTBF Auvio, and VRT Max points to little evidence of the use of PSB algorithms by these organisations. This paper draws on semi-structured interviews with key PSM representatives from the BBC, RTBF and VRT and analysis of policy and strategy documents to ask why this might be the case. Our research reveals that although there is evidence of personalisation within each VOD portal, all three PSM still heavily rely on editorial curation. From a policy perspective, all three cases oscillate between concerns for accountability and the pressures of competition with foreign streamers. Yet, within Belgium, policy debates have raised concerns about the use of user data and the threat of mandatory login to universality, which are absent in the UK case. For regulators and PSM, the primary challenge is how to assess algorithms and their effects, which remains vague and potentially open to interpretation. Within the UK case, specifically, debates within the BBC have centred on the difficulty of coordinating algorithmic recommendation and human curation in order to generate recommendations that support public values. Despite a notable level of techno-optimism with regard to the promise of public service algorithms for achieving the public remit, therefore, our paper argues that the reality is constrained by the organisational, ideological and political contexts within which each PSM operates.

MIP07 Comparative approaches to public service media disruption: The transformation of values, norms and prevailing structures in the age of platforms

PN 109 Analysing Inclusion in Italian and Canadian PSM

[Antonio Nucca](#)¹, Serra Tinic²

¹ Università Cattolica del Sacro Cuore, Research Centre for Television and Audiovisual Media, Milan, Italy

² University of Alberta, Department of English and Film Studies, Edmonton, Canada

The objective of this paper is to understand the differences between Italy and Canada when it comes to ‘inclusion’ in PSM VOD services. While both public service companies talk about inclusion in their policy documents and

regulations, this term has different facets and, consequently, is realized in quite different ways within each PSM organisation's VOD service. The two platforms that will be considered in this study are RaiPlay, the VOD platform of the Italian PSM, and CBC Gem, the VOD platform of the Canadian English-language PSM. Although the two PSM organisations, like the nations themselves, are very different, there are some common features that make the analysis of the concept of inclusion in PSM productive. Both cover a country with a very heterogeneous morphology, both have a diffuse population, and both see public service media as a useful tool for uniting the nation. At the same time, however, there are different migration histories and distinct debates about media and (national) identity, that make these productive sites for analysing how and why inclusion is mobilized within media practice and policy discourse. The paper aims to answer two main research questions: what is meant by "inclusion" by the two PSMs and how does this term find its practical application on their VOD services? The analysis combines data from a multi-method approach. First, we will present the findings of an analysis of the use of the term 'inclusion' within a selection of Italian and Canadian policy documents dealing with public service regulation and objectives. Second, an analysis of the two VOD platforms identifies which genres, themes and structures are related to the theme of inclusion in order to examine the extent to which policy discourses inform practice. Finally, the findings from the first and second phases are discussed with media workers from each PSM organization through a series of qualitative interviews. Our initial analysis indicates that the Canadian authority views inclusion as offering content that reflects the diverse communities present in Canada in terms of both origin and gender. The Italian case, on the other hand, sees the term "inclusion" applied instead to access, aiming to ensure that one's service can be accessible to everyone, regardless of age group, the type of Internet network one has, and the level of computer literacy. By bringing together analysis of policy, VOD services and interviews, this paper will unpack why these two very different definitions of inclusion are in operation and how they impact on each PSM organisation's response to platformisation.

MIP07 Comparative approaches to public service media disruption: The transformation of values, norms and prevailing structures in the age of platforms

PN 110 Reinventing Polish PSM for the Age of Platforms: Qualitative Approach to a Transitional Case Study

[Michał Glowacki](#)¹, [Filip Świtkowski](#)¹

¹ University of Warsaw, Faculty of Journalism Information and Book Studies, Warsaw, Poland

Over the last few years, public service media (PSM) in Poland has become one of the main foundations of societal and political polarisation. The faulty systemic structure, manifested in the lack of resistance of Polish public service media to political pressure from those in power, has led to a strong politicisation of their values alongside organisational structures. This, in turn, has consequently deepened PSM's connection with the conservative government's activities at different levels, including news production, public service media journalism and the values of trust and prominence. Polish PSMs, including the national broadcaster Telewizja Polska (TVP), have been widely accused of being unreliable and politically biased, with additional criticism for being slow in reacting to the emergence of highly data-driven technology media practices. The blend of political goals and narratives over discussing socially relevant digital strategies continues to be a case in the aftermath of the 2023 elections and the taking over of PSM governance by a new liberal government (in December last year). In this paper, we argue for a more in-depth qualitative public service media analysis, as the recent political change to PSM in Poland has resulted in another wave of societal polarisation, rather than a discussion to modernise PSM regulation and organisation. One of the central questions of TVP as a transitional case study is whether political reinvention follows the PSM's adaptation to the age of platforms. And these questions are crucial in order to address further questions on organisational capacity to open up PSM to the successful practices of Netflix, Disney+ or HBO Max. What's at stake when looking at the state-of-the-art regulatory and digital TVP strategies? How does Poland's public service television approach VOD and the rise of streaming? And what work practices and cultures emerge as related organisational reinvention(s)? This paper looks at TVP via document analysis and qualitative interviews as part of a broader international research project, entitled "Public Service Media in the Age of Platforms" (PSM-AP). The study gathers researchers from six countries to look holistically at regulatory, organisational and technological conditions for successful public service media adaptation. Through the PSM-AP methodology, we use analysis of regulations, annual reports and duty charts to identify the current state of TVP's preparation for the changes caused by platformisation and growing competition from private national and global media and metaverse platforms. These are confronted with the outcomes of semi-structured interviews with 10 TVP employees, scheduled for the first half of 2024. Combining different positions in the official organisational charts (top and middle-management grounds) and roles (digital strategy directors, social media managers, heads of audiences, commissioning, HR) provides evidence of the key layers of transformative organisational culture – in particular, selected lenses of work culture – to support VOD and other new potentially relevant transformative PSM practices.

MIP07 Comparative approaches to public service media disruption: The transformation of values, norms and prevailing structures in the age of platforms

PN 111 Representing PSM Values in the Platform Age: Comparative Analysis of Programmes across Markets

[Daniel Martin](#)¹

¹ University of Leeds, School of Media and Communication, Leeds, United Kingdom

In the transition to operating as digital-first organisations competing with an ever-growing number of global platforms and VoD (video-on-demand) services, public service media (PSM) across Europe face related challenges of reach and legitimacy. The problem of how to retain core public service values while reaching the widest possible viewership, on broadcast and online, is shaping not only editorial and commissioning practices but also the kinds of aesthetic strategies which are being prized at the level of production. Moreover, while organisations emphasise the importance of strategies of technological innovation for securing continued relevance in the platform age, television programmes are promoted as a key marker of distinction from commercial competitors, and where a commitment to the democratic values of public service remains visible. This paper advocates for comparative textual analysis of programmes as a method for better understanding the changing social and cultural values underpinning PSM in the platform age. Comparative approaches to the study of PSM have grown increasingly popular over the last two decades, particularly as a means of understanding the cross-national impact of global platforms and the response of national media organisations (see: D'Arma, et. al. 2021; Direito-Rebollal and Donders, 2023). However, comparative analysis of programmes has remained absent from contemporary studies of PSM. Seeking to address this gap, this paper outlines the methodological opportunities and challenges of conducting comparative textual analysis across distinct media markets. The paper begins by situating textual analysis in existing methodological debates within comparative PSM scholarship. Recognising that qualitative comparison between national PSMs remains a 'methodological Pandora's box' (Raats and Pauwels, 2011, 18) with no standardised framework, the paper examines strategies for balancing explanatory relevance and contextual equivalence across multiple national contexts with generic, dramaturgical, and aesthetic traditions. The second half of the paper considers a comparative study of PSM programming relative to trends in television studies, with a focus on how cross-national comparison has proved useful to studies of Netflix programming and the negotiation of transnational 'value systems' (Jenner, 2021) embedded at the level of cultural representation. The paper concludes by reflecting potential opportunities for a similar comparison of hybrid local and transnational 'value systems' across PSM output, as organisations seek to negotiate core public service values amidst changing standards of reach and relevance.

MIP08 Platforms, pluralism and policy

PP 0825 Counterbalancing platform power on the policy level: News media actors as lobbyists on national and EU regulation

[Gunhild Ring Olsen](#)¹, [Tine Ustad Figenschou](#)², [Karoline Andrea Ihlebæk](#)², [Bente Karlsnes](#)¹

¹ Kristiania University College, Department of Communication, Oslo, Norway

² Oslo Metropolitan University, Department of Journalism and Media Studies, Department of Journalism and Media Studies, Norway

Public and political pressure to regulate large platform companies has increased. On November 16th 2022, the most comprehensive regulations of global tech platforms to date, the EU's Digital Services Package, came into force with the aim of leveling the playing field and ensuring transparency and accountability from platform companies. Greater democratic control and mitigation of systemic risks, such as manipulation or disinformation, are among some of the supposed regulatory benefits. Although it is not a media-specific legislation, the regulation potentially had major implications for platform-publisher relations, and it has therefore been imperative for media organizations across Europe to seek to impact the DSA process on the EU and the national level. In the study, we ask: *How did Norwegian media actors work to influence the DSA process, and what can it tell us about media actors as lobbyists?* Theories on platformization and platform power, interest groups and lobbying, and media policy field theory are applied to illuminate the values at stake, alliances made, and strategies mobilized to protect the interests of national media industry actors and interest groups.

Empirically, we have conducted 12 elite interviews with leaders in major news media networks and professional media associations and 6 interviews with umbrella media organizations on the EU level. Furthermore, the paper rests on an analysis of position papers, reports, and policy briefs published by these stakeholders from 2018–2023.

The preliminary findings show two major insights. First, what constitutes “editorial-driven” media in different European contexts and to what degree “editorial” media should be given special protection against platform moderation, became a key question. Norwegian lobbyists united behind a policy aim – that editorial news media, as essential for democracy, should be exempted from platform interference to protect editorial freedom and freedom of speech. However, Norwegian media lobbyists and their allies failed in their call, as the media exemption argument was met with hard resistance from an alliance consisting of tech companies and civil society organizations, including fact-checking organizations, fearing that “editorial” media could be a leeway for unserious actors to spread disinformation. Second, the study shows how the DSA process represented a window of opportunity to professionalize the lobbying work by Norwegian media stakeholders. While lobbying nationally used to be the focus, the growing power of global tech corporations and the DSA process represented a shift towards the EU and Brussels. This professionalization process emphasized the need for new alliances to get their message across, particularly important for a small non-EU country like Norway. Norwegian media stakeholders formed and initiated several collaborations with national political authorities and EU-level umbrella associations. It led to more resources being allocated to advocacy and gave the stakeholders with the most lobbying competence and skills a strong position in the national market.

Overall, the paper shows that Europe’s diverging media systems make counterbalancing platform power on the policy level challenging – also for increasingly professionalized news media lobbyists.

MIP08 Platforms, pluralism and policy

PP 0826 Exploring content creators’ belief systems within the ecosystem of social-media platforms

Daniela Jaramillo-Dent¹, Michael Latzer¹

¹ University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

As essential value originators, content creators have become key actors in contemporary ecosystems of social-media platforms. Extant research has examined the labor-intensive conditions required to become visible and financially successful, and the precarious conditions arising from the current social-media environment. Despite these conditions, the creator economy is growing exponentially. To gain a better understanding of creators’ content-related strategies and decisions, this paper explores the sense-making mechanisms they employ within the social-media platform ecosystems they navigate. Starting from a sketch of the ecosystem of a social-media platform, this paper proposes a systematic analytical framework for investigating the belief systems of content creators.

Our sketch of the ecosystem of a social-media platform locates the different actors that are part of this ecosystem, positions creators as complementors, and maps the flow of resources between these actors, as well as the direct and indirect network effects (Gawer & Cusumano, 2014; Kapoor et al., 2021; Poell et al., 2021). Our proposed analytical framework draws from both the conceptualization of digitalization as a new social form of implicit (everyday) religion (Author, 2022) and belief-system theory (Grube et al., 1994). It further adapts and incorporates Schnell’s (2003) exploration of belief systems by considering three indicators of creators’ belief systems: (1) myths that illustrate the cognitive aspect of content creators’ belief systems; (2) their rituals for content creation as they relate to behavioral aspects of creators’ beliefs within social-media platforms; (3) their experiences (of transcendence), which characterize content creation online and their self-reported and observed activities.

Based on existing research on content creators (Abidin, 2016, 2021; Arriagada & Bishop, 2021; Duffy, 2017; Kubler, 2023; Scolere et al., 2018), and our proposed sketch of the ecosystem of a social-media platform, we argue that creators’ belief systems are developed within a range of (un)knowability about four aspects of their activities within social-media platform ecosystems: (1) themselves; (2) the platform; (3) their audience(s); and (4) their communities of complementors, including advertisers and communities of creators. For each of these indicators, we provide an example of the influence of creators’ belief systems on their decisions to create (or not) content for a specific social-media platform, illustrating the impact of content creators’ belief systems on the social-media platform ecosystem. In addition, our specific approach to creators’ belief systems also enables the examination of two aspects of digitalization as implicit (everyday) religion (Author, 2022): the extent (1) of transcendence in creators’ experiences, and (2) of faith-based beliefs when faced with unknowable aspects of their activities which can be reflected in myths, rituals, and experiences.

Our focus on belief systems facilitates a more systematic exploration of content creation and expands current research to enable the examination of faith-based, transcendent, and theistic epistemologies in the current era of digitalization, which have been underexplored from the perspective of creators. Finally, our proposal enables a deeper understanding of the role and impact of content creators and their belief systems within social-media platform ecosystems.

MIP08 Platforms, pluralism and policy

PP 0827 "Between life and death": The self-concept of advertising in times of disruption and disorder

Andreas Baetzgen¹, Mirus Fitzner¹, Joerg Tropp²

¹ HTW Berlin University of Applied Sciences, School of Computing- Communication and Business, Berlin, Germany

² Pforzheim University, Department of Marketing Communications and Advertising- Business School, Pforzheim, Germany

Across Europe, there is a debate about the future of advertising. The reason for this are several disruptions whose influence on advertising has so far mostly been discussed independently of each other. These include the influence of digitalization and AI, increasing regulation and standardization as well as shifts in power through platforms, influencers and consumers themselves. Influential advertisers talk about nothing less than the "life and death of advertising" (e.g. Roach 2022).

Therefore, our research question is: To what extent is the self-concept of the advertising industry changing in times of social and technological disruption?

As a theoretical framework, we choose the structuration theory (Giddens 1986), which has so far received little attention in advertising research. Giddens opens up a socio-cultural macro-perspective on advertising and thus creates the theoretical basis for bringing together various disruptions and their interactions in three structural dimensions (signification, legitimation, domination).

Following Giddens (1986), we define the self-concept as knowledge about oneself based on an interrelated practical and discursive consciousness. Methodologically, we explore the self-concept of advertising with the help of a two-stage Delphi study. The online survey of 25 advertising professionals was based on three observations of current developments that operationalize the three structural dimensions. The answers were analyzed according to the structural dimensions and their respective forms of action (deductively coded). For the second stage, 28 selected statements were rated on an agreement scale of 0–100%.

The results of our study provide a deeper understanding of the ongoing transformation of advertisers' self-concept. According to the experts/professionals, allocative (domination) and normative (legitimation) modalities are gaining in importance and ensure that the previously central advertising modality of creativity in the dimension of signification is being pushed back and reinterpreted. The results also show that important modalities of advertising are being renegotiated:

Signification

- The economic primacy of advertising is questioned and expanded to include the primacy of sustainability.
- Advertising idealizations are supplemented by new ideals (ESG criteria).
- The practical awareness of advertising is determined by a heightened sense of responsibility and caution.

Legitimation

- Norms and possible sanctions (public outrage/scandalization) limit/challenge creativity and innovation in advertising practice.
- Social rejection, public controversy and displeasure are unavoidable for advertising and ensure its economic legitimacy (attention).

Domination

- Data becomes the central authoritative and allocative resource (budget allocation, decision-making behavior).
- Soft skills such as empathy and gut feeling are seen as the future "bastion of power" in advertising.
- Practical awareness is characterized by growing external control (AI, data, customers, platforms) and dwindling own authoritative power options.

In summary, the results show that the interplay of disruptions shapes the social order of the advertising industry and influences individual behavior and social structures in a significant way.

MIP08 Platforms, pluralism and policy

PP 0828 How much pluralism do you need? Ten years of Danish subsidies for news-media innovation

[Aske Kammer](#)¹, Mark Blach-Ørsten¹

¹ Roskilde University, Department of Communication and Arts, Roskilde, Denmark

The digital disruption of the media industries has put a strong emphasis on news media innovation as a means for survival in uncertain times. In the Danish media system, with its tradition for public subsidies, a target subsidy instrument for news-media innovation was introduced in 2014 (Kammer, 2017). The political goal of this instrument was to secure media pluralism and foster media innovation. Studies of media pluralism in Denmark show a media sector with strong public service news media as well as private news media, and with modest threats to media pluralism (Willig & Blach-Ørsten, 2017).

This study analyzes of the first 10 years of news-media innovation subsidies in Denmark. The subsidies can support either developing or establishing (sometimes both) an innovative project, which might be a new media or new changes or spin-offs of legacy news media. The subsidies are granted on the basis of formal applications, and throughout the 10 years, there has been 216 instances of such granting innovation subsidies to news-media innovation (ranging from 24,800 DKK to 4,400,400 DKK); a total amount of 181,932,454 DKK has been granted. The article is based on both open-source records (from the Danish Ministry of Culture) of applicants and recipients of news innovation subsidies and additional documents from the ministry (obtained through the Danish Freedom of Information Act). Methodological, we use document analysis with a focus on how both 'innovation' and 'pluralism' appear in the analyzed documents.

The preliminary findings indicate that with regard to media pluralism, a little over half of the subsidy (56.4%) has been allocated to existing news media, while the rest have been given to new news media. Of the new news media, some have closed down again during the period, while some still have home pages that are active, but have not been updated recently; around one quarter of the total amount of funding (24.5%) has been granted to new news media that now have become established news media (i.e., they still exist).

With regard to the question of innovation the new news media in many ways mirror the existing media landscape, though some have been successful with reaching a younger audience and contributing further to media innovation by developing open-source solutions, as is the case of Zetland (Newman et al., 2023).

MIP08 Platforms, pluralism and policy

PP 0829 Toward a decentralized copyright infrastructure as a public service: The case of Digiciti and Estonia

[Madis Järvekülg](#)¹, Indrek Ibrus¹

¹ Tallinn University, Baltic Film – Media and Arts School, Tallinn, Estonia

This paper traces the process of collaboration between Digiciti Networks (hereinafter Digiciti), a private company, and the public sector in Estonia, in their experiment of building a decentralized copyright registry for the music industry.

Digital music industry has long suffered from issues like fragmented copyright databases, delayed royalty payments, and opaque value chains. The value chains are abundant in various 'middlemen' and copyright ownership is typically fragmented between multiple parties which complicates business-making and necessitates a 'single source of truth' solution. While previous attempts to create comprehensive databases – e.g. the Global Repertoire Database – have failed, blockchains and other distributed ledger technologies could provide new directions toward more transparent and uniformly recognized copyright registries (Baym, Swartz, and Alarcon, 2019). In the past decade, a number of international initiatives have emerged to experiment with this nascent technological potential.

What makes Digiciti's project unique, however, is its understanding of the 'public' nature of future copyright infrastructures. This vision calls for active engagement of the public sector, and a shift in its focus from merely fixing 'market failures' (support-and-measure) to actively coordinating and initiating public value creation (lead-and-learn) in the interactive network of public and private institutions (Kattel and Mazzucato, 2018).

From the perspective of national innovation systems research (e.g. Lundvall, 1992), Digiciti, therefore, is a pertinent case for exploring the readiness of state entities to join and support the creation of a national copyright registry as

a public service, or an 'industry utility' as a shared infrastructure, to facilitate growth in the music sector, especially in the context of the emerging blockchain-driven Web3 ecosystem (Rennie, Potts, and Pochesneva, 2019).

The paper demonstrates that while the Estonian government has established innovation policy hubs like Accelerate Estonia that are capable of driving and coordinating challenge-oriented policies, other parts of the national innovation system, especially collecting societies (CMOs), lack the capacities and capabilities to organically host ambitious visions of future infrastructures for the creative industries. Nonetheless, the findings also show how the evolving regulatory and policy frameworks of the European Union influenced the development of the case and provided opportunities to advance it, especially with regard to the 'public' or 'common' nature of future data infrastructures as part of the European data and blockchain strategies.

The study is based on empirical evidence derived from 14 semi-structured interviews and various field materials such as meeting recordings, working documents, and reports. Conceptually, the paper synthesizes national innovation policy research (the case of e-Estonia, specifically), music industry studies, blockchain research and public value theory.

MCS02 Participatory arts in mediated cities

PP 0785 All street arts lead to Rome: Hybrid communication, participation and creative practices in the suburbs of the Eternal City

[Fabio Ciammella](#)¹, [Silvia Leonzi](#)¹, [Giovanni Ciofalo](#)¹, [Lorenzo Ugolini](#)¹, [Michele Balducci](#)¹

¹ Sapienza University of Roma, Communication and Social Research, Roma, Italy

Starting from the academic research project "Rome wasn't built in a frame", the paper focuses on the ability of street art in Rome to make use of and give new meaning to suburban locations. The research specifically examines how the current complex imaginary of the Eternal City appears to serve as both a reflection and a catalyst of an implicit yet strong connection between the suburbs and the city as a whole.

To this end, the approach related to media ecology (Ciofalo, Pedroni 2022) appears to be advantageous in order to analyse the phenomenon in its complexity; in our case it is adopted through a transmedia model (Leonzi 2022), which allows to reflect on a shared, coherent and participatory worldbuilding process (Ciammella 2022). The research, therefore, aims to analyse both street art works and their representation in technological and cultural terms as a connector of urban media practices (Tosoni, Ridell 2016). We consider street art as a spontaneous – and "disordered" – grassroots approach to cultural issues, through representations of imaginaries, able to go beyond the meaning of the individual work, and generate a shared narrative of and in the neighborhood, including expanded narratives in digital content.

The analysis focuses on some specific neighborhoods in Rome where emerges a particularly dense cultural, communicative and symbolic fabric: suburban or semi-suburban neighborhoods where opposing movements between induced gentrification and resistance from below intensify (Ciampi 2022). In addition, we investigate the social and cultural meaning that street art takes on. We have summarized three levels of relationship between street art and urban communicative order and disorder: social/political (e.g., suburb-center relationship), aesthetic/narrative (e.g., Dionysian creativity), relational/cultural (e.g., pop culture, civic engagement).

The research methodology is based on an ethnographic approach, which also includes a digital perspective (Pink et al. 2016; Rogers 2019). The first phase of the study involves analyzing works from a transmedia perspective, in the physical space (street art) and in the mediatized space (representations on digital platforms), aimed at highlighting the archetypal figures of the imaginary of Rome. The second phase involves conducting interviews with key informants, such as street artists, activists, association representatives, and digital content creators. These interviews aim to investigate the creative, communicative, and social practices that are activated during the production of street art. Finally, a survey was developed with the aim of investigating the perception of the artworks by residents in the neighborhood.

The initial findings reveal that street art has the ability to represent Rome's imaginary through the urban fabric. The formation of pathways for citizens to view and share artwork, both in person and through digital platforms, connects the neighborhood to the rest of the city. However, the relationship between street art and residents is often controversial: while some see it as a form of induced gentrification (art defined from above), conflict arises; but when street art contributes to the neighborhood's identity and narrative, it can activate social practices and fuel daily life and participatory development narratives.

MCS02 Participatory arts in mediated cities

PP 0786 Engaging local communities through performance art

[Marcos Dias](#)¹

¹ Dublin City University, School of Communications, Dublin, Ireland

This paper focuses on the outcome of the Community Engagement Through Performance Art (CEPA) Project, which aimed to connect the displaced Ukrainian community with the Irish community in Dublin. This project evaluates the potential of performance art and its associated media forms to enable interaction in public space between different communities through a participatory event informed by a series of workshops. It aimed to increase the level of communication and awareness between the two communities, and in doing so also empower members of the displaced Ukrainian community. It was a collaboration between Dublin City University (DCU), Ukrainian Action (a charity supporting Ukrainians in Ireland) and Create – National Development Agency for Collaborative Arts and it was funded by the Irish Research Council.

The project involved a series of collaborative performance workshops developed by artist Sally Walmsley (selected by Create) that took place between May and July 2023 in DCU. The workshops used a variety of performance art prompts, techniques and media forms to engage a group of selected Ukrainian participants to connect with each other and to connect with the Irish community. The workshops culminated in a final performance event in The Steps, a public venue inside DCU's U Building on 20 July 2023. The event consisted of an interactive and

participatory performance that transformed the building into an open stage. This was followed by a community workshop, where audience members had the opportunity to engage with the project participants through collaborative performance prompts. The performance and community workshop were open to the general public and aimed to connect the participants with the audience while also showcasing the social and cultural background of the Ukrainian participants.

The project's output was analysed through observations, interviews with participants and a online survey that took place during the final event. The findings reveal the potential of performance art as a method to connect unrelated communities and to empower them through collaboration. They support the project's future potential to connect communities in local contexts. The CEPA project is particularly relevant in the current context of misinformation and disinformation about the status of the displaced Ukrainian community and refugees in Ireland spread through social media and associated events.

MCS02 Participatory arts in mediated cities

PP 0787 Digital ecosystems, participatory processes and urban spatiality in liminal communities

Michele Sorice¹, [Andrea Volterrani](#)², Gaia Peruzzi¹

¹ Sapienza University of Rome, Communication and Social Research, Rome, Italy

² Tor Vergata University- Rome, Ingegneria dell'impresa, Rome, Italy

This paper explores the complex interplay between digital communication ecosystems and urban spaces, with a particular focus on those referred to as 'liminal'. Liminal spaces, characterised by their transitional and ambiguous nature, become focal points where communicative processes have a significant impact on civic engagement and broader civic participation. The study navigates through participatory practices within these liminal spaces, analysing the potentially inclusive impact of digital communication technologies while remaining attuned to the looming potential for the absorption of resistance practices by neoliberal rationality.

An extensive analysis of theories related to liminality, media ecology and urban participation forms the backbone of the article, aiming to unravel how individuals establish connections with urban spaces. The investigation extends to examining whether and how media can function as a subspace for empowerment or mobilisation within these contexts. The paper adopts a theoretical perspective based on the empirical study conducted by the authors in selected liminal spaces in Southern Italy. The study was conducted as part of a broader training initiative for managers of third sector organisations.

The primary aim of the research is to understand the complex relationship between liminal spaces and civic participation. The paper explores how media can be used strategically to facilitate meaningful participation and potentially promote inclusive practices. By grounding the discussion in concrete experiences from Southern Italy, the authors provide practical insights into the implications of their theoretical framework. The work makes a significant contribution to the discourse on civic resilience, highlighting the need for a nuanced understanding of the relationships between media ecosystems, cities and spatial dynamics. In doing so, it highlights the potential of digital communication to shape civic engagement and argues for the promotion of meaningful and inclusive practices in urban spaces.

MCS02 Participatory arts in mediated cities

PP 0788 Actors, practices and visions of (dis)ordering digital urban spaces

[Peter Gentzel](#)¹

¹ Friedrich-Alexander-University of Erlangen-Nürnberg, Department of Media Studies and Art History, Erlangen, Germany

Digital communication technologies and datafication processes are crucial for understanding current social order. As *elementary media* or *infrastructures*, they have a lasting impact on everyday life, just as they have contributed

to the transformation of economy (platform or surveillance capitalism) or the constitution of public spheres (filter bubbles). There is also vast evidence that specific *sociotechnical imaginaries* in which certain ideas of social order are inscribed curate the dissemination of these technologies.

The presentation highlights the interplay between different actors, practices, and visions in planning and implementing regional and municipal projects for the digital transformation of German cities. The “smart” transformation of urban infrastructures in Germany is currently a highly dynamic field for politics, economy and civil society: politicians have launched extensive funding lines (including *Smart City Model Projects* (MPSC) with a volume of 820 million euros), economic players have developed the “digital city” as a market and numerous civil society players (e.g. Open Knowledge Foundation, Code for Germany) are struggling to participate and get listened in the public discourse.

The practice of this public planning, design and implementation of digital urban infrastructures has barely been researched – and is characterized by numerous challenges: Civil society actors characterize the role of digital citizen participation, for example, as “theatre without substance” (e.g. Deutschlandradio 2023), private sector actors criticize counter-intuitive guidelines (e.g. open source bid for conventional providers); politics and economics primarily strive for the (economically driven) sociotechnical imaginary “smart city”, while civil society actors prioritize other objectives.

We explore the complex field of digital transformation projects, which are characterized by contradictions, focusing on the relationship between design and objectives on the one hand and deficient practice on the other. The analytical findings are based on expert interviews (N = 20) and participant observations. Heuristically, we distinguish the categories (1) actors, (2) practices and (3) visions. It is shown that, in particular, power relations, design and participation opportunities are asymmetrical in favor of established actors; practices tend to result in inefficient combinatorics rather than comprehensive transformation due to systemic path dependencies (e.g. understanding of roles, constraint of fields of action esp. in public administrations); visions and orientations of the actors evoke opposing developments (perpetuation vs. reconfiguration of political and administrative action).

In order to accentuate the role of digital urban infrastructures for social (dis)ordering, we explore the digital planning and participation arrangements that provide the space where different actors, practices, and visions come together. The design principles, objectives and standards of these arrangements (e.g. people-centricity, open source, open data) are politically prescribed by the “Smart City Charta” (BBSR 2021). In contrast, the results are sobering. For example, the CONSUL participation software implemented in many MPSC municipalities has no added value from the perspective of municipal decision-makers after the strategy phase because it does not fit the municipal infrastructure and requires too many resources.

Finally, we discuss the expected consequences of this practice for the citizens critically (e.g. reproduction of power imbalances and orders, disempowerment).

MCS02 Participatory arts in mediated cities

PP 0789 Model/City: Architectural models and the politics of playfulness

Linda Kopitz¹

¹ University of Amsterdam, Media Studies, Amsterdam, Netherlands

Between wooden blocks and miniature trees, open spaces and shared pathways, the architectural model of the luxury residential building VERTICAL in Sloterdijk constructs a vision of green and collective living far detached from the lived reality of a neighborhood undergoing a rapid transformation from a largely industrial area to a ‘desirable’ urban neighborhood marked by luxury residential buildings. This presentation takes the conference theme of (dis)order literally by focusing on the communicative construction of a new spatial order of the city, and the imagination and materialization of better urban futures through architectural models. Following Pauwels’ suggestion that cultural imaginations can be acquired through “observing, analyzing, and theorizing its visual manifestations” (2010, 546), building urban models can be understood as a discursive and collaborative practice in materializing alternative visions of the city – provided this process engages with communities, residents, neighbors. In the context of this paper, however, architectural models become entangled with what Christoph Lindner and Gerard F. Sandoval refer to as the “aesthetics of gentrification” (2021). Recent architectural models for ‘sustainable’ developments in Amsterdam – including publicly available and mediated models for VERTICAL and the municipal neighborhood project Bajeskwartier – are simultaneously referencing and abstracting the (proposed) construction sites. In doing so, I argue that these models draw on a **politics of playfulness** to counter criticism raised against the gentrifying effects of ‘sustainable’ urban planning. Considering the role of architectural models in the presentation of architectural designs to both policy makers and interested publics further highlights the potential consequences of strategically (re)presenting large-scale developments through miniature-scale models, marked by natural materials and playful miniatures. Recognizing “the materiality of designed things and the material and discursive practices through which they come to matter” (Kimbell 2012, 129), here, adds an additional dimension to the entanglement between sustainability and desirability, green imaginations and gentrified realities as an aesthetic and discursive strategy.

Thereby the production of nature in architectural models also expands into socio-political discussions of citizenship, participation and 'ownership' of spaces in the (dis)order of the city. In other words: In the playful representation of green neighborhoods as better neighborhoods, the lived consequences of gentrification disappear in favor of an urban vision of sustainability.

MCS03 Social media spaces and places

PP 0892 Building bonds: Enacting "good neighborhood" through the use of instant messaging apps

Emilija Gagrin¹, Olga Pasitselska²

¹ Universität Mannheim, Institute for Media and Communication Studies, Mannheim, Germany

² University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

The connection between the sense of belonging to a neighborly community and a broader democratic project has long been established (Dewey, 1927). Given the opportunity to meet face-to-face and tell neighborhood stories, residents become more invested in their local communities (Kim & Ball-Rokeach, 2006). However, in the past decades, macro-level forces like globalization, individualization, and urbanization coupled with changes in global connectivity were said to diminish the role of traditional community bonds (Crow et al., 2002; Howley et al., 2015). Physical places became mediated through digital affordances, and local connections were supplanted by globally oriented, interest-driven communities (Bennet & Segerberg, 2012; Meyrowitz, 1986). Notwithstanding these trends, neighborly connections remain rooted in involuntary physical proximity (Simonson, 1996), and their quality significantly influences our lives, e.g., by improving our subjective well-being or becoming sources of inconvenience, discord, and distress (Cheshire et al., 2019).

In this context, messaging apps have recently emerged as new communication channels that permeate our everyday lives and shape our social connections (Matassi et al., 2019). Studies demonstrated that instant messengers like WhatsApp could facilitate mutual aid during COVID-19, serving as alternatives to traditional social media platforms for communication and organization on the local level (Chevéé, 2022). Such ongoing mediated communication can shape the nature of neighborly interactions (e.g., changing the standards of decorum; Simonson, 1996), mutual expectations, and perceptions. However, the user's perspective on the implications of instant messaging chat groups for neighborhood communication beyond the crisis remains unclear.

We argue that communication in instant messaging groups holds the potential to revitalize neighborly connections, reshaping perceptions and belonging to the neighborhood as a place-bound community. To explore this, we conducted in-depth interviews with urban dwellers in Israel and Germany (N = 44) who participated in neighborhood chat groups in their respective condominiums. The interviews took place between December 2022 and July 2023. Specifically, we were interested in the role of chat groups in neighborly communication with a focus on their perceived functions (RQ1), their role in shaping perceptions of "good neighbors" (RQ2), and facilitating neighborly relations (RQ3).

We find that instant messaging groups serve a threefold function (RQ1): a) *Instrumental* interactions involve practical benefits, like exchanging resources and facilitating communication-related to ad-hoc matters. b) *Affective* interactions focus on establishing and maintaining social bonds, fostering a friendly atmosphere through casual exchanges. c) *Communal* interactions involve efforts to manage shared spaces within the condominium and demonstrate a continuous consideration for others, such as by preempting potential inconveniences. Regarding RQ2, the concept of "good neighbors" emphasizes the importance of maintaining a *polite distance*, meaning that neighbors should talk "as much as necessary, but as little as possible." However, instant messaging chats introduce new challenges in balancing proximity and distance in neighborly relations (RQ3). While instant messaging groups reinvigorate a sense of community by lowering thresholds for neighborly contact, they can inadvertently lead to increased informal social control and diminish physical contact.

We discuss continuities and changes in maintaining social order through neighborly interaction and the role of emerging media therein.

MCS03 Social media spaces and places

PP 0893 Urban discourse construction on social media platforms: A co-word analysis and case study of Weibo Trending Topics on Beijing(2019–2023)

Xiangmin Zeng¹, Liping Yang¹

¹ Communication University of China, Television School, Beijing, China

Driven by technological innovation and globalization, time-space compression is spreading around the world (Warf & Barney, 2008). Social media, deeply ingrained in urban life, creates a digital information scene and it serves as a distinct manifestation of urban discourse, which becomes an electronic archive constructing subjective and imaginative urban spaces (Burgess, Jean, & Bruns, 2012). Bonding together with geography, social media can shape public geographical awareness (Ye, Le & Peng, 2021). Specifically, through discussion on urban issues, social media becomes a sphere constructing a city's digital discourse space, where the city space is compressed in discourse expansion (Jessop, Bob, 2002).

This study selected one of the global cities Beijing (ranking: Alpha+), the capital city of China, as the study case to explore the mutually constitutive relationship between urban space and social media discourse. **We analyzed Weibo Trending Topics data containing “Beijing” panning from April 1, 2019 to December 31, 2023. A total of 6,298 pieces of Weibo Trending Topics were collected, of which 6,293 pieces with complete information (e.g. popularity, topic ranking, duration) were confirmed as valid data.** Then, we employed text segmentation and word frequency calculation with Jieba, then cluster analysis with SPSS 25.0., and imported an edge list into Gephi.0.9.2 to visualize the co-word network.

Our findings reveal: **(1) Urban topics on social media present complex and diverse relations within Beijing.** The discourse structure centers around Beijing, extending to cultural and sports activities, education, climate, administration, transportation, and other issues. Notably, online celebrities emerge as the primary “tipping point” in urban public discourse, followed by public emergencies, like natural disasters (eg. earthquakes) and public health crises (eg. newly reported confirmed cases). **(2) Geographical awareness and spatial interactions within Beijing were presented via the Trending Topics.** Location-related terms such as Haidian District, the Universal Beijing Resort and Overseas are the high-frequency word categories, which appeared 921 times in total, shaping the perception of Beijing's geographical spatiality. **(3) Discourse contributes to identity construction** (Bamberg, M. et al., 2006), where city-specific cultural brands, like the Beijing Winter Olympics and Beijing International Film Festival, enrich the digital discourse space and construct Beijing's city image. The shift of brand promotion activities from institutional media to social media platforms signifies a strategic symbiosis rather than competition. **(4) Over the past five years, COVID-19 pandemic has been a core focus in Beijing's public discourse space** (Zeng & Yang, 2022). During the prevention and control efforts period (2019–2021), SPSS cluster analysis identifies four modes of public discourse production: information notification, positive action, focus work promotion, and risk response. Strategic analysis suggests that emotionally triggering risk discourse has the potential to evolve into core discourse.

MCS03 Social media spaces and places

PP 0894 Social support in German-city-centered online communities: Exploring informal urban social media communication for urban well-being

Max Schindler¹, Emese Domahidi¹

¹ Technische Universität Ilmenau, Computational Communication Science, Ilmenau, Germany

This study investigates the interplay between social support processes and city-centered social media (SM) communities, exploring their potential impact on urban residents' well-being. The constitution of individual well-being, intricately linked to the fundamental need for connection, emphasizes the significance of social networks and social capital in navigating life's challenges. Prior research highlights the positive relationship between the use of SM, social capital, and social support, influencing psychological well-being (Thompson et al., 2022). Smart cities, driven by information and communication technologies (ICT), aim to enhance the well-being of residents (Aqbal et al., 2019). SM, as a powerful tool within this context, fosters interconnectedness and inclusivity, offering an informal, bottom-up approach to empower citizens and local communities. Our study leverages Reddit to delve into the dynamics of communication and support within urban communities, broadening the scope of smart city research.

Key questions include (a) how citizens support each other online in city-centered communities and (b) whether support patterns vary across different domains of life.

We obtained low-risk approval from the university's Ethics Committee. Utilizing a Reddit dataset (consisting of posts and comments from German city-centered subreddits) from a previous study (author), we randomly selected 500 threads out of 68,512 threads in the original dataset, with 4,282 comments and 497 posts incorporated into the final analysis. The analytical approach employed a manual quantitative directed content analysis of SM texts. The codebook, developed based on prior work, underwent pre-testing and refinement, resulting in 22 categories.

Results revealed that the majority of posts directly related to the city. The distribution of support-seeking types did not significantly differ between city-related and non-city-related posts. Users in city communities were equally inclined to offer assistance regardless of the post's explicit city connection. Emotional support requests often concerned transportation issues, while informational support focused on topics like housing. Interestingly, even posts not seeking explicit support received substantial support in the comments. Regarding domains of life, threads covered diverse aspects, including housing issues, inquiries about living feasibility, and information on leisure and recreational activities.

This interdisciplinary study delves into the dynamics of support behaviors within city-centered online communities, revealing unexpected patterns of instrumental support seeking and substantial support provision within posts. While acknowledging the potential role of smart cities in addressing citizens' instrumental needs, the study emphasizes the need for a more comprehensive understanding of citizen engagement in digital urban spaces. The findings suggest that discussions around leisure activities, although unconventional in political participation, act as precursors to political engagement. The study calls for reimagining smart cities and citizen involvement, stressing diverse forms of citizenship expression and prompting a critical evaluation of existing support structures.

MCS03 Social media spaces and places

PP 0895 The dying history of an influencer village: The order and disorder of digital media in the media life history of Chinese rural communities

Liu Peng¹, Jiayi Li², Qing Xiao³, Haoran Dai⁴

¹ Communication University of China, Institute of Communication Studies, Beijing, China

² Communication University of China, Television School, Beijing, China

³ University of Oxford, Oxford Internet Institute, Oxford, United Kingdom

⁴ Peking University, HSBC Business SchoolPHBS, Shenzhen, China

In recent years, digital media represented by live streaming has seen vigorous development in rural areas of China, altering the social structure of these villages. Villages led by live-streaming influencers, distinct from those planned by the government, exhibit more grassroots characteristics and greater developmental freedom. This has stimulated potential for further development of rural digital culture. However, most existing studies have focused on how a village becomes an "influencer village," often overlooking the decline of such villages. Indeed, digital-era phenomena like influencer villages inevitably confront the issue of "planned obsolescence (Turner et al. 2000)".

Adopting a media life history research approach, we attempt to shift the focus from people as subjects to places as subjects. This method provides not just a "narrative of action," but also includes the life cycle of the subject and its historical context within the changing social environment.

Since March 2021, we have been tracking the "rise and fall" of an influencer village, Village Y, located in the Yimeng Mountain area, known for its unique CCP Culture and Confucian culture. In March 2021, a villager, Cheng, became famous online for selling noodles at 3 yuan for 15 years without a price increase, gaining billions of clicks and millions of followers on major Chinese digital media platforms like Douyin and Kuaishou. Chinese netizens especially support rural influencers, attracting them to visit Village Y to see Cheng making noodles. Also drawn to the village were professional influencers who live-stream rural life. They gathered offline in Village Y and, through secondary dissemination, attracted even more visitors.

We discovered that: Firstly, The turning point in the development-decline media cycle of the influencer village is highly correlated with the influencers themselves. Following interpersonal troubles and conflicts with local government, Cheng left Village Y. Subsequently, professional influencers who relied on filming Cheng also departed, followed by tourists and returning villagers. This process resembles a distorted version of the "Differential Mode of Association (Fei et al., 1992)". The dispersal of these interpersonal relationships also affects the local order centered

around live streaming and the disordering of digital culture. Thus, the development-decline cycle of the influencer village coincides with the processes of ordering-disordering at a cultural level. Secondly, the 'moment of truth' in the development-decline cycle of the influencer village often relates to changes in media infrastructure (e.g., WiFi rental, live streaming equipment setup, broadcast site construction, streaming props). These maintain a highly independent state of internal order, even during the disordered phase of the village's decline. However, they act as catalysts in the ordering-disordering process (as depicted by the density of points representing the degree of order). After passing through these critical moments, the physical development-decline process of the influencer village accelerates, aligning with the ordering-disordering process.

This research contributes to space-media studies, focusing on alternative rural spaces, that is, how media interferes with government planning and affects spatial order. Through a media life history analysis, this study analyzes how live-streamers, media infrastructure and media villages reshape rural space with ordering and de-ordering.

MCS04 Mobilising methods for post-digital cities

PP 0990 Smart (and autonomous) in the city: A media analysis of sociotechnical imaginaries

Ana Viseu¹, Paulo Nuno Vicente¹, Joao Pedro Pereira¹, Ana Delicado²

¹ FCSH – Faculty of Social Sciences and Humanities – Universidade NOVA de Lisboa, ICNOVA – Communications Institute, Lisbon, Portugal

² Universidade de Lisboa, Instituto Ciências Sociais – ICS, Lisbon, Portugal

'Autonomous stores' are often characterized in the media as the future of shopping: smart physical environments augmented (Viseu, 2003; Viseu & Suchman, 2010) through digital technologies that can process data automatically, seamlessly and without the need for workers, identifying both consumers and their actions. References to autonomy and automation conjure a set of imaginaries of technology in the service of innovation and progress: for consumers these novel environments are proposed to signify gains in convenience, whereby saving time is saving money. For retailers, they mean the possibility of gathering significant amounts of information on the behavior of the customers in a store environment, thus being another manifestation of what Zuboff (2019) calls 'Surveillance Capitalism'.

Despite being hailed as autonomous, these spaces are vast digital assemblages that rely upon networked infrastructures composed of people, knowledges, and numerous technological entities (such as, AI, sensors, algorithms, computer vision, cameras). Portugal is one of the leaders in this future-making endeavor: in 2019, SENSEI, a Portuguese "unicorn" specialized in the development of autonomous stores technologies, partnered with SONAE, one of the largest Portuguese retail chains, to open 'Continente Labs' an autonomous store in Lisbon.

This paper draws upon a thematic analysis of data generated from a media analysis of Portuguese and international newspaper articles from 2016 until 2023, as well as interviews with SENSEI and SONAE, to examine the sociotechnical imaginaries that are mobilized in the media to both drive and justify the development of these digital infrastructures. We pay particular attention to the discourses through which they are built: Who is pushing for them? Why? What are the main issues that are being discussed both in terms of advantages and problems? Who is included/excluded? And, finally, what futures are being built? This will then allow us to shed light on the concepts that underlie these spaces – What are "autonomy" and "smartness" in autonomous stores?

MCS04 Mobilising methods for post-digital cities

PP 0991 Navigating realities: Examining the role of visual communication in urban experiences

Borbála Jász¹

¹ Kodolányi János University, Department of Communication, Székesfehérvár, Hungary

In this essay, I will begin by arguing

- [1] that maps, particularly digital navigation applications and image sequence-based digital maps, can be categorized within the epistemological domain of photography and film. For instance, if we regard the route image elements of the popular Google Street View navigation system as the frames of a unique film, we encounter the issue of the relationship between the image and the represented reality.
- [2] When analysing the urban orientation and wayfinding mechanism, it is essential to differentiate between dynamic (e.g. walking, running) and static activities (e.g. standing, sitting).
- [3] This issue is discussed by Kendall Walton in his essay 'Transparent Pictures: On the Nature of Photographic Realism'. Walton provides the example of examining a photograph of a deceased relative, differentiating

between seeing and perceiving as distinct activities. He suggests that „the viewer of a photograph sees, literally, the scene that was photographed“. (Walton 273)

- [4] When analysing the urban orientation and wayfinding mechanism, it is essential to differentiate between one's familiar, known city and an unfamiliar city that one has not personally experienced.
- [5] What distinguishes experiencing a city in person from merely seeing it in a photo? Can one truly grasp the essence of a city by observing its landmarks alone? While landmarks are more detailed and easily discernible in photos, the question arises: Why do we travel to a city to witness these landmarks firsthand, even if the visual clarity may be inferior? The personal experience, despite its potential limitations, often surpasses the impact of a photograph. Is first-hand experience necessary to get to know a city, or is it sufficient, or even preferable, to see it in a photo?

In the presentation, I will discuss three case studies that categorize instances based on the distinction between personal acquaintance and mediated visual communication according to their respective types.

MCS04 Mobilising methods for post-digital cities

PP 0992 Post-Digital City commuters' digital footprint: An integrated Framework for analysis

[Helena Atteneeder](#)¹, [Joan Ramon Rodriguez-Amat](#)²

¹ University of Tübingen, Institut für Medienwissenschaft, Tübingen, Germany

² Sheffield Hallam University, Department of Culture and Media, Sheffield, United Kingdom

Commuting in post-digital cities is characterised by a complex interplay between media- and mobility practices. Citizens not only move in physical-material space, they also do it while using their internet connected phones, swapping apps, and being immersed in a rich environment of information flows, constructed infrastructural and data ecosystems, and systems of validation, authorisation, and access. The fluid communicative spaces commuters dwell in cannot be easily grasped or conceptualised.

Research has tried to approach these complex environments of increased mobilisation of media technologies i.e. communicative mobility (Berg, 2017; Wimmer and Hartmann, 2014), as the amalgamation of media and urban infrastructure (Hespanhol et al., 2017; Krajina and Stevenson, 2019; McQuire, 2008, 2016) with its "atmospheres" as the totality of signals that are exchanged between digital devices (Ash, 2013). What people "do with media" (and vice versa) is to be framed as media practices amongst a whole set of everyday social practices (Moores, 2018) that are also bodily experienced (Moores, 2019) and can best be captured "in situ" (Kaufmann and Peil, 2019; Kubey et al., 1996).

This paper is part of a broader effort to map the mobilised media and communication practices of commuters and presents the effort to incorporate a data framework that integrates the multiple sources of information collected combining the digital footprint of the mobile phone activity of the participants, their media diaries, and the qualitative interpretation of the participant's process. The purpose is to check to what extent combining these data sources will help understand the complex phenomenon that involves mobilised media and communication practices.

In pursuit of this objective, we recruited individuals who routinely utilise public transportation for daily commutes lasting 40 minutes or more. They were asked to document their media activities during both the outbound and return journeys. The participants shared their mobile phone online-activity via VPN, took geolocated pictures to mark moments (and places) of their journey, and used the app "Me Tag" (Hohmann et al., 2023) as a form of media diary (Hyers, 2018). Subsequently, participants were interviewed to share additional insights and provide further commentary on the reported activities and thus reconstruct the commute.

In this presentation, we will only briefly describe the findings coming from the participants activity; instead the presentation will focus on the assessment of the integrated framework. Indeed, the diversity and richness of the data collected required an extra effort of architectural design that included identifying timestamps across the whole dataset and locations to anchor and synchronise the activity to space. The contribution here is thus the assessment of that framework: the technological complexity of its implementation, the collateral problems encountered (including participant recruitment and ethical issues) the epistemological aspects including what does this framework help to understand, and how can the knowledge obtained contribute to the conceptual debate and therefore help understand the complex phenomenon of media and mobility in the post-digital cities.

MCS04 Mobilising methods for post-digital cities

PP 1091 Breaking barriers: Gender-inclusive digital mediated mobility in urban environments. A study on women- and queer-inclusive urban public transportation through technologically mediated support in Vienna

Gerit Goetzenbrucker¹, Kai Daniel Preibisch²

¹ University of Vienna, Department of Communication, Wien, Austria

² Austrian Academy of Sciences, Institute for Comparative Media and Communication Studies, Vienna, Austria

Free choice of mobility (Elliott/Urry 2010) is considered to be a basic human need, serving for expansion of lifestyles (Leskau et al. 2021) and being an essential precondition for social participation. Given the complexity, intensity and diversification of urban day- and nightlife, planning services such as apps, maps, messengers have the potential to overcome spatial and social mobility barriers, particularly for queer persons and women (Weber/Heckel 2019). Mobile route planning technologies serve as 'boundary objects' (Star 2017), not only mediating between social worlds, but also setting compatible and connectable standards.

Based on the mutual influence of users and systems by doing mobility, 'mobility justice' (Sheller 2018) still lacks gendered perspectives. Balanced 'mobility capital' (Kaufmann et al. 2004) necessitates the incorporation of feminist development perspectives (Wajcman 2009) to make mobility more comfortable, predictable and safer for people of all genders, especially during nighttime (Farina et al. 2022).

A multi-method design that combines auto-ethnography, in-depth interviews, and accompanied mobility walks (Kusenbach 2003) with mobile media storytelling (Farman 2015) in urban day and night mobility allows for deep insights into the public mobility of 25 women and queer persons aged 19 to 25 living in Vienna. Continuing, 17 young women autoethnographically documented their mobility behavior while using location/position data.

A comparison of mobility planning tools 'in situ', with Google Maps being the standard tool used, reveals only marginally considered needs for women in multi-modal urban mobility. IT-Tools tend to neglect the usability approach, currently prioritizing efficiency, punctuality, and inter-modality over situational ('live') usability. Due to these lacks, the participants rely on self-developed strategies, such as avoiding certain modes of transportation, only using specific routes at certain times, and seeking help and support, both personal and digital, preferably from trusted individuals. Additionally, participants prefer familiar routes and places where they are not alone to enhance their sense of security.

Young women and young queer persons especially ask for the expansion of interaction features with both the environment and other users. They also miss services for accompaniment and integrated hotlines. Additionally, they lack information about route conditions, such as street lighting and predictions about the timing of dawn. Furthermore, flexibility in planning is crucial: Alarm systems with self-created/selected security parameters and increased location accuracy could also help reducing (nocturnal) uncertainties and anxiety. Especially the use of location/position data – despite bearing risks of violating privacy – serve as valuable tools for feeling safe, and supported.

MCS05 Spaces of mediated inequality and inclusion

PP 1090 Mobility (dis)orders. Discourses of unequal access to the German railway services

Helena Attenecker¹, Martina Thiele¹

¹ University of Tübingen, Institut für Medienwissenschaft, Tübingen, Germany

Under the keywords of sustainability and "Verkehrswende" (change in the transportation sector), public transport is increasingly central in current climate change and future mobility debates. Associated discourses have changed over time and were connected to different kinds of societal power structures hence ideological assumptions about the understanding of movement and mobility. From a car-dominated era to privatizing public transport infrastructure

and current debates on e-mobility and smart mobility services, it's evident that past discourses significantly shape present societal orders, structures, and the scope of action for various interest groups.

"The right to the city" (Lefebvre, 2000) is therefore closely linked to and also includes "the right to public transport" or broader a "right to mobility", i.e. the access to public mobility infrastructure, whereas mobility infrastructure is more and more converged with media and communication technologies forming part of the fabric of highly digitalized cities that are grounded in advanced models of data capturing and processing. Accordingly controlling the flow of data, people, goods, and city logistics is crucial for urban cohabitation, but may not always align with social needs inherent to urban societies. Simultaneously, unequal distribution of infrastructure access raises questions about data and infrastructure ownership.

Uneven mobilities (Sheller, 2016) are connected to the question of how certain politics control movement and circulation of data, people, and goods. In other words, which policy promotes which forms of mobility for which people, while other people are excluded from so-called critical infrastructure. Using the theoretical concept of "mobility justice" (Sheller, 2018), we critically analyse the situation in Germany using the example of Deutsche Bahn. We take a closer look at the offers on different train tickets (the so called ".9-Euro-Ticket", a special offer from Deutsche Bahn limited to three months in summer 2022, and the so called ".Deutschlandticket" for 49 Euro in 2023) and examine how unequal access is newly created and how this in turn (re)produces social (dis)orders.

Our method is a Critical Discourse Analysis (Fairclough, 2013; Jäger, 2001, 2019). The text corpus consists of articles from daily newspapers and news magazines, online comments and Deutsche Bahn advertising. We examine how ".the right to mobility" was negotiated in various discourse strands by different actors and interest group. The results of our analyses are placed in a broader context, we consider them in relation to earlier political decisions, such as a transport policy that for decades gave preference to the car ("free travel for free citizens") and promoted the privatization of Deutsche Bahn.

Results suggest that a fine-grained analysis of different time-levels and different scales is fruitful to make sense of unequal access to public transportation. For example, the ".9-Euro-Ticket" shows that the demand for affordable public transport exists, but cannot be met by the highly dysfunctional mobility infrastructure. Further conclusions can be drawn from analysing of how access to an ailing, broken, privatised infrastructure has come about, what continuities and (social) disruptions can be found from previous political decisions and how slow or quick policymaking trickles down to structural long-term impact.

MCS05 Spaces of mediated inequality and inclusion

PP 1092 Territorial inequality in Spain: Depopulation and news deserts on the news media landscape

*María-Cruz Negreira-Rey*¹

¹ Universidade de Santiago de Compostela, Communication Sciences Department, Santiago de Compostela, Spain

The crisis suffered in recent decades by the local press has raised awareness of the consequences that the lack of news service can have on local communities. The disappearance of daily local press titles endangers the satisfaction of basic information needs (Ferrier, Sinha & Outrich, 2016; Friedland et al., 2012) and motivates research on the emergence of so-called news deserts and their effects (Abernathy, 2020; Bucay, Elliott, Kamin & Park, 2017; Ferrier et al., 2016; Gulyas, 2020; Jerónimo, Ramos & Torre, 2022; Lins da Silva & Pimenta, 2020).

The Spanish map of digital news media is stable and with a tendency to grow. However, the map reveals territorial inequalities that may be related to the gradual process of depopulation and exodus from rural areas to the large capitals. There is concern about citizens' access to a quality local journalistic service, which is key to the strengthening of communities and their democratic functioning (Galletero-Campos & Saiz-Echezarreta, 2022).

This work explores the phenomenon of news deserts in Spain, identifying the areas that can be considered as such and those that are at risk. We study the characteristics of the media ecosystem in the regions with the most news deserts and check whether the population or the wealth index can be related to their appearance. To do so, we take as a starting point the digital news media map of Spain (Negredo Bruna & Martínez-Costa, 2021). Subsequently, the areas of news coverage of each media outlet are identified, obtaining their geographical distribution and the number of media outlets with coverage in each municipality of the state. The descriptive and correlational statistical treatment of the data allows for an in-depth study of the autonomous communities and an analysis of the risk factors.

Results show that 6.304 (77.53%) Spanish municipalities can be considered news deserts, where 11.6 million inhabitants live, that is, 24.51% of the country's total population. In addition, another 523 municipalities are at risk of becoming deserts. In the regions with the highest number of news deserts, there is a clear concentration of outlets in the main capitals and a weak ecosystem of local and hyperlocal media. Depopulation is the main risk factor in the loss of news media and news coverage in local communities. Although the phenomenon of news deserts affects a minority of the population, there is a large territory that does not have its own media to tell its reality and satisfy its

citizens' right to information. Knowing the risk factors and their evolution in the territories, as well as the situation of the media ecosystem, makes it possible to work towards reversing the situation.

MCS05 Spaces of mediated inequality and inclusion

PP 1093 Municipal communication applications as public service?

Matthias Berg¹

¹ Fraunhofer IESE, Smart City Design, Kaiserslautern, Germany

The development and operation of communication applications by municipal actors is becoming increasingly relevant. Examples range from information portals and citizen apps to social media services with a local or regional focus. Such services cover the entire spectrum of municipal structures, from the smallest local authorities to urban metropolises, often being part of smart city or smart region activities.

This contribution discusses such digital applications from the perspective of communication and media studies. The focus is on the question to what extent not only municipalities' information dissemination via digital media, but also their organisation and provision can be regarded a public service activity and thus a legitimate responsibility of public authorities. To this end, this presentation takes the following steps of argumentation:

Firstly, the fundamentals of the increasing digitalisation of services of general interest are introduced. This means that existing service areas are being transformed by digital processes and new services as well as tasks come into existence. This is associated with "organisational, legal and technical changes for all stakeholders in the service areas" (Berg et al. 2022).

In a second step, links are established between digital services of general interest and media communication. Two aspects in particular are emphasised: On the one hand, the ongoing crisis of local print journalism (Tomaz 2023) is resulting in a decrease of media coverage on municipal affairs. Additionally, legal issues such as the EU-US-Privacy Shield which was declared invalid by the CJEU in 2020 (European Commission 2023) severely limited municipalities in their use of major social media outlets. On the other hand, the "platformisation" (Poell et al. 2019) of not only global, but also local communication offerings is increasingly taken up by municipal authorities and other public actors.

In a third step, the implications of these theoretical considerations are illustrated by means of the case study of the German pilot project "Digital Villages Lower Saxony". In this context, communication services are made publicly available not only to municipal administrations, but also to civil society and private actors. However, it must be taken into account that the provision and use of digital communication services in the case of municipal actors is caught between the conflicting priorities of media law, the press' independence of the state and the legal obligation of German public authorities' to provide information on their administrative action.

Finally, the case study is used to reflect on the initial question of the validity of considering the municipal provision of communication offers as a public service. The article concludes that not only the provision of information via self-organised and shared channels can represent added value. Enabling and empowering civil society institutions and citizens to engage in communicative exchange can also be supported by such communication services in the interests of the common good, safeguarding social order in local communities. However, next to transparency it is has to be ensured that the state is not given the opportunity to influence other actors' communication.

MCS05 Spaces of mediated inequality and inclusion

PP 1094 Hyper surveillance of Public Space: The case of Bairro Alto, Portugal

Ana Viseu¹, Paulo Melo¹

¹ NOVA University of Lisbon, NOVA Institute of Communication, Lisbon, Portugal

The field of public surveillance studies has undergone numerous changes in the past 20 years. The popular studies of CCTV of the 90s were supplanted by studies of web surveillance and, lately, of what Zuboff (2019) termed 'surveillance capitalism' and Lyon (2018) calls a 'surveillance culture'. As this went on, CCTV technology became a different a different beast: from a static, granular, stand-alone artefact, it became a 360°, connected, sound-recording, night-vision, facial-recognition enabled digital assemblage. In Portugal, for policymakers and public security agencies it also became "the strategic, and smart, means to protect the public".

In 2024, Bairro Alto – a Lisbon neighborhood known for its nightlife and attractive to tourists – will complete ten years of video surveillance system operation. In a document from the Ministry of Internal Administration (MAI), the Public Security Police (PSP), the entity responsible for managing the surveillance system, describes it as operating "uninterruptedly, twenty-four hours a day, every day of the week" (Portugal, 2022, s/p), through the capture and recording of images and, "whenever there is a situation of concrete danger to the safety of people and property", possibly sound. Likewise, both in interviews conducted by the authors and in outdoors in the city of Lisbon, those responsible for these systems perform a semiotic operation of moving them from 'video surveillance' to 'video protection'.

The case of Bairro Alto highlights a logic observed globally, analyzed for at least four decades by surveillance studies (Lyon, 2022), which, among other perspectives, discusses the implications for the right to privacy (Viseu, Clement & Aspinall, 2004) and makes critical comments about surveillance as an "easy solution" that "transports" the real problems to another location (Carli, 2008).

Drawing upon interviews with relevant actors including, MAI, police, and residents, as well as documentary and policy analysis, this paper does two main things: (a) it examines the visions and motivations that are mobilized to promote and legally and politically justify the use of video surveillance in Bairro Alto, including the ways in which the community of residents position themselves in relation to this surveillance; And, (b) it examines the practices of operation and use of this system, highlighting the dissonances between the legal scope and the use of video surveillance in Bairro Alto.

MED01 The end of mediatization? Rethinking media reliance in the post-digital age

PN 006 Rethinking media reliance in times of deep mediatization

[Stina Bengtsson](#)¹, André Jansson², Johan Lindell³

¹ Södertörn University, Media and Communication Studies, Stockholm, Sweden

² Karlstad University, Geography Media and Communication, Karlstad, Sweden

³ Uppsala University, Media and Communication Studies, Uppsala, Sweden

This paper forwards the argument that the process of mediatization, and the increasingly deepened significance of media technologies in everyday life, contribute to a renewed and converted relevance of the concept of media reliance in media and communication studies in general and mediatization studies in particular. Such rethinking of media reliance introduces new ways of understanding the media in relation to different social domains and thus expands what we aim to, and may, understand of our contemporary media lives (Deuze 2011). Media reliance is one of the classic concepts in media and communication studies. Traditionally building on empirical research about media experiences of news consumption, media reliance has predominantly been used to explain how people develop a citizen identity and their public connection, initially often operationalized as "exposure" (Faber et al. 1985). During the last decades, new digital media technologies, algorithms, and the process of datafication in varied spheres, have profoundly transformed the basic conditions for daily human life, our habits and rituals, how we socialize and develop our intimate relationships, connect to each other as well as to the world, etc. This transformation of contemporary life and culture is sometimes conceptualized as "deep mediatization" (Couldry & Hepp's (2016: p. 37) understood as "the increased reliance of all social processes on infrastructures of communication". Deep mediatization then, on the one hand, means that people depend to an increasing extent on media technologies to manage and navigate their daily lives. On the other, it also means they may be less aware of this, due to the opacity and ubiquity of algorithmic cultures. In light of this discussion, this paper forwards a rethinking of the notion of media reliance, a concept we argue has the potential to largely expand its scope and explanatory significance in media and communication studies as a consequence of the processes of deep mediatization. Based on a literature review and retrospective discussion about the use of the concept of media reliance in our field, and from the perspective of (deep) mediatization theory, we argue for a renewed, deepened, and transformed importance of the concept of media reliance.

MED01 The end of mediatization? Rethinking media reliance in the post-digital age

PN 007 Digital reliance as a threat to communicative agency in the work-place

[André Jansson](#)¹, Karin Fast¹

¹ Karlstad University, Department of Geography Media and Communication, Karlstad, Sweden

Today, many work procedures and tasks across different occupations are reliant on digital media. While digital tools are implemented to make work more efficient and flexible, mandatory use of new, and continuously upgraded, platforms and infrastructures may also foster experiences of media over-reliance, and a fractured sense of communicative agency. This means that people feel that their "capabilities to meaningfully influence communicative interactions in their daily lives" (Ytre-Arne & Das, 2021: 784) are hampered. Under certain circumstances, they may even feel that basically "positive" media affordances are turned upside-down. Connectivity is turned into digital intrusiveness and enclosure: the capacity to make oneself visible becomes a means of surveillance; logistical affordances may underpin a bewildering state of spatial and temporal boundlessness. While these types of ambiguities bespeak the dialectical nature of mediatization processes in general (Jansson, 2018), they also provide a backdrop to the so-called disconnection turn (Fast, 2021) and the (sometimes enforced) emergence of post-digital sensibilities in working life. The troubled relationship between digitalization and communicative agency has been actualized in self-help literature promoting things like "digital minimalism" (e.g., Newport, 2019), as well as in research on, for example, "digital wellbeing" (Vanden Abeele & Nguyen, 2023). Yet, there is no dedicated overview of how it unfolds in different realms of society and in different occupational sectors. To chart such patterns, this paper deploys data from a nation-wide survey conducted in Sweden in 2023. The questionnaire included a set of 20 statements aiming to capture emerging post-digital conditions in the workplace. Starting out from a factor analysis of how the respondents rated these statements, the paper scrutinizes the two most outstanding factors (those with the highest level of explained variance). The first factor is tentatively labelled Fractured communicative agency and is marked by feelings of digital distraction, surveillance and technology-induced time-waste, combined with an inclination to exclude certain technologies and platforms and even escape to digitally disentangled work-places. The second factor, conversely, is called Expanded communicative agency and is characterized by a sense of enhanced spatial and temporal freedom, combined with an appreciation of new logistical affordances and access to online meeting spaces. The subsequent analyses demonstrate how demographic factors as well as sectorial and work-place specific conditions (e.g., regulations pertaining to digital connectivity) play into people's tendency to align with either Fractured or Expanded communicative agency. The paper concludes with a discussion of how

communicative agency plays into social power relations in the post-digital society, where access to disconnected, or non-connected, time-spaces is an increasingly scarce resource.

MED01 The end of mediatization? Rethinking media reliance in the post-digital age

PN 008 Fashionably post-digital? Coworking territoriality as a response to media over-reliance

[Karin Fast](#)¹, André Jansson¹

¹ Karlstad University, Department of Geography Media and Communication, Karlstad, Sweden

Although popularly described as shared work environments where people from different organizations can work individually or collaboratively, coworking spaces (CWS) are contradictory spaces that escape simple classification. This paper demonstrates how CWS feed from, and reinforce, three inter-related processes which can all be connected to structural media over-reliance among knowledge workers. The first of these processes, and our key concern here, is post-digitalization. The post-digital signifies a new type of sensibility and a way of problematizing media over-reliance on a day-to-day basis. At present, both organizations and workers search for solutions to digital "stress", "fatigue", and related problems (Guyard & Kaun, 2018; Fast, 2021). In CWS, post-digital ideals materialize as, for example, designated areas for disconnected activity (e.g. yoga), community events (e.g. "mindfulness"), and display of analogue media (e.g. vinyl players). Through these and similar operations, CWS ultimately emerge and/or present themselves as "post-digital territories" (Adams & Jansson, 2022) – as bounded areas where the hegemonic digital regime is (claimed to be) challenged. The post-digital character of CWS contributes to their ambiguity. Partly because of their approach to technology, CWS appear as both connected and disconnected spaces; they promote both hard work and recreational ease; and they function as both disciplined spaces and experience-laden "destinations" for "digital nomads" (Fast, 2022). Ultimately, we argue, CWS become promoters and exploiters not only of post-digitalization, but also of processes implied by the notions of post-work and post-tourism. This is to the extent that the post-digital is framed as a key aspect of even grander transformations of working life through which work and leisure coalesce. At stake here is workers' "right to disconnect" not only from digital media, but, more generally, from the world of work as we have come to know it. But who is likely to feel at home in this new world of work? Who is probable to make it into post-digital territories, and who is left outside? However open-ended CWS might appear, especially given their mediatized nature, they do have boundaries that serve to include and exclude. Through a review of existing literature, in combination with ethnographic fieldwork carried out in CWS in Oslo and Palma de Mallorca, in 2023 and 2024, we hope to inspire a broader discussion around the social implications of media-induced transformations of contemporary work and life.

MED01 The end of mediatization? Rethinking media reliance in the post-digital age

PN 009 Media reliances in the post-digital office

[Magnus Andersson](#)¹

¹ Lund University, Department of Communication and Media, Lund, Sweden

According to a report from OpenAI (in collaboration with University of Pennsylvania), Generative Pre-trained Transformers (GPTs) have potential to not only affect the work tasks of 80% of the American workforce but also replace a significant number of administrative workers in a near future (Eloundou et al. 2023). Against such a background it may seem less relevant to discuss neither office workers' media reliance, nor a post-digital workplace where manual and digital work are hard to separate. Yet, in order to deepening our understanding of threats of office automation, we should scrutinize past and present relationships between humans and machines; how analog and digital work has been configured in the workplace. A historical perspective on office work and office technology shows that automation is a process rather than a quick transition. In this paper, I discuss how office technologies such as word processors, personal computers, chatbots and apps have automated parts of the work; how that has changed the socio-material office environment, and transformed – rather than replaced – the human work. For example, recently, in an intense period of digitization, a partly new occupation has emerged; the virtual assistant, competing with the bots. She (it is almost always a woman) is a precarious platform/gig worker who works remotely, and who can be procured for longer or shorter time to manage social media and calendars, organize mails, answer calls, vet clients, and do other clerical work tasks. The occurrence of the (human) virtual assistant at a time when visions of office automation grow stronger says something about media reliance and the post-digital office. Media reliance appears in different shapes in the modern office; from chatbots that automate several work tasks, to the virtual assistants who work from home and rely on media technologies both to get jobs and to perform them. Many of the work tasks in the modern office can be executed by either AI or virtual assistants. It demonstrates that the development of the office is not a linear path towards automation; the manual and the automated – the virtual assistant and ChatGPT – may exist side by side.

MED02 Theoretical and methodological insights

PP 0143 Exploring the Concept of generative mediatization

[Katalin Feher](#)¹

¹ University of Public Service, Department for Science Strategy, Budapest, Hungary

Our research studies in 2023–2024 confirmed the concept of dynamic generative mediatization through two different approaches. First, developers and investors in AI from different industries formulated the manner in which the media landscape can be disrupted by AI-generated content, even while investing resources in those technologies, the most significant risk of which lies in the misuse of sophisticated AI services, leading to a dystopic future in media and communication (Feher and Veres, 2023). Second, AI-driven communication and media experts are perilously optimistic, believing that future developments in AI could mitigate the adverse outcomes generated by current AI technologies (Feher, Vicsek and Deuze, 2024). These two studies illuminate the complexities and uncertainties inherent in the evolving landscape of 'AI to AI' mediatization, underscoring the multifaceted impact of emerging generative AI technologies.

Accordingly, the era of 'generative AI' and 'generative AI media' facilitates a new and controversial paradigm in digital communication and media engagement by:

1. Fostering a reconceptualization of mediatization dynamics (Feher 2022)
2. Extending the helpful concept of "deep mediatization" (Hepp 2020)
3. Understanding the two-fold characteristics of mediatization with beliefs and uncertainties resulting in dual impacts (Feher, Vicsek, and Deuze 2024)

This presentation thus introduces and explores the term 'Generative Mediatization,' a concept that encapsulates the profound changes in media landscapes brought about by the advent of advanced generative AI technologies.

Generative mediatization means a dynamic era of intertwining transformation and disruption. AI algorithms transcend traditional content dissemination, creation, and modification roles, leveraging a synergistic blend of open-source data, advanced deep learning techniques, synthetic data, and neurotechnology. This convergence shapes public discourse and molds individual perceptions, operating as an enigmatic 'black box' in the technological realm (Feher and Veres 2023). Generative mediatization stands at the forefront of media evolution, offering a window into the intricate socio-technical trajectories anticipated in AI's future (Feher 2024). This concept is pivotal in decoding the complex interplay between media progress and AI advancements, highlighting the dual nature of AI as both a disruptor and catalyst in the digital age.

Additionally, the sociology of (technological) expectations (Borup et al. 2006) plays a pivotal role in framing our understanding of generative mediatization. This theoretical perspective helps us comprehend the way in which societal expectations and speculation about AI's future shape its development and integration into media practices. Generative AI content, media products, and info-communication are also coded by the narratives of disruptive and transformative technologies, placing them in competition in a post-truth context. These AI-generated and -related narratives increase fragmentation and entropy in media studies. Thus, entropy and uncertainty assessment are essential in identifying generative mediatization.

In conclusion, the concept of 'generative mediatization' provides a dual-focused framework for analyzing AI's impact on media and communication that is essential in understanding the complex relationship between technological advancements and societal change, preparing us to adeptly face the challenges and opportunities of the rapidly evolving generative AI-driven era.

PP 0144 Deep mediatization by Anthropomorphization: Accommodation to communicative AI

[Engelhardt Phillip](#)¹, Caja Thimm¹

¹ University of Bonn, Media Studies, Bonn, Germany

Framework

In sociotechnical interaction both human and technological agents or artefacts enter into a more reciprocal relation, thereby causing new *challenges for social order*. By design technological systems are constructed to fulfill specific requirements like ergonomic shape, intuitive usability or efficient support of humans. On the other hand, users learn to understand and utilize the functions of the system and adapt according to system logics. In its simplest, optimal form, user-centred adjustments on the technological side and technology-centred adjustments on the human side complement each other reciprocally.

The newest generation of communicative AI systems seems to enhance this paradigm (Etzrodt & Engesser, 2021). Voice-assistants like Alexa, humanoid robots like NAO or LLMs like ChatGPT present themselves as hyper-advanced, intelligent, (partly) autonomous and publicly accessible communication agents. They even promise

creative production of text, problem-solving and the simulation of authentic 'interpersonal' exchange. The development of more and more parasocial elements such as personalization, conversational reciprocity and human likeness in voice qualities or body shapes underscores the tendency to 'humanize' AI systems. Considering the fact that anthropomorphization is implemented both in design and in interactive practice, we want to follow up the path of deep mediatization by the subsequent research questions on changes in socio-technical relations: (1) How does user-accommodation change in interaction with anthropomorphic conversational agents? (2) Can we observe a self-enforcing relationship between anthropomorphic design and the performance of accommodation practices? (3) What implications does this relationship have considering ontological questions at the root of human-machine communication research?

The Studies

In order to systematize various degrees of adaption, distancing or acceptance of communicative behaviors we developed a concept of *digital communication accommodation practices* (Edwards et al., 2023) based on the sociolinguistic approach of the 'Communication Accommodation Theory' (CAT) (Gallois et al., 2016). In order to evaluate our model, two studies were carried out.

Study (1): The Anthropomorphic Impact of Voice in Robot Interaction

In this study, we altered the voice quality (human vs. synthetic) to investigate the influence of voice expression, whether human-like or robot-like, on sympathy and trust towards robots. Twelve participants engaged in a conversation with a NAO robot on an emotionally charged topic ("winter blues") in each condition. The findings indicated a preference for the synthetic human voice, highlighting the recurrence of the uncanny valley paradigm.

Study (2): Verbal Interaction and emotional closeness with ChatGPT

Study 2 explored the utilization of ChatGPT in two conversational scenarios involving individuals seeking support for personal conflicts. Observations, data analysis, and post-experimental interviews with participants (n = 12) revealed a trend toward eliciting human-like conversation and fostering anthropomorphic attitudes. This was achieved through the adoption of communicative accommodation practices towards AI speech patterns.

Addressing the three research questions, all studies indicate that users adapt not merely to a technological spectrum of functions but rather to anthropomorphic interpretation and allocation of human likeness. We will tie these results into more recent research on anthropomorphism and deep mediatization.

MED02 Theoretical and methodological insights

PP 0145 Towards an ecology of mediatization: Bridging the media ecology approach with the mediatization paradigm through Bourdieu and Elias

Marco Pedroni¹, Giovanni Ciofalo²

¹ University of Ferrara, Humanistic Studies, Ferrara, Italy

² Sapienza University of Rome, Coris, Rome, Italy

This paper revisits the media ecology perspective, proposing a theoretical reflection based on its integration into the mediatization paradigm by leveraging the contributions of Pierre Bourdieu and Norbert Elias. These contributions are employed to address the gaps identified in the traditional media ecology approach, providing a more dynamic framework for understanding the complex and dynamic nature of media in contemporary society.

The study emphasizes three fundamental dimensions of media ecology that it seeks to reinterpret: the definition of its object of study, the extension of its semantic universe, and the evaluation of media types and effects, including contemporary platforms and advanced digital technologies such as AI. Firstly, the paper redefines the object of study of media ecology, moving beyond the analysis of media as mere tools for human agency. Bourdieu's field theory enriches this understanding, providing a lens to view media as arenas where battles for dominance, representation, and cultural capital create fluctuating states of order and disorder.

Secondly, the paper expands the semantic universe of media ecology by drawing parallels between the physical/natural and communicative/media dimensions. This expansion is informed by the ecological perspective, which incorporates notions of adaptation, toxicity, pollution, and survival. The paper argues for a nuanced understanding of media as environments that individuals navigate, influenced by power struggles and hierarchical dynamics. As agents of change, they can either contribute to social cohesion or fragmentation, highlighting the dual role of media in creating and resolving entropy within the communicative ecosystem.

Thirdly, the evaluation of media types and effects is revisited, focusing on how media and platforms construct, convey, and influence content. The paper analyzes the impact of media on individual perception, behavior, and opinions, considering how the interplay of forces within social fields affects cultural production and power distribution. This analysis is enriched by Elias's figurational sociology, viewing media and digital platforms as part of a reticular configuration in constant flux, shaped by ongoing tensions and structural changes, thereby either reinforcing established orders or contributing to their dissolution.

In conclusion, the paper posits that by combining the environmental, field, and figurational perspectives, a more current conception of a composite and dynamic space can be referenced. This habitat, wherein media logic acts as an ecological principle, conditions or generates practices and processes, is shaped by the ongoing mediatization of society. Media, in this sense, are not only instrumental but transformative, modeling every aspect of social interaction. Consequently, the scope of media ecology itself is potentially amplified, suggesting its plausible transformation into an ecology of mediatization. This proposed evolution reflects the pervasive and integral role of media in shaping contemporary societies, advocating for a reconceptualization that recognizes media as complex, multifaceted systems with far-reaching ecological implications.

MED02 Theoretical and methodological insights

PP 0146 Mythological analysis of the AI media narratives: A comparative approach

[Ionel Barbalau](#)¹

¹ University of Bucharest, Doctoral School for Communication Sciences, Bucharest, Romania

Context

Lately, Artificial Intelligence (AI) seemed to have been increasingly a disruptive subject, generating constant media scrutiny, public debate, and controversy, implicating from some the biggest names in technology to Scientifics and various experts, journalists, and political actors alike.

Far from being fully understood in its scientific-technic essence, and far too technical for a simple public understanding, AI mediatization seems to be privileging series of rather similar narratives with the intention to explain, and to bring order into a symbolically distressed collective imaginary, in searching for meanings.

Objective, Research Questions & Methodology

This paper aims to analyze the media narratives about AI from an anthropological perspective, further focusing on identifying mythological manifestations and constructions present in the media discourse, in a comparative approach of main UK and French national newspapers.

We are interested in **which are the major, dominant mythological structures** of media narratives about AI, but also in **how /or if these symbolic constructions and representations may differ**, depending on the specific media discourse language/cultures. We seek also **which are the main discourse strategies** used to define AI in media narratives, and **how their usage may differ** in the reference corpuses.

We will be following 2 theoretical approaches:

- a media anthropological interpretation of media narratives about AI. According to this approach, "mass media continue in modernity the functions, contents and social prestige of the myth" (Coman, 2003);
- an identification of specific mythological structures defining AI myth present in media narratives, from the perspective of structural, symbolic, and interpretive anthropology and cultural analysis.

Through qualitative content and discourse analysis we will identify the major themes, the dominant symbolic structures of AI media narratives. Following the application of an anthropological interpretative analysis model inspired by Greimas, Levi-Strauss and Geertz, we will be mapping the manifestations of the modern AI myth in its different forms present in the media narratives, then we will be comparing the specificities of these findings in relation to our English (UK) and French corpuses.

Corpus

Relevant UK and French main quality national media articles covering 2 major 2023 AI related events:

- the Future of Life Institute open letter about AI impact on humanity – March 22, 2023;
- the OpenAI employee's announcement / open letter – November 22, 2023.

Conclusions / expected results

Both French and British Media narratives about AI are prone to reveal archetypal, mythological symbolic structures which we believe will be rather similar for both reference analysis corpuses, despite language and [superficial] cultural differences. Far from resuming at or preferring scientific, technical discourse, narrative sources will try to offer sense and understanding rather than just informing about the disruptive AI controversy, by appealing to deep social and cultural symbolism, cultural meta-narratives and master-myths. This narrative approach is of paramount importance in relation to the collective imaginary regarding AI, directly influencing its social acceptance or rejection. Finally, the AI media narrative will reveal that it tends to appeal to the public's emotional understanding, rather than to its rational thinking.

Keywords: *artificial intelligence, media narratives, myth, anthropology, comparative analysis.*

MED02 Theoretical and methodological insights

PP 0147 Social actors' implicit theories about the media and its impact as a transmission belt and a yardstick of mediatization

Gerrit Philipps¹

¹ Heinrich Heine University Düsseldorf, Department for Social Sciences, Düsseldorf, Germany

This theoretical contribution seeks to illustrate how mediatization research can benefit from taking up social actors' implicit theories about the functionality of the media and media effects as an analytical point of reference. From an institutional perspective, mediatization can be understood as a process through which other social institutions, such as politics or religion, become dependent on and influenced by the media and its logic (Hjarvard 2008, 2012). This concept is the subject of a diverse theoretical debate and the foundation of a constantly growing body of empirical studies. It has been pointed out that mediatization is spurred by social actors' attempts to use the resources of the media for their own purposes (Hjarvard, 2014; Marcinkowski & Steiner, 2014). However, a central question remains as to why, for example, political actors increasingly rely on media visibility to achieve their goals (Marcinkowski, 2014). Here, it is argued that this question can be addressed by analyzing social actors' presumptions about a) how the instrumentalization of the media and its resources can contribute to achieving their objectives and b) how they therefore have to adapt to media logic.

The premise of this approach is that media-related behavior of social actors is not a natural reaction to supposedly objective circumstances but instead based on a subjective ensemble of axiomatic, causally linked presumptions about the functionality of the media and its impact. Such implicit theories can not only explain why actors make use of the media and their resources and adapt to media logic but also reveal how, when, and to what extent they do so. Accordingly, actors' implicit theories about the media and its effects are both a transmission belt and a yardstick of the mediatization of social institutions. The suggestion to conceptualize and investigate mediatization as a process mediated by perceptions and interpretations of social actors has been introduced previously. This idea can also be found in the concepts of *mental mediatization* (Marcinkowski, 2014), *media orientation* (Kohring et al., 2013; Wonneberger & Jacobs, 2016), and *perceived media logic* (Nölleke & Scheu, 2018). The recourse to the concept of implicit theories does not contradict these considerations but builds on and combines them. Thereby, this approach does not just focus on certain perception variables (e.g., presumed media influence) but captures the presumptions underlying media-related behavior and adaptation to media logic in their actual complexity. Furthermore, examining the consequences of media-related behavior based on these implicit theories can reveal substantial consequences of mediatization in relation to their cognitive causes. Comparing these consequences with the presumptions of social actors provides the possibility to uncover systematic distortions of perception regarding the functionality of media and media effects.

Empirically, implicit theories of social actors can be meaningfully assessed using in-depth qualitative interviews. The practical research benefits of this theoretical approach will be discussed at the conference based on an exemplary study on the mediatization of political lobbying.

MED03 Mediatization in conflict and politics

PP 0251 Mediatization of politics – Toward a research model

Ewa Nowak-Teter¹

¹ Maria Curie-Skłodowska University, Department of Media and Communications Studies, Lublin, Poland

While theorizing on mediatization is well developed and rich in a variety of trends and patterns, methodological approaches to mediatization research are significantly less often the subject of academic debate (Couldry & Hepp, 2013; Hepp, 2013; 2020; Hepp & Hasebrink, 2018; Peruško, 2017; van Es & de Lange, 2020). Mediatization of politics is one of these most studied areas (within mediatization studies), forming an influential stream of research focusing on media-related interdependencies that explain public, political, and electoral transformations (Strömbäck, 2008; 2014; Strömbäck & Esser, 2017; Kissas, 2019). The application of methods typically used in media studies (e.g. content analysis) can be a starting point for certain facets of mediatization phenomena, but they are not sufficient if we want to investigate the process of media-related political change more deeply (Ekström et al., 2016). What we need to study a particular area of mediatization is a set of methods applied in an appropriate configuration. The choice of methods and techniques depends on the research goal, but they should allow us to capture and explain the key moments and developments of mediatization phenomena. However, what is needed in the next step is the elaboration of a methodological framework, based on existing research experiences, in which certain models of investigation can be recognized and developed. Without aspiring to universalism, we aim to present certain methodological paths and good practices applied in high-quality studies on the mediatization of politics.

In this study, we aim to explore the existing mediatization of politics studies, especially considering empirical works that reflect mediatization processes in different national and temporal contexts. Based on the corpus of

mediatization studies in politics, consisting of the research articles collected through keyword searches in two academic datasets (Scopus, Web of Science, 2018–2023), we aim to (1) identify methodological paths (and good practices) applied in high quality mediatization studies in politics; (2) elaborate research models (based on existing experiences) that can be recognized and developed. The categories used to determine the model will include, among others: research approach (quantitative, qualitative, mixed); type(s) of method(s) applied (e.g. content analysis, discourse analysis, in-depth interviews, surveys, etc.); time and scope approach (cross-sectional, longitudinal, regional, global); subtopics within the mediatization of politics; related concepts (e.g. datafication, algorithmization, etc.). The expected results will reflect features of a research model that informs how mediatization theory is applied in empirical studies devoted to the field under observation. A preliminary observation, limited to journal articles, shows that in Scopus we can find 20 documents identified by the keywords search: mediatization AND politics AND methods (2018–2023). This observation may suggest that there is a need for more focus on the methodological side of mediatization of politics research.

MED03 Mediatization in conflict and politics

PP 0252 Celebrities go to war: The transformation of social media discourse in Ukraine during the full-scale Russian invasion

[Olena Zinenko](#)^{1,2}

¹ V. N. Karazin National University, School of Sociology- Media Communication Department, Kharkiv, Ukraine

² Center of East European and International Studies, Fellow researcher, Berlin, Germany

Prior to the full-scale invasion, celebrity culture in Ukraine was largely represented as a space for the production and promotion of entertainment content in genres accessible to the general public. Over the years, in the context of the information wars that Russia intensified after the collapse of the USSR, show business in Ukraine has, to some extent, also been a space for the full promotion of pro-Russian narratives. The election of the stand-up comedian Volodymyr Zelenskyy as president, the COVID-19 lockdown, and the full-scale invasion restructured the media landscape in Ukraine. At the beginning of the full-scale invasion on 24 February 2022, Ukrainian patriotic opinion leaders, as before the war in the Eastern part of Ukraine from 2014 onwards, continued with their usual agenda, while celebrities, who were previously uninterested in politics or social activism (with rare exceptions), showed a dramatic shift towards the patriotic agenda in their public communication, changing their language, narratives, value preferences, etc. The study **aims** to analyze the transformation of the social media discourse of Ukrainian celebrities during the full-scale military invasion in 2022–2023. I accept the Penfold idea that we are living in celebrity culture (Penfold, 2004) and agree that we need to understand and interpret it more broadly as it connects to social life and many social spheres (Marshall 2004, Driessens, Van Krieken, 2012). It goes to the problems that Couldry outlined as mediatization of mediation (Couldry, 2008). In understanding social media logic I refer to VanDijk's concept, which arose from Altheide & Snow's media logic theory. In this study, I focus on the social media discourse of celebrity culture and how it contributes to collective memory construction (Assman, 2004), in what meaning celebrities added to their meaning of "us" (Dhoest, 2005). To build an analytical model, I use discourse, event, and frame analysis to identify themes, actors, events, and narratives and describe communication patterns. The research is based on a sample of posts and comments on Facebook, Instagram, YouTube, Telegram, VKontakte, and TikTok with the geolocation 'Ukraine' and 'Not determined' considered, with the highest audience engagement coverage written between 24 February 2022 and 24 February 2024 (approximately 2.8 million posts gathered by YouScan program using semantic cloud request randomized, 1200 relevant (meaningful statements related to the war in Ukraine topic with mentions of celebrities) messages manually coded and analyzed. The preliminary analysis shows that despite the transformation in the rhetoric of the celebrities, their millions of followers are ready to change with them. They are cooperating with world stars in supporting Ukraine and they are attracting those who, before the war, had little interest not only in celebrities but also in politics and patriotic agendas. New influencers complement and change, if not destroy, the seemingly withered celebrity culture. Celebrity culture is changing and showing itself as an unpredictable field of new power, and this can be both an opportunity for democracy and authoritarianism. This study will provide some predictions on how it works.

MED03 Mediatization in conflict and politics

PP 0253 Digital diplomacy strategies in the mediatization of the Russian-Ukrainian war on Chinese digital social networks

[Zhuoran Ma](#)¹

¹ Université Grenoble Alpes, Laboratory GRESEC, ECHIROLLES, France

Introduction

This article delves into the nuanced strategies employed by countries with divergent stances in the Russian-Ukrainian war to shape public opinion on Chinese Digital Social Networks (DSNs). It explores the dynamics of mediatization by these nations and scrutinizes the responses evoked among the Chinese populace. The study elucidates how

Chinese DSNs serve as a battleground where digital diplomacy practitioners from conflicting standpoints grapple with countering strategies and vie for validation within the Chinese public sphere.

Methodology

The research gathered over 300,000 posts spanning from January 1, 2022, to August 31, 2023, from the Weibo platform, housing content related to the Russian-Ukrainian war. These comprised posts from involved embassies (Ukraine, Russia, US, France, Germany, and the European Union delegation in China), user comments, and broader discourse regarding the war. Methodologies encompassed automatic thematic analysis, sentiment analysis, and extraction of pivotal information from the involved countries' posts.

Furthermore, network analysis was conducted to comprehend the intricate web of reposts among digital diplomacy stakeholders and users. User participation in influencing strategies was assessed via sentiment analysis based on supervised learning and graphical semantic analysis of user comments, facilitating a comparative evaluation of diplomatic intentions versus user responses.

Analysis and Results

The findings revealed pivotal insights into the mediatization landscape. Firstly, digital diplomacy practitioners engaged in stiff competition, forming alliances among like-minded factions to fortify information aligned with their interests. However, the subsequent stage highlighted the limited impact of their strategies, evident in the constrained dissemination of their information within a comparatively small network. Users assumed a passive role akin to spectators, exhibiting heterogeneous opinions, largely independent of digital diplomacy players.

Moreover, the study elucidated the marginal influence wielded by digital diplomacy stakeholders on DSNs. The predominant currents of public discourse predominantly swayed under the influence of established influencers, overshadowing the diplomatic players' endeavors. Consequently, within the realm of profound mediatization, digital diplomacy confronts a fragmented, diverse, and individualistic discursive space, challenging their ability to assert substantial influence.

Conclusion

In conclusion, this research underscores the intricate dynamics of digital diplomacy strategies within the Chinese DSNs concerning the Russian-Ukrainian war. Despite concerted efforts by diplomatic entities to mold public opinion, their impact remains circumscribed amidst a complex, influencer-driven landscape. Understanding these dynamics is crucial for digital diplomacy actors aiming to navigate and assert influence within the evolving terrain of mediated public opinion.

MED03 Mediatization in conflict and politics

PP 0254 Mediatization of science: Academic evidence and public opinion on the Russian war in Ukraine

[Oleksandra Iaroshenko](#)¹

¹ National University of Kyiv-Mohyla Academy, Mohyla School of Journalism, Kyiv, Ukraine

In the contemporary landscape, media is reshaping every aspect, including science. Media serves as a mediator between scientific findings and the public, a consumer of science outside academia. Previous studies have explored the mediatization of science, examining its impact on scientific capacities, the shift in activities, and the alignment of science with media logic (Schäfer, 2014). Additionally, media is one of the instruments used to evaluate the worth of research conducted at academic institutions, ushering in a new era of research engagement in which the value of the study is given greater weight than its citation count. Growing public interest in science (Bauer, 2012) is evident in increased media coverage and diverse science-related publications and broadcasts. Academic institutions now lean towards media engagement, driven by the necessity to validate their societal relevance through the media. Therefore, accurate scientific reporting through news media plays a crucial role in shaping public opinion, attitudes, and decision-making. Understanding how media use research data and reference academic sources helps identify the simplification, sensationalization, and misinterpretation of scientific findings. When news outlets provide such material inaccurately, it can lead to false beliefs among the public. Moreover, accurate reporting of research data can protect public confidence in academic institutions and make it easier for the public to decide based on factual information.

This study examines a rapid rise (Ostapenko et al., 2023) in scholarly publications regarding Russia's war in Ukraine and their portrayal in the news media. Using bibliometric analysis and relational content analysis, this study investigates evolving communication patterns of science in media, highlighting the crucial need for maintaining information integrity. The results reveal cases where biased text is juxtaposed with authentic research citations, implying false correlations with genuine research facts, and selectively citing reliable sources, thereby significantly influencing public opinion. The study introduces new tools for identifying connections between research and news articles, assessing objectivity, considering diverse viewpoints, and evaluating information sources. It underscores the

importance of accurately reporting war-related issues, contributing to a well-informed society, particularly in the global discourse on Ukraine.

MED03 Mediatization in conflict and politics

PP 0255 The framing of the Russian war in Ukraine in the Italian media

Anastasiia Simashova¹

¹ Kamianets-Podilskyi Ivan Ohienko National University, Educational and Scientific Institute of Ukrainian Philology and Journalism, Kamyanets-Podilskyi, Ukraine

Italy is one of the EU countries that are regularly under the powerful influence of Russian information attacks. The full-scale military invasion of the Russian Federation in Ukraine in February 2022 caused a certain imbalance both in Italian society and in the media environment (Lami, G., & Sahota, S. (2022) and showed vulnerable places for the penetration of malign actors into the information space (Di Pasquale M., Germani L.S. (2023)). Attempts to investigate the media frames of the Russian-Ukrainian war in the European mass media have already been made (Chernov (2023); Pavlik, J. (2022); VRBA, P. (2022)) The purpose of the study is to analyze media frames regarding the coverage of the Russian-Ukrainian war in four most popular daily newspapers of Italy (“La Repubblica”, “Il Corriere della sera”, “Il Fatto Quotidiano”) in the first period of the war (the time frame encompassed February-May 2022) and to compare them. Applying the theory of news framing and agenda-setting (Goffman E. (1984); Entman (1991); Van Gorp V. (2005), De Vreese C. H. (2005); Tewksbury, D., Scheufele, D. (2009)) and using the method of traditional content analysis, this study inventories the frames used by Italian news outlet for providing news content about the Russian-Ukrainian war. The study identified frame packages for each of the analysed media, which will be presented in detail during the presentation of the research results. It was found that each of the Italian news outlets applies and follows particular frames in the coverage Russian-Ukrainian war. Some of the news frames, e.g. regarding the reasons of the war, US/NATO participation, the actions of the Ukrainian government, the figures of Putin and Zelensky in different media has different interpretation, in some cases they promote radically opposite definition and treatment recommendation for the item described. The frames of news publications of some of the analysed media partially or even completely coincide with the narratives of Russian propaganda, without being directly related to it. The results of the study will be useful during the study of media impacts in the formation of the public opinion of EU residents regarding the Russian-Ukrainian war by means of mass media, hybrid warfare and the impact of Russian propaganda on democracy.

MED04 Cultural and social impacts of mediatization

PP 0346 Datafication and cultural complexity: Navigating the tensions between institutional accountability, mediatized everyday creativity, and the arts

Sara Trentham-Black¹, Joan Ramon Rodriguez-Amat¹

¹ Sheffield Hallam University, Culture and Media, Sheffield, United Kingdom

This paper builds on the intersection of three contemporary dynamics: first, datafication, as a process that permeates everyday life with data (Hepp et al. 2018; Kitchin, 2014). Second, culture in its complex tension between institutionalised culture (cultural organisations) and the cultural dynamics extended in its increasing mediatization across social media platforms (Burgess et al. 2022); and third, the tensions between culture as a space for support, investment, and accountability, and culture as a space for artistic expression and creativity (Bennett & Belfiore, 2010; Durrer et al. 2019; Henley, 2016).

National cultural agencies deal with this triple tension in their efforts to curate, support, and nourish cultural activity, and to navigate accountability, the fallibilities of data (Pasquinelli & Joler, 2021; Schafer & van Es, 2017), and the uncertain terrain of a mediatized cultural sector. This paper explores how the policies and practices of the arts councils in England and Sweden deal with these tensions. It uses discourse analysis to identify 1) how the data from organisations is defined, shaped, and processed within the arts councils; and 2) how the documentation defines the relationship with those organisations, as well as how the data obtained from them generates implications.

expectations, and understandings about the work of cultural organisations; and 3) what implications these processes have, and how they shape the definitions of culture and cultural activity, subjacent in these forms of policy and documentation.

The cases of Sweden and England resonate in their claims to adherence to transparent, objective data, and the professed 'arm's length' relationship of the organisations, key cultural agencies and government as funder. Arts Council England, and the Swedish Arts Council (Kulturrådet), combined with other European examples of cultural management, will work as a sample to explore the ways government demands for accountability design the capture of data about culture, reflecting the disrupted, mediatized cultural environment; and how the complexity of the cultural sphere tenses with the demands for accountability and transparency of a datafied society.

MED04 Cultural and social impacts of mediatization

PP 0347 Privacy mediatized: Seeking for order in times of datafication

Jakub Nowak¹

¹ Maria Curie-Skłodowska University, Institute of Social Communication and Media Studies, Lublin, Poland

The paper's goal is to reconstruct sociopolitical implications of mediatized privacy as the sphere of realizing people's agency in datafied environments. By combining qualitative media sociology (the media as practice approach as elaborated in mediatization studies) and cultural studies perspective in media research (Roger Silverstone's double articulation of media), the paper analyzes the concept of privacy as media practices being one of the key spheres of how people position themselves against datafied – and increasingly unstable, fragmented, ambiguous – social structures. Within this approach, privacy is reconstructed as the phenomenon that is pursued by broad repertoires of everyday, mundane media practices that are context-related, collective, and never fully achieved. In this light, privacy may be seen as a lens exposing tensions of datafied societies: people seek to gain control over flows of their personal information and, by these often futile or compromised attempts, they perform their own "fights" for order their own being in the world.

The paper has a strong empirical foundation of qualitative methods divided into 2 research components: in-depth semi-structured interviews (IDI) with 30 activists working in the field of privacy and 12 focus groups (FGI) with 'ordinary citizens' (4–6 persons each). IDI are designed to reconstruct repertoires of privacy media practices performed by tech-savvy citizens and to reveal tensions of realizing agency in datafied social spaces. The interviewees' views and practices arguably differ from those realized by larger populations on an everyday basis. Their insight in the subject of the study, however, is crucial to recognize not only how privacy is understood, evaluated, or done by the most skilled, and politically aware, but also provides nuanced knowledge on tensions of how agency is realized in datafied societies. FGI are organized to reconstruct varied imaginaries and practices of privacy done by people of highly diverse sociological characteristics. The groups do not constitute a representative or statistically significant sample, they, however, represent a cross section of media users with divergent privacy imaginaries and practices.

Reconstructing repertoires and shared definitions of privacy – as I argue in the paper – contributes to learning the conditions, contexts, and practices of realizing agency against datafied, (dis)ordered social structures. In particular, I discuss 1) new tensions tied to datafication that escalate power-related pressures when privacy as becomes increasingly vulnerable; 2) various bottom-up responses to datafication: how algorithms-driven visibility (as a new predominant norm, practice, resource) is addressed. Here, by drawing on the Raymond Williams concept of culture as a whole way of life, a new concept is introduced and discussed: self-exposure as a whole way of life being both a hegemonic norm and common practice when people's mediated visibility is ongoingly demanded, negotiated and compromised.

MED04 Cultural and social impacts of mediatization

PP 0348 'POV: ur on TikTok'; Understanding the mediatized social worlds of teenagers

Emilie Owens¹

¹ University of Oslo, Media and Communications, Oslo, Norway

In her 2002 book *Young People and New Media*, Sonia Livingstone argued that there was a pressing need to understand the media environments of young people as different from those of adults. She suggested that young people were a "distinctive and significant cultural grouping... and one which often 'leads the way' in the use of new media." (Livingstone, 2002, 3) Over twenty years later, these arguments remain salient, if not heightened: the past two decades have witnessed the development and dissemination of digital media technologies which have galvanised the distinction between children, teenagers, and adults in terms of their media use. Research conducted in 2019, for example, indicated that only 20% of individuals under the age of 10 in the United Kingdom have their own smart phones while, by age 15, 90% of adolescents reported owning a smart phone of their own. (Ibbetson, 2020) Adolescents, or teenagers, thus make up a distinct category, both as media users and as individuals in relation to broader society. Individuals in this period of their lives are now the ones who 'lead the way' when it comes to new media and digital technologies; to understand how this works, and to what social end for those individuals in question, research is needed which explores the complex relationships among teenagers, digital media, and the broader realm of the social.

The proposed paper seeks to address this need by examining how the social worlds of young people are being constructed on, around, and with the digital video-sharing app TikTok through a constructivist mediatization lens. Mediatization is defined by Hjarvard (2013) as "the long-term, large-scale structural transformation of relationships between media, culture and society," (3) and the constructivist approach to mediatization research specifically attempts to trace how socio-cultural processes and practices are shaped by the ever-evolving set of communication tools and technologies available to us in the form of media. (Kopecka-Piech and Bolin, 2023; Lundby, 2014) Following the recognition by Couldry and Hepp (2017) that the social world is constructed with and through media, the aim of this work is to investigate how the specific social worlds of teenagers are constructed with and through the digital video sharing platform TikTok. Building on the existing scholarship of TikTok as an emergent and culturally significant short video platform (Boffone, 2022; Kaye et al., 2022), and following the recognition by Alice Marwick (2013) that "memes are the closest thing to a native culture form the internet has," (13) this investigation will be undertaken through an analysis of the POV ('point of view') meme on TikTok, which functions to express and share a distinct and relatable perspective across the app. The proposed paper thus inquires as to the role of TikTok in the articulation and construction of teenage cultures in the present day: what is the 'point of view' of teens living in such a digitally saturated and hyper-mediated present?

MED04 Cultural and social impacts of mediatization

PP 0349 Mediatization, classification, and exclusion. Borders and detention centres for migrants in Sweden

Miriana Cascone¹

¹ Södertörn University, Media and Communication Studies, Stockholm, Sweden

What do the three terms have in common? What is the thread that runs from one to the other? Mediatization, pervades every aspect of everyday life (Couldry, Hepp 2017); this has naturally changed the contours of society, by shifting boundaries and inserting new ones. However, for its ambiguous nature, a critical evaluation of the transformation to which mediatization has led becomes necessary (Kopecka-Piech, Bolin 2023), including the processes, meanings, and purposes with which it is used. This paper reflects on it, setting the analysis in a very specific context: borders and detention centres for migrants in Sweden. Migration, as an experience and its narration, has always been a mediatized event (Leurs 2023; Leurs, Smets 2020). Here, the focus is on the mediatization of borders through the adoption of technologies related to surveillance and biometric recognition systems, identification through computer systems that cross biological and behavioural characteristics with data acquired through databases and algorithms (Chouliaraki, Georgiou 2020; Madianou 2019). Digitization has led to the 'datafication of human mobility', making everything about migration measurable and quantifiable. After all, the human beings are classifier animals (Levi-Strauss 1962). This classificatory logic, which is in their nature, is today implemented by technologies, AI, platforms, datafication that in their place, divide, classify, in this case migrants into desirable and undesirable at the borders of a country (Leurs, Seufferling, 2021; Latonero, Kift 2018). Hence the exclusion, which, in this paper, takes on two different meanings. The first meaning represented is exclusion from a country. Migrants at the border are registered, controlled, and classified. If they are considered undesirable, they are excluded from a reception system and potentially detained for repatriation. The second meaning concerns more explicitly the mediatization from which migrants can be excluded. Here I will analyse the Swedish detention centres, which are highly mediatized spaces, equipped with surveillance technologies and where everything happens digitally. There are cards with personal information to move around the interior spaces, surveillance cameras capable of collecting and classifying

the behaviour of individuals in detention through algorithms. On the other hand, however, migrants detained in Swedish detention centres are not allowed to bring their smartphones, which must be handed in before entering the facility. Furthermore, while the entire system is completely digitised, decisions and official communications arrive to migrants in the form of letters. A return to paper, which only applies to them.

So, while we witness a rapid and pervasive mediatization of spaces, we can also see a kind of counter-mediatization of the individuals inhabiting those same spaces. In this sense, this paper argues that it is a mediatization that follows different speeds and directions. It will thus be demonstrated, not only the union that binds the term mediatization, classification, and exclusion, but also how they are almost incorporated into each other.

MED04 Cultural and social impacts of mediatization

PP 0350 A figurational territorial approach for studying domestication within the mediatized family

[Gaia Amadori](#)¹

¹ Università Cattolica del Sacro Cuore, Department of Communication, Milano, Italy

The domestic context represents the key site in which gender and generational differences are socially constructed in everyday life. In this process, media play a central role by either reinforcing or challenging the status quo, not without tensions and ambiguities. Indeed, the everyday domestication of ICTs (Silverstone, Hirsch & Morley, 1992) shows how patterns of media adoption are influenced by, and in turn influence, family culture and relationships, as defined by actors' gender, age, status, as well as their intersection (Crenshaw, 2017). This becomes particularly relevant in families with young children, where parents articulate hybrid mediation styles based on their parental cultures and technological imaginaries, while children negotiate, resist, or disregard parents' efforts to regulate their media activities (Mascheroni, 2014).

This research aims at providing a deeper understanding of media domestication within families with young children (0–8 years old) through the lens of a 'figurational territorial approach'. This interpretative framework understands families as communicative figurations (Hepp & Hasebrink, 2018) and focuses on the media territories (Tosoni & Tarantino, 2013; Tosoni & Ciancia, 2017), emerging from actors' daily media practices, to examine interactions between the family power structure and actors' strategies to negotiate it. This approach is fundamentally *non-media-centric* (Krajina et al., 2014) as it recognises the situated nature of domestication and mediatization (Mascheroni & Siibak, 2021), and *space-sensitive*, navigating the intersections between physical, technological, and social space (Venkatesh, Kruse & Shih, 2003).

Building on the constructivist epistemology of grounded theory (Charmaz, 2014), the study involved a longitudinal mixed-methods research comprising 3 waves of data collection among 20 families with children aged 0 to 8. Qualitative data from domestic observations, guided interviews, visual methods, and digital media diaries constituted the basis for a network analysis. This technique aims to materialise the mediatized relationships that underpin the articulation of media territories in the domestic context from a socio-spatial standpoint.

Building on its results, a dynamic model of media territoriality is presented. Four typologies of media territories (*institutionalised*, *hide-and-peek*, *hegemonic*, *latent*) plus an additional hybrid form (*latent institutionalisation*) are outlined, based on the degree of 'territorialisation' of the family media ensemble and the moral economy attitude towards legitimising the articulation of interdependent media territories within the figuration. The goal is to discuss potential misalignments between the family's and individual values, norms, and interests, which result in specific practices of territory management. This underscores the power negotiations intrinsic to the family configuration, crossed by coexisting centrifugal and centripetal forces along gendered and generational trajectories.

Therefore, the contribution helps to understand how power asymmetries are reflected in media domestication processes and reveal taken-for-granted patterns, which often mirror broader societal imaginaries. Moreover, this approach accounts for the triple articulation of media (Courtois, Verdegem & De Marez, 2013), overcoming some limitations of domestication research that underestimates the intersection between texts, artifacts, and the context in which they are situated (Livingstone, 2007).

MED05 Mediatization dynamics and resistance

PP 0466 Resisting an always-on society — A qualitative exploration of manifestations, motives, and consequences of digital resistance

[Kiran Kappeler](#)¹, Noemi Festic¹, Michael Latzer¹

¹ University of Zurich, Department of Communication and Media Research, Zürich, Switzerland

Our everyday life is marked by using the internet. Whether it is for searching for information on Google, entertainment on Netflix or TikTok, socializing on Instagram, or buying goods on Amazon, algorithmic curation of content leads to increasing time spent online. In [country blinded for review], the internet is used 5.6 hours per day on average (Latzer et al. 2023). Only few people consciously abstain from using digital media. Rather than so-called *have-nots*,

who do not have access to the internet, they are *want-nots*, consciously deciding against using digital services (Kappeler et al., 2021; van Dijk, 2020). In a society where using these services is the norm, not doing so can entail social exclusion (Baumer et al., 2015; Melton et al., 2019). Recent studies of non-use of digital media have concentrated on forms like digital disconnection or digital detox, that refer to shorter or limited forms of non-use (Lomborg & Ytre-Arne, 2021; Melton et al., 2019; Nguyen, 2021; Syvertsen & Enli, 2020). The term *digital resistance* refers to non-use as a political practice that is rooted in technology push-back and media refusal (Kaun & Tréré, 2020; Syvertsen, 2017). Digital resistance can therefore be understood as an active choice and behavior (Casemajor et al., 2015). The different forms that such digital resistance can manifest in, the motives for it, and the consequences it can entail have yet to be mapped. Therefore, we ask the following research question: *Who are the digital resisters and how do they resist digital media in an always-on society?*

We aimed to answer this research question by qualitatively analyzing semi-structured interviews with 16 adult internet users from various sociodemographic backgrounds. Our findings explore digital resistance by investigating manifestations of digital resistance, motives for resisting, and consequences thereof. First, we saw that manifestations of digital resistance can be understood on a continuum: Digital resistance ranged from *niche* resisters not using certain services like Facebook, but other services from the same corporation like WhatsApp, to *thorough* resisters, that did not use any services by Microsoft, Google or Meta at all. In some cases, resistance was *partial*, mainly due to lock-in effects: these resisters decided against using WhatsApp and switched to Signal, but their group chats remained on the former. In some cases, resistance was also *discontinued*, mostly due to impractical reasons and having to juggle several services. Second, our findings show that a central motive for resistance was viewing services as problematic because of surveillance practices, lack of privacy, data-monetizing practices, or monopoly position. Digital resisters were characterized by low trust in digital corporations, a wish for more regulation, and high internet skills. Third, we saw that unless digital resisters had an understanding social circle, a consequence was social exclusion. Besides that, mostly, digital resistance led to heightened self-empowerment and thus feeling better. By mapping digital resistance, this article contributes to a more in-depth understanding of this phenomenon. This user perspective contributes to a better insight into what not using digital media in a highly digitized society signifies.

MED05 Mediatization dynamics and resistance

PP 0467 Experiencing music media change in mediatized everyday life: Comparing the early phases of the appropriation of the Walkman and music streaming services

Jo Marie Dominiak¹

¹ University of Muenster, Department of Communication, Muenster, Germany

Music media are subject to constant change, which is reflected not only in the transitioning infrastructures and the emerging new media technologies, but especially becomes evident through the changing music reception within the users' mediatized everyday lives (Lepa & Hoklas, 2015; Prior, 2018; Tofalvy & Barna, 2020). While current changes due to streaming services such as Spotify seem to enjoy broader research (Datta, Knox, & Bronnenberg, 2018; Hagen, 2015; Johansson, Werner, Åker, & Goldenzwaig, 2018; Lüders, 2021), historical perspectives are often neglected. Following on from the mediatization approach (Couldry & Hepp, 2017; Krotz, 2017), extended by the concept of dynamics and persistence (Röser, Müller, Niemand, & Roth, 2017) the presentation will address how new music media is appropriated and how users deal with these transitions and music media change within their everyday lives. Building on the concept of *musicking* (Small, 1998), which accentuates the reception of music as a socially embedded set of ongoing practices, the project at hand focuses particularly on the early phase of media appropriation and, directly linked to the everyday context of the users, considers both dynamic changes through new music media as well as the persistence of established practices with music media already in use.

The insights derive from a PhD-project examining the Walkman, the CD, the MP3-Player and music streaming services as music media transitions. However the lecture will provide exemplary results on the Walkman and music streaming services and will therefore open up and compare recent, as well as historical perspectives. With the help of qualitative guided interviews that focus on the early phases of appropriation, a total of 18 music enthusiasts (aged 27 to 73) were questioned about their experiences of music media transitions.

The presentation will discuss the results along the following three categories:

1. *Media practices in the early stages of appropriation*: The emergence of new music media triggers change on a temporal-spatial, technological and social level but is particularly reflected in media practices such as collecting, discovering and sharing music.
2. *Significance of media technologies in the music media repertoire*: Each transition is closely associated with the media technological environment and causes shifts and new combinations in the media repertoire of users, especially with regard to streaming services (e.g. use of streaming services in combination with wireless headphones or smart speakers).

3. *Users' experience of music media change*: Music media change is experienced differently in the transitions examined. While the Walkman was perceived as a more continuous transition due to its close connection to the cassette, users considered the appropriation of streaming services to be a far more radical shift.

MED05 Mediatization dynamics and resistance

PP 0468 Communication: The blindspot of mediatization theory in the Era of Communicative AI

Göran Bolin¹

¹ Södertörn University, Media & Communication, Huddinge, Sweden

Mediatization theory has, in its Western European variety, either focussed on institutional relations, or, from a cultural-constructivist approach, on the media as parts of our everyday worlds (Lundby 2014). Mediatization theory in both these approaches, however, implies a focus on the role of "the media" in culture and society. Less focus has been put on questions of "communication" as a process. However, the fact that we are increasingly communicating with machines in our everyday lives in the affluent and technologically advanced parts of the world poses interesting questions for mediatization theory: how would we regard communication as a dialogical undertaking when one of the communicators is a machine? What types of understanding can we reach by human-machine communication? Is understanding dependent on two subjective or "autonomous selves" (Peters 1999) for communication to occur? How can we think about communication as transmission and ritual (Carey 1975) in the era of communicative automation?

Such questions should be of high relevance, and it should be important for mediatization theory to incorporate theories of communication more specifically in the debates, for example, by looking at other theoretical traditions such as human-machine communication and communicative AI. If the institutionalist approach focusses on the impact of social institutions on one another, and the social-constructivist emphasizes the phenomenological appreciation of the surrounding world, a communications approach can contribute with questions related to meaning-making, intersubjectivity, and understanding, that is, the more hermeneutic aspects of communication. This theoretical paper will explore some of these domains of inquiry in order to have communications theory inform and enrich mediatization theory. It will first address the question of meaning-making involving humans and machines. Secondly, it will focus on the distinction between communication as transmissions and ritual, and whether ritual communication is at all possible. Thirdly, it will discuss the relations between instrumental communication in human-human communication and human-machine communication. The paper then concludes with how these discussions can inform mediatization theory.

MED05 Mediatization dynamics and resistance

PP 0469 Mediatization of resistance: Exploring the dynamic network of the state and grass-roots actors in the pro-Ukrainian cyber army on Telegram

Kateryna Maikovska¹, Richard Canevez²

¹ University of Vienna, Department of Communication, Vienna, Austria

² Michigan Technological University, Department of Humanities, Houghton, USA

Russia's invasion of Ukraine in 2022 highlighted the role of social media as a liberation technology in the modern, highly digitized world. There is an established strand of literature on online protest organization and digital activism. However, Ukraine's resistance provides a new opportunity and context to examine the coordination of war-time resistance on social media. In this contribution, we add to the growing research of the anonymous platform Telegram and explore the structure of the Telegram-based pro-Ukrainian resistance network. We collected the data of the first two months of the full-scale war (from February 24, 2022, to April 24, 2022) from 16 Telegram channels identified through one of the co-author's familiarity with the pro-Ukrainian resistance network and snowball sampling. The first stage of our study used qualitative content analysis to identify a mixture of grassroots and state-initiated channels that coordinate various forms of cyber resistance, such as collective cyberattacks targeting Russian websites and informational operations targeting international companies, organizations, and politicians.

Here, we present research that continues our qualitative work through a social network analysis with Gephi. The network consists of the Telegram channels' reposts and links (N = 8868) toward various websites and social media pages (N = 7497) shared with the goal of cyberattack or information operations. The inter-channel tagging and reposting suggest that the resistance community is aware of its other members. We identify nine communities within

the network partly corresponding to their specific tactical repertoires. The largest community includes channels of various origins (grassroots, student-led, state-led channels), which implies the unity of vision among the channels. However, the network is generally loosely connected, with wide diversity in channel sizes and output. The dynamic analysis did not detect initiators of the link sharing, suggesting all channels performed their operations autonomously. However, different channels sometimes target the same groups of websites in one day and continue joint attacks on further groups of targets for several days in a row. It can signal that these operations are coordinated between the channels' administrators. Our research contributes to the growing literature on war mediatization as an increasingly participatory phenomenon. It provides insights into creative and impactful ways social media users utilize platforms as a form of digital resistance.

MED05 Mediatization dynamics and resistance

PP 0470 The office as a reflection and projection of social change

[Christian Oggolder](#)¹, [Caroline Roth-Ebner](#)²

¹ Austrian Academy of Sciences / University of Klagenfurt, Institute for Comparative Media and Communication Studies, Vienna, Austria

² University of Klagenfurt, Department of Media and Communications, Klagenfurt, Austria

Spaces are the result of communicative and social action (Christmann et al., 2022: 3). Accordingly, the conditions for this action are also subject to historical changes. In this sense, industrialization has created two different areas of social life that were previously undifferentiated and interwoven: the private and the public (Taylor, 2004: 101). These areas of life are increasingly amorphous as a result of mediatization (of work) as well as further meta processes like globalization and individualization. This also applies to the office, which is now in a field of tension between the tendencies of the dissolution of well-known structures and its own local reorganization (Matsushita, 2021).

In the course of digitalization and the ubiquitous availability of the internet, digital media have taken on functions of the traditional office in the contemporary company and made work available regardless of location in the service of efficiency (Roth-Ebner, 2022). In this, however, work is by no means placeless. Instead, places are now used more flexibly, and new places for and new forms of work are being created simultaneously (Will-Zocholl & Roth-Ebner, 2021). Manifestations for this development range from hoteling to home office to working on vacation ("workationing"). The architectural solutions operate under fancy concepts such as Open Space or Multi-Space Offices, Smart Offices, or New Work Offices. These arrangements imply propagated ways of working and subject forms that arise in interrelation with social and cultural norms and economic conditions.

Both the historical conception of work and its spatial organization as a result of communicative and social action reflect and project social change. This paper addresses different historical conceptions of work and their spatial conditions to discuss the current transformation of work and the office's spatial manifestations in the digital age. By examining the current disruptions in the realm of work from a historical perspective, we can contribute to better assessing and evaluating these changes and their long-term societal implications.

OSC01 Sustainability and trust

PP 0094 Strategic communication for sustainable change: Introducing 'corporate environmental efficacy' as an organizing principle

Markos Mpadanes¹, Alexandra Schwinges²

¹ University of Zurich, Department of Communication and Media Research IKMZ, Zurich, Switzerland

² University of Amsterdam, Amsterdam School of Communication Research ASCoR, Amsterdam, Netherlands

The human-made climate crisis has become the severest threat to all living creatures and biodiversity. Multinational corporations, in particular, are responsible for a vast amount of carbon emissions (Steenbergen & Saurav, 2023) and, thus, bear a special responsibility regarding several environmental, social, and governance (ESG) aspects. The EU (2022) instituted the corporate sustainability directive, mandating corporations to provide extensive information through ESG and sustainability reports, which aligns with strategic communication's objective of informing and shaping public discourse, policy, and perceptions (see Zerfass et al., 2018). Ultimately, it is for corporations to communicate to various audiences they are effective in sustainable transformation.

Being dependent on approval not only from consumers/shareholders but also from any party interested in/affect-ed by their business, corporations need to engage in constant dialogue to ensure their organizational legitimacy (Suchman, 1995). Consequently, corporations must strategically communicate how they effectively address the needs and expectations of society to maintain their social license to operate (van der Meer & Jonkman, 2021). Convincing audiences to be capable of addressing ESG issues is crucial for corporations. Such (environmental) efficacy beliefs have long been recognized in social psychological research on intentional behavior (see Bandura, 1977) but have not yet found their way into strategic sustainability communication research. By introducing this concept, we propose a vital and innovative analytical tool that empowers strategic communicators to articulate their objectives in shaping stakeholder perceptions in a participatory process.

With this theoretical contribution, we introduce the concept of 'corporate environmental efficacy' as the belief among stakeholders that a corporation is capable of engaging in sustainable change. We lean on and synthesize different strands of literature to translate the concept of environmental efficacy into a corporate setting. Efficacy beliefs are vital for sparking pro-environmental behavior (PEB) and comprise the notion of capability (efficacy) and effectiveness (outcome efficacy) of engaging in PEB (Bandura, 1977). Meijers and colleagues (2023) introduced a self-collective-governmental efficacy typology, integrating collective and governmental institutions as important reference points in climate action. However, the role of corporations has so far been neglected.

Corporate interest-holder self-efficacy describes the belief that one is capable in the corporate realm concerning the environment. Corporate communication efficacy labels the belief that a corporation will respond to citizens' demands concerning the environment, thus bridging literature on CSR (Kuokkanen & Sun, 2020) and stakeholder communication (Crane & Livesey, 2003). Lastly, corporate environmental outcome efficacy describes the belief that a corporation's actions are effective in realizing a pro-environmental outcome.

In strategic sustainability communication, new norms are cultivated (Weder & Eriksen, 2023). These social norms are not only closely related to efficacy, but both drive sustainable change (Barth et al., 2016). Hereby, corporate efficacy beliefs build capacity (Weder & Eriksen, 2023) by considering individuals as active actors in communicative processes for sustainable change. Thus, the concept is inherently participative and organizational, as the stakeholder is considered a participant in the negotiative and transformatory process. We conclude our theoretical contribution by suggesting avenues for future research based on corporate environmental efficacy as an organizing principle.

OSC01 Sustainability and trust

PP 0095 Introducing 'Trustless Strategic Communication': Navigating the communication landscape amidst misinformation and technological evolution

Aviv Barnoy¹

¹ Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

In an era of misinformation and a growing cynicism towards experts and institutions, a critical reassessment of the role of trust in communication is needed. This paper seeks to address this imperative need by introducing the concept of "Trustless Strategic Communication," offering an innovative framework that promotes reliance even in the absence of traditional trust. Drawing inspiration from the realms of "trustless technology" and the concept of "reliance without trust", this paper endeavors to synthesize these models into a cohesive one and introduce an alternative communication dynamic.

The origin of trustless communication lies in the realm of trustless technology, specifically in blockchain protocols and advancements in cybersecurity. The foundational principles of trustless technology, such as double verifications and decentralization, originally developed to mitigate risks in financial systems, establishing a framework that minimizes reliance on trust. The philosophical underpinning of *reliance without trust* further informs the exploration of scenarios

wherein individuals act based on the words or actions of others without necessarily conferring benevolence or competence upon them – the two inherit antecedents of trust.

To contextualize these theoretical underpinnings, the paper embarks on an exploration of interdisciplinary perspectives on trust. This encompasses an in-depth analysis of the dynamics governing trust in relationships between media professionals, ranging from traditional PR-journalist interactions to the evolving influence of social media. Key debates are examined, including the shift from institutional trust to reliance on individual strangers and the nuanced role of trust in the relationship between social media influencers and discerning Gen Z audiences.

A critical lens is then turned towards examining perspectives where trust may be perceived as a burden rather than an asset. This leads to the conceptualization of *trustless strategic communication* as a strategic approach that acknowledges the limitations and risks associated with conventional trust-based models.

In the empirically informed part of the study, two case studies are explored. The first scrutinizes the communication challenges amidst the Covid-19 pandemic, unveiling the intricacies of disseminating information during a global crisis. In the second, the paper explores the communication actions of a businessmen whose reputation shadows the reputation of his businesses: Elon Musk

The paper concludes with a contextualizing discussion, extending beyond the analysis of contemporary challenges to proactively consider present and anticipated changes in strategic communication. Special attention is given to the imminent advancements in AI technologies and their potential impact on communication dynamics. This comprehensive and forward-looking guide not only unravels the complexities of strategic communication in our fast-evolving world but also provides practical insights and recommendations for navigating these intricacies. In doing so, it offers a valuable resource for communication practitioners and policymakers.

OSC01 Sustainability and trust

PP 0096 'What if you can't walk the talk?': How can a company with a non-sustainable business model communicate sustainability?

Bárbara Costa¹, Alexandra Leandro²

¹ Polytechnic Institute of Leiria, School of Education and Social Sciences, Leiria, Portugal

² Polytechnic Institute of Coimbra, School of Education / CEOS,PP-Coimbra / CECS-UMinho, Coimbra, Portugal

Currently, companies must navigate in a society increasingly focused on sustainability. Corporate Social Responsibility (CSR) has been on the social and political agenda over the last decades, with European and international programs such as the 2030 United Nations' Agenda for Sustainable Development. Additionally, the urgent climate crisis is calling out for companies to challenge current business and economic models and follow scientific recommendations.

Since the 1960's, society and stakeholders have increasingly demanded more from organizations to act and communicate in a way that benefits not only them, but the entire social and environmental system. Communicating some level of CSR has become not only a societal but also a legal obligation. Stakeholders, increasingly informed and demanding, push companies to continue strengthening their CSR activities and communication, while international programs demand companies to take responsibility for sustainable development.

However, there are still companies that do not align with the defined parameters of sustainability due to the nature of their business model, that is considered inherently socially, environmentally or economically unsustainable. Companies whose core business is set upon products or services that inevitably create an environmental or social imbalance. Then, is it possible for those companies to communicate sustainability? And if so, is this communication really responsible, or is it considered greenwashing?

To answer this question, a qualitative methodology was selected, resorting to two research instruments: interviews with company representatives or communication professionals; and documental analysis on companies' sustainability reports, since it's one of the main formal communication tools of social responsibility and sustainability. The sample is characterized by three companies with an unsustainable business model, in the energy sector, textile sector (fast fashion) and financial sector.

Through the reports we are able to determine the companies' practices and channeling of investments in the areas of sustainability and social responsibility. On the other hand, in the interviews, we can clarify discursive inconsistencies regarding the practices reflected in the reports, intentions and the idealization of Social Responsibility communication.

The ultimate goal of the study is to find out which areas unsustainable companies invest more in communication and practice, and whether this is compatible with the Social Responsibility Communication guidelines that emerged from previous research (Costa & Leandro, 2023; Viererbl, & Koch, 2022).

Keywords: Communication; Social Responsibility; Sustainability; Greenwashing.

PP 0097 Sustainability Manager as Curators of Change: A typology of job profiles in the field of Sustainability, CSR, DEI and ESG Management related to required communication competences, green skills and agency

Franziska Weder¹, Manuel Harm², Florentina Höhs²

¹ University of Queensland, School of Communication and Arts, Brisbane, Australia

² Vienna University of Business and Economics, Department of Business Communication, Vienna, Austria

Purpose / Objectives

Sustainability and climate protection are becoming increasingly important for companies, as well as political institutions, NGOs, or educational and cultural institutions. This constant change in our society also impacts the job market. In recent months and years, numerous new professional roles have emerged, and sustainability management, as well as environmental, sustainability, CSRm DEI or ESG reporting, is no longer solely located in the communication department but has reached the 'C-Suite,' attaining a strategic and management level.

But what exactly defines these professions where environmental and climate protection, sustainability, innovation, and transformation play a significant role? What qualifications are expected for these new job profiles, what (communication) competencies are in demand, and what definitions of sustainability, CSR, DEI and ESG management are represented in these professional profiles or in the corresponding job advertisements?

Study / Conceptualization

In the project at hand, we address these questions from a communication perspective, conceptualizing Sustainability, CSR, DEI and ESG Managers in business settings as communicators who enact communication with two methodological approaches, delving into the Austrian market and, furthermore, in the European neighboring countries, including Germany, France, Switzerland, Poland, Romania, Croatia, and comparing the typology developed from the data with job descriptions in the USA and Australia/NZ. The empirical analysis involves a statistical analysis of actual job advertisements from the largest job portals as well as LinkedIn in two languages (English & German) (Nov./Dec. 2023) and the full greenjobs.de-database (2014–2023) to study changes over time. This was complemented by a series of interviews with role holders (n = 25 per country), conceptualized as semi-structured interviews (Bryman, 2016, Schmid, 2004). The job ads and the interviews have been treated as text material that we analyzed with an inductive category formation, following the research questions. We chose this question-led approach used in qualitative content analyses using the open access analysis web-tool QCAmap (Mayring, 2019; Fenzl & Mayring, 2017).

Findings / Originality

The job announcements give a clear picture of how *sustainability management* emerged as new profession over the years (2014–2023) and how it moved from communication departments to strategy, innovation and management departments. However, green skills and communication competences are increasingly articulated as requirements for all kinds of transformational roles in organizational contexts. Roles like 'Chief Sustainability Officers', 'Sustainability' and 'ESG Managers', or other 'green jobs' show the value of strategic communication for jobs related to what is called sustainable development, societal transformation or global change. The paper complements the debate around skills and professionalization in business and corporate communication and adds to broader discussions about role responsibility, agency, and authorship related to public conversations in an age of social change, global crises and a massively changing environment. Thus, the study answers the core question of what role communication competences play in these emerging new roles and shows that it's crucial to adapt education and training programs at universities, colleges, and academies in the future.

OSC01 Sustainability and trust

PP 0098 How do organizations responsible for green energy projects employ strategic communication to legitimize such projects? A quantitative content analysis

Bernadette Uth¹, Julia Lührmann¹, Helena Stehle¹

¹ University of Münster, Department of Communication, Münster, Germany

Public discussions regarding energy projects (i.e., infrastructure projects for the generation or transmission of electricity such as biogas or solar plants) are among the most intense (Schweizer et al., 2016¹). Challenges—such as perceived risks, the ‘not in my backyard’ phenomenon, and controversial media coverage—characterize these discussions and increase the pressure on involved organizations and decision makers from business, politics and society to communicate (Latapi Agudelo et al., 2020²). Organizations in the energy sector thus must engage in the public debate and communicate about their intentions, plans and efforts in order to build legitimacy. Legitimacy refers to the fundamental acceptance of an object (e.g., an organization or a project) by its environment (e.g., an organization’s stakeholders) and is the result of a process of perception, evaluation and attribution on the part of this environment (Bartlett & Hurst, 2021³). Legitimacy is a prerequisite for organizations and for the planning and implementation of energy projects (Authors_anonymized_a). Research on legitimacy as a goal of strategic communication categorizes different types of legitimacy and different modes of influence (in particular in the form of discursive communication strategies) that can be used to build, maintain, or restore legitimacy (e.g., Crumley et al., 2021⁴). However, thus far, only little is known on how organizations in the energy sector actually communicate in order to build legitimacy, which types of legitimacy they aim for and which modes of influence and legitimacy strategies they use in doing so. To address this research gap, we ask: *How do organizations from politics, business and society involved in or responsible for energy projects communicate with citizens to legitimize these projects?*

To answer this question, we conduct a quantitative content analysis that examines the strategic legitimacy communication of such organizations directed at affected and interested citizens. We examine green energy projects in one German region (anonymized for review), where climate change and mitigation are seen as a key and urgent challenge. Two projects were selected as case studies (a wind farm and an extra-high voltage bulk power line) that are both the subject of particularly intense debate and of extensive strategic communication by those responsible. For both projects, key written communication materials from the responsible organizations that address citizens (e.g., project website, blog posts, newsletters, flyers) are examined. Due to the large amount of material, we drew a random selection based on the full sample. The main categories of the quantitative content analysis are the discursive legitimization strategies used by the organizations, objectives, topics, and stakeholders of the strategic legitimacy communication, and the type of legitimation sought (pragmatic, moral, cognitive).

The analysis is currently underway and will be completed by the time of the conference. At the conference, the results of our study and their implications for the strategic communication of energy projects by responsible organizations are presented and discussed. In doing so, we contribute to strategic energy communication research and practice by providing further insights into how organizations communicate green energy projects to legitimize them.

OSC02 Corporate activism and diversity

PP 0197 How important are Fundamental Civil Rights as an aspect of Corporate Sustainability Communication? A comparative content analysis among German organizations on their CSR, SDG and ESG reporting practices

Florian Haumer¹, Oliver Hellriegel², Castulus Kolo¹, Holger Sievert³

¹ Macromedia University GmbH, Faculty ‘Culture – Media – Psychology’, Munich, Germany

² Macromedia University GmbH, Faculty ‘Business – Design – Technology’, Leipzig, Germany

³ Macromedia University GmbH, Faculty ‘Culture – Media – Psychology’, Cologne, Germany

Not least the political developments of recent years and even months have made it abundantly clear how central and important the issue of fundamental civil rights is since the world finds itself in many ‘social disorder’, according to the ECC conference title. This applies not only to the area of political debate but also to Corporate Communication which links to ‘communication’ aspect of the congress title. According to the OSC section call for paper for this conference, ‘organisations are increasingly called upon to address socio-political challenges by means of corporate citizenship, corporate activism, corporate social responsibility, sustainability plans, ESG initiatives, or even adopting a B-corporation status’.

This study conducted a quantitative, comparative content analysis of n = 242 different types of organizations’ reports to examine CSR-reporting practices across various organizations (n = 103). Among them, there were five

ESG Reports, two CSR Reports, 83 Sustainability Reports, 61 Annual Reports, eleven Non-Financial Reports and 80 Corporate Websites. We aimed to systematically evaluate the content and quality of sustainability-related reports and documents produced by different types of entities, including DAX/MDAX companies, large non-DAX companies, public sector organizations, churches, non-governmental organizations (NGOs), and large family businesses. We employed a deliberate selection strategy to ensure our sample's quality and comprehensiveness. The criteria for inclusion were carefully chosen to capture a wide range of organizations with varying characteristics.

As the results show, there are surprisingly few differences in the overall sustainability communication regarding fundamental civil rights. Interestingly, our results revealed considerable variations in the importance of fundamental civil rights as a matter of Corporate CSR reporting among different sectors as well as different types of organizations. It appears that DAX 40 companies deal most intensively with fundamental civil rights, while family-owned companies attach significantly less importance to the issue. Such differences could be explained by different legal requirements for general reporting or by different levels of professionalization regarding CSR reporting. However, Family Businesses are still concerned with fundamental civil rights, although they have a different focus within the topic ("own workforce"). In the group-specific analysis of the various sectors, it is noticeable that some sectors strongly outweigh fundamental civil rights-related topics in their CSR communication ("Manufacturing," "Finance, Insurance, Real Estate"). At the same time, it is clearly underrepresented in other sectors ("Construction," "NGO / Churches"). In principle, such differences in content would be explained by the general requirements of the legislator for CSR reporting. However, it is unclear why fundamental civil rights should not be a relevant topic around "Construction" or "NGOs" – instead, the opposite seems to be true. This result should therefore be tested in further investigation.

Nevertheless, our findings hopefully contribute to a comprehensive understanding of sustainability reporting practices across diverse sectors and organizations regarding communication on fundamental civil rights. We hope that we could fill the above-described blind spot on fundamental civil rights-related research in this context at least a little bit. In this context, communication might help to change some social disorder from the conference title into much more fundamental civil rights oriented social order.

OSC02 Corporate activism and diversity

PP 0198 Corporate activism in contemporary Portugal: Perspectives from public relations and strategic communication professionals

[Evandro Oliveira](#)¹, [Sónia Sá](#)¹

¹ Universidade da Beira Interior, LabCom Research Center, Covilhã, Portugal

European countries are experiencing changes in deliberate democracy, with the fragmentation of the public sphere and the polarisation of political discourses. With a weaker public sphere and media landscape, the need for other social actors becomes evident. In this context, organisations that don't traditionally take a stand on social issues are becoming more active.

Corporate activism, a phenomenon where companies engage in socio-political issues, has become a subject of significant discourse in academic circles. This form of activism involves corporations taking public stances on various social and political matters, often aligning themselves with causes that resonate with certain societal values. However, the concept of *rhetorical washing* has emerged as a critical lens through which to analyse these corporate engagements. Rhetorical washing refers to the potential exploitation of socio-political issues by corporations to enhance their public image rather than genuinely contributing to societal progress. Companies may adopt a discourse of social responsibility without substantive action, leading to scepticism about their authenticity.

There are also risks associated with corporate activism, as taking positions on controversial issues can polarise stakeholders and consumers. While some believe that companies have a responsibility to use their influence for positive change, others warn of the potential damage to companies' trust and/or reputation if they become involved in polarizing discussions. Striking a balance between genuine engagement with societal issues and avoiding the pitfalls of mere rhetoric is a complex challenge that requires careful consideration at the intersection of the corporate and socio-political spheres.

This research explores the landscape of corporate activism in Portugal, focusing on the perceptions, experiences and opinions of public relations and strategic communications professionals. Through 100 expert interviews, followed by five in-depth interviews, this exploratory research captures valuable insights from professionals directly involved in shaping and communicating corporate narratives. Through the lens of PR and strategic communications professionals, it explores the opinions and expressions, the motivations behind corporate activism initiatives and the integration of social responsibility into overall communications strategies. The analysis and interpretation of the data is embedded in an effort to contextualise the Portuguese reality within broader trends in corporate activism at a global level.

Key themes emerging from the interviews include the delicate balance between authenticity and perceived opportunism, the role of cultural and historical factors in shaping activism narratives, and the challenges of aligning corporate values with societal expectations. It also considers the ethical issues and mechanisms of *corporate hypocrisy* and/or manipulation. By analysing perceptions and practices within the field of public relations and strategic communication, this study contributes to a nuanced understanding of how organisations in Portugal navigate the intersection of corporate activism and effective communication; as well as revealing the specific case of a Southern European country with its *ryzhomes* that influence socio-communicative practice and the shades of legitimisation processes within it.

OSC02 Corporate activism and diversity

PP 0199 A global comparison of organizations' strategic diversity communication on social media using a supervised machine-learning approach

Joep Hofhuis¹, Lorenzo Cupri¹, Pytrik Schafraad²

¹ Erasmus University Rotterdam, Media & Communication, Rotterdam, Netherlands

² Tilburg University, Communication and Cognition, Tilburg, Netherlands

Workplace diversity has become an increasingly important topic for both scholars and practitioners in organizational communication. In recent decades, we have seen an increase in the prevalence of diversity-related messages by organizations, for example in annual reports, websites, and social media. This increase of strategic diversity communication has been found to lead to positive increases in public perception of the company and a positive reception by the shareholders.

Most previous research on strategic diversity communication was conducted in Western countries. As a result, we have not been able to systematically compare the prevalence and type of diversity-related messages across the globe. This study aims to fill this gap, comparing the different approaches to diversity communications in cultural clusters from around the world (clusters are based on House et al., 2004; Mensah & Chen, 2013). The research question posed was: How does diversity communication on companies' Facebook accounts differ across cultural clusters?

We performed a large-scale content analysis of multinational companies' (n = 151) Facebook posts (n = 786.156), taken from their different national and regional accounts. The Facebook posts were analyzed through an automated content analysis tool (DivPSM) which uses supervised machine learning to identify the presence of diversity communication on social media. DivPSM is also able to code whether the post mentions racial/ethnic/cultural diversity, gender diversity, or LGBTQ+ diversity. Furthermore, it examines whether the post makes use of specific diversity perspectives: the Moral, Market, and Innovation perspectives (Ely & Thomas, 2001).

Results show that LGBTQ+ diversity communication is the most prevalent around the globe, followed by gender diversity and racial/ethnic/cultural diversity. We also see that the Moral Perspective is most common, followed by the Innovation Perspective and the Market Perspective.

Comparing cultural clusters, we see that high rates of diversity communication are not only found in Western countries. While the overall average rate of diversity communication is about 9.8%, it was found to be higher in the Anglo-Saxon (11.8%), Latin American (23.3%) and Middle Eastern (12.7%) clusters. LGBTQ+ diversity communication shows above average (62.8%) rates in the Eastern European (88.4%), Latin European (77.1%) and Middle Eastern (90.2%) cultural clusters. This coincided with above average (41.8%) use of the Moral Perspective in the Eastern European (65.4%) and Middle Eastern clusters (64.3%).

OSC02 Corporate activism and diversity

PP 0200 Exploring strategies for positioning communication departments in organisations in times of social (dis)order

Jana Brockhaus¹, Ansgar Zerfass^{1,2}

¹ Leipzig University, Institute of Communication and Media Studies, Leipzig, Germany

² BI Norwegian Business School, Department of Communication and Culture, Oslo, Norway

Social disruptions such as political conflicts, the impact of artificial intelligence on job profiles and rising stakeholder demands shape today's context of organisational communication (Argenti, 2023). This increases the impact of strategic communication on success. However, empirical studies and practical experience show that this does

not go hand in hand with a strengthening of communication departments as the primarily responsible units in organisations. Rather, communicators compete with marketing, sustainability, HR and IR for scarce resources and mandates like leading critical initiatives, e.g., on AI-based listening and messaging. This debate is not new, but it is amplified in times of rising challenges and shrinking resources due to the inflation. Communicators need to explain better than ever what they do and why their contributions are needed.

Previous research has shown that appreciation of internal decision-makers and a positive image within the organisation are essential if communicators want to be heard and involved (e.g., Brockhaus & Zeffass, 2022; Moreno et al., 2023). In Sweden, only 42% of managers and employees interviewed in a large-scale study across 10 organisations were aware of what their communicators do (Falkheimer et al., 2017). In another European country, a recent study in large companies (n = 1,147) revealed that two third of top managers (67%) and every second middle manager and employee believes that their communication department should make it clearer what its tasks are and who benefits from them (AUTHORS, 2024).

In view of this debate, this study aims to shed light on the internal positioning of communication departments in organisations by addressing the overarching research question: *How do communication leaders position themselves and their departments within organisations?* Based on an extensive literature review on this scarcely researched topic, we developed a questionnaire, used a systematic approach to recruit a sample of communication leaders in a large European country, and conducted 30 qualitative interviews. The study generated insights about the necessity of internal positioning (RQ1), the specific context and situations (RQ2), and the strategies that communication leaders use to demonstrate their tasks, goals and performance towards top/middle management and employees (RQ3).

The study contributes to the body of knowledge by revealing strategies to develop and convey a clear profile and positioning of communication departments within organisations in troubled times of social (dis)order.

OSC03 Higher Education Environment

PP 0290 Responsible universities for engaged communities. The role of public engagement in the Italian Academia

[Letizia Materassi](#)¹, Laura Solito¹

¹ University of Florence, Department of Social and Political Sciences, Florence, Italy

The rise of community-engagement activities in the Universities is part of the so-called "third mission".

Far from the traditional "ivory tower" model, nowadays Public Engagement constitutes a new challenging opportunity to reshape the missions and the identities of universities, but also the relationships within their internal and external communities.

Although it is widely acknowledged the crucial role played by Public Engagement (PE) and theoretical advances have been made in the last years, a shared definition of PE is still lacking. Furthermore, if many studies face the impact of PE on society, suggesting specific measurement indicators, few of them seem to consider the "maturity" of these activities from an organizational perspective and their part in the overall organizational identity and in the communication strategy.

In this explorative study we assume that PE is part of a social positioning of the University and a way to be responsible, acting as a pivotal player in the public sphere and as a hinge between the knowledge production – thanks to the first and second mission – and the public opinion. But are the universities aware of the importance of their activism in the social responsibility field? How do they implement this mission and how do they include PE in their communication strategies? And lastly, how do scholars perceive their "social" role, that implies an interaction and a collaboration between university and its stakeholders?

In this contribute, that is part of a wider financed research project on the role of the scientists and the experts in the contemporary society and in the media system, we aim at investigating the different forms adopted by Italian universities in order to engage the communities, pursuing the general interest of citizens with a collaborative approach.

In the last years, in Italy as in many other Countries – for ex. USA, Canada, UK, etc. – a specific organization – APEnet Association – has been created in order to help universities in achieving their "third mission" aims, supporting the planning activities, fostering educational programmes, sharing national and international best practices and

building a strategic network among the Universities. Starting from this meaningful experience and adopting the ministerial criteria, we selected a representative sample of universities, based on four different dimensions: the size of the universities, their geographical collocation (North Italy – Centre – South and Islands), the organizational nature (public or private) and the position in the national ranking, selecting the top universities in 2023 (www.censis.it).

The ongoing research attempts to investigate the sample through 2 different steps and methods: 1. quali-quantitative analysis of the contents of the institutional websites, specifically addressed to public engagement activities; 2. in-depth interviews to PE experts in the selected universities and to APEnet representatives in order to draw the state of the art of PE in the Italian Academia and to highlight the strategic orientations and the operative declinations of PE.

OSC03 Higher Education Environment

PP 0291 Organizational communication in Higher Education Institutions: What are the consequences for student well-being?

Rita Monteiro Mourão¹, Susana Mourão², Inês Sousa³, Cláudia Pacheco⁴, Sónia Silva⁵, Sandra Miranda⁶

¹ School of Communication and Media Studies – Lisbon and IADE-Universidade Europeia, Human Sciences, Lisbon, Portugal

² Universidade Autónoma de Lisboa, Universidade Autónoma de Lisboa, Lisbon, Portugal

³ ISCTE-IUL, iscte-iul, Lisbon, Portugal

⁴ Instituto Politécnico de Portalegre, Escola de Ciências Sociais, Portalegre, Portugal

⁵ Universidade do Minho, Universidade do Minho, Braga, Portugal

⁶ ESCS-IPL, Escola Superior de Comunicação Social – IPL, Lisbon, Portugal

The well-being of students in higher education has been subject of concern among practitioners and researchers at a global level (Cunha, et al., 2017; Eisenberg et al., 2013; Stallman, 2010). Specifically in the Portuguese context, this concern extends to policymakers and, therefore, to society (National Health Service, 2023), since it is estimated that a large number of students will experience mental health problems during their academic paths. With this in mind, the FLOW project was born: Facing obstacles to well-being in academia: is organizational communication a starting point? (with reference IPL/IDI&CA2023/FLOW_ESCS). During this project (September 2023-September 2024) we will explore how Higher Education Institutions (HEI), specifically through their institutional communication, have been promoting the well-being of their students. Although there are already some studies that suggest strategies at this level (e.g. Baik et al., 2019), the evidence on the role of organizational communication is still scarce. Thus, the main objectives of this project are: to identify the main channels, flows and means of communication used by HEI to communicate with students, to understand how these relate to students' well-being; to analyze the communication actions implemented by HEI to promote a better inclusion and overall well-being of their students.

In this case, we seek to understand both the students' perspective and the institutions' perspective, using a qualitative methodology. During the last quarter of 2023, we conducted individual interviews with communication managers and psychology counsellors from Portuguese HEI at different country regions, and during the first quarter of 2024, we will do focus groups with the students.

The results are still preliminary, but it is possible to conclude, from the interviews with communication managers, that communication with students includes the frequent transmission of a lot and not personalized information. These professionals suggest that guidance and good practices manuals should be developed and implemented.

Although the project is still at the data collection stage, its results will be presented during the congress and its main theoretical and practical implications will be discussed.

PP 0292 "What is your revolution?": Capturing contemporary visions of (dis)order

Ana Duarte Melo¹

¹ University of Minho NIF 502 011 378, Communication Sciences Department / CECS-Communication and Society Research Centre, Braga, Portugal

"What is your revolution?" is the motto of an institutional strategic communication campaign of the Institute of Social Sciences (University of Minho, Portugal) conceived to celebrate the 50th anniversary of the April 25th 1974 Portuguese Revolution, also known as the "Carnation Revolution". The idea was to think about what it means today, in conceptual terms and in the everyday practice, for different generations and fields of knowledge. How is it expressed and manifested? How is it lived and brought to life? What are the revolutions that we live and dream of? And which ones do matter to us today?

In this paper we will describe the communication strategy designed with the following main objectives: 1) to mark and celebrate the 50th anniversary of the Portuguese Revolution at our institution; 2) to engage community members around a common idea, following years of pandemic distance; 3) deepen knowledge about the stakeholders, especially internal publics, of the Institute of Social Sciences at the University of Minho.

We will present the results of the "Revolution Mural" (Mural da Revolução) – that included a digital platform – where people were invited to express their own "revolutions", and we will discuss them in the light of the stakeholders theory applied to organizations (Parmar et al., 2010), of the order/disorder theory as part of the construction of social orders (Baker, 1993; Moessinger, 2000; Mouzelis, 2016) and of the revolution conceptual frame (Balibar, 2015; Kamenka, 2017; Thagard, 1993; Viroli, 1992). Furthermore, we will eventually identify categories and matching contemporary social issues. We intend to compare them with the most popular revolutionary slogans of fifty years ago, namely, "peace, bread, health, housing, freedom".

Based on the findings the paper we will also discuss the challenges and opportunities of establishing participatory methods as part of institutional communication strategies, particularly, in the scope of an academic organization.

PP 0293 Unveiling integrated communication strategies on Facebook across universities in Latin America, Europe, and the United States

Andrea Oliveira¹, Ileana Zeler², Paul Capriotti³

¹ University of Malaga, Audiovisual Communication and Advertising, Malaga, Spain

² Autonomous University of Barcelona, Department of Advertising- Public Relations and Audiovisual Communication, Bellaterra, Spain

³ University Rovira i Virgili, Communication Studies, Tarragona, Spain

Social networks present significant opportunities for universities to effectively achieve their communication goals (Eger et al., 2020). Among these platforms, Facebook stands out as an optimal tool for connecting universities with the community. Studies have shown that the stronger university community on Facebook is, the higher the level of trust and identification is with the real university community (Nevzat et al., 2016).

Research has delved into various aspects related to universities' presence on social networks, including the level of activity, general approaches employed, communication resources utilized, and the disseminated content (e.g., Ebrahim & Seo, 2019; Sørensen et al., 2023). However, there is a gap in research that comprehensively analyses all dimensions of universities' social media communication strategy. Therefore, this study aims to identify the key dimensions of universities' communication strategy on Facebook and assess the level of interaction achieved by universities through various communication strategies: posting strategy, interactivity strategy, and content strategy.

For this study, a quantitative methodology was developed based on the content analysis of 27,356 posts disseminated by 70 universities in Latin America, Europe, and the United States on their institutional profiles on Facebook. Information was collected on the number and type of posts, as well as the number of interactions generated in the posts and the number of followers of the Facebook profiles. Three categories of analysis were developed: 'posting strategy,' 'interactivity strategy,' and 'content strategy.' In addition, a fourth category called 'integrated communication strategy' on Facebook was designed, which combines the three previous strategies. A fifth category was developed for the 'engagement level.' The data was recorded in an Excel template and subsequently analysed using IBM SPSS Statistics 25.

The results suggest that universities tend to adopt a 'passive funnel' posting strategy. Additionally, they favour 'exclusive' or 'dominant' content strategies, with 'monologic' approaches prevailing in their interaction strategies. The level of engagement achieved by these overall 'passive monologic' communication strategies is remarkably high, indicating that universities employ these strategies because they prove to be the most effective in achieving better interaction results with their users. This also reinforces the idea that users prioritise content quality and innovation over the interactive aspects of posts.

This study advances organisational communication research by integrating social network management into a holistic model, offering practical guidance for optimising Facebook communication strategies to enhance engagement and build more effective connections with users.

PP 0294 Are Italian universities reassessing their communication in the age of social unrest? The enforcement of academic accountability within the context of social disorders

Andrea Lombardinilo¹, Paolo Brescia²

¹ Gabriele D'Annunzio University- Chieti-Pescara, Department of legal and social sciences, Chieti, Italy

² Sapienza University of Rome, Department of Communication and social research, Rome, Italy

How can organizations recover the trust of their stakeholders in an era when the principle of credibility is undermined by crises that break the stability of social systems from the ground up?

Framed as organizations and educating communities, Universities are not immune from an analysis of their governance processes, in order to overcome the social gaps (Canel, Luoma-aho 2019) that strongly emerged from the covid19 pandemic and chart a new course capable of stemming the challenge of disillusionment that characterizes Gen. Z.

Assuming that no structural change is exempt from the revision of communicative practices (Lombardinilo 2019), universities are adopting (still tentatively) new forms of dialogue, characterized by the integration of different levels and directions (Lovari, Ducci 2022) with more complex ecosystems mutually convergent (Jenkins 2013). The pushes toward inclusion, social responsibility and sustainability aim at the construction of the future-oriented university (EUA 2021) moving from tentative approaches to true measurable outcomes and impact.

However, a sudden translation of communication in the digital context, the chaos generated by information clutter, the paradox of infodemics, and other often underestimated factors of always-on, however, present just as many prominent risks, as the lack of awareness that transferring cannot be merely moving content from a previous context to a new one, but completely rethinking the purpose of communication (Pireddu 2023).

Facing this evolving scenario, a multi-step research methodological approach is needed, with the purpose to explore the conceptual dimensions and the operational activities implemented by universities to give communication a new strategic role.

In the first phase of the survey, the delegates for communication of six Italian Universities (Sapienza University of Rome, Macerata, Calabria, Urbino, Milano Statale, Chieti-Pescara) will be interviewed with the purpose to understand how their universities are coping with the post-pandemic communicative scenario and emphasize what enforcement digital communication reached in the last two years about the strategies of inclusion and accountability within academic environments.

In the second phase of the survey, the websites of the six involved universities will be investigated (with an in-depth analysis) with the aim to analyze what communicative evidence universities are supporting in line with the informative and narrative tasks imposed by the new communicative scenarios engendered by post-pandemic needs.

Considering some major trends in the public communication sector (Canel 2018; Lovari et al. 2020; Van Dijck et al. 2018; Sorice 2020) and in the light of other researches on the Italian universities context, we expect to collect some primary findings as an increasing effort of universities in a more relational, visual and impactful communication. This new model aims at disseminating user-generated content, exploiting the power of new social networks (Instagram, Threads and also TikTok); a decisive shift towards inclusion and accountability, with the purpose to generate shared values (Grunig 2016) within academic communities and its differences (f.i. sensibilities for LGBTQIA+ community, people with disabilities, international students).

OSC04 Internal communication

PP 0404 Communicating against age bias in employers: The effects of message style in employer-endorsed communication about older workers on employability perceptions

Martine Van Selm¹, Linda Van den Heijkant²

¹ Erasmus University Rotterdam, Erasmus School of History Culture and Communication, Rotterdam, Netherlands

² University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

This study examines how employer-endorsed communication can help counteract prejudice against older workers among other employers. Employers are important communicators of beliefs about the abilities of older workers. Our aim is to determine which message style in employer-endorsed communication is most effective in improving other employers' perceptions of older workers' employability. Based on the findings of the most effective message style, we developed a communication tool tailored to employers (i.e., a video message that can be used by organizations). In this project, we collaborated with key societal partners, notably AWWN, the largest employers' association in the Netherlands, and RADAR, an agency dedicated to equal treatment and combating discrimination.

The study expands upon two theoretical approaches to reducing stereotypical thinking induced by communication strategies: media-literacy and counter-stereotypical information strategies to neutralize biased beliefs about stigmatized groups. In the media-literacy approach, messages contain explicit instructions to negate or suppress harmful (implicit) stereotypes. Although some studies have found evidence for this effect, other studies have shown that explicit instructions to negate or suppress harmful stereotypes can result in rebound effects. Our research addresses the nuances of these conflicting findings by incorporating explicit instructions that convey realistic *positive* information about the abilities of older workers, with the intention of circumventing any potential rebound effects. An alternative approach to mitigate prejudice relies on counter-stereotypical information. Rather than explicitly instructing audiences to resist the effects of negative (media) portrayals, this strategy aims to indirectly foster more favorable intergroup attitudes by exposing individuals to counter-stereotypical exemplars. In the present study, we explore the effectiveness of two employer-endorsed counter-stereotypical messages: one emphasizing older workers' contribution to organizational success (i.e., employers act as *ambassadors*), and the other urging employers to do their part in solving the employability problem among older workers (i.e., employers act as *educators*).

We conducted an online survey-embedded experiment with a 2 (exposure vs. no exposure to an instruction about older worker capabilities) × 2 (exposure to ambassador vs. didactic counter-stereotypical message) between-subjects design with a control group. Participants consisted of HR professionals and direct managers recruited from a panel agency (n = 444). We found that the ambassador style message, including exposure to an explicit instruction with realistic positive facts about older workers' abilities, was most effective in positively influencing employers' evaluations of older workers' employability. The didactic style message was found to be the least effective, even compared to the control condition.

In collaboration with our societal partners, the effective elements of employer communication identified in this study were translated into a communication tool. This animated video features an employer-endorsed message in ambassador style that highlighted the value that older workers bring to the table and how their contributions are vital to the success of the organization, combined with explicit instructions about realistic facts about older workers. In contrast, the didactic approach was avoided as it appeared to be the least effective – and might even be advised against when compared to showing no message at all in the control group.

OSC04 Internal communication

PP 0405 Understanding and managing work-related social media use: An employee perspective

Ellen Soens¹, An-Sofie Claeys¹

¹ Ghent University, Department of Translation- Interpreting and Communication, Ghent, Belgium

Media reports about employees being disciplined or fired after sharing inappropriate messages on their personal social media accounts are nothing new. Misled by a false sense of privacy, employees are often surprised about the consequences of what they consider online statements or jokes made in the private sphere. Scholars, therefore, advise organizations to implement a social media policy that informs employees about responsible social media use during and outside work hours (Parker et al., 2019).

So far, research on this matter has predominantly focused on the managerial perspective. Scholars have, for instance, interviewed communication managers about their perceptions of and attempts to govern employees' social media use (e.g., Pekkala et al., 2022). The employee's perspective, by contrast, has received much less scholarly attention. Yet, while a social media policy may protect organizations from legal and reputational risks, employees could perceive it as a violation of their privacy and freedom of speech (Opgenhaffen & Claeys, 2017).

The current study, therefore, conducted 45 semi-structured in-depth interviews with Flemish employees holding different blue-collar and white-collar positions in organizations of varying sizes and industries. We aimed to answer

the following research questions: How do employees actually communicate about work on social media and for what reasons (RQ1)? What do they perceive as their rights and duties toward their employer on social media (RQ2)? How do they feel about social media policies (RQ3)?

Preliminary findings from a thematic analysis paint a positive picture of the interviewees' work-related social media use (RQ1). On public platforms like Facebook, they mostly aimed to contribute to organizational goals like attracting new employees and customers by (re)posting vacancies and promotional messages. It seemed to be common sense that "you don't post anything on Facebook or social media that could harm your employer." As such, public social media were generally not considered suited for discussing sensitive work-related matters, criticisms or frustrations. A fair number of interviewees did turn to instant messaging groups (e.g., WhatsApp) with colleagues to ventilate about work. Yet, even these more private channels were mostly used to exchange job-related information and connect with co-workers in a positive and responsible way.

Overall, participants agreed that their employer can expect and enforce a certain loyalty from them on social media. Yet, this should not come at the expense of their privacy and freedom of speech (RQ2). As a postal worker stated: "That's my privacy. I still post what I want and I have my own opinion, so I'm allowed to express that." Employers can, therefore, implement a social media policy to delineate the boundaries required to protect the organization's functioning, but in a way that does not threaten employees' freedom of speech (RQ3). As one participant aptly put it: "You are not allowed to speak negatively about your employer, [but] you're still free to express your opinion. In that sense, it's about finding a balance somehow." We hope to discuss our findings and implications in more depth at ECREA 2024.

OSC04 Internal communication

PP 0406 Fostering organizational bonds: Unveiling the impact of internal communication on workers' affective commitment through the mediation of employer attractiveness

[Alexandra Leandro](#)¹, [Daniel Gomes](#)², [Neuza Ribeiro](#)³, [Bárbara Costa](#)⁴

¹ Polytechnic Institute of Coimbra, School of Education / CEOS,PP-Coimbra / CECS-UMinho, Coimbra, Portugal

² Polytechnic Institute of Coimbra, School of Education / CEOS,PP-Coimbra, Coimbra, Portugal

³ Polytechnic of Leiria, Technology and Management School / CARMÉ - Centre of Applied Research in Management and Economics, Leiria, Portugal

⁴ Polytechnic of Leiria, Education and Social Sciences School, Leiria, Portugal

Objective

Internal Communication (IC) is a key area of organizational development on the path of competitiveness improvement. Enabling organizational IC policies and practices is currently seen both by practitioners and academics as a solid ground of investment to nurture workers' alignment with organizational strategies and goals. Having this standpoint in reference, one comes to question whether IC can develop enduring bonds between workers and organizations, notably, workers' affective commitment (AC) and the perception that the organization is a good place to work (employer attractiveness (EA)). The main objective of this study is to evaluate the impact of IC on worker's AC, and more specifically, to understand whether this relation occurs due to a mediational effect of EA over this relation.

Methodology

To achieve the aforementioned objectives, a cross-sectional quantitative study was developed, whose data was obtained through a structured questionnaire containing the measures of the study variables. 532 individuals from all districts of Portugal and the Islands have participated in the study. Genders were 62% female, with ages ranging from 20 years to over 66 years old, 47% having a graduation and 6,4% a MSc graduation level. The Harman test and bootstrapping method were applied previously to the results' assessment. The mediation study hypothesis was evaluated using Baron and Kenny's (1986) linear regression method, and subsequently complemented using Sobel Test (Sobel, 1978).

Results

The main results obtained show that IC is significantly and positively correlated with AC and with workers' EA perception, implying that IC has a positive relation with the affective bond between workers and organization, as well as with the perception of an organization as a good place to work. Furthermore, results also pointed for a total mediation effect of EA in the relationship between IC and AC, thus confirming the study's main hypotheses.

Practical implications

These results seem to support the idea that internal communication practices may shape and stimulate workers' affective bond with the organization, having thus positive prospective impacts on performance level and positive internal working climate. IC also seems able to activate a process through which is possible to explain that the relation between IC and AC is due to a process that has EA as the mediator. In this sense, IC seems to contribute to the development of workers' perception that the organization is a good place to work, and that this will explain the affective bond between workers' and the organization. Managers and practitioners should be aware of the

distal effects of IC investment on workers' positive attitudes development, and on the building of positive work environments.

PP 0407 The invisible hand – Shareholders' control over organizational purpose and communication of purpose

[Ilari Ceder](#)¹, [Leena Mikkola](#)², [Steve May](#)³

¹ Tampere University, Communication Sciences- Faculty of Information Technology and Communication Sciences, Tampere, Finland

² Tampere University, Faculty of Information Technology and Communication Sciences, Tampere, Finland

³ The University of North Carolina at Chapel Hill, Department of Communication, Chapel Hill, USA

As crises, such as economic and ecological, are challenging the global society, organizations have increasingly sought to legitimize their existence and actions via communication of organizational purpose. With the concept of purpose, organizations usually attempt to link their business to furthering public good. Purpose has emerged to the discussions among scholars interested in variety of topics, such as strategy, management and economics. Apart from few exceptions, purpose has been neglected among organizational communication researchers. However, particularly critical organizational communication research offers a prolific ground to study purpose, as critical analysis seeks to understand the power relations formed and manifested via communication, and scrutinizes how organizational communication is utilized not only to create organizations, but to accumulate capital as well. Thus, organizational communication research should seek to analyze communication of purpose, since firms use purpose in their organizing and strategy, and they are eager to use purpose in their communication to different stakeholders.

The aim of this unfinished study is to analyze how employees make sense of organizational purpose. Furthermore, our aim is to analyze, how the contemporary capitalism controls communication of organizational purpose and members of organization. The study focuses on one public company in the Nordic countries. The organization is a large, multi-billion enterprise operating in manufacturing industry. The firm in focus communicates purpose openly and actively to different stakeholders inside and outside the organization. This study utilizes Grounded Theory, and due to the methodological background, the research question will sharpen as the research advances. Data gathering and analysis are still underway, but the data of the study will consist at least about 25 interviews of employees on middle management level. The further data and data gathering will be specified by the findings of the initial data analysis.

Until now, 10 informants have been interviewed, and nine interviews have gone through preliminary coding. Precursory open coding seems to suggest that meaning creation about organizational purpose happens in the context of elements including shareholder primacy, (financial) value creation, and transformation of business and society. In presentation, we will present results and discuss how the control produced by contemporary economical model shapes organizational thinking and communication about purpose.

OSC04 Internal communication

PP 0408 Fear of being replaced: The dark side of employee ambassadorship on social media

[Alessandra Sossini](#)¹, [Mats Heide](#)¹

¹ Lund University, Strategic Communication, Helsingborg, Sweden

Social media platforms offer employees new opportunities to tap into the role of communicators and ambassadors and contribute to the strategic communication of organizations (Andersson, 2022). The potential of this engagement has been widely acknowledged, leading organizations to encourage employees to take on an ambassador role (Thelen, 2020; Pekkala et al., 2022). While social media is often understood as a simple tool to make organizational communication more effective and credible, predominately positive aspects are emphasized.

This study problematizes the prevailing normative and managerial-dominated view on self-initiated employee ambassadorship on social media and focuses on the darker side of this phenomenon as well as the power relations in which employees' communication on social media is embedded. The aim of this study is to provide a more nuanced and critical understanding by taking a power perspective on self-initiated employee ambassadorship on social media. The empirical material consists of qualitative interviews with employees from 14 organizations, which are analyzed using Foucault's (1972; 1977) concept of disciplinary and discursive power. The analysis concentrates on which and how discourses exert power over employee communication on social media and what role visibility on social platforms plays in it. The result of the study indicates that social media communication of employee ambassadors is rarely influenced by direct managerial control. Instead, it is governed by the discourse of employee substitutivity and the discourse of authenticity in brand communication. These two disciplinary discourses bring complex tensions, where ambassadors must constantly negotiate between self-branding requirements and an authenticity paradox. The tensions intensify through the visibility on social media, where employees strategize and

situationally silence their communication through self-monitoring and self-surveillance practices. By introducing a new critical power perspective, this study contributes to a more nuanced understanding of self-initiated employee ambassadorship on social media and highlights disciplinary power relations that go beyond organizational borders. Further, the findings underscore that organizations need to address the critical aspects of self-initiated employee ambassadorship and act as facilitators rather than as regulators to support employees in their navigation process. Conclusively, the findings also outline the need for further critical research to offer a deeper understanding of power relations beyond organizational borders that influence the communication practices of organizational members.

PP 0521 Citizen engagement for democracy: Information strategy of intermunicipal communities on social media

Gisela Gonçalves¹, Mateus Noronha¹, Branco Di Fátima¹

¹ LabCom – University of Beira Interior, Communication – Philosophy and Politics, Covilha, Portugal

In a decentralizing logic, the recent reform of local government in Portugal sought to bring public governance closer to the population through the creation of 21 intermunicipal communities (IMCs). IMCs are entities that promote territorial cooperation between associated municipalities by allowing the resolution of common problems and the management of resources across municipalities. Lack of knowledge of the work developed by IMCs may lead to a problem of democratic deficit and recognition, with negative consequences for the management of public policies with impact on the quality of populations life. An ineffective online public communication may be at the root of this problem. Literature on local government use of social media has stressed how these platforms could be used for fulfilling basic democratic goals of transparency, citizen participation, dialogue and engagement (Bonsón, Torres, Royo, & Flores, 2012; Chun and Luna-Reyes, 2012; Criado et al., 2013; DePaula & Dinceli, 2018; Mergel, 2012).

To better understand the information strategies of IMCs and how citizens react on social media, we asked the following research questions: What do IMCs organizations post on Facebook, and how do citizens react to this social media content? The data was gathered utilizing the CrowdTangle platform, a tool developed by Meta, and configured within the Intelligence module. This approach enables access to official data through Facebook's Application Programming Interface (API). The original dataset comprises 7,858 posts from the 21 IMCs fanpages and 138,183 million interactions from their users between August 2022 and July 2023 – almost a year. This data facilitates the analysis of both the content published by the fanpage administrators and the online behavior of their audiences.

For the quantitative analysis, we categorized the posts using a framework of government communication and information strategies on social media that had been previously tested by DePaula, Dincelli and Harrison (2018). Based on that we then analyzed differences in users' reactions in the form of likes, shares, and comments, to the distinct types of content (photos, videos, links, etc.). By analyzing the effects of content type on user reactions it is possible to understand what IMCs information strategies drive social media responses and consequently, increase notoriety of these singular organizations.

We found some statistically significant results, offering some evidence for better understanding of which different types of information affect user interaction. The results reveal an asymmetry in the utilization of Facebook by the CIMs. Moreover, none of the fanpages attained an interaction rate sufficient to conclude that the platform is effectively being utilized by users as a communication channel. It was also identified that the number of posts is not necessarily a determining factor in increasing the interaction rate; rather, the type of post plays a crucial role. Our results highlight how users are more engaged by affective and symbolic nature of social media content, rather than more serious and institutional IMCs information.

OSC05 Public sector and legitimacy

PP 0522 Who Am I? Tracing the future of public sector communicators between technological challenges, information disorder and social disruptions

[Alessandro Lovari](#)¹, [Fabrizio De Rosa](#)²

¹ University of Cagliari, Political and Social Sciences, Cagliari, Italy

² Italian Government, Department of Digital Transformation, Rome, Italy

In the post-Covid 19 era the role of public sector communicators has undergone a profound transformation due to the turbulence of socio-political scenarios, the spread of disinformation, the rapid technological advancements, and the increasing influence of digital platforms on governments and public institutions (OECD, 2021; van Dijck, 2019; Zeffass et al., 2023).

The aim of this study is to examine the evolving responsibilities, challenges and ethical considerations faced by public communicators in European countries. The focus is on understanding the dynamic nature of their hybrid role as "centaur communicators" (Lovari, 2022), redefining their identities and combining traditional media practices with the innovative approaches from social media and artificial intelligence.

Through 12 in-depth semi structured interviews (Johnson, 2001) with elite publics, this study aims to provide original insights into how public communicators are adapting to these socio-technological disruptions, can face contemporary challenges, and be able to navigate the complex communication landscape in leading EU institutions and governments. The high level of information provided by these elite communication professionals is crucial in the study (Hertz & Imber, 1995).

From the thematic analysis of the interviews (Braun & Clarke, 2006), several trajectories emerge regarding the future of public sector communication and the strategic role of communicators. These perspectives range from problem-solving approaches to addressing emerging trends such as the threat posed by disinformation across social media platforms to society, as well as the challenges offered by generative AI tools. In particular the study explores how these professionals are including and forecasting the use of AI solutions in their communication and media relations strategies, along with the ethical dilemmas associated with the implementation of this new technology in the relationships with strategic publics and EU's AI Act (Ferrari, van Dijck & van den Bosch, 2023). Furthermore, the evolving role of public communicators is examined considering the key competencies, skills and training that will be essential for professionals in the near future. The role of international cooperation, particularly in addressing digital transformation cross-border trends, is also a critical aspect reported in the interviews.

Investigating the voices of these professionals provides a relevant snapshot of best practices and innovative strategies that are being employed across Europe at the top level of public organizations. This is critical in understanding how public communication is managed as well as deepening the ethical considerations faced by public entities in developing and disseminating information and communication campaigns to citizens using social media and emerging technologies (Lovari, Bowen & D'Ambrosi, 2020). Such insights are particularly important in rethinking the role of future public communicators and the implications for practitioners and scholars doing research in this field (Luoma-aho & Canel 2020). Finally, this study offers a comprehensive overview of the current and future landscape of public sector communication in Europe, shedding light on the actual disorders and criticalities, but also highlighting the challenges and opportunities enabled by the interplay between technological developments and communication practices.

OSC05 Public sector and legitimacy

PP 0523 (Dis)ordering gender strategies in Italian public sector communication. Regulation, social media practices and the role of professionals at local level

[Gea Ducci](#)¹, [Lucia D'Ambrosi](#)², [Marica Spalletta](#)³, [Paola De Rosa](#)³, [Camilla Folena](#)⁴

¹ University of Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies, Urbino, Italy

² Sapienza University of Rome, Department of Communication and Social Research, Rome, Italy

³ Link Campus University, Department of Human Sciences, Rome, Italy

⁴ University of Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies, Urbino, Italy

In times of polycrisis (Morin-Kern 1999) and communication (dis)order, there has been growing attention in a more ethical and responsible dimension of organizational communication (Bowen 2016; Gonçalves-Oliveria 2022; Luoma-aho, Badham 2023), which involves also the public sector (Canel, Luoma-aho 2019; Materassi, Solito 2021; Lovari, Ducci 2022). In particular, the importance of more inclusive and diversity-sensitive communication strategies is highlighted in the public debate on gender-sensitive policies both at international level (UNESCO 2020; European Commission 2020) and at national one (e.g. National Plans for Recovery and Resilience, and National Strategies for Gender Equality 2021–2026). Therefore, several new challenges arise for public sector communicators in European countries, concerning the development of professionals' skills and capacities (OECD 2021).

Looking specifically at the Italian context, the attention on public sector communication strategies towards gender issues emerged slowly, often appearing barely visible (Faccioli 2020), and it has been growing only starting from the pandemic (Lovari, D'Ambrosi 2022; Faccioli, D'Ambrosi 2023). In particular, previous research (D'Ambrosi *et al.* 2023; Spalletta *et al.* 2023) has highlighted how institutional public communication, especially in digital environments, runs at different speeds at the regional level when it comes to addressing gender issues and/or adopting gender-sensitive approaches: on the one hand, official guidelines (where adopted) tend to differ from each other in respect to the different fields and languages they address (administrative and normative texts vs. institutional communication: verbal vs. visual language); on the other hand, communication practices differ both in respect to the attention they paid to gender issues in ordinary coverage and media hype and in the adoption of a gender-sensitive approach in verbal and visual languages.

Based on these premises, this paper pursues the ongoing research aiming to achieving two different goals:

1. to explore the role of communicators/professionals in developing gender-sensitive communication strategies in those Italian Regions in which guidelines were adopted (involvement in decision-making, autonomy, creativity, skills/knowledge, training);
2. to extend the analysis to those Italian Regions that have not yet adopted suitable guidelines, considering that: a) the existence of guidelines does not necessarily lead to gender-sensitive communication; b) a gender-sensitive communication can take shape even in the lack of those guidelines.

From a methodological point of view, this study carries out a mixed methods approach (Creswell 2015), which blends in-depth interviews with communicators/professionals from Regions which provided themselves with guidelines, and social media content analysis of the official Facebook pages of Regions without guidelines.

The study tends to confirm a marked unbalance between regulation and communication practices, because of different communication cultures, resources (dedicated structures, professionals, etc.) and influence of political governance (left-leaning coalitions vs. right-leaning ones) among Italian Regions. In this scenario, the empowerment of communicators (Grunig 2009; 2016) stands out as even more relevant in reinforcing the trustee relationship between institutions and citizens that represent the main goal of public institutional communication.

OSC05 Public sector and legitimacy

PP 0524 Frictions of public sector organizations' strategic communication: A study about the Swedish Police's social media use for public safety

Jens Sjöberg¹

¹ Jönköping University, School of Education and Communication, Jönköping, Sweden

In today's fast-paced digital world, public sector organizations (PSOs) face communication challenges that can impact the public. These challenges depend on the organization's and its employees' use, understanding, and knowledge of the purpose of communication and communication platforms. This is particularly true when PSOs use social media to communicate about complex societal issues strategically. In this case, strategic communication about public safety can do good by opening up interaction, further information sharing, and community engagement. On the other hand, it can harm the public by instilling fear, for instance, by using the wrong digital media or steering a narrative that benefits the organization but not society. This is where the friction (disorder and potential) around PSOs' use of social media lies.

This study focuses on the Swedish police as a specific PSO due to their work to create public safety, besides preventing and investigating crimes according to Swedish law. Another reason is due to their extensive use of Facebook and Instagram lately. Therefore, this study aims to investigate how PSO employees, in this case, Swedish police employees, make sense of their use of social media to contribute to public safety.

The empirical material is based on 20 qualitative interviews and four critical making workshops with Swedish police officers from one police region in Sweden. The material is analyzed with a hermeneutic approach to understand how employees make sense of their social media communication to contribute to public safety.

The results of this study show that employees find it useful to use social media as a strategic communication tool to inform their community, to control the narrative, or to avoid criticism for doing nothing or ignoring it. Police social media links to presence as a strategic communication counterpoint to the difficulty of being present in the non-digital realm. However, the findings also highlight the friction between what needs to be communicated, how, by whom, and across which media channels. This increases the aspect of communication disorder, which has implications for the content of public safety. Furthermore, this stems from avoiding popular social media platforms, inhibiting creativity, and causing communication challenges for employees trying to fulfill their digital communication roles in promoting public safety to diverse audiences.

This study adds to the literature on PSO communication, strategic communication, and policing regarding the challenge of communicating complex societal issues in a rapidly changing world.

OSC05 Public sector and legitimacy

PP 0525 Big tech discourse on Reddit: How big tech are publicly discussed online and its implications for corporate legitimacy

[Alexandra Schwinges](#)¹, [Rebecca Wald](#)¹, [Dong Zhang](#)¹, [Valeria Resendez Gómez](#)¹

¹ Amsterdam School of Communication Research – University of Amsterdam, Communication Science, Amsterdam, Netherlands

Big tech organizations form the digital backbone of our societies and penetrate practically all facets of them. Their unprecedented stake in issues of high socio-political relevance has raised concerns among scholars and, notably, the public. To uphold their social license to operate, organizations are dependent on public approval and must therefore project a public image of legitimacy. Corporate legitimacy describes a perceived alignment of a corporation's actions with societal norms, values, and expectations, which means it lies in the eye of the beholder. Given the ubiquity of big tech's products and services, citizens emerge as crucial stakeholders, while finding it increasingly difficult to disengage from the pervasive influence of these corporations. Social media platforms are important public forums for citizens to discuss, deliberate, and form an opinion. Yet, few empirical studies have investigated the public discourse and the discursive legitimization of these corporations in these arenas. In particular, a close inspection of the public discourse on Reddit – a popular social media site with specific design features that have proven to strongly influence public opinion – is missing in the existing body of literature.

To fill this gap, our study pursues a two-fold objective. Firstly, we explore how public communities on Reddit discuss big tech. Specifically, we look into the most prevailing topics that characterize the online public discourse about big tech overall, and we discern how these topics evolve over time. Such temporal shifts may uncover noteworthy patterns in discourse dynamics and indicate the influence of pivotal events. In addition, we examine differences in the topics within public discourse among some of the largest companies in the information technology sector: Alphabet (parent company of Google), Amazon, Apple, Meta (parent company of Facebook), and Microsoft. To gain a comprehensive understanding of the big tech discourse on Reddit, we collected a total of 7,247,762 comments from 18,683 posts in 21 different relevant Reddit communities that discuss big tech – both the term 'big tech' and the different individual corporations as stated above. For analytical depth, we use BERTopic modeling to identify the most prevalent topics more generally, over time, and in discussions about individual organizations. Secondly, we interpret the most prevalent topics through the lens of corporate legitimacy as a heuristic device. This involves the pragmatic, cognitive, and moral dimensions of legitimacy to provide a nuanced understanding of discursive legitimization.

Our findings map dynamic discursive legitimacy processes in public forums like Reddit and thereby provide valuable insights into public deliberation and opinion formation processes towards organizations online. In the age of big tech, these insights become instrumental in comprehending the unprecedented role of these organizations in shaping our digital society. It is imperative not to overlook the considerable power vested in the public to hold these organizations accountable and contribute to understanding the delicate balance between public expectations and the social license granted to these influential organizations to operate within our increasingly interconnected digital landscape.

OSC06 Technological trends

PP 0632 The overlooked role of communication in organizational information security: Vertical and horizontal information security communication among employees

[Špela Orehek](#)¹, [Gregor Petrič](#)¹

¹ Faculty of Social Sciences- University of Ljubljana, Centre for Methodology and Informatics, Ljubljana, Slovenia

Nowadays, information security is one of the top priority of organisations as the number of cyber security breaches is massively increasing worldwide, causing enormous financial, business, reputation and other damages. It is argued that information security is not just a technical matter, but should become an integral part of organisations' core strategies and processes, along with human capital. Recently, social science perspectives on information security have emerged, offering various socio-psychological, communicative, managerial and other aspects pertaining to the implementation and management of information security technologies, processes and policies in the organisation. There are several explanatory, mostly behavioural models in the literature, while the communication aspect of information security processes in an organisation is largely missing. To some extent it is at least implicitly present in discussions about information security culture, persuasive communication techniques, incident reporting, but there is no systematic, comprehensive approach to identify and analyse the security communication processes in organisations. This is surprising as strategic communication within organisation is a key mechanism for establishing a good security culture that guarantees resilience against threats and incidents.

The first aim of our study was therefore to introduce the concept of employees' information security communication (ISC) as one of the types of information security behaviour. Based on Habermas' theory of communicative action,

we present three types of human interaction that apply to the field of information security: human-computer interaction as the use of ICTs, human-to-human interaction as communicative information security behaviour (CISB), and human-to-human interaction with oneself as making information security decisions. The focus of the study is on CISB, which we define in the organisational context as the exchange of information about information security between employees. Within CISB in the organisational context, we define two dimensions: vertical (bottom-up) and horizontal ISC. This communication includes proactive communication about information security policy, improving information security, reporting incidents, etc. The second aim of the study was to analyse the organisational communication processes that are part of CISB and to identify explanatory factors for CISB. The explanatory model was derived by combining the spiral of silence theory in the organisational context and well-known behavioural theories, such as the theory of planned behaviour and the protection motivation theory. The proposed model was tested using a multilevel modelling analysis of vertical and horizontal ISC with data from a web-based survey of employees at the University of Ljubljana ($n = 560$). The results showed that in general, employees are more willing to talk about information security with colleagues than with superiors. Among the explanatory factors for employees' CISB, subjective norms stand out, followed by attitudes, fear of formal sanctions, education and age. Examining employees' information security communication practises is crucial to identify various incidents and avoid risks that threaten the organisation's information. On the other hand, increased communication regarding information security is essential to create a well-informed and vigilant workforce. It empowers employees to actively participate in protecting the organisation's assets and contributes to a more resilient and secure business environment.

PP 0633 Materialization of digital platforms in a coworking space

[Tomi Laapotti](#)¹, [Mitra Raappana](#)²

¹ University of Vaasa, School of Marketing and Communication, Vaasa, Finland

² University of Jyväskylä, Department of language and communication studies, Jyväskylä, Finland

The significance of digital platforms in current organizations is usually taken for granted and contemporary organizing can be seen built on digital platforms. However, research on organizations and technologies has not fully followed the trend of platformization of organizing and, thus, recently, there has been arguments for studying digital platforms in organizing empirically from new perspectives (e.g., Guzman & Lewis, 2020; Laapotti & Raappana, 2022). Moreover, the communication research on technologies in organizations has focused mainly on communication technologies or technologies that explicitly communicate, such as social bots and robots, not on the other platforms that are commonly in use in organizations. In this study, we answer to these challenges by studying digital platforms outside the situations when these platforms are in use, because these platforms "communicate to us and through us throughout time and space" (Laapotti & Raappana, 2022, p. 499).

Empirically, this study focuses on the materialization processes and the agency of digital platforms in a coworking space (CWS). Materialization refers to the communicative process where beings "come to appear and make themselves present throughout space and time" (Cooren, 2020, p. 2). Furthermore, we understand agency as relational phenomenon between beings (Cooren, 2018). These relational views stem from the Montreal School (MS) of the communicative constitution of organizations (CCO) perspective (see Brummans et al., 2014). The aim of this study is twofold: first, we aim at describing how digital platforms materialize in a CWS and, second, we aim at understanding the difference these materializations make in the organizing of a CWS.

The data for the study are collected from a well-established and growing private Nordic CWS company. CWS's are office environments that provide working places for example for entrepreneurs, freelancers, and remote workers, against a membership fee (Spinuzzi, 2012). The data comprises of 10 video-recorded weekly staff meetings of the CWS crew and 50+ hours of shadowing data consisting of fieldnotes and audio-recordings of spontaneous meetings and encounters. For the analysis of the data we are applying Nathues et al.'s (2021) ventriloquial analyses because it can help us in understanding "how various elements of a situation are communicated into being and make a difference in interaction" (Nathues et al., 2021, p. 1457). The analysis process contains four steps: identifying, ordering, relating, and showing the multiple voices through which digital platforms materialize in the CWS. Preliminary results show that digital platforms carry many central functions for organizing, by participating in information and knowledge management, by defining the borders of the CWS, and by building shared identities, even when these platforms are not in use.

PP 0634 Humanization of AI: implications of agency perception for strategic CSR communication

Cyril Schaub¹, Friederike Vinzenz¹, Diana Ingenhoff¹, [Roman Winkelhahn](#)¹

¹ University of Fribourg, Department of Communication and Media Research DCM, Fribourg, Switzerland

Our study explores the integration of artificial intelligence (AI) in corporate social responsibility (CSR) communication, examining the impact of attributing human-like characteristics to AI (called *anthropomorphization*) on stakeholder trust and organizational reputation. This investigation is particularly relevant in light of the increasing societal importance of AI and the growing significance of strategic sustainability communication for organizations in meeting legal and public expectations. We consider the mediating variables of credibility and perceived agency to assess the influence of AI anthropomorphization and source on stakeholder trust and organizational reputation.

While previous research has extensively addressed AI anthropomorphization (e.g., Blut et al., 2021; Coeckelbergh, 2022; Glikson & Woolley, 2020; Scorici et al., 2022), its application in strategic communication remains understudied. Given that the portrayal of anthropomorphized AI is primarily constrained by design and creativity rather than technological limitations, there is considerable potential for its development. Furthermore, since the literature on AI in strategic corporate communication research is still in its early stages, it is crucial to promptly investigate the consequences of integrating AI in organizational communication in different contexts.

Focusing on CSR communication, which inherently targets relational outcomes such as trust, reputation, and legitimacy and is dependent on contextual factors (Carroll & Shabana, 2010; Maon et al., 2019; Orlitzky et al., 2003; Pivato et al., 2008; Smith, 2005; Vishwanathan et al., 2020), our research addresses the following questions:

RQ1: How do AI anthropomorphization and source in CSR communication affect stakeholder trust and organizational reputation?

RQ2: What role do credibility and perceived agency play in mediating these relationships?

We aim to answer these questions through an experimental 2 (AI anthropomorphization: *low* vs. *high*) x 2 (source: *corporate* vs. *governmental*) between-subjects design. Currently developing the instrument, we will collect data in February to present results at the conference.

Our study seeks to advance the understanding of cognitive processes involved in estimating outcomes in strategic CSR communication. Specifically, we investigate the perception of agency of AI systems and its consequences. In light of the rapidly developing landscape of AI technology and the growing urgency for sustainable practices, we make an initial step in investigating implications for strategic CSR communication in the age of artificial intelligence.

PP 0635 How Artificial Intelligence is being used by Strategic Communication Professionals

Patrícia Dias¹, Priscila Krolow², [José Gabriel Andrade](#)³

¹ Universidade Católica Portuguesa, CECC/CRC-W, Lisbon, Portugal

² Universidade Católica Portuguesa, CECC – Research Centre in Communication and Culture, Lisbon, Portugal

³ Universidade do Minho, ICS – Instituto de Ciências Sociais, Braga, Portugal

Artificial Intelligence (AI) is expanding across various contexts and organizations, and becoming ingrained in the daily practices of professionals. Our study looks specifically into the adoption of AI in strategic communication, setting out to map how and why communication professionals and experts are adhering to AI. Our goals are delineating its applications and objectives, as well as discussing associated opportunities and risks.

Our empirical work is exploratory and follows the qualitative method, based on interviews to a purposive sample of 22 communication professionals and experts. A thematic analysis was applied to the data.

The results of our study provide valuable insights into the current state of AI adoption in strategic communication, offering both confirmation and expansion of the theoretical framework. Our findings reveal a widespread integration of AI platforms among communication professionals, with ChatGPT standing out. They are used for multiple purposes, from social media content creation to data analysis, optimizing processes, and facilitating various functions. The practical applications of AI in sentiment analysis, content generation, and enhanced consumer experiences align with theoretical expectations and previews of the broad potential of AI. The main advantages identified are enhanced efficiency, resource optimization, and speed, while challenges revolve around the potential replacement of human labor and concerns about data privacy. But there are also challenges such as job displacement, ethical concerns, and the evolving roles of communication professionals underscore the complex interplay between AI and humanity.

Our findings highlight the dynamic nature of AI's role in strategic communication. The continued development of AI's capabilities and its integration with other technologies point to a future in which AI becomes an indispensable tool for communication professionals. The future trajectory foresees AI increasingly streamlining mechanical tasks,

fostering a positive view among professionals who anticipate a strategic shift toward critical thinking and specialized roles. Ethical considerations play a central role in shaping the trajectory of AI adoption, emphasizing the need for a balanced and responsible approach. As organizations navigate this transformative landscape, our study prompts further reflection on the ethical implications of AI, the evolving roles of communication professionals, and the collaborative synergy between human expertise and AI in the ever-evolving field of strategic communication. This study contributes to a deeper understanding of the practical dimensions, challenges, and potential future trajectories of AI in this critical domain.

OSC06 Technological trends

PP 0636 Corporate newsrooms and future strategies: Redesigning corporate communication for digital transformation. Insights from guided interviews with communication professionals in newsroom organisations

Megan Hanisch¹, Marcel Franze¹

¹ Ostfalia University of applied sciences, Institute for public communication, Salzgitter, Germany

The currently most dominant challenge for organisations in today's sociocentric world, is the impact of artificial intelligence (AI) which creates a new context of uncertainty. In particular, AI has a disruptive impact on corporate communication leading to a progressive dissolution of boundaries by overlapping and partially merging with other communication disciplines and departments of the organisation (Heidbrink et al., 2022, S. 13). Hence, organisations more than ever aim at reducing those disorders, making decisions necessary regarding the adoption of those technologies into corporate communication. Organisational redesigning into so-called corporate newsrooms – based on the journalistic model – are considered to be a reaction to digitalisation enabling a consistent communication across all channels. However, the main challenges reported by communication practitioners across Europe are communication tasks and processes which are not prepared for digitalisation as well as structural barriers, such as inflexible organisational set-ups and cultures (Zerfaß et al., 2023, S. 14).

The idea of dissolved structures will be addressed referring to Luhmann's systems theory. Guided interviews with German communicators provide insights on the potential of corporate newsrooms and related future strategies in digital transformation processes of corporate communication and their consequences for structures, processes and tasks.

Corporate newsrooms are one innovative example for handling the accelerated, condensed and increasing communication. The structure based on topics or subject areas – a central criterion of journalistic newsrooms – is also being adapted by corporate newsrooms. Following the function of corporate communication, though, corporate newsrooms not only encompass publication activities, but also have a monitoring and evaluation function (Seidenglanz, 2022, S. 110ff.). With AI being able of analysing and predicting behavior based on big data (Buhmann & Gregory, 2023), it transfers the newsroom's potential to a new level, enabling organisations to take more informed decisions.

To investigate this empirically, guideline interviews with communicators in German newsroom organisations, e.g., Volkswagen AG and Otto Group, will be conducted and analysed using MAXQDA in qualitative content analysis. The guide integrates questions on changes regarding structures, hierarchies, decision-making processes and tasks requiring new skills and competences. Finally, the study gives first insights on how corporate communication need to adapt to keep up with advanced tech and data use to have continuous influence in the future.

PP 0662 Alternative narratives on the meaning of nonprofit work at a European environmental NGO

Tünde Taxner¹

¹ Corvinus University of Budapest, Doctoral School of Sociology and Communication Science, Budapest, Hungary

Nowadays, nonprofit organizations (NPOs) operate in an increasingly competitive, global environment that requires credible and inclusive organizational communication (Beger, 2018). To recruit and retain the help NPOs need to operate and make nonprofit work worthwhile for employees and volunteers, they need to communicate the meaning of their work strategically (Sanders, 2020). Experiencing work as meaningful contributes to employee well-being and other positive personal and organizational outcomes like commitment and engagement (Bailey et al., 2019). Thus, the examination of meaningful work in the context of NPOs not only fills in a gap in current scientific literature but also provides insights for a well-being-focused development of organizational communication.

This case study explores how members of a European environmental NGO experience meaningful work and how this organization communicates the meaning of its work. The study adopts the constitutive (Schoeneborn & Vásquez, 2022) and critical approach to organizational communication (Daniels et al., 1997) and it aims to provide a deeper understanding of meaningful work through narratives as communicative ways of meaning-making (Fischer-Appelt & Dernbach, 2023). The author uses a mixed-method approach and compares the results of semi-structured interviews conducted with members of the organization to the narrative and thematic analysis of officially communicated narratives from online platforms. The study reveals discrepancies between strategically constructed and personal interpretations of meaningful work and uncovers the credibility of strategic communication practices. A deeper understanding of alternative narratives about the meaning of work provides valuable insights for the development of the organizational communication of environmental NPOs while contributing to a more nuanced understanding of meaningful work.

OSC07 Civil society organisations

PP 0663 Authority in leading communality

Mitra Raappana¹, Tomi Laapotti²

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

² University of Vaasa, School of marketing and communication, Vaasa, Finland

In this paper we examine authority in leading processes in the context of coworking spaces (CWS). CWS's are collaborative environments that bring together employees with different backgrounds to share physical, professional, and social resources in a flexible and creative way (Spinuzzi, 2012). CWS's have increasingly intrigued organization communication scholars: studies are focusing, for example, on knowledge sharing (Bouncken & Aslam, 2019; Rese et al., 2020), and sociomateriality (Bouncken et al., 2021; Larson 2020). Community and communality have been acknowledged to be important in CWS (Spinuzzi et al., 2019), but how they are developed and led remains understudied. In this paper we are broadening the question of leadership in CWS to how communality processes are led in CWS by focusing on the concept of authority.

We treat CWS as organizational. Our viewpoint is in CCO Montreal School (MS, Brummans et al., 2014), and we use the concept of authority to develop understanding of these shared processes. The interest of MS has been merely on authority and authoring when considering leadership questions (Bisel, Fairhurst, & Sheep, 2022). In general,

leadership is seen in MS as a collective act because communication is always performative and consequential and takes place with human and nonhuman actors and targets (Schoeneborn et al. 2020). Moreover, the authority different actors might have been seen as important in materializing organizational values and goals in communication (Bisel et al., 2022). Thus, we examine leadership processes in CWS in affordance of the concept of authority. We state that communality materializes in communication and relationships in CWS, and thus authority offers tools in understanding the leadership processes of this communality.

The data (10 video recordings of weekly staff meetings, from 7 to 19 staff members participating face-to-face and remotely) is collected from a Nordic CWS company. We applied ventriloquial analysis (Nathues et al., 2021) to unpack the processes of leading communality, and by whom or what are those processes led. Our preliminary findings show that authority is shared and constituted in connections between human and non-human voices and vents, and leading processes of communality are animated by several authoritative activities. We also found out that authority in leading processes of communality materializes nonlinearly in time: communality can be lead retrospectively, in real-time, and as foretelling the future. Thus, this study contributes to CCO and sociomaterial perspectives as strengthening their theoretical assumptions. We also contribute to CWS literature by suggesting, that they might not be that far from traditional organizations after all, at least they do get constituted and coordinated in communication in impressive ways.

OSC07 Civil society organisations

PP 0664 The role of communication in reducing the severity of domestic violence in Portugal: A comparative analysis of NGO communication strategies from COVID-19 to 2023

Sónia Sá¹, Evandro Oliveira¹

¹ Universidade da Beira Interior, LabCom Research Center, Covilhã, Portugal

This study addresses the alarming increase in cases of domestic violence in Portugal, which escalated by more than 30% from the beginning of the COVID-19 pandemic until the end of 2023, as reported and documented by authorities and victim support structures (Barros et al., 2021; CIG, 2023). Focusing primarily on women and children, this increase has not been matched by a corresponding escalation in communication strategies aimed at promoting early intervention and providing accurate violence prevention information to different audiences. In particular, NGO communication in Portugal operates within an information dissemination paradigm that lacks a robust framework for effective and dialogical or transformative communication between the publics and the organisations (Sá, 2023; Oliveira, 2010; Gonçalves & Lisboa, 2017). Moreover, dialogic or transformative socio-communicative processes are incipient or not carried out from a strategic communication management point of view, also due to the lack of communication professionals and/or the professionalisation of those in charge.

This study conducts a comparative analysis of registered data on domestic violence in Portugal during the pandemic year (2020) and the subsequent period until the end of 2023. In particular, it examines the communication strategies used by NGOs to prevent and combat domestic violence. The findings, based on data analysis from 120 Portuguese NGOs, reveal a consistent underinvestment in communication, particularly in the recruitment of public relations professionals. This prioritisation, which favours professionals with backgrounds in psychology, criminology, sociology or social work, is indicative of a systemic problem within the sector.

In an effort to understand the communication gap surrounding domestic violence in Portugal, this research also uses semi-structured interviews to 48 NGOs professionals as a primary data collection method for a second step of the empirical design. In doing so, it seeks to shed light on the implications of this communication gap and its potential impact on the effective management of domestic violence in the country. By collecting the perceptions of professionals involved in the fight against domestic violence, the paper aims to provide a comprehensive view of the communicative processes within NGOs. Through this lens, the study will stimulate critical discussion, highlight the opportunities and challenges inherent in these processes, and contribute to a nuanced understanding of the broader socio-cultural context. The findings of the study are expected to provide valuable insights into the key issues that shape the communicative backdrop of domestic violence, thus facilitating the development of recommendations for practice. These advice is intended to guide strategic communication management within NGOs, emphasising dialogic and transformative processes that can have a meaningful impact on both society and the organisations involved in the fight against domestic violence.

OSC07 Civil society organisations

PP 0665 Against social disorder? – Enhancing visibility of non-profit organizations by artificial based communication assistants

[Nele Hansen](#)¹, Laura-Maria Altendorfer¹, Josef Arweck¹

¹ IU International University of Applied Sciences, Department of Marketing & Communications, Erfurt, Germany

In the European Union over 3.5 million non-profit organizations significantly contribute to various sectors, including health, social services, humanitarian aid, social inclusion, research and development, culture, education, and sports. In contrast to their profit-driven counterparts however, they have significantly smaller marketing and communication budgets (Bruhn & Herbst 2016). This is particularly true for smaller organizations that often operate only locally. As a result, many non-profit organizations suffer from low visibility, which manifests as insufficient donations and members, as well as a lack of public support and recognition (Bruhn & Herbst 2016). In most cases, this low visibility can be attributed to insufficient or inadequate public relations.

The rise of artificial intelligence (AI) immensely changes the communication landscape. Open AIs' Chat GPT, for example, enable the automatic generation of text on a wide array of subjects within seconds, while programs such as OpenAI's DALL-E can swiftly generate images.

With the ability to modify voices and images, distinguishing between authentic and manipulated content can pose a challenge not only for non-experts. This dual-edged sword of AI presents both threats and opportunities. On the one hand, the use of AI may jeopardize democratic processes due to the difficulty in discerning the authenticity of textual, audio, and visual content. On the other hand, AI holds the potential to offer novel solutions, especially to organizations operating on limited communication budgets.

Although a variety of AI tools that can assist in public relations already exist in practice, studies (including Zerfaß et al. 2020; Zerfaß et al. 2023) show that their use in companies is still very low. For non-profit organizations, the reasons mainly lie in the lack of technical understanding of those responsible (Zerfaß et al. 2020).

However, AI tools could particularly help staff members in the non-profit sector, who are often employed part-time or as freelancers (Zimmer & Priller 2022), in optimally allocating time and financial resources in their public relations' work. They could also provide staff with more time for challenging strategic communication work and significantly relieve the operational workload, thereby increasing the visibility and influence.

However, to date, little is known about the specific requirements and potential uses of AI-based tools for non-profit organizations and there are no comprehensive tools designed for use in non-profit organizations.

Therefore, our study aims to close this gap conceptually and empirically.

We use a mixed method approach to first conceptually determine the needs and use cases of public relations work in non-profit companies. Based on the results of 20 in-depth interviews with members of non-profit companies we conduct an online survey with 2000 non-profit organizations. The results lay the foundation of the conceptual and empirical AI-based public relation assistant that allows non-profit organizations to improve their public relations work.

The innovative tool is supposed to empower non-profit organizations with a wide-ranging PR-package, facilitating the formulation of press releases, creation of invitations and social media posts, for example. By enhancing visibility, it has the potential to mitigate some aspects of social disconnection and contribute positively to the broader social fabric.

OSC07 Civil society organisations

PP 0666 Explicit privacy policies in cookie disclosures: Effects of credibility for non-profit organizations

Melissa Costello¹, [Benjamin Johnson](#)¹

¹ University of Florida, Advertising, Gainesville- FL USA

An experiment tested effects of website privacy policy disclosures on consumer responses (Li, 2014; Metzger, 2006). Specifically, we examined whether a transparent (vs. opaque) statement about data collection practices, crossed by the presence (vs. absence) of agree/deny buttons, affected website attitudes, organization attitudes, organization credibility, behavioral intentions, and behavior toward the organization. Proposed effects were tested in the context of (fictional) non-profit organizations and their GDPR- and CCPA-based privacy disclosures.

H1: The presence of a transparent (vs. opaque) privacy statement on a website's landing page will produce more positive (a) website attitudes, (b) organization attitudes, (c) perceived organization credibility, (d) willingness to donate to the organization, and (e) simulated donation behavior.

H2: The presence (vs. absence) of agree/deny buttons on a privacy statement on a website's landing page will produce more positive (a) website attitudes, (b) organization attitudes, (c) perceived organization credibility, (d) willingness to donate to the organization, and (e) simulated donation behavior.

H3: Transparency and buttons on a privacy statement will positively interact to produce more positive (a) website attitudes, (b) organization attitudes, (c) perceived organization credibility, (d) willingness to donate to the organization, and (e) simulated donation behavior.

Method

A within-subjects factorial experiment used a 2x2 (transparency x buttons) design, producing four types of privacy disclosures. Data were collected from undergraduate students ($N = 157$) at a public university in the USA. Participants were aged $M = 21.20$, $SD = 4.82$, 83.4% women, 29.9% Latinx, and 86.0% White. A priori power analysis for a small effect of $d = 0.20$ with .70 power indicated 157 cases were needed. The study was preregistered at https://osf.io/zn5bp/?view_only=38a03dd938804e4b831ee149c1077ca8.

Each participant viewed four website landing pages with different types of privacy policy presentations. Experimental manipulations were rotated across sites for four fictional non-profit websites for international teaching organizations. Participants saw webpages in a randomized order. Transparent disclosures stated "Our data collection is used in target advertisements as well as a means to provide specialized content to our viewers," whereas opaque disclosures stated "We use cookies to collect and use your data to give you the best possible web experience we can offer." In conditions with interactivity, large "Agree" and "Deny" buttons appeared below the disclosure.

Dependent variables were measured with 5-point single-item Likert scales, repeated for each stimulus: (a) Attitude toward the website, (b) Attitude toward the organization, (c) Organization credibility, and (d) Willingness to donate to the organization. Then, simulated behavior was measured with an item that asked participants to divide a hypothetical \$100 among the four organizations (TravelTeach, ExploreTeach, TeachAdventure, TeachTrip).

Results

For each of the 5 DVs, a 2x2 repeated-measures ANOVA was conducted, to test H1, H2, and H3 (two main and one interaction effect). There were no significant main effects of disclosure transparency ($p_s > .239$), buttons ($p_s > .057$), or their interaction ($p_s > .063$). With a well-powered and pre-registered design making use of within-subjects control, we find that presenting more transparent privacy disclosures on landing pages, and presenting interactive controls, does not diminish attitudes, credibility, or donation intentions for non-profit organizations.

PHC01 Rethinking theories of communication

PP 0751 Between disinformation and propaganda: Ameliorating a conceptual disorder

[Mats Bergman](#)¹

¹ University of Helsinki, Swedish School of Social Science, University of Helsinki, Finland

The last fifteen years or so have produced countless accounts of purportedly new kinds of information disorders, associated with buzzwords such as “fake news”, “filter bubbles”, and “infodemic”. Although a number of detractors have maintained that the novelty and magnitude of these tribulations have been greatly exaggerated, the feeling that something is amiss in our communication environments can be hard to avoid. Concurrently, the issue of propaganda – long out of vogue – has witnessed something of a renaissance. Predictably, much of this newfound interest has been focused on various forms of digital propaganda, with research being pursued under banners such as “computational propaganda” and “participatory propaganda”. Further, it has been suggested that these technological disruptions have shifted the primary *modus operandi* of propaganda away from manipulative persuasion toward the production of doubt and division by means of disinformation.

Such claims are not fully borne out by the facts. On the one hand, the phenomenon of “disorder propaganda” is hardly novel, as the diffusion of false information with an aim to confuse and paralyse has long been a central feature of so-called “black” (or “impersonated”) propaganda operations. And, on the other hand, much contemporary authoritarian propaganda is strikingly traditional in both format and persuasive intent, seeking social order rather than disorder. Still, it is evident that the revival of propaganda studies has to a significant degree intertwined with the massive expansion of disinformation research. The result is arguably an information disorder of a different kind, where the concepts of propaganda and disinformation are diversely entangled not only in the media but also in academic discourse – sometimes treated simply as synonyms, but more often articulated by means of varying relations of intersection and hierarchy.

In this presentation, I first identify the principal ways in which the relationship between propaganda and disinformation has been conceptualised. Next, drawing on pragmatist philosophy, I make a case for the need of an ameliorative clarification of the meaning of these terms, while I simultaneously reject the suggestion that their employment in research would require a sharp analytical definition in terms of necessary and sufficient conditions. Although the proposed conceptual clarification, which views meaning in terms of potential practical implications, can be characterised as neutral with regard to the question of the reality of the designated phenomena, I proceed to a defence of the continued value of these concepts for media and communication studies. However, in a more provocative vein, I also put forward some arguments against the overemphasis on disinformation in the field. Although not all disinformation is propaganda, there is a pertinent sense in which the latter designates a broader conception than the former, incorporating oft-ignored forms of malinformation in its sphere. In conclusion, I will highlight the danger of paying too much attention to present instances of disinformation propaganda and piecemeal remedies to perceived ailments – something that can be likened to “missing the forest for the weeds” (Wanless, 2023) – while ignoring extended temporal continuities in processes of social order and disorder.

PHC01 Rethinking theories of communication

PP 0752 Between solipsism and recursivity: The critique of radical constructivism

[Kestas Kirtiklis](#)¹

¹ Vilnius University, Faculty of Communication, Vilnius, Lithuania

Many publicly debated issues, such as pandemic constraints, climate crisis, identity politics, Western migration policy, wars in Ukraine and Israel seem to polarize Western societies unprecedentedly. Fake news and deep fakes further complicate our understanding of contemporary communication. It is hard to believe in the communicative rationality of people, even in the notion of the mutual understanding among the participants communication. These changes show the shortcomings of the established theoretical approaches to communication and suggest that theories, long considered overly provocative, such as radical constructivism, might offer important insights into the processes of contemporary communication.

One of the leading proponents of radical constructivism Colin Grant aims at conceptualizing social communication as a complex operation in uncertainty. He argues that neither monologic transmission, nor dialogism offers an adequate account of the uncertainties of communication. Such uncertainty is a result of complex relations between speaker and speaker, speaker and world. Besides, as modern philosophy suggests and constructivists radicalize – reality is an observer-dependent category, therefore, it can be described as contingent, depending on the observer’s point of view. This leads to the conclusion that communication is uncertain, messages are always unstable, their stabilization is the task of receiver. Moreover, radical constructivism conceptualizes communication as a process based on cognitive autonomy, or even some kind of solipsism, at an individual level or atomism at a social level. The uncertainties are negotiated for purposes of social interaction by means of fictions which, as

social constructions, are contingent. Thus, radical constructivism opposes considerations of permanent stability of interactions, relationships, conventions, rules, institutions, or systems. The most important point, however, is that the reference / meaning it is not stable either. All the stabilizations of communication are temporal – they are produced through recursivity and recursively constructed communicative networks.

Seems that radical constructivism is at least useful way to conceptualize present forms of communication. However, in this presentation I will argue that the tension between the cognitive autonomy of communicators and recursive stability of communicated cause major problems for constructivist theorizing. Since the meaning is essentially unverifiable, it is hard to see how arbitrary and uncertain meanings might lead to effective and adequate utterings and actions. If the stabilizations are contingent, perhaps Grant must presuppose that the message-stabilizing power should be innate, or to accept that not the reality is subject dependent, but the communicating subjects are contingent reality dependent.

PHC01 Rethinking theories of communication

PP 0753 For an apology of contingency: Rethinking disorders and epistemologies

[Jose Gomes Pinto](#)¹

¹ Lusofona University, School of Communication/CICANT, Lisbon, Portugal

In thinking about disorders recalling David Hume is always a good beginning, mainly when we approach the late essays, and especially those concerning the problem of human finitude and contingency. That's what we can read in *The Stoic- or the man of action and virtue* (1742): «If nature has been frugal in her gifts and endowments, there is the more need of art to supply her defect». It is, therefore, possible to legitimate and reconcile Odo Marquard's thesis on *the defense of the accidental* with Hume's dilemma, viz., human beings are both what happens to them and what they accomplish for themselves. Invention by opposition to nature/spontaneity is the matrix that supersedes *the frugal gift* Hume had in mind. Deleuze went back to Hume to overcome again the problem and once more we face harmonization of contingency and necessity by the way of *creative acts*; Deleuze states, «l'homme est une espèce inventive, l'artifice est encore nature; la stabilité de la possession est une loi naturelle». In the immediacy of what is given in experience, artificiality not only compensates, filling the theoretical gaps left by the precariousness and limitations of human judgment, but it also rewards: artifice is the principle of construction and determination of human nature. What is given is taken up by a movement that exceeds what was always taken as a given; the spirit becomes human nature. On doing so, subjects invent, they create beliefs; they become synthesis-machines or synthesis of synthesis, so to say, Spirits. The described movement occurs when identity predominates over difference, when the general supersedes the singular, the concept over the concrete. Hume efforts are due to "save" the singularity of every phenomenon, viz., to present concepts as phaenomena, as invented/created objects. In fact, determining the concrete mode of any phenomenon is something necessary in present times for it is the only way mediated societies have to create the given or, to it put in a phenomenological formula, the *things themselves*. Deleuze pointed out in *Différence and Répétition*: «L'empirisme n'est nullement une réaction contre les concepts, ni un simple appel à l'expérience vécue. Il entreprend au contraire la plus folle création de concepts qu'on ait jamais vue ou entendue. L'empirisme, c'est le mysticisme du concept, et son mathématisme». It will be by reference to this conceptual grid, from Hume, Leibniz, Deleuze, Marquard, that we will seek to understand which epistemology is suitable for a historical moment where idealistic *mathématisme* lives along with the deepest and immersive empirical situation. Before a common shipwreck, a sceptical approach can be a suitable tonic to revisit by disordering the established order and we will do it by a radical *apology of contingency*.

PHC01 Rethinking theories of communication

PP 0754 Platform and thought form – How the base/superstructure model found its way into mainstream media theory and what to make of it in times of regression

[Daniel Issl](#)¹

¹ Universität Klagenfurt, Medien- und Kommunikationswissenschaften, Klagenfurt am Wörthersee, Austria

During the heydays of poststructuralism and Weberian sociology it was rather *en vogue* to dismiss Marx's base/superstructure model as too simplistic and deterministic. It was thought to be emblematic to Marxism as such, which would not take into account superstructural forces and suggested that by a crude transmission process

material conditions could be one-sidedly translated into ideal forms. To the critics, the infamous formula that "being determines consciousness" was a clear expression of it. However, Marx wrote of "social being" and the "social" carries a lot of weight. It includes not only class and property relations which structure the social, but also consciousness, thought "materialized", all of which influence the ways in which these relations are then thought of. The base thus already involves the superstructure. Their relation is dialectical and not dualistic.

As I aim to show, this figure of Marx has lately been somewhat redeemed *via* theories of the platform. In many of the landmark studies of platform capitalism we can find some variant of the model. Maybe most strikingly so in van Dijck et al.'s *Platform Society* in which the question of the inscription of "libertarian norms and values" into the platform's very architecture (materialized in the form of competitive metrics) is assumed to influence the way people think, feel and behave on these platforms. The platform, then, has a lot in common with the base in Marxist theory. This is not because the authors "have read their Marx" (they have not), it is, I argue, because they find themselves confronted with the same problem Marx did: A universal structure is positioned between the individual and its needs. This structure's defining features, on which the individuals rely, thus influence the way in which the people come to think of the structure itself. While Marx had the market structure in mind, which in capitalism gained expansive and integrative forces and is marked by stark inequalities; the theorists of platform capitalism have the *digital* market structure in mind, which shares these features and which is, consequently, assumed to have an impact on thought forms – mostly for the worst. The platformization of society has often been theorized to undermine rational forms of deliberation, ultimately contributing to cultural and societal regression, which ultimately finds expression in triumphs of proto-fascist politics.

While there lies a lot of truth in such analyses, its premisses and conclusions are somewhat flawed as they tend to attribute effects to the digital platform that have been well theorized parts of the original capitalist "platform", the market structure, (maybe more so by the Critical Theory than Marx himself). By not taking this structure into account critically newer analyses tend to be apologetical of it. I conclude that both, Marxist theory and media theory must be brought into constructive dialogue to theorize the current capitalist disruptions in an encompassing way. The base/superstructure model is helpful in that regard – if not conceptualized too crudely.

PHC01 Rethinking theories of communication

PP 0755 Reconciling framing and stasis theory via the therapeutic topology of (dis)order

Chris Miles¹

¹ Bournemouth University, Communication and Journalism, Bournemouth, United Kingdom

Despite their clear relationship, the Classical rhetorical concept of stasis (or status) and the more contemporary notion of 'framing' have rarely been considered together, a situation that is made all the more surprising considering that the latter term can be argued as originating from a rhetorical context, namely, Kenneth Burke's "acceptance frames" (1937, p. 92). In this paper I seek to examine the similarities between stasis theory and the various ways in which the trope of framing has come to be instantiated in argumentation in the social sciences, the humanities, and select therapeutic modalities. While it is Goffman's (1974) **Frame Analysis** that is usually provided as the origin point for the adoption of the concept of framing into common intellectual parlance, Goffman himself credited Gregory Bateson's formulation of "psychological frames" ([1955], 2000) as his source (Goffman, 1974, pp. 10 and 21). However, consequently, in this paper, I will argue that it is the therapeutic-oriented work of Bateson (and its later development in Watzlawick, 1967, 1993, and Watzlawick et al. 2011) that represents the potential bridge between the current demotic understanding of framing, the introductory conceptualisation of Burke, and the Classical stasis tradition. The uncovering and exploration of the relationships between the traditions of stasis, Goffman's frame analysis, Burke's acceptance frames, and the Batesonian approach to therapeutic reframing, will allow us to re-position stasis at the heart of modern rhetorical theory and, furthermore, advance a therapeutic understanding of rhetoric that both reconnects it to its deepest past while also preparing it for its future place in an increasingly disordered (even (dis)eased) environment of public address and interpersonal communication.

PHC02 Materialities of communication

PP 0857 Human and algorithmic decision-making in uncertainty

[Ekaterina Pashevich](#)¹

¹ University of Copenhagen, Department of Communication, Copenhagen, Denmark

Recent advances in AI technologies have led to increased dependence of societies on algorithmic decision-making. Seeing the benefits of accuracy, impartiality and reduced cost of labor, more businesses and governmental institutions rely on algorithms to make decisions on behalf of human individuals. In this light, the present study aims to address the shortcomings of algorithmic decision-making by highlighting the gap between human types of reasoning and that of machines.

Among the biggest limitations of algorithmic decision-making is its inability to handle the complexity of the world and social interactions. In clearly defined and predictable situations, its performance tends to be generally beneficial (granted that programming is done right). Rather than in algorithm itself (which simply follows a set of rules), the problem lies in the fundamental impossibility to predict all the potential outcomes of each decision at the stage of programming. Not considering seemingly unrelated factors can easily lead to unwanted long-term individual and societal consequences. In such examples of algorithmic decision-making in real-world environments, such as self-driving cars and chatbots, it has been shown that human decision-making is more flexible and efficient.

In this work, I discuss several uniquely human types of thinking, challenge the notion of human irrationality, as well as reflect on the ways in which algorithmic decision-making may be improved using the knowledge of human decision-making in situations of uncertainty. Humans consider a wide range of contextual/environmental, social, and emotional factors, when making a decision. Among the reasoning techniques humans use in everyday life are abductive reasoning, heuristics, absence-based inference, etc.

Drawing on the epistemic works of C. S. Peirce on abductive reasoning and L. Wittgenstein on certainty, I look specifically at absence-based inference and at the mechanisms of transforming it from a logical fallacy to an epistemically good way of making inferences. I theorize how absence-based inference can strengthen algorithmic decision-making. Better knowledge and implementation of uniquely human ways of reasoning in algorithmic decision-making may reduce the grave consequences of overreliance on algorithms when making socially significant decisions.

PHC02 Materialities of communication

PP 0858 Intimacy at display: Telephony, dialogue and dissemination

[Lars Lundgren](#)¹

¹ Södertörn University, Media and Communication Studies, Huddinge, Sweden

Satellite broadcasting and telephony may at first seem as wide apart as one can think of in terms of communication practises. Broadcasting via satellite, indiscriminately disseminating its signal over vast territories reaching diverse audiences across the world. A telephone conversation, by contrast, establish and maintain an intimate connection between – for the most part – two persons who engage in a dialogue to share thoughts, ideas, and perhaps secrets for no-one else to hear. Yet, during a number of years in the early history of satellite communications they were intimately linked, not only technically by relying on the same infrastructure, but also rhetorically. The introduction and promises of emerging satellite communications infrastructure, the network of earth stations being built across the globe, tied broadcasting and telephony together. Besides allowing for broadcasting as well as increasing the number of intercontinental voice circuits, phone calls between dignitaries – presidents, kings, prime ministers – were often included as part of the opening ceremonies when new satellite stations were first brought into use.

In bringing broadcasting and telephony close together these opening ceremonies collapsed one of the long-standing conceptual gaps in media theory; between dissemination and dialogue, between transmission and ritual; between the postal and the erotic (Carey 1989, Peters 1999, Krämer 2015). In this paper I use the opening ceremonies and inaugural calls to reconsider that gap, suggesting dialogue and dissemination being inseparable rather than mutually exclusive. I do so by building on Amit Pinchevski's recent proposal that the two concepts exist in a relationship of mutually assured heteronomy, and what ultimately separates dialogue and dissemination is their relation to *the other*, that they represent 'two approaches to alterity' (Pinchevski 2021, 251).

Introducing the notion of *intimacy at display* the paper adds to Pinchevski's discussion by demonstrating the co-existence of multiple relations to *the other* in the inaugural phone calls. By revisiting three such calls, during the opening ceremonies of satellite stations in Morocco (1970), Israel (1972), and Madagascar (1970), the paper makes the argument that the disseminative dialogues of the calls, their performance of intimacy at display, allows for a communicative situation marked by the coexistence of dialogic and disseminative others.

PHC02 Materialities of communication

PP 0859 The public value of media: A systemic and pragmatist approach

[Indrek Ibrus](#)¹

¹ Tallinn University, Baltic Film- Media and Arts School, Tallinn, Estonia

The concept of 'public value' has been theorised since the days of Aristotle and his distinction between exchange value and use value. While the concept of value was further developed by classical economists the 'public value' concept started to receive more systematic attention in the works of institutionalist economists and, at the end of the 20th century in public administration studies, especially in the works of Mark H. Moore and his colleagues (Benington & Moore, 2011; Moore, 1995). As Benington and Moore put it, the values that public agencies should work toward should be defined by the public and should emerge in dialogues and interactions in the public sphere. The latter is often seen as constituted by PSM and other mainstream media channels. Today's public sphere involves multiple actors and different types of institutions, including independent media and international platforms. In this context, Benington and Moore suggest that thinking about public value involves analyzing the interactions, interdependencies, and cocreation between complex sets of actors. However, differently from this dialogical account, the dominant discourse in the public service media studies has been only focusing on the "strategic uses" of the public value concept (e.g., Donders, 2021; Moe & van den Bulck, 2013). In addition, classification lists of how PSM could produce public value have been provided (Cañedo et al., 2022; Chivers & Allan, 2022).

Our approach in returns to the interactionist understanding of "public value" and has been generally built on institutionalist and evolutionary economics (Commons, 1931; Dopfer & Potts, 2008; Lundvall, 2010; Mazzucato, 2018; Veblen, 1899) and cultural science (Hartley et al., 2021) approaches. According to these, value perceptions are not universal but are culturally contextual and specific. They change through dialogic communications between different cultural or knowledge communities; hence, both the economy and culture evolve via exchanges between such communities. As such, "public value" differs from "public good" as it is not static but an emergent property—always context-specific and changing, emerging in interactions and public dialogues.

While the above-described ideas have been proposed by the authors in parts before, the specific new contribution of this paper is linking the approach to the tradition of pragmatist philosophy. While it is already well established that the ideas of CS Peirce influenced Veblen in developing his versions of both institutional and evolutionary economics we'd like to also highlight the potentials of the works of William James (and to a lesser extent James Dewey) in defining and understanding the concept of public value in the era of datafying media industries. In the presentation, we aim to highlight the usefulness of pragmatism as a method of sorting out 'what works'. We suggest that open-ended dialogism of Moore and Benington and of the cultural science approach needs to be trimmed by an analytical method of sorting out what of the values can be claimed to work in the public interest. Under further focus will be James' pluralism and its uses in conceptualising and analysing datafied relationships of value creation.

PHC02 Materialities of communication

PP 0860 Monitoring the Baltic Sea: on submarines, mediation, and veracity

[Staffan Ericson](#)¹

¹ Södertörn University, school of culture and communication, Huddinge, Sweden

This paper originates from an ongoing research project: "A Sea of Data: Mediated Temporalities of the Baltic Sea" (Lundgren & Ericson). The overall aim of this project is to analyze technologies of mediation and data collection of the sea, in relation to past and present practices of monitoring, transportation, and environmental formation. Philosophically, the project is associated with notions of "elemental media", and mediation as a "traffic between nature and culture", developed by, among others, John Durham Peters (2015a, b).

This paper presents a sub-study of the use of *monitoring* media, during the so-called submarine crisis: the series of alleged intrusions in Swedish territorial waters, emerging in the early 1980s, continuing through the next decades, and generally regarded as the most serious national crisis in Swedish modern history. While these events has produced three parliamentary commissions, controversies about "what actually happened" under the surface of the sea has continued to this day. The paper does not aim to settle the issue, rather to illuminate the persisting uncertainties in finding it out, and how these are related to processes of mediation. The submarine crisis is thus

regarded as a tricky instance of the “veracity gap” (Peters 2001): How do we make events believable, for people who were not present, in space or time (or both)?

The paper will focus on two forms of monitoring media (both emerging during the cold war, and residing at the centre of attention during the submarine crisis): *sonar* and *television*. While television coverage dominated public imagination, and set the agenda for political debate and initiative, sonar – “a new technical-natural object: the under-water ear” (Shiga 2013) – gathered evidence from environments inaccessible to the human sensorium. Both, however, presented severe epistemological challenges: The preferred formats of television – the witnessing of history through live broadcasting, and/or the televised narration of the past through the crisis chronicle (cf Doane 1990) – were increasingly criticized as “tricks of illusion” (Mossberg 2016), producing collective “hysteria”, rather than historical representation. Further, the evidential status of sonar was increasingly exposed as unreliable in depicting the outer world: sound recordings initially classified as the registration of “confirmed” submarines, with “fingerprints” of national origin, turned out to be produced by minks, herrings, propellers from boats on the sea surface. In other words, sonar turned out to be a thoroughly *saturated* medium (Jue & Ruiz, eds 2022), resisting the strict demarcation of element, man, machine, animal, signal. As an *echo* technology (Pinchevski 2022), sonar remained stuck in the “traffic between nature and culture”, a closed system of relationality (cf. the “echo chamber”), a sound existing only in the absence of its original source.

The paper will illustrate how such epistemological dilemmas were activated, and interrelated, during the submarine crisis. It will further discuss how they may be understood in terms of a general media philosophy, specifically that of Sybille Krämer (2016), in which a medium is posited “in-between” two worlds, both linking and separating them, by “transporting perception” and “reading traces”.

PHC02 Materialities of communication

PP 0861 Materialities of aesthetic communication

João Carrilho¹

¹ Universidade Lusofona, Cinema and Media Arts, Lisbon, Portugal

If the materialities of communication are, in the words of Friedrich Kittler, perhaps the greatest modern enigma [1], then investigating the materialities of aesthetic communication presents itself as an unequivocally relevant proposal for ECREA, which leads the interdisciplinary communication research in Europe.

This proposal is based on what we consider to be the fundamental event of our time, namely the almost unlimited expansion of technology to all domains of life and experience. The space between nature and the human domain has become increasingly filled with technical advances and technologies that constantly reshapes its discourse. This is then a place in constant transformation, mobile, increasingly moving humans further away from a natural situation. Today, almost all knowledge we have about nature can only be understood from a technical point of view that encodes and decodes natural propositions.

Going beyond language and logos itself, the technical object experienced a radical evolution: from mechanical object to communicative materiality, from instrument to machine and finally to the device as a general system. In this sense, it can be said that the critique of reason has today become the critique of the media [2].

But there is a totalising impulse within digital technology itself: not limited to the infinite recycling of what is reproduced, it also encompasses a broad social interdependence. In the second industrial revolution both the producer and an entire social context are produced.

The proposal focuses on the aesthetic dimension, which, together with the ethical and alethic dimension, constitute the three main pillars of experience. The artistic object shares with its technical counterpart the fact of being an integrated unit of meaning – one that does not simply concern its direct perception, but involves the entire world of experience, playing freely with the boundaries and rules that delimit it.

If something defines our time, it is precisely the impossibility of defining it. The apparent failure of modernity is expressed in the inability of major conceptual categories to currently grasp the historically constituted experience. This situation also extends to the aesthetic dimension, with the ruin of all criteria that guided artistic creation in the past, and from which a single principle seems to emerge: *es geht alles*.

Under the imperative of the new and the ideology of freedom, the current technological revolution tends towards total paralysis, channeling any free thought and action into its self-designed structures. The difficulty in assuming an artistic-political position is mainly due to the invisibility of the structures, which permeate everything. However, its contradictory material substrates are discernible: the increasing automation of all areas also encompasses those of production. If the technological paradigms that artists have disseminated over the last decades have only taken them deeper into the structures of power, it is essential to think not only about the quality of artistic products, but also about the quality of the production modalities themselves.

PHC03 Living in the age of immersive media

PP 0956 Political and social potentialities of tele-immersive media: An interrelated critique of the concepts of presence, distance, virtual and travel

Joana Bicacro¹

¹ Universidade Lusófona, ECATI / CICANT, Lisboa, Portugal

This paper explores the process of redefinition of presence within the discourses of the metaverse and VR, particularly by Big Tech or Platform Capitalism companies marketing of virtual travel media. It examines the use of digital means to subvert scale and transcend the dimensions at which human contact, social and political action and events typically occur. This raises the question: what exactly is being mediated and which aspects of place are being re-mediated? When information reception becomes a surrogate for movement, homes paradoxically become total institutions. Along a widespread belief that a media culture of distance and passive reception has ended, the promises and perils of the virtual are linked to the hopes of redefining and continuing community, both local and global, and (dis)ordering the social.

The paper discusses theories of simulacrum and spectacle, commonly associated with notions of authenticity in experience. It argues that virtuality, as a question of distance, relates not entirely to an internalization of experience and pure imagination but also to the virtualization of experience — even as affect and body — following the mourning of the metaphysics of presence and the sacrifice of the political.

Derrida's critique of presence, distance, and virtuality stands out here. His concept of "hauntology," opposing ontology and starting from the idea of "specter", helps us analyse the collapse of oppositions between presence and absence while opening the question of automatism as hauntomatization. This aligns with media theorists who argue that VR renders the issues of presence and absence irrelevant, leading to significant epistemological consequences.

The paper identifies two parallel trends in the process of virtualizing places and spaces. First, the Cartesian territory, abstracted and perpetuated by modern science, GPS mythologies, and space travel, expands and declines materially in teletechnological epistemes, economies, and politics. This expansion is seen through the control of territories via what is termed operational images (Farocki, Parikka, Elsaesser), which offers insights into global conflicts, ecological struggles, and general material, political, economic and social divides. Secondly, there is a critique of virtuality as dissolving collectives and communities. This trend is marked by the atomization of subjects in stationary positions, intersected by the fragmentation of the world through increasing mediatization. It raises concerns about corporate platforms commodifying attention and discouraging encounters.

Lastly, the paper introduces the concept of operational materialism. This concept emphasizes a post-epistemic attitude, a media arts and critical practice that transcends representational paradigms and delves into the material and relational realms, even within highly abstract and informational systems like capital. There is a process underway, as seen in Stiegler, for the possibility of repoliticizing the operational image. Operational materialism occurs when, beyond representing a distant place and time, one can have an effect on them. It implies a reciprocity not of representation or cognition, but of a material nature. It invites a reconsideration of bodily experience and mental representation in the context of VR and tele-immersion, proposing a new perspective on community in a post-human and political sense, and art case studies. Media art case studies are examined.

PHC03 Living in the age of immersive media

PP 0957 Communication platforms and the philosophy of Ayn Rand: Examining its influence in the transition from Twitter to X

Philipp Bachmann¹

¹ Lucerne University of Applied Sciences and Arts, Lucerne School of Business, Lucerne, Switzerland

Many tech entrepreneurs from Silicon Valley and other areas, including Elon Musk, are reportedly influenced by Ayn Rand's philosophy and ethics. Ayn Rand's "objectivism" places individualism and rational self-interest at the core of her philosophy. Rand, and by extension, Musk and other tech entrepreneurs, believe that only an unregulated market economy can foster optimal human creativity and economic prowess. Rand vehemently opposes state intervention in the economy and welfare initiatives, viewing them as infringements on individual freedoms and hindrances to personal and economic growth.

This submission posits that Musk is applying the libertarian stance of Rand's philosophy and ethics in his management of Twitter/X. Elon Musk has dismissed employees responsible for screening and moderating the platform's content. Over a thousand employees were let go at X for moderation. In communication science, particularly in media economics, there is a significant emphasis on business models and strategies to rationalize decisions like these.

However, the role of libertarian ethics in our contemporary communication structures and digital media society has been largely overlooked. Scientific classics on the relationship between ethics and entrepreneurship still need to be remembered.

Max Weber, in his seminal work "The Protestant Ethic and the Spirit of Capitalism," argued that Protestantism, especially Calvinism, played a pivotal role in the development of modern capitalism. He suggested that the Protestant ethic, focusing on hard work, discipline, and a rational lifestyle, is aligned with the capitalist spirit. This way, Protestantism fostered a culture conducive to capitalism's rise and spread. Similarly, it can be argued nowadays that Rand's objectivism plays a crucial role in the structuration of modern digital capitalism. Her philosophy and ethics proliferate global tech platforms, emphasizing self-interest, autonomy, and opposition to state regulation.

On Twitter, the implementation of Objectivism's libertarian ideals is influencing social interaction: the discourse on Twitter has become significantly more aggressive; dubious, offensive posts, and even fake news and propaganda, are now widespread. This has led to a marked decline in the platform's credibility and respectability. It is high time that the philosophy of communication takes a closer look at this context.

PHC03 Living in the age of immersive media

PP 0958 AI-generated photo-based images: Their ontological status and interpretation

Zsolt Bátor¹

¹ Kodolányi Janos University, Department of Communication, Szekesfehervar, Hungary

In a recent Science paper, Epstein, Hertzmann, et al. argue that generative AI doesn't herald the demise of art but introduces a new medium with unique possibilities (Epstein, Hertzmann, et al., 2023, p. 1110). They draw parallels with historical technological shifts, such as photography's perceived threat to painting, emphasizing that new tools don't replace but transform artistic practices. Epstein, Hertzmann, et al. advocate viewing generative AI as a tool for artists to reshape current practices rather than a threat. They highlight the term "artificial intelligence" as potentially misleading, suggesting that it may imply human-like intentions or consciousness. Dispelling these misconceptions is crucial for fostering acceptance of generative AI as a creative tool.

The ontological debate surrounding AI-generated artworks centers on authorship. Some argue for AI programs as potential authors, while skeptics insist on human involvement due to the absence of consciousness in generative AI. Others emphasize the role of social agency in traditional art creation. I argue that the ontological status of AI-generated photo-based images is better understood through contextual interpretation than ties to consciousness or social agency. Relying on theories of pictorial and photographic illocutionary acts, I suggest that the interpretation process involves recognizing literal pictorial content at the locutionary act level and considering contextual information at the illocutionary act level.

I argue that in the case of generative AI-produced images, audiences identify literal content and contextual cues. They acknowledge the generative AI's role, perceiving the image as a manipulated rendering, not an indexical photograph. However, I question whether this leads to a new genre or simply introduces novel ways of creating composite images. On authorship, the interpretation attributes it to the human user of the generative AI, likening the programmer's role to that of camera or darkroom equipment constructors. Generative AI is viewed as a complex tool for rearranging images, not an author. I also argue that the distinction between traditional and AI-generated images parallels handmade and mass-produced items. In the instance of traditional production, the object's creator retains complete control over all the encompassing processes, whereas the designer of a mass-produced item only creates the distinctive facets of the product, without direct involvement in each stage of production.

Based on the interpretation process described at the illocutionary act level, it can be concluded that audiences come to have true beliefs about the nature of photo-based images produced using generative AI, as long as the image's nature is readable from it or deducible from the context. Audiences are not deceived in such cases. However, if the image's nature is neither deducible from the context nor readable from the image itself, they might be deceived into interpreting it as an indexical photograph of a scene captured by a camera. During my talk, I will present examples of both deceptive and non-deceptive photo-based images produced using generative AI.

PP 0959 The indefinite wait: A theoretical approach of time-critical media (the case for throbber)

Manuel Bogalheiro¹

¹ Lusofona University, School of Communication/CICANT, Lisboa, Portugal

In almost every type of experience mediated by digital interfaces – loading images and pages from the World Wide Web, updating social media feeds, streaming videos and multimedia content – we can find an animated icon, usually a spinning wheel, that appears in a perpetual circular movement on itself, which is commonly referred to as

the *throbber* and, for users, means a time of waiting or a form of temporal indetermination. Unlike a progress bar, the state of progress is unknown. In other words, it is unknown when what we are waiting for will eventually arrive. In this sense, and thinking from Bergson's (1889) concept of "la durée", the *throbber* configures a type of temporality that resists to measurement, a type of intensive magnitude, not extensive, that resists to the reduction of time to a homogeneous medium. From the point of view of the mediated communication operationalization, in terms of this temporality, the *throbber* corresponds to a *surface effect* (Kittler, 1999), that is, to a way of ensuring *entertainment* – the production of a humanly symbolized reality – given the abstraction of the formal computing processes in the *depth*. The *throbber* seeks to hide the temporal discontinuities of the system. Faced with an interruption or delay, users should not abandon the process: their attention is hypnotically held and a singular feeling of indefinite anticipation comes to define the experience.

In a culture of speed (Virilio, 1997) in which the instantaneity is proclaimed, and the digital network is announced as a *real-time system*, the suspended temporality of the *throbber* emphasizes that the notion of *real-time* "refers to the time of computer processing, not to the user's time. Real-time is never real time – it is deferred and mediated" (Chun, 2011). The *real-time system* is, therefore, more of a cultural promise – or fantasy – than a technical reality. Despite the so-called quantitative discretization of machinic time, the image of a universally distributed speed is still permeated by all types of disruptions and latencies that expose the intensive nature of the mediated processes. This is caused by both the media processing conditions and the different geographic and socioeconomic conditions of users.

From this framework, we propose to present two hypotheses: the *throbber* is not just a simple time-based *media* object, but, insofar as it reveals a "genuine event-like nature of media", is a form of time-critical *media* in which "minimal time processes represent a critical and thus decisive criterion of medial operativity itself." (Ernst, 2016) Regarding epistemological implications, instead of a linear, chronological and teleological conception of communication (or interaction), according to which the result can be predicted before a calculable action, we point to a materialist approach, according to which communication unfolds contingent and dynamic dysfunctions that, as a form of *epoché*, challenge the logic of means and ends, as well as the human-based phenomenology of continuous stream. The analysis of the *throbber's* specific temporal ontology can contribute to a critical diagnosis of the theoretical-epistemic conditions of access to information in mediated environments.

PHC03 Living in the age of immersive media

PP 0960 "Your 'Order' is built on Sand!" – On the benefits of disorder and questioning the status quo

Steffen Göths¹, Florian Primig¹

¹ Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

As social disorder is connected to the notion of chaos and destabilization it might be viewed as something inherently negative. On the contrary, social order seems to be something that has to be achieved and ultimately maintained as it stands for stability and predictability. Although that might be a desirable outcome, it also includes the stability of the society's power relations, rendering overcoming these relations as a threat. This contribution is therefore arguing for a change of perspectives.

According the thoughts of Rosa Luxemburg, social order stands not only for the stability of power relations but also for the oppression of those who are arguing for social change. In her famous last article, Luxemburg wrote "Order prevails in Berlin! You foolish lackeys! Your 'order' is built on sand" (1919). These words were written in a moment of total defeat and only hours before her murder and yet, they convey the hope for another society beyond the prevailing order. So, instead of framing communication that is questioning the social order ultimately as a threat, I propose to rather discuss its potentials to shake up the fundamentals of power the social order is based on.

As a key example, I would like to refer to the current understanding of alternative media in the field of communication studies. Following the influential definition of Haller & Holt (2019), many empirical studies from recent years focused on the perils of emerging alternative media towards political discourse, mainstream media and democratic societies themselves. Using alternative media as an "umbrella definition" (Holt et al., 2019) that is supposed to be non-ideological bears the risk of mix up alternative media that have diametral opposing stances on social conflicts. Thus, the potential to criticize mainstream media as well as the broader society might be limited as the term comes out tainted by the association with right-wing ideologies. In that sense, a certain academic definition cannot only yield problems in terms of accurately defining objects of research but also in reaffirming the status quo of social order.

PHC04 Communication and (social) environments

PP 1052 Dysfunctional Communication and well-being

Lydia Sanchez¹

¹ Universitat de Barcelona, Biblioteconomia- Documentació i Comunicació Audiovisual, Barcelona, Spain

It seems that current democracies live under a paradox: digital communication has penetrated broad sectors of society, and on the other hand, communicative disorders seem to be increasingly more and more far-reaching. Digital communication has created difficulties that harm the quality of life of citizens, with unhealthy communication practices. Inappropriate consumption of digital media carries risks such as misinformation, infoxication, addictions and mental health, which worry society. The last decade has marked a turning point in people's well-being. The pandemic and post-pandemic have contributed to many citizens living with insecurity, uncertainty, exhaustion and anxiety.

The omnipresence of multimedia devices in daily life has brought with it a series of information disorders such as fake news, populist and "techno-populist" discourses, ideological polarization, selective exposure to information, information bubbles and echo chambers, and infoxication. Although these phenomena are not new, they have intensified due to the diffusion and reach of digital media among the population, especially adolescents.

Information disorders have led to the emergence of unhealthy communication and information use practices. There is growing concern about addictions and mental illnesses derived from the use of social networks (RRSS) and mobile devices, especially among adolescents and young people. Social media and video game companies use intricate algorithms to capture users' attention and make them spend as much time as possible in front of screens. This brings them economic benefits, but at the expense of the health and well-being of the users. Various studies show that Internet addiction causes loneliness, phubbing, anguish, psychological deterioration, sleep disturbances and poor academic performance. All of this shows a clear absence of well-being and health.

Some authors argue that the problem is not so much the existence of fake news, disinformation or infoxication, but rather the critical skills that the individual has to confront this model of society. But, on the other hand, information disorders and unhealthy communication practices have a cognitive origin to which communication science must pay special attention. Cognitive social psychology emphasizes the tendency to reason in a biased way, so that we tend to consume information that is similar to us, avoiding questioning our beliefs. Our cognitive structure is such that motivated reasoning predominates, that which is at the service of the initial judgments that we formulate based on emotions. We tend to ignore the truth of an opinion, and even adopt the opposite, if that opinion threatens our intuitions, emotions, and most fundamental ways of understanding the world.

In this work we present a possible philosophical conceptualization of the aforementioned paradox, considering the assumptions of cognitive psychology, and analyzing to what extent critical thinking can help us recover non-dysfunctional communication. The idea is that communication and well-being are two related concepts.

PHC04 Communication and (social) environments

PP 1053 The Metaverse vs. Hannah Arendt: A critical reminder of our embodiment and need for disorder

John Magnus Dahl¹

¹ University of Bergen, MediaFutures/Department of Information Science and Media Studies, Bergen, Norway

You don't need to look long to find characteristics of the metaverse as something that "could fundamentally change how humans live", that the metaverse will be "like real life, only bigger and better", and that "the metaverse will arrive". According to a Pew Research poll, 54 % of "624 technology innovators, developers, business and policy leaders" believe that the metaverse by 2040 will be "truly fully-immersive" (Pew Research Centre, 2022). Although the percentage indicates a divide, it is safe to say that a central element in widespread imaginaries on the metaverse concentrate on how it will revolutionize not only internet, but people's daily life. Behind this promise lays technological problems of how to standardise and order the internet.

But can a virtual word ever be fully-immersive, and do internet users want order? In this paper, I use Hannah Arendt's distinction between the three kinds of human activity – labor, work, and action – to critically dissect imaginaries of the metaverse. The paper is based on theoretical discussion of Arendt's thinking and an analysis of marketing material and popular writing on the metaverse, but the idea stems from empirical, ethnographic research on teenager's social use of smartphones and computers, which will be used to illustrate and illuminate the points of discussion.

Arendt uses the opening lines of *The Human Condition* to reflect on how modern science, in its manifestations as space engineering and the life sciences, builds on an imaginary where mankind can exchange "...human existence

as it has been given [...] for something he has made himself" (Arendt, 1958, 2–3). Writing these lines in 1957, the alluring future was spaceships and artificial life. Today, it is a safe bet that Arendt would have seen AI, AR, VR and the Metaverse as clearer examples of how science is imagined as promising us a world where we can "escape the human condition" (Arendt, 1958, 2).

At the same time, Arendt's division of three distinct spheres of life proves useful in criticizing the promises of this imaginary, most visible in popular discourse around the metaverse, through reminding us of our embodiment. Starting with the sphere of labour, I discuss how the metaverse cannot be fully immersive because human beings can never be born, die, or feed in the metaverse. Furthermore, using the categories of work and action, I argue that the allure and attraction of a virtual world – be it the metaverse or contemporary use of all kinds of social media – lies in how it allows us to be *disconnected* from our bodies. We can always turn off the computer. Virtual worlds should thus be seen as a parallel world where we can engage with others not through one unique, constant avatar, but through the opportunities to enact many different identities, offered by disembodiment. The metaverse might thus be 'overrated' regarding its attractiveness and its radicalness. The imaginaries of the metaverse are based on corporate and capitalistic order – while truly human use of the Internet is based on disorder.

PHC04 Communication and (social) environments

PP 1054 Environmental sensitivity as the philosophical foundation for a resilient communication theory and practice

Arthur Kok¹

¹ Fontys University of Applied Sciences, Fontys Business and Communication, Eindhoven, Netherlands

Crisis and disruption can induce feelings of self-loss, instability and fragmentation, but they can also be a catalyzer for connecting to the core of who you are and what is really essential. As Hegel says, living from crisis to crisis, feeling an ongoing urgency to 'respond', is not the result of disruptions outside but a lack of resilience within. It is in this search for resilience that I put forward the question: is it possible to find a comprehensive and foundational philosophy of communication?

For good reasons, many philosophers consider communication – or at least some forms of communication – to be a defining characteristic of what it means to be human. However, these approaches place communication in the context of specific questions – What is the nature of consciousness? Why do we have language? How can political power be reconciled with freedom? – rather than placing communication in the center of the question itself. The concept of communication has great explanatory power, but the question remains: what is communication? I argue that to answer this question, we have to look at communication as a professional reflective practice.

It is not easy to find an approach to professional communication that lends itself to something ontological, or perhaps even metaphysical. There is a lot of knowledge and skills involved in professional communication, but there is not one core activity; in that sense, it is not a craft. Communication theory tends to be an aggregate of different outlooks and borrowed methodologies, anchored in other disciplines, like psychology, sociology and anthropology. Also, the development of professional communication is mainly driven by external societal and technological developments like (mass) mediatization, market globalization and political emancipation, rather than a search for the true nature of communication.

However, there is one competency often attributed to the communication professional that lends itself for deep philosophical analysis: sensitivity to the environment – be it organizations, society or other stakeholders. Environmental sensitivity is a fundamental competency, but it is not knowledge or skill. It is not an instrument but rather something that the communication professional has to be – as a mode of existence. And what is more, environmental sensitivity plays a key role in metaphysics since the late 18th Century, especially in continental philosophy. Kant, Hegel, Husserl, Heidegger and Merleau-Ponty all stress, in distinct ways, the importance of 'transcendental openness' to what is present to us but appears to come from outside of us – whether you call it *Ding-an-sich*, *Epoche*, or simply *Otherness*.

In this paper, I use this philosophical tradition to make explicit how professional communication not only instrumentalizes communication in terms of knowledge and skills, but also appeals to this fundamental mode of existence. I argue that this does justice to communication as a reflective practice and provides a philosophical grounding for communication theory that appeals to a metaphysical understanding of what communication in itself is: openness as an existential mode. In that sense, environmental sensitivity is what makes professional communication a resilient reflective practice.

PP 1055 Shaping self-regulation with social norm affordances; New ways of thinking about platform moderation

[Nathalie Van Raemdonck](#)¹

¹ Vrije Universiteit Brussel, IMEC-SMIT, Brussels, Belgium

Democratic societies are dealing with increasing polarization, misinformation, radicalization and hatespeech; challenges that are not new but differently experienced with new media communication tools. To deal with current social disorders, platforms and governments are expected to intervene. Their solutions are however challenged by the cross-border character of the digital space, where national regulations can cause internet fragmentation, and uniform platform interventions can enforce top-down constraints that may not be sensitive to cultural differences.

How 'radical' members of society can be, when to treat a hypothesis as disinformation, and what constitutes 'hatespeech' are examples of questions that can differ across the digital landscape. While Habermasians might argue deliberative democracies assume a certain rationality that provides answers to these questions, in practice 'truth' and 'morality' run into the demarcation problem as described by Popper. They are to a certain degree socially constructed through consensus, or as Mouffe and Laclau would argue a 'conflictual consensus' that is subject to change.

While there is no immediate solution to avoid the fragmentation of the web through regulation on one hand, and curb the authoritarian power platforms have over user behavior on the other hand, there is an opportunity to improve the possibilities users have to self-regulate and increase culture-sensitivity in content moderation. Helberger, Pierson & Poell (2018) have also called for such a cooperative responsibility of users, platforms and public institutions in governing platforms. One of the ways humans have always self-regulated in the offline world is through social norms. Social norms are the non-institutionalized rules governing societies. They are expectations raised on members of collectives that share a certain identity. Norms are always in flux, subject to a similar conflictual consensus, and (temporarily) set the demarcations on what is acceptable behavior.

The possibilities for users to self-regulate online are dependent on the architectures of platforms and what it affords users to do. These so called 'affordances' shape how users can establish, enforce, challenge or transform social norms online. We theorize that the relevant affordances for users to participate in normative processes are those that provide the ability to interact and intervene, giving users interactability and interventionability. Other relevant affordances determine the visibility of interactions in time and space; how long they are visible, and to whom they are visible in the digital publics. Lastly are the ways in which platforms shape group membership, as norms are only respected insofar one feels a shared social identity with those enforcing them.

In conclusion, in order to allow users to take up their shared responsibility in platform moderation and create boundaries on acceptable behavior, we need better thinking about how platform architectures are shaping normative processes between users.

Helberger, N., Pierson, J., & Poell, T. (2018). Governing online platforms: From contested to cooperative responsibility. *The Information Society*, 34(1), 1-14.

PHC04 Communication and (social) environments

PP 1056 Dialogue in an Age of (Dis)order

[Johan Siebers](#)¹

¹ Middlesex University, Language and Communication Research Cluster, London, United Kingdom

In philosophy of communication a distinction is sometimes made between the social world as the sphere of structured collective action and the interhuman or interpersonal sphere of personal encounter. This distinction goes back to an essay by Martin Buber, *Elements of the Interhuman* (1965), where a hard contrast is made between those interactions that follow and cement social structures on the one hand, and interactions that have to do with the mutual over-againstness of existential recognition, a sphere of experience for which Buber reserves the term "dialogue". Any kind of social organisation (family, workplace, public sphere, cultural interactions, etc.) in and of itself has nothing to do with the unique moment in which two people acknowledge each other's irreducible, free existence and the communicative appeals that are part of this situation. Buber also speculates that this type of relationship is not limited to humans but has transhumanist correlates in nature and faith, and even in the sphere of ideas and of art.

Can a renewed reflection on the specific nature of dialogic communication as distinct from social order and disorder provide orientations to theorise the role of communication in navigating today's changing and challenging societal orders? In this article the uniqueness of Buber's insights into the nature of dialogue as both togetherness and separateness are brought to bear on contemporary philosophy and theory of communication against the background of this question. The relative absence or misunderstanding of Buber's thought in contemporary

communication studies is explored and placed against the background of, on the one hand, influential trends in media and communication theory and, on the other, the elusiveness of Buber's insight itself. Finally, the potential of his philosophy of communication for some of the main themes of contemporary communication scholarship are explored. What is the heuristic value of demarcating the interhuman from the social for this year's ECC theme, communication and social (dis)order?

POL01 (Micro)targeting in political advertising

PP 0021 Citizens' perception of effectiveness of microtargeted political advertisements: A 25-country cross-national vignette study

[Christofer Talvitie](#)¹, [Puck Guldemond](#)², [Rens Vliegenthart](#)², [Sanne Kruikemeier](#)²

¹ University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

² Wageningen University and Research, Strategic Communication Group, Wageningen, Netherlands

Modern political campaigns have widely adopted political microtargeting (PMT) – collecting and analyzing personal data to create customized political messages aimed at specific audiences – as part of campaigning strategy (Kreiss, 2016; Anstead, 2016; Dobber et al., 2017). As PMT uses citizens' data to sell targeted political ideas and candidates it has raised normative concerns regarding, for instance, voter manipulation (Zuiderveen Borgesius et al., 2018). This concern seems to be heightened among citizens and concerns are assumed to be in line with the Third Person Hypothesis (Davison, 1983). People often overestimate the influence of media (in this case PMT) on the attitudes and behaviors of others. Nevertheless, whether citizens perceive PMT to be effective in influencing them or their peer citizens is empirically unanswered. Drawing on data from a vignette study across 25 countries, this study aims to explore how citizens' perceptions of the effectiveness of PMT vary across different countries.

The Third Person Effect (TPE) occurs especially when the type of media influence is perceived to be negative (Perloff, 1999). While literature suggests that individual citizens might perceive PMT as both personally beneficial and harmful (Herder and Dirks, 2022), PMT as a practice is often seen as morally wrong and will have a detrimental impact on democracy, often referring to the Cambridge Analytica scandal (Bodo, et al., 2017). Hence, in the public debate, PMT is seen as possibly undermining citizens' trust in democratic processes (Bennet, 2016). Hence, due to the negative connotations of PMT as a media format, this paper posits that the personalization of political advertisements leads to greater third-person effects, that is, the perception that PMT influences others more than oneself (H1).

Furthermore, TPE literature suggests that the TPE can be moderated by perceived risks associated with the media format (Ham and Nelson, 2016; Nelson, et al., 2021). Specific to PMT, Matthes, et al. (2023) found that citizens who perceive PMT taking place were more worried of its effect on others and democratic processes. Hence, this study predicts that greater concern about privacy will increase the TPE-driven perception that PMT influences others more than oneself (H2).

However, countries might vary in the extent to which PMT is perceived as a negative practice. As the TPE is spurred by public perception of the given media format being undesirable to be influenced by, it might be that third-person effects are moderated by the amount of public debate there is in the country on the negative effects of PMT. Hence, this paper aims to compare the variation in third-person effects among countries, expecting that the more public debate there is in the country on the effects of PMT, the greater the perceived effect of PMT on third person rather than oneself (H3).

Drawing on cross-country data from an extensive study that presents respondents from 25 countries across the world with different scenarios of PMT, this study aims to elude how individual perceptions of the effectiveness of PMT might be common worldwide and their contingency upon country-level characteristics.

POL01 (Micro)targeting in political advertising

PP 0022 Political microtargeting: Sweet as sugar? Assessing the effects of being (mis)targeted on topic attitude, topic importance, and ad liking

[Annelien Van Remoortere](#)¹, [Susan Vermeer](#)¹, [Sanne Kruikemeier](#)¹

¹ Wageningen University and Research, Strategic communication, Wageningen, Netherlands

The way politicians communicate to citizens has fundamentally changed. With the rapid growth of data-driven techniques, political messages are increasingly matched to individual voters (political microtargeting), in particular online. Matching takes place using large databases containing personal information that voters — knowingly and mostly unwittingly — leave online, such as individual characteristics, preferences, and behaviors (Acquisti, Brandimarte, & Loewenstein, 2015). The personal information that is collected is subsequently used to show people individually targeted messages, mostly on social media. When successfully and repeatedly targeted, it is expected that these messages have robust and long-term effects on citizens. Evidence finds that targeting ads indeed increases the likelihood to vote for a certain party or candidate and can strengthen party ties (e.g., Krotzek, 2019; Lavigne, 2020; Zarouali, Dobber, De Pauw, & de Vreese, 2020). We, however, still know little about how political microtargeting exactly works and which processes are behind potentially influencing voters. Therefore, the aim of this study is to understand how targeted messages affect citizens' attitudes towards the ad and viewpoints on a particular issue.

Method

To do this, we conducted an online survey experiment in the Netherlands (N = 1,245) in which we embedded the experimental treatment in a mock Instagram feed. We utilized the information gathered pre-treatment to tailor the political ads based on respondents' party preference and topic stance on the sugar tax. We thus varied both party preference and topic stance alignment in our experiment to operationalize (mis)targeting on party and topic.

Results

Our (preliminary) results indicate that respondents that see an ad that matches their topic stance, are more likely to change their initial position compared to respondents that see an ad that did not match their topic stance. Additionally, we find that respondents with a moderate topic stance on the sugar tax, become more extreme after being exposed to an ad that matched their topic stance. Overall, the effect on party congruence is limited when it comes to topic attitude. Secondly, we did not find a significant effect on party or topic stance congruency when it comes to the importance respondents give to the sugar tax (topic importance). Finally, we found a strong targeting effect for party congruence and topic stance congruence on ad liking. Meaning that respondents who see an ad by their preferred party or an ad in line with their topic stance, tend to like that ad more. Important here is that we did not find a reinforcing effect between being matched on both party and topic.

POL01 (Micro)targeting in political advertising

PP 0023 From informed to overwhelmed: The Dual Dynamics of political microtargeting exposure on political interest and engagement

[Brahim Zarouali](#)¹

¹ KU Leuven, Communication Science, Leuven, Belgium

In the current digital era, **political microtargeting** (PMT) has emerged as a pivotal and widely adopted strategy in political campaigns, significantly shaping voter engagement and political discourse. Despite its prevalence, there remains a notable gap in our understanding of the longitudinal impacts of PMT exposure on voters, as most existing studies focus on short-term experimental setups rather than observing effects over time. Moreover, the majority of studies have focused on between-person effects, thereby overlooking the potential for media effects to manifest at the within-person level. Therefore, this research aims to unravel the influence of exposure to PMT on political interest and political engagement over a six-month period leading up to a political election (the 2024 elections in Belgium), taking into account the multifaceted effects at both the between-person and within-person levels.

We expect *varying findings* depending on whether we examine the effects at the between-person or within-person level. At the **between-person level**, our hypothesis is that individuals who are exposed to higher frequencies of PMT are likely to exhibit higher levels of political interest and political engagement, as this frequent exposure keeps them well-informed about political issues and integrates political events more prominently into their daily lives and activities. In contrast, at the **within-person level**, we expect findings in the different direction. On this level, we examine how sudden variations in PMT exposure (e.g., a peak during an election) influence an individual relative to their typical level of exposure. In this situation, a sudden increase of exposure to PMT (relative to what a person is used to or comfortable with) could lead to a decrease in both political interest and engagement. This expected decline is attributed to the overwhelming nature of a sudden influx of political content. Altogether, this research highlights the critical need to consider both between-person and within-person effects of PMT, providing valuable theoretical insights.

In terms of **methodology**, this study adopts a longitudinal design, encompassing three waves of data collection over a six-month period leading up to the Federal elections in Belgium in June 2024. The research started with 1508 participants in the first wave (W1), which took place in December 2023. We are currently progressing through the second wave (W2) starting in February-March, and will conclude with the third wave (W3) in May-June. The aim is to maintain a final sample size of about 600 participants by W3, taking into consideration a calculated dropout rate. The participants consist of a representative sample of the Belgian population (ages 18 to 79). Ethical approval is secured for the project. Participants provided informed consent at the beginning of the longitudinal study. The project is pre-registered, and can be consulted in more detail on OSF: https://osf.io/3bwtv/?view_only=b0281bb6ee314da2924f6fcc2975c695

The **analytical approach** consists of using a Random-Intercept Cross-Lagged Panel Model, which allows us to examine both the between-person and within-person effects. These analyses are planned in June, followed by writing the full paper over the summer months. We anticipate that the full paper will be ready for presentation at the ECREA conference.

POL01 (Micro)targeting in political advertising

PP 0024 Boosting political advertising literacy? An ad training intervention to detect and evaluate political microtargeting during the 2023 Dutch parliamentary elections

[Carmen Dymanus](#)¹, [Annelien van Remoortere](#)¹, [Susan Vermeer](#)¹, [Sanne Kruike-meier](#)¹, [Rens Vliegenthart](#)¹

¹ Wageningen University & Research, Strategic Communication, Wageningen, Netherlands

The way politicians communicate with citizens has fundamentally changed through the rapid growth of data-driven techniques. Political messages are increasingly matched to individual voters, made possible by large databases containing personal information that voters leave online, such as individual characteristics, preferences, and behaviors. This phenomenon is known as political microtargeting, which can be seen as a form of *political* behavioral advertising where citizens receive targeted messages and advertisements to influence their *political* attitudes and behavior (Zuiderveen Borgesius et al., 2018). When successfully and repeatedly targeted, it is expected that these messages have robust and long-term effects on citizens and most notably on their electoral preferences. Potential benefits of political microtargeting include increased political participation and political knowledge and more informed voting choices among citizens. Moreover, targeted online messages have the potential to inform, interest and mobilise citizens who are difficult to reach with traditional media (Zuiderveen Borgesius et al., 2018). However, others worry microtargeting might invade citizens' privacy, and may lead to voter manipulation and a biased view of politics. Not everyone has access to the same political information, which could possibly amplify information asymmetries among citizens. In this sense, political microtargeting could harm the democratic process of deliberation (Bayer, 2020).

Citizens are often unaware of being targeted and face difficulties recognising and understanding political microtargeting. However, boosting interventions provide a means to enhance citizens' understanding, conscious evaluations, and skills with regard to targeting (Kozyreva et al., 2022). A boost is an intervention that enlists human cognition, the environment or both in order to strengthen (digital) competencies, for example through literacy tips. This study aims to test such a boost aimed at fostering citizens' competencies with regard to microtargeting, as we set up an educational training that would help people recognize and evaluate online political advertisements. Data collection took place in the run-up to the Dutch general election in November 2023 together with polling agency I&O Research. Using a mobile Experience Sampling Method (mESM), we asked respondents to upload political advertisements they encountered online during the 2023 Dutch general election campaign. With their first upload, two-thirds of the respondents were asked to complete an 'ad training' (N = 100). This training had two components: firstly, respondents were asked if they thought the shown picture was an online political ad (recognition), and secondly, they were asked why they thought so (evaluation). This training will give us insights into how people evaluate political ads and what elements or associations lead to the (correct) detection of political ads. Moreover, we will use a matching design to test whether there were differences with prior mESM data from the 2021 Dutch general election. Data has been collected and will be analyzed in January 2024.

POL01 (Micro)targeting in political advertising

PP 0025 Centre of attention? An Eye-tracking experiment examining if political ads attract visual attention

[Puck Guldmond](#)¹, [Susan Vermeer](#)¹, [Sophie Boerman](#)¹, [Sanne Kruike-meier](#)¹

¹ Wageningen University & Research, Strategic Communication, Wageningen, Netherlands.

Political microtargeting (PMT) has become a commonly used approach to reach voters during political campaigns. However, scholarly consensus about the impact and effects of PMT is lacking. On the one hand, PMT has raised concerns as it allegedly poses threats to democracy (Bayer, 2020), for example, by manipulating or suppressing voters (Zuiderveen Borgesius et al., 2018). On the other hand, academic research suggests that PMT has limited effects (Kalla & Broockman, 2018; Tappin et al., 2023). The limited effects of PMT might be explained by the possibility that targeted political ads attract little attention, or that people do not expose themselves to them. For example, people with low political interest tend to skip any content that is related to politics (Bode et al., 2017). On this basis, concerns about PMT might be overestimated. To further understand if people are affected by PMT this study examines whether personal preferences drive visual attention to, and memory of, political ads.

We conducted a within-subject eye-tracking study using Tobii Pro Spectrum (N = 143). Participants were asked to perform a goal-directed task (i.e., read six short news articles) while different ads were depicted on the lower right corner of the screen (two non-political and four political ads). The political ads stemmed from the VVD (a prominent right-wing party in the Netherlands) and GroenLinks-PvdA (a prominent left-wing party in the Netherlands). The

ads either showed the party leader of the political parties or a political topic (i.e., climate or security). We expect that the extent to which a political ad matches its receiver's political preferences (i.e., voting intention for the depicted party and party leader) positively affects a) visual attention to the ad, and b) ad memory (i.e., ad recall) (H1). Moreover, we expect that the degree of topic importance of the topic depicted in a political ad increases a) visual attention to the ad, and b) ad memory (i.e., ad recall) (H2).

We ran preliminary linear regression analyses for the measures of fixation time on the four different political ads, with party preference (measured as voting intention) for VVD and GroenLinks-PvdA and topic importance as factors. In addition, we ran preliminary logistic regression analyses for recall of the ads for the two parties, with party preference for VVD and GroenLinks-PvdA and topic importance as factors. Preliminary results show that party preferences can predict visual attention for all political ads, regardless of the depicted political party. More specifically, the fixation time of participants who indicated voting for GroenLinks-PvdA was significantly higher for all the political ads compared to the fixation time of those who voted for VVD.

These results indicate that left-wing voters pay more attention to political ads compared to right-wing voters, regardless of which party the ad depicts. This finding contradicts previous findings that people spend more time looking at political ads that are in line with their political views (Marquart et al., 2016), and avoid looking at political ads inconsistent with their political orientation (Schmuck et al., 2020).

POL02 Seeking and sharing: Patterns of the online media use

PP 0026 The end of recommender systems. Assessing differences in information seeking behavior between forms of recommended and AI generated search results

Edina Strikovic¹, Sina Blassnig², Marieke van Hoof¹, Aleksandra Urman³

¹ University of Amsterdam, Communication Science, Amsterdam, Netherlands

² University of Zurich, Media and Communication Studies, Zurich, Switzerland

³ University of Zurich, Department of Informatics, Zurich, Switzerland

Recent developments in artificial intelligence, such as ChatGPT and Large Language Models, are reshaping the way individuals encounter (political) information and news. This is sparking concerns about the accessibility of accurate and diverse political information – a cornerstone for an informed citizenry and a functioning democracy. The digitalisation of the media environment has focused much scholarly attention on the effects new technologies have on users' information seeking behaviour as well as their trust in this information. In the case of the news media, this has especially been the case with algorithmically manipulated information environments, where new pathways of accessing information have introduced search engines as gatekeepers to political information. Search engines have been examined in terms of users' trust in the selection, display and prioritisation of search results, which redirect users to a primary information source. With the addition of generative AI features, search engines can now provide comprehensive answers to search queries, possibly shifting their function from gatekeepers to being the primary source or end point of political information. This could lower the threshold of acceptance of information and lead to less diverse information seeking behaviour.

In this study, we examine to what extent different formats of search engine results pages – i.e. AI-generated answers, featured snippets, and "traditional" ranked lists of search results without additional elements – affect individuals' acceptance of and trust in the presented information. We do this by conducting an experiment across four countries (NL, CH, US, UK), using a customisable website where a fully tracked, manipulated Google-style search environment is replicated. Participants will complete a simple search task in the simulated environment, which will pertain to one of two possible topics: a current political issue (high-stakes condition) or a non-political, entertainment topic (low-stakes condition). Data will be collected through an international opinion research company using quotas for gender, age, education, and region for the population in each country (N = 1000 per country). Data collection will start in the beginning of April and analyses of results will be completed by June 2024. We hypothesise that AI generated answers will lead to overall fewer clicks on other linked sources and less time spent on those sources, contributing to the idea of search engines as end points of information seeking. We also investigate how the format of search results affects the trustworthiness of the presented results between high-stakes and low-stakes topics. Furthermore, following an international comparative approach, we explore whether these effects vary between countries where Google has not yet rolled out its generative AI features and countries where this is already the case.

In conclusion, this study investigates the transformative impact of AI-generated answers on individuals' acceptance and trust in political information, aiming to shed light on the evolving role of search engines. The research, conducted across four countries, anticipates that AI-generated answers may consolidate search engines as primary information endpoints, influencing users' click behaviour and perceptions of trustworthiness.

POL02 Seeking and sharing: Patterns of the online media use

PP 0027 Google, how should I vote? How Swiss citizens use search engines to find political information in the context of popular votes

Maryna Sydorova¹, [Victoria Vziatyshcheva](#)¹, Mykola Makhortykh¹, Vihang Jumble¹

¹ University of Bern, Institute of Communication and Media Studies, Bern, Switzerland

Intensively used by citizens, search engines play an increasingly important role in shaping how users consume political information and are capable of shaping voter preferences (Epstein & Robertson, 2015). The content recommendations of such algorithm-driven platforms are influenced by various factors, including the randomization of results or the time of access (Hannak et al., 2013; Makhortykh et al., 2020). Yet, the composition of search results depends not only on how the algorithms are designed but also on how users interact with them. For example, research shows that the choice and wording of search queries used by individuals can be influenced by their political views, education, or attitudes towards a particular topic (Ekström et al., 2023; van Hoof et al., 2022). However, in contrast to the system-side factors of content personalization, fewer studies have examined the role of individual factors in shaping user engagement with algorithm-driven platforms.

To fill in this research gap, this study examines the information-seeking behavior of Swiss citizens on search engines in the context of federal popular votes. A representative national survey (N = 1,100) will be conducted shortly before the upcoming round of federal votes in March 2024. Specifically, we will investigate how users search for political information before voting and how their information-seeking behavior is influenced by their individual differences. The collected data will be used to analyze how properties of search queries (e.g., sentiment, semantic complexity, political leaning) are shaped by individual factors. These include socio-demographic characteristics, political views, institutional trust, perceived importance of a vote, and media consumption. This study will provide insights into how individual factors influence information-seeking behavior on search engines in the context of Swiss direct democracy and suggest new evidence of how individuals use search engines to consume political information.

POL02 Seeking and sharing: Patterns of the online media use

PP 0028 Watching the Greens? Predictors and contingencies of partisan political information seeking with online search engines

Cornelius Puschmann¹, [Helena Rauxloh](#)², Sebastian Stier², Lisa Merten³, Katrin Weller², Juhi Kulshrestha⁴

¹ University of Bremen, ZeMKI, Bremen, Germany

² GESIS Leibniz Institute for the Social Sciences, Computational Social Science, Cologne, Germany

³ Leibniz Institute for Media Research, none, Hamburg, Germany

⁴ Aalto University, Department of Computer Science, Aalto, Finland

Political information seeking online has been an important aspect of democratic participation since the inception of the Internet (Arendt & Fawzi, 2019; Granka, 2013; Kaye & Johnson, 2002; Weeks & Southwell, 2010). Whereas an increasing number of citizens tune out of news and current affairs due to association with rising polarization and negativity, some actively look for contemporaneous information on political issues, parties and candidates in order to form their view on policies and electoral preferences, or out of partisan commitment or personal curiosity (Trielli & Diakopoulos, 2022; Unkel & Haim, 2021). In the course of the past two decades online search engines have become important tools for information seeking in such contexts, as in other areas of life (Granka, 2010). However, while there has been a significant growth in scholarly research on search engines as arbiters of political information, for example on the breadth, diversity and truthfulness of search results on political issues, there exists a gap regarding

research that specifically investigates political search engine use in connection to user characteristics (Kulshrestha et al., 2019).

Extant research can be subdivided into three categories. Firstly, a large number of studies investigates the diversity of search results to political queries with regard to the quality of results (Haim & Puschmann, 2023). Secondly there exists a strand of experimental research that investigates the degree to which search engine personalization impacts the diversity of results (Haim et al., 2018; Puschmann, 2019). Thirdly research has simulated interaction with search engines through controlled mock-up environments, asking participants to form queries on particular issues in order to investigate partisan bias in query formulation (Ekström et al., 2023; Haim et al., 2017; van Hoof et al., 2022). By comparison, the relationship between political search engine use and users' political preferences has so far been explored less, owing mostly to methodological constraints (Menchen-Trevino et al., 2023).

Our contribution is twofold. Firstly, we investigate political interest, partisanship, and sociodemographic characteristics as determinants of political information seeking via search engines. Secondly, we analyze the interdependence between party preference and searches for political issues, parties and candidates. This approach allows us to shed a light on aspects of issue ownership and the degree to which political partisans follow both their favored candidates and the actions of competitors and divisive actors. Our analysis is based on a dataset of 1,562 German internet users that combines longitudinal desktop and mobile-based automated tracking with a multi-wave survey in a panel design, running over the course of almost two years.

Early results suggest that (a) salient and underappreciated differences exist between users who do and do not engage in political search in terms of factors such as political interest, partisanship, and sociodemographics and that (b) partisans search frequently both for candidates they presumably support and for their presumed political competitors. Our results will contribute valuable insights into the dynamics of political information seeking in personalized online environments and help elucidate the extent of individual selective exposure/characteristics/motivation in political search engine use.

POL02 Seeking and sharing: Patterns of the online media use

PP 0029 Users, not Algorithms: Investigating user choice and algorithmic personalisation in Google Search results on climate change and immigration

Marieke Van Hoof¹, Damian Trilling¹, Judith Moeller², Corine Meppelink¹

¹ University of Amsterdam, ASCoR, Amsterdam, Netherlands

² University of Hamburg-Hans Bredow Institute, Leibniz Institute for Media Research, Hamburg, Germany

Search engines are important pathways to political information and news, with implications for political decision-making. Concerns arise about selective exposure driven by user choices and the creation of 'filter bubbles' through algorithmic personalisation, which may limit exposure to diverse political content.

While concerns about filter bubbles persist, research rarely finds distinct search results for different individuals. One explanation may be that this research typically does not consider the role of user choices. Recent studies suggest selective exposure effects in search queries: individuals with varying political beliefs formulate distinct search queries about the same political issue. Yet, the consequences of these choices are rarely examined. Therefore, this paper's primary goal is to examine the impact of user choices and algorithmic personalisation on political Google Search output.

We employed agent-based testing, which allows isolating inputs to an algorithmic system that cannot be controlled in other settings. Virtual agents impersonate search engine users, conducting Google searches, and collecting autocomplete suggestions and the first page of search results. Algorithmic personalisation is operationalised as the past searches performed by an agent (i.e., search history), while user choice refers to the *current* search query. Our research design builds on our previous research identifying clusters of Dutch individuals using distinct search queries about immigration and climate change, which were associated with attitudes towards the issue and issue importance.

Specifically, we used a 3 (user choice: pro/high, neutral, anti/low) × 6 (search history: pro/high, neutral, anti/low, mixed, unrelated, none) experimental design for each issue. ($N_{\text{immigration}} = 2052$; $N_{\text{climate}} = 2052$). Each condition encompasses a set of search queries representing different issue attitudes and/or levels of importance.

We constructed metrics for the ranked variation in information sources, and, extending prior research, the information presented by those sources (i.e., content). We compared these scores between experimental conditions.

Our preliminary findings indicate mostly identical scores across different search history conditions within the same user choice condition. This suggests very minimal variation in the selection and ranking of sources and content is caused by search history. Conversely, choosing different queries leads to substantial variations in the selection and ranking of sources, roughly indicating a minimum of 94% (immigration) and 88% (climate) unique sources on the search result page for user choice conditions.

Content-level variation scores are generally lower, suggesting that, despite different sources, the topics described in the textual snippets are relatively similar. Nevertheless, we also note substantial variation in content between user choice conditions, i.e. minimum of .64 (immigration) and .68 (climate). These patterns become even more distinct when examining search output returned to the exact same query.

In summary, search history caused minimal variation in search results, while considerable variation in the sources and, to a lesser extent, the information was presented to users using different (types of) queries. These findings suggest that the focus may have to shift from filter bubbles in search engine algorithms towards diversity in user choices, which appears to have the most influence on the information encountered when searching for contested political issues.

POL02 Seeking and sharing: Patterns of the online media use

PP 0030 Sharing the alternative – Motivational factors of (non-)sharing of alternative news on digital platforms

Felix Gaisbauer¹, Jakob Ohme¹

¹ Weizenbaum-Institut e.V., Digital News Dynamics, Berlin, Germany

In times of growing turmoil around questions of factual correctness of information flowing through the public sphere, so-called alternative news media have established themselves as a counterpole to legacy mass media (Andersen et al., 2023). In Germany, many online-only media outlets present information to a growing audience, pursue different goals, follow different standards, and are financed differently than what they would describe as 'elite media' (Schulze, 2020). Digital platforms are the key to success; here, media outlets can grow their audiences with little financial resources and bypass pre-digital media systems' critique and verification mechanisms.

However, their reach depends on their followers, how they share information, and how they use the network effect of social media to draw attention to information that is often only relevant to a niche audience. Yet, the sharing patterns of alternative news audiences have not been explored extensively. Studies exist that investigate content characteristics or motivations that influence general news sharing (Trilling et al., 2017). Some studies differentiate between different types of news or audiences, but usually they focus on sharing of misinformation or hyperpartisan news pieces/outlets (Wischnewski et al., 2021). Hence, little is known about the frequencies and motivations of alternative news audiences to share information.

This study addresses these questions by utilizing an original dataset collected via an online survey of more than 2000 German alternative news users in September 2023. Based on an extensive list of news-sharing motivations, the study is the first to explore the motivational patterns of alternative news audiences in depth. Possible motivational factors were compiled from several previous studies on individual motivations for sharing news (Lee et al., 2012) and included, among others, altruistic, social, and information-seeking motives. Moreover, the study investigates why users might sometimes refrain from sharing news online.

Hence, we explore the extent to which motivational patterns among this audience are responsible for the success of alternative news media as a counterweight to established journalistic sources by asking three research questions:

RQ1: What ideological and sociodemographic characteristics predict the sharing of alternative news?

RQ2: What motivational patterns exist behind the decision to share alternative news on digital platforms?

RQ3: Do reasons not to engage in news sharing differ audiences of different types of alternative news?

POL03 Activism, protest, & political participation

PP 0031 "Doing the [digital] work": Everyday activism, ICTs, and collective identity in NYC-DSA

Mads Skovgaard¹

¹ University of Copenhagen, Department of Communication, Copenhagen S, Denmark

This paper explores the role of 'everyday activism' in social movement organizations, focusing on the impact of everyday information and communication technologies (ICTs) on political organizing and 'collective identity' formation. The paper is based on 5 months of ethnographic fieldwork in New York City and focuses on the New York City Chapter of the Democratic Socialists of America (NYC-DSA). Leveraging qualitative data collected through classic ethnographic research methods such as in-depth interviews with organizers and participatory observational research, as well as digital ethnographic methods, the paper examines what it means to "do the work" at the intersections of the digital and the non-digital. "Doing the work" is a phrase used by organizers in NYC-DSA when referring to the everyday activist and organizing work required for sustainable protest politics and is the process of continuous investment of volunteer hours by members in the socialist-inspired political organizing within the NYC-DSA. It requires doing practical work, such as organizing meetings, planning actions, sharing knowledge, and developing strategies. It is when they are "doing the work" that activists and organizers in NYC-DSA negotiate and cultivate a particular socialist activist 'collective identity' per Melucci's understanding of the concept.

As coordinating efforts, political debates, discussions, and mobilizing efforts in social movement organizations have turned digital or hybrid, "doing the work" is extended beyond in-person meetings and events into the digital realm of everyday ICT platforms such as WhatsApp, Signal, and X - what I term "the [digital] work". Although it has been argued that 'everyday politics' belong outside of the realm of large social movements and institutionalized protest politics, I argue, that "doing the [digital] work" appropriates the everyday lives of organizers and activists and becomes 'everyday politics' by establishing organizers' political engagement in the social movement organization as omnipresent. As "the [digital] work" transcends the temporal and spatial constraints that have previously characterized social movement organizations, it blurs the lines between social movement organizational activism and the more recent phenomenon of individualized and networked online activism. This tendency could be interpreted as a confirmation of the decline of social movement organizations as an actor in protest politics and 'collective identity' formation, in favor of the rise of networked protest politics. On the contrary, in this paper, I suggest that the case of NYC-DSA illustrates how social movement organizations adapt to the increasingly complex intersections of everyday habitual digital communication and protest politics, and that "the [digital] work" exemplifies how ICTs consolidate the continued importance of social movement organizations as co-constructors of 'collective identity' in contemporary social movements.

POL03 Activism, protest, & political participation

PP 0032 Climate advocacy in a multi-platform environment: Networked coalitions of German climate protestors

Hannah-Marie Büttner¹, Hendrik Meyer², Patrick Zerrer³, Tim Schatto-Eckrodt²

¹ Bremen University, AG Information management, Bremen, Germany

² Hamburg University, Department of Communication, Hamburg, Germany

³ Bremen University, ZeMKI, Bremen, Germany

Digital platform environments indistinguishably intertwined offline and online spheres of protest. Anyone can receive real-time updates of ongoing climate protest actions, such as anti-coal-activists barricading themselves in the German village of Lützerath. The protest received a lot of media attention and highlighted the ideological cleavages between supporters of climate protests and their political antagonists.

The extension of protest into the digital sphere impacts protest movements, making it easier, cheaper and faster for protest movements to mobilize for political action. Networked processes of amplification and gatekeeping (Gallagher et al. 2021) can thus produce advocacy coalitions (Guo & Saxton, 2014) and online-counterpublics (Kaiser & Puschmann, 2017).

Different platforms offer a range of affordances and architectures, impacting the formation of networked discourses (Yarchi et al., 2021). The centralized and algorithmically structured Twitter, the non-algorithmic and decentralized Mastodon, and Telegram's semi-private and channel-based structure enable the comparative analysis of three contrasting types of social media. In the current study, we pose the following research questions:

RQ1: Which protest-related coalitions of advocates and antagonists can be found on Twitter, Telegram, and Mastodon?

RQ2: How do these coalitions differ in regard to user interaction, network structure, and disseminated content on Twitter, Telegram, and Mastodon?

To answer these questions, we conducted automated network and content analyses of a dataset that covered posts from January 5–18, 2023, including 114,000 individual posts and interactions of 170,918 Twitter users, the messages from 388 public Telegram channels and groups, and 25,023 posts by 9,060 Mastodon users.

To capture 'advocacy coalitions,' we uncovered community clusters based on amplifications of specific posts as retweets (Twitter), reblogs (Mastodon), and shared group activity (Telegram). We qualitatively determined the most relevant users per network cluster in order to determine their general composition before starting an automated content analysis with BERTopic (Grootendorst, 2022).

In Twitter and Telegram, network structures separate along ideological poles. For both, we found an isolated sub-community in opposition to more interconnected and diverse mainstream communities. The content analysis showed that the Twittersphere is divided into climate protest advocates and a fairly large antagonist cluster, while supporters of Lützerath protests were isolated minorities on Telegram.

The protesters' advocacy coalition on Twitter was composed of one cluster, talking about organizational issues and first-hand experiences such as police violence, and an external cluster of advocates defending the protesters' actions and policy goals. This indicates that protesters were successful in spreading their content to a wider, supportive audience on Twitter, while Telegram mainly represents an organizational tool for them. Additionally, the protesters' antagonists were composed of diverse groups on Telegram that also promoted extreme ideologies and diverse conspiracy myths and therefore formed 'Alliances of Antagonism' (Kaiser & Puschmann, 2017). This observation only partially aligns with our findings from the Mastodon analysis. Although there were evident structural divisions between communities, all posts show unconditional support for protesters. Mastodon's decentralized structure seems to result in a high local influence on users' visibility within their instance. Instances appear to be a major determinant in whether users amplify each other.

PP 0033 Freedom of speech on campus: A student nightmare? Investigating freedom of speech on university campuses via a German nationwide student-survey

Nathalie Neuendorf¹, Anna-Luisa Sacher², Carsten Reinemann²

¹ Augsburg University Germany, Digital Health Communication, Munich, Germany

² Ludwig-Maximilians-University Munich, Department of Media and Communication IfKW, Munich, Germany

Freedom of speech is one of the most central human rights (Garton Ash, 2016) and is guaranteed to EU citizens in Article 11 of the Charter of Fundamental Rights (FRA, 2007). On university campuses, this fundamental right is of particular importance. As a center of academic discourse, universities are a platform for diversity of opinion and, thus, a democratic training center for around 20 million European students (European Commission, 2020). However, it is remarkable that only a few studies have examined free speech on campus, primarily in the USA (e.g., Gallup & Knight Foundation, 2018). At the same time, there are recurring debates in several European countries, such as Germany, about perceived restrictions of free speech in general (e.g., Petersen, 2021), and specifically on campus. Yet, despite these ongoing debates, only one study (Revers & Traumüller, 2020) has investigated these perceptions at German universities, with the results initially suggesting actual restrictions among students, predominantly influenced by their political predispositions.

We aim to address this research gap by examining (a) how students across Germany perceive freedom of speech on university campuses, (b) how tolerant they are of various current issues and incidents and (c) how this is influenced by individual and study-specific characteristics.

We conducted a nationwide survey of 928 German students in July 2023 and asked them about their current assessment of free speech on their campus. The results indicate that, on average, students tend to rate freedom of speech on campus positively – comparatively even better than the population in general (e.g., Petersen, 2021). In contrast to prior findings, the crucial political factor driving the perceptions was not political disenchantment but one's position on the left-right scale. The more right-leaning a student identified, the more likely they felt their freedom of speech to be restricted. Additionally, the field of study played a crucial role, with engineering or science students, for example, being less likely to perceive such restrictions. Notably, these two factors exerted the most significant impact on students' perception of free speech.

A majority of students disapproved of viewpoints linked to far-right ideologies and would only respond to fundamentally dissenting views with factual criticism or counter-arguments (rather than more hostile approaches). Furthermore, there was a notable divergence in these perceptions of free speech on campus between East German and West German students, whereas West German students were more critical. Additional findings and implications for European universities will be discussed during the presentation.

POL03 Activism, protest, & political participation

PP 0034 Digitalization, value change, and political consumerism in Europe: A multi-level trend analysis based on the European Social Survey

[Ole Kelm](#)¹, [Marco Dohle](#)¹

¹ Heinrich Heine University Düsseldorf, Institute for Social Sciences, Düsseldorf, Germany

People in many European countries engage in political consumerism, which involves boycotting or deliberately buying products and services based on political, ethical, or ecological reasons (Boulianne et al., 2022; Stolle & Micheletti, 2013). Scholars argue that digitalization and value change are central drivers of this trend (e.g., Copeland & Atkinson, 2016). Digitalization has expanded opportunities for accessing information, connecting with like-minded others, and consuming alternative products and services (Kelm & Dohle, 2018). Additionally, the shift from materialistic and self-enhancement values to post-materialistic and self-transcendence values has heightened the importance of the "politics of products" (Micheletti, 2010). Some survey studies indeed indicate positive correlations between political consumerism and digital media use (e.g., Kelm, 2023) as well as post-materialistic/self-transcendence values (e.g., Koos, 2012; Leissner, 2023). However, it remains unclear whether the country's level of digitalization or whether the society's prevailing values can account for the substantial differences in political consumerism behavior between countries. Moreover, it is unclear whether the relationships between political consumerism, digitalization, and values at the micro and macro level change over time.

To address these gaps, a comparative multi-level trend analysis utilizing data from the European Social Survey (ESS) was conducted. The ESS, a cross-national survey conducted biennially since 2002, provides representative samples of populations aged 15 and above residing within private households. Data from all ten waves are available for 15 countries. Political consumerism was assessed in all waves by asking respondents whether they had boycotted products within the last 12 months. Digital media use was measured in eight survey waves by asking participants how often they used the Internet. Self-transcendence values were measured in all waves using the human values scale (Schwartz, 2007). Moreover, aggregated country-level data on digital media use and self-transcendence values were included as macro variables. Various control variables at micro- and macro-level were also considered. The analyses were weighted in accordance with ESS recommendations.

The findings reveal an increasing use of digital media across all countries. Despite notable exceptions, such as Hungary, participation in boycotts and self-transcendence values have also increased. Multi-level logistic regressions indicate consistent positive associations between individual-level digital media use, self-transcendence values and boycott participation across all survey waves. Furthermore, different levels of self-transcendence account for differences between countries regarding their boycott engagement, whereas different levels of digitalization do not. The results hardly change between 2002 and 2020.

The study has limitations, such as the simple measurement of digital media usage. However, as the variables have been measured almost consistently over many years in many countries, comparative trend analyses are possible. The results confirm that besides people's values, their digital media use is important for engaging in political consumerism activities. Although the opportunities of the Internet have changed considerably in recent decades, and the effect of digital media use on political participation in general is increasing according to survey studies (Boulianne, 2020), the relationship between digital media use and political consumerism in Europe remains fairly constant over time. This aspect and further implications of the results will be discussed at the conference.

POL03 Activism, protest, & political participation

PP 0035 Tracing appeasement: Language similarity between corona protest mobilizers on Telegram and German politicians on Twitter

[Maximilian Zehring](#)¹, [Emese Domahidi](#)¹

¹ Ilmenau University of Technology, Computational Communication Science, Ilmenau, Germany

Protest movements against COVID-19 containment measures like the German Querdenken movement act as counterpublics with the goal of putting their positions on the political agenda. The German far-right party AfD operated as the extended arm of Querdenken in the federal parliament, fueling discontent with containment measures. However, the role of other parties remains unclear despite initial evidence for acceptance of the movement on the part of important political actors in Germany. The unequal distribution of COVID-19 protests and far-right attitudes in Germany indicate additionally that there could be differences in alignment with Querdenken between politicians with constituencies in East or West Germany. The current paper explores Querdenken's ability to stimulate the discourse in the political arena in Germany. Consequently, we investigate language similarity of Querdenken and German politicians using $n = 934,432$ Telegram messages from Querdenken and $n = 445,690$ tweets from all six major German parties between 2020–2021. We use a mixed methods approach, combining sentence transformers, time series analysis, and a qualitative analysis.

The semantic similarity between all six German parties and Querdenken increased after fall/winter 2020 for different reasons. While the AfD's communication is the most similar toward Querdenken, the discrediting of left-wing/green politics and the spurning of corona containment measures unites parts of the liberal FDP and conservative CDU/CSU with Querdenken as well. Furthermore, language similarity toward Querdenken within the parties varied depending on whether the politician's constituency is in East or West Germany, contradicting stereotypes of a more right-wing East among federal politicians.

Querdenken has successfully provoked a reaction in the political system, showing ideological proximity to established parties alongside the AfD. Based on our results, we discuss several reasons for communication similarity, question the strategic anticipation of far-right discourses for political gains, and outline the challenges and opportunities of mixed method designs for investigating and interpreting semantic similarities between political actors.

POL04 Strategies & tactics in political campaigns

PP 0114 "I" and "The Party" in campaign communication: Cross-platform characteristics and changes in personalization on social media in the 2019 and 2023 Finnish Parliamentary elections

Elisa Kannasto¹, Pekka Isotalus², Lassi Rikkonen²

¹ Seinäjoki University of Applied Sciences, Master School, Vaasa, Finland

² University of Tampere, Faculty of Information Technology and Communication Sciences, Tampere, Finland

As the significance of social media keeps growing in election campaigning, the styles and contents of political communication and campaigning evolve as different platforms affordances develop. Both parties and their leaders communicate on social media, and in campaigns party leaders are seen as the main media for their party.

This study focuses on the transformation in personalization on different social media platforms in the Finnish parliamentary elections in 2019 and 2023. We define the personalization of politics through two dimensions, based on the operationalization of Van Aelst and colleagues (2012). First, personalization means that individuals are emphasized over political topics, and second, the professional roles and qualities of individuals are overshadowed by their private lives. Our comparative approach asks the following research questions: 1) To what extent were different social media platforms used by party leaders in the 2019 and 2023 elections? 2) How was personalization manifested by parties and party leaders? 3) What kind of changes can be seen in how personalization manifests with the adoption of new platforms?

We collected the data during a month-long period before the Finnish Parliamentary elections of 2019 and 2023 from Facebook, Twitter and Instagram. TikTok data was collected in 2023. The social media data were collected from the public accounts of the leaders of the parties that were represented in the parliament in the periods before the elections and analyzed with quantitative and qualitative content analysis.

The Finnish Parliamentary elections build a compelling case for the study because the role of social media in the Finnish elections is significant, with 23% of voters following campaigning on social media in 2023. It has been argued that social media, due to its nature and logic, may encourage political actors to self-personalize, thus increasing the personalization of politics. In addition, there is an emphasis on individuals in the Finnish multi-party system during parliamentary elections.

The preliminary results show that regarding the change between the 2019 and 2023 elections, significant cross-platform differences were found. Twitter and Facebook, for instance, differed from each other in that while on Twitter, the share of messages with personalized content decreased for almost all party leaders, on Facebook, their share remained on the same level. Hence, in 2023 Twitter was used differently from previous elections. A similar decrease was observed in Instagram postings' text contents for parties and their leaders. The decrease in personalization in Instagram postings' text contents may indicate that the latent personalization made possible by visual content has been adopted more strongly in political communication. In addition, personalization may be decreased because of the increased polarization and verbal attacks on social media. The changes may indicate that as the politicians gradually familiarize themselves with new platforms, their communication strategies evolve. Thus, as suggested before, different platforms have a role in changing political communication and styles in addition to the political actors.

⁴ RPTU Kaiserslautern-Landau, Department of Political Science, Landau, Germany

⁵ Carl von Ossietzky University of Oldenburg, Carl von Ossietzky University of Oldenburg, Oldenburg, Germany

Most scholars agree that candidates' use of negative campaigning is based on rational considerations, i.e., weighing likely benefits against potential costs. Benefits are that a successful attack increases a candidate's net popularity at the expense of the targeted political opponent. Costs are seen in so-called "backlash effects"—a situation in which an attack on the opponent hurts the sponsor's evaluation. We argue that this perspective is far too narrow and outline the elements of a more comprehensive approach on the use of negative campaign communication that builds on personality traits, values, social norms, attitudes toward negative campaigning, and the political opponents' attack behavior as complementary mechanisms to classical rational choice theory. For each of these factors we describe the mechanisms that explain attack behavior. We test our theoretical assumptions using candidate surveys for eight state elections in Germany with more than 1,600 candidates. Our results strongly suggest that negative campaigning goes beyond rational considerations. Although benefit-cost calculations are the primary driver of the decision to attack the opponent, all other factors significantly explain additional variance of candidates' attack behavior. Our results show that candidates attack political opponents not only because they believe that doing so is beneficial to them overall (rational considerations), but also because they are hardwired to show this type of behavior (personality), because they associate attack behavior with personal achievements in life (values), because they see that it is normal for other candidates to criticize (descriptive norms), because they have certain opinions about whether it is appropriate to attack political opponents (attitudes toward negativity), and because they have learned that retaliation is a successful strategy to protect their image when being attacked. Hence, factors beyond the rational choice approach are important and enhance our understanding of why candidates choose to engage in negative campaign communication. Our findings have important implications for research on candidate attack behavior.

POL04 Strategies & tactics in political campaigns

PP 0116 Unraveling the social media electoral puzzle: Analysis of online campaigning strategies and their impact on election outcomes

[Norbert Merkovity](#)¹, Peter Bence Stumpf¹

¹ University of Szeged, Department of Political Science, Szeged, Hungary

Election campaigns in the digital age have witnessed a transformative shift, with social media platforms becoming crucial landscapes for political discourse. This study examines the intricacies of political campaigning on Facebook, one of the most pervasive social media platforms, to uncover the dynamics shaping electoral outcomes. Despite the wealth of research on social media campaigns (e.g., Bene et al., 2022; Peeters, 2023; Ross et al., 2020; Schäfer, 2023; Štětka et al., 2020), a notable gap exists in comprehensively understanding the impact of Facebook on political communication and its correlation with voter support. This study aims to bridge this gap by scrutinizing the efficacy of leading candidates' political campaigns on Facebook, exploring the association between social media campaigning and electoral outcomes, and investigating the correlation between online interactions and election results (see: Dommet & Power, 2023; Kirk & Teeling, 2022; Sobieraj et al., 2020). The research framework adopts a hybrid media system perspective (Chadwick, 2017), exploring the adaptive strategies of political actors within the developing network logics of social media platforms (Klinger & Svensson, 2015). Notably, our study examines the nuanced use of different messages and interactions during election periods, shedding light on the distinctive communication strategies employed by politicians. We also examine the density of political candidates' messages and the electorates' responses. To analyze the impact of Facebook during the campaign period, we collected and analyzed data in the fifty days preceding four first-order elections held between September 2021 and April 2022 in France, Germany, Hungary, and the Czech Republic. The research methodology involves a detailed examination of interactions and personalized communication on Facebook. Collected data encompass the number of comments, shares, and reactions politicians receive, providing insights into the engagement and attention generated on social media (DiGrazia et al., 2013). We also explore the broader impact of social media by examining the relationship between mentions and interactions on multiple platforms and election results, analyzing the translation of social media engagement into tangible votes.

Our findings reveal a complex relationship between social media interactions and election outcomes. While social media interactions show a significant predictive relationship with election results, distinctions emerge between candidates and political parties. Populist leaders often outperform their election results in online engagement.

leveraging the unfiltered nature of social media. Furthermore, incumbents enjoy an advantage in the online space, receiving more attention and interactions than their challengers. This study contributes valuable insights into the evolving landscape of political communication, emphasizing the need for nuanced analyses of social media dynamics.

POL04 Strategies & tactics in political campaigns

PP 0117 Negative campaign tactics and changing party dynamics: Party communication on Facebook during three parliamentary elections in Sweden 2014–2022

Andreas Widholm¹, Mattias Ekman², Walid Al-Saqaf³

¹ Stockholm University, Department of Media Studies – JMK, Stockholm, Sweden

² Stockholm University, Department of Media Studies, Stockholm, Sweden

³ Södertörn University, Department of Social Sciences, Stockholm, Sweden

Among the myriad of communication tactics employed by political actors during elections, negative campaigning constitutes one of the most well-researched internationally. Negative campaigning can be understood as communication efforts focusing on the weakness of opponents rather than on the strengths of one's own party (Klinger, et al., 2023). Negative campaigning encompasses adversarial tactics aimed at individual candidates as well as parties and its policies, with the aim of generating fear about future implications if the opponent would win (Sanders & Norris, 2005). Scholars have warned that negative campaigning can be harmful for democracy, since it may fuel polarization, generate political cynism, distrust in politicians, and lower voting turnout (Nai, 2020). However, negative political confrontations also underscore areas of disagreement and ideological divisions that may be beneficial for citizens in their decision-making (Haselmayer, 2019).

Unlike the political cultures in countries such as the US and the UK, from which many studies of negative campaigning originate, Nordic political cultures have for long been defined as consensus-driven and less personalized. This has been used to explain the lesser prominence of negative campaigning there (Hansen & Pedersen, 2008). However, despite transformations in the political landscape, including new alliances across liberal, conservative, and nationalistic lines, there are no systematic or longitudinal studies of negative campaigning during national elections in the region. This is problematic, since a growing body of research suggests that particularly right-wing populist parties have introduced a more conflictual dimension to the political culture that may have affected also how other parties communicate. Another reason why longitudinal studies are necessary is the increasingly central role of social media platforms. There are plenty of platform studies that focus either on how party leaders communicate (Ekman & Widholm, 2017), single national elections (Larsson, 2020), or compare campaigning strategies during European elections (eg. Klinger, et al., 2023), yet few studies address how negative national election campaigning of different parties have evolved over time.

This study seeks to fill this research gap by examining negative campaign tactics by Swedish political parties on Facebook during three elections: 2014, 2018 and 2022. Drawing on a census sample of posts published by all parties represented in parliament four weeks prior to each election (N = 2795), we deploy content analysis to reveal a) whether negative campaign messages have become more salient over time, b) if the targets of negative campaigns have changed in light of new party constellations and power dynamics, and c) if there are differences over time concerning the types of negative campaign tactics deployed.

Results show that negative campaigning have become more salient over time, and that oppositional and far-right parties are more likely to go negative compared to governmental parties and those located closer to the center on the left-right spectrum. Attacks against parties are more common than attacks against individual candidates, yet there are noteworthy differences between parties. In terms of targeting, we find that despite changing party constellations, negative campaigning still adheres to a left/right logic, as many parties avoid attacks on former allies.

POL04 Strategies & tactics in political campaigns

PP 0118 Entitled by the past: Nordic parties' legitimization of political imaginaries for the future

Manuel Menke¹, Karoline Andrea Ihlebæk², Samuel Merrill³, Katarina Pettersson⁴

¹ University of Copenhagen, Department of Communication, Copenhagen, Denmark

² OsloMet, Department of Journalism and Media Studies, Oslo, Norway

³ Umeå University, Department of Sociology, Umeå, Sweden

⁴ University of Helsinki, Social Psychology, Helsinki, Finland

In the last crisis-ridden decade, right-wing populist parties have strategically exploited the sense of comfort and security originating from the nostalgic idealization of the past to attract voters experiencing disorientation and ontological insecurity, i.e., those who feel lost, overwhelmed, and disenfranchised in modern societies (Steele & Homolar, 2019). Contrasting this present with a romanticized selective past helped right-wing populists gain political ground in Europe and beyond (Menke & Hagedoorn, 2023; Norocel et al., 2020). Research has found that the strategy behind the populist right's use of the past is to create a sense of entitlement for a future restored in the voters' favor.

stemming from allegedly historically legitimized privileges (Smeekes et al., 2021). The literature further outlines how right-wing populist actors were able to promote nationalist collective identities, foster in- and outgroup mentalities, and promise the return of the *heartland*, i.e., a future society catering to the supposedly disenfranchised by restoring their past privileges and securities (Menke & Wulf, 2021; Merrill, 2020; Pettersson & Sakki, 2017; Taggart, 2004).

These cases demonstrate that strategic uses of collective memories and histories in politics can have implications for identity formation and vast consequences for social cohesion and legitimacy claims that shape the future of societies. Whose past is included and for whom imaginaries of the future are offered is subject to a party's political ideology and engenders its appeal to specific segments of the population they aim to convince. Whereas this strand of research highlights the potency of the past in right-wing populist campaigns, it suffers from a narrow focus that reduces political uses of the past to extreme political actors and the fueling of polarization, nationalism, and xenophobia, eventually threatening social cohesion and democracy. However, depending on the parties, the collective memories and histories that are woven into the campaign communication might be more versatile across parties based on whose sense of collective identity and common interest is targeted and how exclusive or inclusive the communication is (Liu & Hilton, 2005; Molden, 2016).

In our presentation, we advance beyond the focus on right-wing populism with an analysis of the uses of the past in Nordic political communication across the party spectrum. Based on a comparative, qualitative content analysis of the party programs of parliamentary parties from the latest elections in Denmark (n = 12), Sweden (n = 8), Norway (n = 10), and Finland (n = 10), we identify references to the past across political ideologies, and their uses to legitimize imaginaries of the future in different policy areas. While the Nordic region shares many important cultural, political, and historical similarities, the comparative research design allows for an in-depth, discursive exploration of how the distinct collective memories, histories, and trajectories of each country shape the parties' political communication. Our results create awareness of how the past and derived political imaginaries of the future are used strategically as a foundation of political campaigning, focusing specifically on the established ingroup/outgroup mechanisms. Eventually, our research answers whose pasts, needs, and demands for the future are given legitimacy in different party programs – and whose not.

POL05 News media diet

PP 0119 What is a healthy political media diet? Conceptualizing and theorizing citizens' news media diets across democratic political information environments

James Stanyer¹, Agnieszka Stępińska², David Nicolas Hopmann³

¹ Loughborough University, Social Sciences, Loughborough, United Kingdom

² Adam Mickiewicz University, Political Science and Journalism, Poznań, Poland

³ SDU, Department of Political Science and Public Management, Odense, Denmark

The idea of an informed citizenry is at the heart of democratic theory, however, recent developments have raised some alarm about citizens' unhealthy media habits (e.g., Van Aelst et al., 2017). In other words, the media diets of citizens, have become a focus for concern with anxiety about the negative effects of poor or limited media diets (Terren, 2022). Across the literature, though, there are embedded assumptions about what poor diets contain and good ones encompass, indeed, some research attempts to put forward solutions to existing poor diets. But are such concerns justified across democracies? What is meant by media diet anyway and what is a healthy media diet?

These questions are important for normative political communication research. Indeed, the diet analogy is a useful way to identify healthy normative practices and can operate as a helpful yardstick with which to measure democratic performance. However, we need to identify 'theoretical inconsistencies' (Althaus, 2012) if haphazard theory development is to be avoided. To address the above questions, and aid theory development, this proposed paper seeks to do the following:

1. conduct a systematic review of the various information diet related concepts. These have been variously termed citizen's information diets, news diets, or media diets (see for example Trilling & Schoenbach, 2015). This will provide not only the basis for concept development but also provides useful basis to understand how citizens engage with the media.
2. critically scrutinize existing assumptions in the literature about good and bad diets, and presented solutions, exposing the often implicit values underlying uses of the concept.
3. examine what citizens think and what they expect through a series of focus groups. Very little research asks citizens what they perceive of their own and others' media diets. To achieve these goals, the paper draws on the findings of a series of focus group interviews conducted by the authors with younger adults (18–25 years old) and older adults (above 55) in five European countries (Germany, Spain, Poland, Romania, and UK). Research on media diets has been mainly focused on the US, or other single countries (Trilling & Schoenbach, 2015) but we know countries vary by key contextual factors including, "young" and "new" democracies with different political heritages, democratic traditions, and media systems and different news consumption habits. Focus group interview as a method provided us with the data needed for an in-depth assessment of people's perceptions.

POL05 News media diet

PP 0120 Changing levels of interest in news and politics in the last decade

[Richard Fletcher](#)¹, [Waqas Ejaz](#)¹, [Rasmus Kleis Nielsen](#)¹

¹ University of Oxford, Reuters Institute for the Study of Journalism, Oxford, United Kingdom

Individual motivation is often seen as the primary reason for why some people choose to engage with news and politics. In survey research this is typically captured by measuring people's level of 'interest'. If people are interested in news, they will tend to consume more of it, and if they are interested in politics, they are more likely to vote or participate in politics in other ways.

Data from the latter part of the twentieth century suggests that people's interest was formed in adolescence through contact with friends and family, and remained largely stable throughout adulthood. However, it is unclear whether this still holds true today.

Using nine years of survey data (2015–2023) from 46 countries and over half a million respondents, we explore changes to interest in news and interest in politics over time. We find that (i) there has been a significant overall decline in both interest in news and interest in politics since 2015, and (ii) while declines are not evident in every country, they are visible in most. In some cases, the declines are large. In the UK, for example, the proportion highly interested in news has declined by 27 percentage points (pp) from 70% in 2015 to 43% in 2023, while in the US there was a 18pp decline from 67% to 49%.

At the individual level we find that (iii) both interest in news and interest in politics is higher among older people, men, those with more formal education, those with higher trust in news, and those who use news more frequently. At the national level, we use random effects within-between modelling to carry out panel analysis that controls for stable country-level variables. We test for several possible factors, and (iv) while we do find a weak positive association between levels of interest in news and freedom of the press, this alone does not adequately explain why there has been such large declines in interest in many parts of the world.

Our findings therefore highlight important changes to people's motivation to engage with news and politics, and help us understand emerging trends such as rising news avoidance. But they also suggest that we may need to explore new ways of thinking about how interest is created and maintained, perhaps looking to the huge changes to the information environment we have seen in the previous two decades, and in recent years, a string of global events that may have fundamentally changed some people's relationship with news and politics.

POL05 News media diet

PP 0121 Mobile news media diets across platforms: More diversity in news sources but the same ideological slant

[Silvia Majo-Vazquez](#)¹, [Marta Cantijoch](#)², [Ana Sofia Cardenal](#)³, [Victoria Mas Maria](#)⁴, [Ivan Lacasa](#)⁵

¹ Vrije University Amsterdam, Department of Communication Science, Amsterdam, Netherlands

² University of Manchester, Political Science, Manchester, United Kingdom

³ Universitat Oberta de Catalunya, Law & Political Science, Barcelona, Spain

⁴ Universitat Abat Oliba, Journalism, Barcelona, Spain

⁵ Universitat Internacional de Catalunya, Journalism, Barcelona, Spain

One-sided news exposure has been deemed to threaten democratic ends and for this reason the role of social media in shaping news consumption has been widely studied. There have been multiple contributions to understand the effects of algorithmically driven platforms on news exposure in Western Democracies, mostly in the US (Cardenal et al., 2019; Fletcher et al., 2021; González-Bailón et al., 2023; Wojcieszak et al., 2021). Less attention has been paid though to understand their effects on different dimensions of the *diversity of news exposure*, specifically when using mobile phones. The increase in use of mobile devices to access news, as opposed to desktop machines, is accompanied by a less fragmented news media ecosystem, suggesting that people access a wider range of news sources when navigating the media environment through their mobile phones (Yang et al., 2020). Yet, it is pending to be investigated the specific effects of technological platforms on the types of news sources accessed and whether they limit or broaden ideological selectivity in news exposure. To address these questions,

in our study we conceptualize and measure diversity of news exposure using multiple indicators including types of sources, depth of news exposure within each source and ideological diversity too. We identify the platforms effects on the number and types of sources that individuals navigate on their mobile devices and then, look at levels of audience polarization across the most prominent side-doors to news, including Google, Facebook and WhatsApp, which allow us to understand ideological selectivity in news exposure too.

In our study, we focus on the effects of the largest platforms used for news consumption in two European countries, namely Spain and the UK. In Spain, we pay special attention to the effects of messaging apps on the diversity of news sources, because WhatsApp is the second largest platform used for news consumption (Newman et al., 2023) in that country and also, because users experience with news content on WhatsApp is not algorithmically-driven, but mostly curated by *strong ties*. Our data strategy includes a novel dataset with mobile tracking information for two months and survey data for 700 and 500 individuals in Spain and the UK respectively.

Our results show that the effects of digital platforms in mediating news consumption is not consistent across either countries or platforms. The use of technological platforms does increase individual exposure to a wider range of news outlets and it is associated with accessing more articles in each outlet in both countries. Yet, this does not result in more ideologically diverse news repertoires, except for those who use Facebook in the UK. In Spain, the use of WhatsApp to access news does not have a different effect from that of the use of Facebook and Google, except for those on the left who are accessing less pro-attitudinal information on WhatsApp. Our study suggests it is necessary to go beyond "the more the better approach" and reflect on the democratic effects of diversity in news exposure across platforms and its heterogeneous effects.

POL05 News media diet

PP 0122 Unveiling the Mobile Media Mosaic: Analyzing news repertoires combining individual mobile and desktop tracking data

Patrick Zerrer¹, Lisa Merten², Sebastian Stier³, Cornelius Puschmann¹, Frank Mangold⁴

¹ University of Bremen, Zentrum für Medien- und Kommunikations- und Informationsforschung, Bremen, Germany

² Leibniz-Institut für Medienforschung, Hans-Bredow-Institut HBI, Hamburg, Germany

³ University of Mannheim, Computational Social Science, Mannheim, Germany

⁴ Leibniz Institut for the Social Science – Gesis, Computational Social Science, Mannheim, Germany

The ubiquitous presence of smartphones has revolutionized the accessibility of news, becoming an inseparable companion in our daily lives (Newman et al., 2021). These emerging mobile and digital media platforms have not only significantly broadened the spectrum of available information but have also become an integral part of our daily information repertoire. The integration of these technologies has introduced new usage options and routines, such as checking or scanning, providing a more nuanced understanding of news consumption practices (Meijer & Kormelink, 2015). However, these changes in user behavior are often fragmented, marked by cross-platform use and varying functionalities of mobile applications, making measurement challenging.

The existing literature on the relevance of (mobile) news consumption primarily focuses on the frequency of news use and categorizes different types of (young) users, with news avoiders and news omnivores being the most stable groups (Strömbäck, Falasca, & Kruike-meier, 2018; Trilling & Schoenbach, 2015). Nevertheless, most studies rely on self-reported news usage, which has proven to be inaccurate in digital media environments (Parry et al., 2021). Moreover, studies utilizing web tracking data have historically been limited to desktop data (Jürgens & Stark, 2022; Möller et al., 2021; Scharrow et al., 2020). Consequently, prior research has struggled to reliably address the share and specific behavioral patterns of mobile news use concerning the overall digital news diet.

Building on the media repertoire approach (Hasebrink & Popp, 2006; Hasebrink & Hepp, 2017), which analyzes the entirety of media regularly used by an individual to gain insights into cross-media patterns of everyday news consumption, we aim to identify the role of mobile news within the overall repertoire. This involves identifying news repertoires based on tracking data for both mobile and desktop devices, following the approach of Mangold et al. (2022), to offer detailed insights into usage patterns and routines during everyday life. The tracking data, collected over 16 months from September 2022 to December 2023, with the consent of 1,756 German panelists, includes desktop web browsing activities and mobile browser and app usage.

This data enables us to (1) identify the correspondence between mobile and desktop behavior, including comparing usage patterns to identify specific characteristics of mobile news use. Additionally, (2) we determine the proportion of mobile news use in relation to the overall digital news repertoire to draw conclusions about the relevance of mobile news consumption.

Our analysis involves conducting a medoids cluster analysis based on the frequency of used news sources, mobile apps, access time, and usage duration to identify media repertoires (Park & Jun, 2009). Subsequently, we ascertain the proportion of mobile media and news usage in relation to the overall repertoire and compare desktop and mobile usage for various behavioral patterns, such as usage throughout the day.

As of December 2023, data collection is complete, and data analysis is ongoing. Through a comprehensive examination of mobile and desktop news use, we aim to gain a better understanding of news consumption behavior during times of 'deep mediatisation' (Couldry and Hepp, 2017).

POL05 News media diet

PP 0123 News exposure on social media platforms and the illusion of knowing

Tilman Klawier¹, Natascha Hetzel¹, Lisa Curdes¹, Wolfgang Schweiger¹

¹ University of Hohenheim, Department of Online Communication, Stuttgart, Germany

Studies have shown that news exposure via social media elicits an illusion of knowing (IoK), i.e., that the users feel better informed about current affairs (subjective knowledge) than they actually are (objective knowledge; e.g., Yamamoto & Yang, 2021). However, most of these studies have focused on social media use in general, without taking platform-specific characteristics or user motivations into account. As social media platforms differ in their affordances (e.g., the dominant modality: text vs. videos vs. images, length limits, hyperlinks to external sources, and sanctions against misinformation), this might determine to what extent they facilitate true learning about politics or just a feeling of being informed, resulting in platform-specific differences in IoK (RQ1). User motivations that may drive IoK include the news-finds-me perception (H1) and issue-specific interest (H2). Individuals with a news-finds-me perception might think that incidental news exposure via social media is sufficient for them to stay informed, which may result in swift news snacking and thus foster the IoK. Persons who are involved in particular issues may be more motivated to process relevant information thoroughly, which could mitigate IoK.

To test these hypotheses, a representative German online survey was conducted in July 2023 (n = 682). We measured news exposure via traditional media and popular social media platforms. Subjective and objective knowledge was assessed for three topics: climate change, public service broadcasting, and migration. To measure objective knowledge, respondents rated eight pre-tested factual statements per topic as true or false. Moreover, we assessed the news-finds-me perception, issue-specific interest and demographics.

An OLS regression yielded a weak but significant positive association between general social media news use and the IoK regarding climate change. Looking at the different social media platforms we found that individuals who preferably use Facebook, TikTok, and Telegram as news platforms exhibit a higher IoK concerning the issue (RQ1). These platforms likely offer little affordances for knowledge gain beyond superficial or even misleading information. For instance, TikTok has a strong focus on short clips and limited possibilities to set links to external pages, while Telegram is known to be popular among misinformation spreaders. Greater associations were found for motivational aspects. As expected in H1, the news-finds-me perception is positively related to IoK regarding two of three issues (climate change and public service broadcasting). In contrast to H2, however, issue interest is positively associated with IoK across all three topics: Respondents who indicated a higher level of interest in an issue had a slightly higher level of actual knowledge than those who were less interested, but as they rated their (subjective) knowledge significantly higher, this resulted in a higher IoK. This result contradicts the current state of research and will be further investigated. In the presentation, these and other results will be presented in detail, interpreted and discussed.

POL06 Science communication as political communication? Scientific experts, policy-making, and media in the digital age

PN 023 How social media platforms shape the politicization of science

Donya Alinejad¹

¹ Utrecht University, Department of Media and Culture Studies, Utrecht, Netherlands

Scientists with specific areas of expertise are increasingly called upon to enter the realm of public deliberation. Issues such as climate change and the Covid-19 pandemic, and to a lesser extent Anglo-European colonial history and questions around gender, have all called upon academics, scholars, and scientists to participate in intensified public engagement in recent years. Media research has traced and mapped a range of important controversies in which scientific knowledge features as part of public contestations. However, there has been a relative lack of focus on understanding the role of the media environment, itself. The contemporary communicative environment in which scientists/academics engage with the public is undergoing profound transformation. The current ubiquity of social media usage, and the far-reaching effects of the rise of powerful platforms, are substantially changing the media landscape that academics step into when participating in public engagement activities. These changes warrant revisiting the main theoretical framework we have for understanding the relationship between media

and science in society: the “medialization/mediatization of science” thesis. Does this idea – originally developed to understand mass media phenomena – sufficiently capture how contemporary platform processes shape the relationship between media and academia? This paper addresses the above question by focusing on the political implications of the increasingly platform-oriented media landscape for the public status of scientific knowledge. On the basis of a literature review that brings the concept of platformization further to bear on how science is mediated, the paper argues that the changing politics of the media environment, itself, has important consequences for the content of public deliberation about issues involving scientific knowledge and expertise. A key implication of the paper’s argument is that new conceptual and methodological approaches are called for if media scholars seek to comprehensively understand the influences of social media platforms on the way scientific/scholarly knowledge enters the realm of public contestation. Directions for the design of future research are presented that foster empirical investigation of social media’s influence on user, institutional, and political economy levels.

POL06 Science communication as political communication? Scientific experts, policy-making, and media in the digital age

PN 024 Linking research topic characteristics with scientists’ willingness to engage in public discourses

[Lennart Banse](#)¹, [Friederike Hendriks](#)¹

¹ Technische Universität Braunschweig, Junior Research Group fourC, Braunschweig, Germany

Science as a system is increasingly being mediated (Välvirronen, 2021) and politicised (Schmid-Petri et al., 2022). Researchers are thus becoming central mediators between science, society, and politics (Peters, 2021). In light of recent challenges (e.g., climate crisis, COVID-19, gender issues), there is a growing view that public communication by researchers in controversial contexts can constitute ‘political communication’ (Scheufele, 2014). Understanding why some researchers participate in public debates while others retreat into their ‘ivory tower’ is key to understanding the dynamics of public (political) communication on science-related topics. Large-scale surveys reveal a link between researchers’ disciplines and their willingness for public communication, with social scientists typically more inclined than natural scientists. Yet, studies on specific sub-disciplines like climate research and nanotechnology suggest that research topic characteristics, such as perceived politicization or public controversy, are more influential in determining researchers’ orientation to communicate than differences between overarching disciplines (Schäfer, 2007). Hence, this study investigates how these topic-specific perceptions impact scientists’ willingness to engage directly in public dialogue (RQ1) and participate through media discourses (RQ2). A quantitative survey is planned for March 2024 targeting researchers at all career stages in doctoral-granting universities in Germany. The sampling aims to represent all main academic fields as per the German Research Foundation classification: humanities & social sciences, natural sciences & mathematics, engineering, and life sciences & medicine (DFG, n.d.), allocating quotas for each overarching discipline in order to achieve a distribution by discipline that corresponds to the actual distribution in Germany. We are targeting a total of 500 respondents. As similar previous studies report a response rate of around 5%, we will contact 10,000 researchers using a combination of systematic (quotas for disciplines) and random sampling (random selection of universities from the whole population). The questionnaire covers research demographics (discipline, specific research topic, career stage, years in career) and science communication practices (frequency and willingness for direct public and media engagement). Additionally, based on the theory of scientific knowledge cultures (Bösch, 2002; Schäfer, 2007), new items were developed to analyse researchers’ perceptions of their specific research topics regarding inner scientific and public discourses, including basic research orientation, public and scientific controversy, public relevance, abstraction, amount of uncertainty, interdisciplinarity, and stakeholder diversity, operationalised as semantic differentials. The analysis will use two multiple hierarchical regressions to explore the willingness to directly engage with public audiences (RQ1) and media (RQ2). These regressions will examine the impact of the research topic characteristics, controlling for established factors like discipline, career stage, career age, gender, and past communication activities. Our study seeks to elucidate the impact of researchers’ self-perceived characterisation of their research topics on their engagement in scientific, social, and political discourses. By integrating these insights with content-analytical studies of public and political discussions on scientific matters, further research could enhance understanding of how the mediation and politicisation of science influences scientists’ motivation to actively participate in political communication.

POL06 Science communication as political communication? Scientific experts, policy-making, and media in the digital age

PN 025 Scientific expertise, advocacy, and politicization in environmental and pandemic crises

[Nils Bienzeisler](#)¹, [Senja Post](#)²

¹ Nils Bienzeisler, Karlsruhe Institute of Technology, Karlsruhe, Germany

² Karlsruhe Institute of Technology, Department for Science Communication, Karlsruhe, Germany

In the light of environmental concerns and the COVID-19 pandemic, scientists have found themselves at the center of policy disputes testing their “traditional” role simply communicating “the science.” Instead, they serve as public

experts applying their knowledge in policy-making contexts. Such communication can be defined as scientific expertise. Scientific expertise at times extends into advocacy, where scientists support particular policies and causes. This can lead to politicization by scientists. Politicization is a communicative action that creates opportunities for exercising power within social relationships: scientists leverage science to sway public opinion and policy in their favor. Therefore, the purpose of this study is to examine how scientists participate in policy disputes in a mixed-methods design combining survey and interview research. In particular, we hypothesize that political-oriented scientists are likely to utilize science in a politicized manner. We surveyed scientists from Germany who published medical (N = 174; RR = 12.6%) or ecological papers (N = 175; RR = 28.7%). Participants were asked to define their concept of expertise, rating a) their involvement b) neutrality, and c) epistemic authority in policy disputes. Additionally, each survey contained an experiment designed to test our hypothesis. Subsequently, we interviewed a subsample of n = 24 participants that agreed to a follow-up interview. The interviews were coded to align with the survey dimensions. We applied a latent profile analysis (LPA) with model specifications validated by sensitivity analyses and theoretical alignment evaluation, ensuring robust group identification. Last, we linked interviewees with class assignments retrieved from our survey combining quantitative and qualitative data. The descriptive results from both the qualitative interviews and the quantitative survey show a range of perspectives among scientists. Many viewed neutralities as key to good science. They generally agreed on guiding societal debates. However, there was less agreement on directly engaging in politics, indicating a tendency to maintain a distance. The LPA shows that the scientists surveyed can be grouped (AIC = 11204.40, BIC = 11388.19, Entropy \geq 0.80) separating a moderate group (36.5%) showing average agreement to items measuring involvement, neutrality, and epistemic authority, a strategic (30.9%) high in agreement on epistemic authority and neutrality, an active (25.0%) showing strong involvement, and a reserved (7.6%) preferring non-involvement. Next, we examined the behavior of these groups in our experiments. The first experiment, conducted as a between-subject study with pandemic researchers, revealed that politicization strategies are less influenced by content and more by group membership. In the second, within-subject experiment with biodiversity researchers, it was found that the active group favored explicit politicization strategies over the communication of neutral expertise. The analysis of the interviews corroborated the group characteristics identified in the LPA and shows that the active group uses explicit politicization strategies to influence policy disputes, while strategic and moderate researchers predominantly delegitimize non-epistemic positions. In conclusion, we confirm our hypothesis and demonstrate that scientists exhibit varied approaches to engaging with policy disputes. This underscores the need to explore the role of scientific experts as players in political communication.

POL06 Science communication as political communication? Scientific experts, policy-making, and media in the digital age

PN 026 "They should make it apolitical": Public's role perceptions of scientific experts on social media

[Kaija Biermann](#)¹, [Monika Taddicken](#)¹

¹ Technische Universität Braunschweig, Institute for Communication Science, Braunschweig, Germany

In recent years, the rise of digital communication environments has intensified the politicisation of scientific discourses. Thus, scientists increasingly engage in contexts determined by factors outside of science and perform "new" roles. Despite typologies outlining scientists' roles in public and political interactions (e.g., Pielke Jr., 2007), empirical studies on the public's ascribed roles to scientific experts online are lacking. To fill this gap in understanding the perceptions of scientific experts' roles on social media from the public's perspective, we ask: RQ1: What expectations do laypeople have of scientific experts' communication on social media? RQ2: How do laypeople perceive scientific experts' roles on social media? We conducted 33 qualitative interviews with German laypeople using an interview guide on characteristics, expectations, and roles of scientific experts on social media. To comprehensively understand scientific experts' ascribed roles, we considered diverse age groups, educational levels, and professional backgrounds, ensuring an even gender distribution. In a deductive-inductive approach based on Mayring's content-structuring qualitative content analysis, overarching categories were first defined based on the guide, followed by an inductive sub-categorisation. Our results show differences in interviewees' expectations of scientific experts on social media. Some did not see participation in discourses on social media as a fundamental role of scientific experts. Almost all interviewees stated they should behave objectively and communicate factually (RQ1). Many interviewees mentioned that they should not express opinions or politicise themselves. In their view, scientific experts should stay as far away from politics as possible. However, many acknowledged that scientific experts engage on social media at the intersection of science and politics and thus also have an opinion-forming power in online discourses. Regarding RQ2, we found that almost all interviewees primarily see scientific experts on social media as pure information providers. In addition, some mentioned the role of knowledge translators that goes beyond the mere provision of scientific information. By translating scientific information and thus making science accessible to the broader public, they fulfil the interviewee's view of a democracy-promoting function. A few interviewees mentioned associated roles as educators (e.g., sparking interest in science) and as role models for "good" scientists. Many interviewees also see scientific experts as enlighteners, particularly in social media discussions, clarifying socio-scientific issues and their impacts. As voices of rational arguments, the interviewees stated

that scientific experts can help to emphasise evidence-based information and counteract purely political opinions. Some interviewees also ascribed a watchdog role, which includes exposing pseudoscience and critically analysing political arguments. In this way, scientific experts are intended to debunk politicised content and misinformation. Overall, our study reveals diverse expectations and role perceptions towards scientific experts on social media. Our findings indicate a tension between expectations of pure information provision and acknowledgment of scientific experts' engagement in politicised social media discussions. This emphasises the need to further examine scientific experts' roles in online public debates at the interface between science and political communication from different perspectives. POL06 Science communication as political communication? Scientific experts, policy-making, and media in the digital age

PP 0963 Virtue or passion? How moral frames in climate change appeals elicit emotions and change opinions

[Linda Bos](#)¹, [Rosa Sanchez Salgado](#)²

¹ University of Amsterdam, ASCoR, Amsterdam, Netherlands

² University of Amsterdam, Political Science, Amsterdam, Netherlands

Political climate change debates make use of different moral frames of climate change diagnoses and solutions. These moral frames are known to sway opinions on climate change, especially for those who align with the moral values embedded in them. Affect and emotions have also been considered important drivers of climate change attitudes and behavior. While it is argued that moral frames are more effective when they invoke strong moral emotions, thus far the relationship between real-world political moral viewpoints on climate change, the arousal of related emotions, and attitudes has not been studied. In this paper, we raise the question whether existing moral climate frames are effective through emotions ("passion") or through direct moral persuasion ("virtue").

We compare three viewpoints on causes of and solutions to climate change, differing in their appeals to moral foundations and emotions: the mainstream, the green-left, and the populist right viewpoint. All three appeals are prominent in the European debate on climate change. Grounded in moral framing research and moral foundations theory, we discuss how we can conceptualize these distinct viewpoints on the causes and solutions of the climate crisis as moral appeals: the mainstream appeal focuses on harm, the green-left addresses fairness and the populist right narrative concentrates on loyalty. In addition, based on moral foundations and appraisal theory we expect these moral climate appeals to elicit specific emotions, respectively fear, anger and pride.

In a next step, we use these specific appeals as input for a 3x2 between-subjects factorial survey experiment with a control condition among a diverse sample of 1708 Dutch respondents. We expose respondents to either a mainstream, green-left or populist right viewpoint, excluding or including solutions for the presented diagnoses, and investigate the extent to which they differ in their self-reporting of emotions and agreement with the proposed diagnosis and solutions.

Our results show first that exposure to the moral climate appeals by and large has little direct impact on support for suggested diagnoses and solutions. In other words, climate moral appeals *alone* do not have many public consequences since they do not lead to support to the solutions that were connected to these appeals. We do find that climate appeals indeed elicit emotions, and that distinct appeals affect different emotions, including anger and pride. The harm appeal in the mainstream message -including references to the suffering of future generations- elicits anger, the fairness appeal in the green message anger, while the appeal to loyalty in the PRR message elicits pride in people. Importantly, these emotions act as mediators for the impact on issue agreement, with moral anger having the strongest impact, most notably on the green-left diagnoses and solutions of the climate change issue. Finally, moderation analyses showcase that all effects are by-and-large across the board.

Based on these findings we tentatively conclude that passion is more powerful when it comes to affecting climate opinions and (eventually) political behavior than virtue. We discuss findings in light of moral foundations research, emotions and climate politics.

PP 0221 Adolescents' political empowerment on social media: Exploring the relationships between role models' political content and political self-efficacy

[Anaëlle Gonzalez](#)¹, [Laura Vandenbosch](#)¹

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

Over the past decades, an increasing body of research has informed on the discernible disengagement from traditional political institutions and detachment from conventional politics among youth. Such disengagement in adolescents is of particular concern as adolescence is a pivotal phase to build skills necessary to participate in civic and political activities in adulthood. One particular skill is political self-efficacy, which is a key driver of democratic

involvement activities, such as voting and cause-oriented participation. In response to youth's increasing disengagement and the related lower levels of political self-efficacy, scholars searched for sources that can empower the younger generation to participate within the political sphere actively. Recent reports suggest individuals under 35 consider famous individuals like influencers as the most important sources of news. Influencers, whose propensity to share political opinions on their social media accounts has been documented, are frequently cited as favorite role models by adolescents. The casual and incidental integration of entertaining and engaging political messages in their leisure-oriented posts makes them especially appealing for young, less politically-informed and -interested audiences.

Building upon social cognitive theory which articulates how individuals can learn from observing role models' (political) behavior, the current study among adolescents examines the associations between the promotion of political content by one's favorite social media role model (i.e., celebrities, influencers, and athletes) and adolescents' political self-efficacy. Additionally, there remains a lack of understanding about the conditions under which these role models' political engagement can relate to adolescents' political self-efficacy. Such knowledge is key to understand which type of adolescents, social media actors and content can be empowered/empower in terms of political self-efficacy. To address this gap, conditions that relate to the message source (e.g., the type of role model and their characteristics), the relationship between the source and the user (e.g., the parasocial bond between them), and user characteristics (their political interest and cognitive processing of political social media content) are examined as moderators.

We conducted a cross-sectional survey ($N = 415$) among French adolescents aged 11–18 in August 2022. We first asked the adolescents to report their favorite role model on social media. Next, we assessed this anchor's frequency of portraying political themes on their social media content (predictor), the adolescents' parasocial interactions with this anchor (moderator), elaborative and selective processing of political information on social media (moderator), political interest (moderator), and political self-efficacy (outcome). The type of famous person (moderator) was coded a posteriori based on the anchor into three categories (1 = influencer/YouTuber/streamer, 2 = celebrity, 3 = athlete). The moderation analysis using Hayes PROCESS macro showed that a higher prevalence of political content in role models' social media was associated with higher levels of political self-efficacy among adolescents. None of the explored conditions moderated the relationship of interest. Our findings add that different type of online entertainment personalities' coverage of political content equally relates to adolescents' political self-efficacy and thus has the potential to empower active democratic citizenship in youth.

PP 0222 Gen Z's news consumption patterns: Impact on political knowledge

Nabila Patwari¹, Alexandra Feddersen¹, Friederike Vinzenz¹, Jérôme Chariatte¹, Diana Ingenhoff¹

¹ University of Fribourg, Department of Communication and Media Research DCM, Fribourg, Switzerland

Is incidental news exposure good or bad for young people's political knowledge? Incidental news exposure on social media has been shown to create a feeling among individuals that they can be informed without needing to actively follow the news, the so-called *News-Finds-Me* (NFM) perception. While some studies show that NFM perception leads people to be less informed or even misinformed about politics, and report lower levels of political knowledge, others see it as an opportunity to stimulate political participation by reducing inequalities between individuals who may be exposed to information without needing to be interested in the first place. Additionally, previous studies measure political knowledge and interest with very general questions (e.g., "Are you interested in politics?"), which may lead young people to answer negatively, as their interest in politics is more issue-specific. This, we argue, can better be captured using narrower issue-specific questions (e.g., "Are you interested in climate policy?").

Our study delves into the interplay between Gen Z's news consumption patterns and their political interest and knowledge, as little research focuses on this generation. It assumes that a) incidental exposure can compensate for the lack of interest and lead to an increase in political knowledge, and b) young people's level of political interest differ across issues.

Data was gathered via a quantitative survey conducted among 387 participants aged between 16 and 25 from mid-September to mid-November 2023 during the Swiss federal election campaign. The survey is distributed via a smartphone application, which allows not only to portion the survey into smaller increments sent directly to participants' smartphones but also to generate all kinds of survey-related information in real-time.

Results partially support our expectations. Incidental news exposure, while not extensively stimulating young people's political knowledge, works as an equalizer between politically interested and uninterested youth. Furthermore, a more issue-based approach to measuring respondents' political interest and knowledge is worthwhile, as it shows that young people are not as uninterested in politics or uninformed about politics as is often assumed. Through these results, we gain a better understanding of the news consumption habits of Gen Z and their opinion-formation

process, but they also open up new research opportunities to explore the impact of these new habits on young people's political participation. Indeed, understanding Gen Z's habits is crucial for our media and political environment since – as the “adults of tomorrow” – this generation and their behavior are likely to affect the future of our democracies.

POL07 Young media users – Young voters

PP 0223 From the influence of the social environment to perceived disinformation – An analysis of factors influencing intentional and unintentional news avoidance among young adults

[Paula Weitz](#)¹, Marie Rosauer¹, Julia Metag¹

¹ University of Muenster, Department of Communication, Münster, Germany

The number of news avoiders has been increasing worldwide for several years. The reasons for this growth are manifold and range from individual influencing factors, such as personal well-being (e.g., Mannell & Meese, 2022) and trust in news (e.g., Goyanes et al., 2023), to contextual influencing factors, such as the increasing problem of disinformation (e.g., Vogler et al., 2021). Which factors are influential depends on the type of news avoidance (intentional or unintentional) as well as the occasion (topic-specific or general) and the respective sample under study. Young adults are the most likely to avoid news (Newman et al., 2022). However, only a few studies have focused on young adults and news avoidance (e.g., Edgerly, 2018) and those who did, did not differentiate between intentional and unintentional avoidance and did not take a set of different factors into account. The present study tries to close this gap by analyzing which factors explain young adults' (between 16 and 29 years old) intentional and unintentional news avoidance. This phase of life is a formative time in dealing with news and news use is significantly influenced by one's social environment, such as one's family's news use as well as descriptive and injunctive norms. In addition, the extent to which the duty to keep informed, need for news, trust in news, news self-efficacy, and perceived disinformation lead young news users to avoid the news was studied.

We use a representative online survey (n = 920, 49.89 % female, $M_{age} = 25$, $SD = 3.93$, 48.14 % higher education), which was fielded in October/November 2023. Multiple linear regressions were used to determine the factors that influence intentional and unintentional news avoidance among young adults. The need for news has an effect on intentional ($\beta = -0.23^{***}$) and unintentional news avoidance ($\beta = -0.13^{**}$). In addition, significant influences of the perception of disinformation on news avoidance were identified (intentional: $\beta = 0.17^{***}$; unintentional: $\beta = 0.21^{***}$). News avoidance of the social environment plays a particularly important role. There is a positive influence of descriptive social norms (intentional: $\beta = 0.20^{***}$; unintentional: $\beta = 0.13^{**}$) and a negative influence of following the news together with the family on intentional news avoidance ($\beta = -0.11^{***}$). It was also confirmed that news overload influences news avoidance (intentional: $\beta = 0.20^{***}$; unintentional: $\beta = 0.11^{**}$). Duty to keep informed had only a significant negative effect on intentional news avoidance ($\beta = -0.07^*$). News self-efficacy and trust in news turned out to be no significant influences on (un-)intentional news avoidance.

Even though no substantial differences were found between intentional and unintentional news avoidance, the study managed to highlight key factors influencing news avoidance among young adults. A high-choice media environment can overwhelm young adults and accordingly encourages them to avoid news. The influence of shared news consumption in the social environment and the orientation towards descriptive social norms are particularly relevant factors for the news behavior of young adults.

POL07 Young media users – Young voters

PP 0224 Friend or foe? Exploring young people's bias perceptions, trust and news use regarding the Middle Eastern conflict

[Alexandra Wölfle](#)¹, Desirée Schmuck¹

¹ University of Vienna, Department of Communication, Vienna, Austria

Some people nowadays tend to avoid the news, in part resulting from the perception of news as biased and a lack of trust in legacy media (Gorski, 2023). While media trust and the hostile media phenomenon have been studied quite extensively in regards to traditional news sources (Goyanes et al., 2023; Matthes et al., 2023), we lack similar insights for social media. Yet, research in this direction is crucial, as social media constitutes the main news source of young people, who are most affected by news avoidance (Karlsen et al., 2020). Further, troubling topics such as war are particularly avoided (Newman et al., 2023), while being seemingly omnipresent on social media in times when conflicts escalate.

Accordingly, based on previous findings (Ardèvol-Abreu & Gil de Zúñiga, 2016; Goldman & Mutz, 2011; Kleinnijenhuis et al., 2020; Soontjens & Van Erkel, 2022; Tsfati & Cohen, 2005), this study explores young people's bias perceptions and their consequences for trust and news use during the current Middle Eastern conflict, not only taking into account traditional news sources, but also social media personalities (e.g., influencers or celebrities) and peers (e.g., friends or followers).

Method

A quota-based quantitative survey (N = 569) was conducted in December 2023 among young people (49.6 % male) aged 16 to 25 years in Austria. We assessed the use of different news sources, perceived trustworthiness and bias towards the Israeli or Palestinian side based on established measures. Moreover, we assessed participants' own stance on the conflict to compute a bias variable that ranges from -1 (hostile bias), over 0 (no bias or neutral stance) to 1 (friendly bias) (M = .002, SD = .219). We controlled for age, gender, migration background and education; in the path analyses additionally for the bias and trust variables of the respective other sources. The study was IRB-approved.

Key findings

Both mainstream media (M = 2.918) and peers (M = 2.984) were deemed significantly more trustworthy than social media personalities (M = 2.743) (both $p < 0.01$). Moreover, youth perceived a hostile bias for news by mainstream media (M = -.047), a friendly bias for peers' news (M = .050), and no bias for personalities' news (M = .002) (all $p < .05$). For all sources, we found trust to increase with a friendlier bias perception (all $p < .01$). For personalities and peers, but not for mainstream media, trust in turn predicted more use of the respective source (both $p < .001$).

Implications

The hostile media phenomenon typical for traditional news media for polarized topics like the Middle Eastern conflict does not seem to extend to social media personalities and peers. Furthermore, young people seem to trust sources more that display a friendly bias towards their own stance. Rather than news avoidance, our findings suggest selective exposure to attitude-congruent news, which bears the risk of further polarization. However, our cross-sectional survey does not allow the inference of causal relationships, which is why longitudinal studies or experiments will be needed going forward.

POL07 Young media users – Young voters

PP 0225 Polarized scenario and the shift to a non-partisan relationship of young people with politics in social media in Brazil

[Anna Catharina Vale](#)¹

¹ Faculty of Human Science of Catholic University Portugal, Communication, Lisbon, Brazil

With the prominence of social media as a gateway to accessing news and politics in Brazil, where voting is mandatory, young adults experienced their first elections mediated by the internet and social media with their first vote. According to C. Mudde (2004, 2016, 2020), G. Mazzoleni (2008), and L. Cesarino (2020), Brazil is socially and politically polarized, facing an affective polarization (Barberá, 2020) which is calcified in the society (Nunes and Traumann, 2023) with emotional exhaustion in dealing with conflicts. In this context, the objective of this doctoral research is to understand how the use of social media networks contributes to the relationship of young adults with politics in Brazil.

Using a qualitative methodology with inductive methods (Grounded Theory), 24 semi-structured on-line interviews were conducted with young adults aged 21 to 34 in 2022, before the presidential election campaign period in Brazil. These young adults have experience with politics in the internet and social media since their first time voting and this matters to their perception of politics, as stated by E. Solano (2022), C. Fuchs (2020), A. Bruzzone (2021) and by F. Nunes and T. Traumann (2023).

This abstract presents preliminary results of a doctoral investigation to discuss new arguments such as that among these young adults, there is no depoliticization. It discusses the socially and politically polarized context Brazil has been experiencing since 2013; how this is connected to populist communications (Aalberg and de Vreese, 2016) and how this may affect people's perception of reality.

Corroborating with previous findings by E. Solano, and F. Nunes and T. Traumann, it also debates that young adults are exhausted and need to simplify life to protect themselves of fear and exhaustion. To achieve that, the argument is that they do so by curating what is important to them. The main contribution to the debate is that politics curating could be leading to a non-partisan way of perceiving politics, with a possible rejection of affiliations with political parties, nurturing non-partisan relationships, shifting partisan ideology to the curation of topics.

POL08 Social disorder through discursive polarization? What to do about polarization emerging in communication

PN 036 Drivers of polarized media debates: the case of (disruptive) climate protests

Hendrik Meyer¹, Mike Farjam², Louisa Pröschel², Helena Rauxloh³, Michael Brueggemann¹

¹ University of Hamburg, Journalism and media research, Hamburg, Germany

² The New Institute, Depolarizing public debates, Hamburg, Germany

³ GESIS Leibniz Institute for Social Sciences, Computational Social Science, Cologne, Germany

Climate protesters are sometimes characterized as polarizing, but not all movements equally. Some movements' actions are perceived as more disruptive than others, for example, by blocking traffic on a street, compared to a registered demonstration as a more conventional form of protest. Such unconventional, illegal, or disruptive forms of protest do not necessarily lead to a rejection of the cause such as climate protection measures. Radical movements may even increase support for moderate protests. In Germany, however, support for climate protests has recently decreased significantly (More in Common, 2023 survey), after the disruptive protest organization "Letzte Generation" (Last Generation, LG) emerged. LG is said to have polarized the debate. We therefore test whether disruptive forms of climate protest lead to more polarized climate debates in Germany and which actors actually drive these polarization processes. We present results of large-scale manual and computational analyses of German media discourses during 2022 and 2023, consisting of more than 12,000 news articles and 5,000,000 Twitter posts, comparing debates surrounding Fridays for Future (FFF) and the Letzte Generation (LG). We investigate whether the discourses vary in their degrees of "discursive polarization" operationalized as the use of extreme frames, toxic and angry interactions both in media content and in network structures. The analyses of the Twitter debates show that while discourses around LG generate more attention, they also lead to more antagonistic and extreme frames, labeling protesters as terrorists or murderers. This aggression is directed not only against LG as an organization, but also against their online supporters. The LG supporters on the other hand, mainly call for action against climate change and defend the actions of the movement, while only very rarely promoting extreme doomsday scenarios or attacking the oppositional network cluster. FFF-related Twitter debates also attract extreme and uncivil content, but this content is posted by a comparatively smaller network cluster of right-wing users. A similar picture emerges in journalistic coverage: reports on FFF are less toxic and refer to the cause of the movement (climate justice), whereas LG is primarily discussed from the perspectives of the extremism and crime frames. While only right-wing populist media talk about FFF in an extreme and toxic way, these voices are found in the entire media landscape when discussing LG protests. Subsequently, the language of rightwing-populist media is adopted across all outlets for the more disruptive protests. We thus argue that mostly rightwing-populist actors (both political actors and media outlets) are responsible for the initial spreading of polarizing content in climate protest debates, resulting in an 'asymmetrical polarization' of online and news media debates: the whole debate becomes more toxic and moves to frames originally propagated by populist-right wing actors. While media outlets only quote extreme voices and do not necessarily share them in their own commentary, journalists are to be held responsible for providing salience to certain frames. While LG has provided the trigger for the polarization of the debate, it was fuelled by interested political-media actors. The process of discourse polarization is driven by the interactions of politics, journalism and digital media use under the influence of the affordances of digital platforms.

POL08 Social disorder through discursive polarization? What to do about polarization emerging in communication

PN 037 Happy to disagree: Drivers of affective and ideological polarization in interpersonal discussions

Lore Sorensen¹, Matthias Revers², Michael Brueggemann²

¹ University of Leeds, School of media and communications, Leeds, United Kingdom

² University of Hamburg, Journalism and media research, Hamburg, Germany

While polarization is most pronounced in the US, there is a strong sense also in European democracies that a gulf is emerging between groups of citizens. Meanwhile, the climate crisis is becoming ever more urgent and is being increasingly politicized in culture war discourses by some political elites. The scientific consensus on climate change remains; however, citizens who are differently affected by and engaged with climate change also appear to drift apart both on policy issues and how they feel about activist interventions. We conceive of polarization as a discursive and interactive process. Polarization is thereby dynamic and engendered, shaped, reinforced, or broken down by communication, whether face-to-face or mediated. This paper deals with interpersonal communication – what Revers and Coleman term micropolarization (forthcoming) – and explores how macro-level affective and ideological divisions are enacted, negotiated, or overcome in communicative interaction. We focus on climate change as a highly politicized topic that mobilizes variant affective engagement among different groups of citizens while, partly, cutting across traditional ideological divisions. This exploratory study uses unmoderated dyadic conversations, i.e. between two participants. We explore micropolarization in two countries, the UK and Germany, both of which have

similar levels of climate denialism (YouGov, 2019), with a sample of 80 self-selected German citizens and 50 British citizens acquired through cooperation with the "My Country Talks" initiative in Germany and with The Daily Mirror in Britain. The dyadic conversations involve participants with oppositional positions on climate change paired through a recruitment survey which measured their opinions on climate activism and climate policies. People were paired and conducted unmoderated online video conversations to explore their differences. Each conversation lasted approximately one hour. After the conversation, participants completed a second survey to measure any change in their views concerning the issues discussed (ideological polarization) and their feelings towards their conversation partner (affective polarization). The interview transcripts were also coded for these categories, as well as for a range of speech acts that polarized or depolarised the subsequent discussion. First results from our analysis indicate that interpersonal conversation encourages affective depolarisation but entrenches ideological polarization. Affective depolarisation appears to be driven by the identification of common ground, often unrelated to ideological positions, the perception of willingness to listen and the articulation of appreciation of the value of the other's perspective. While these conversational moves are performed by individuals and their personal political identities, they reflect, take cues from and reference politicians' public performances of ideas and emotions. Ideological polarization seems to be more frequently reinforced than affective polarization, often accompanied by participants' misrecognition of each other's identities. Notably, ideological polarization comes with affective depolarisation in some cases, often through active listening and expressions of empathy. In other words, the interaction made some people happy to disagree and to get along with others who think differently. Further analysis will deepen understanding of how different dimensions of de-/polarization in interaction reinforce and alleviate antagonism. A more detailed picture of micro-level polarization will also elucidate larger-scale discursive polarization.

POL08 Social disorder through discursive polarization? What to do about polarization emerging in communication

PN 038 Democratic listening in online discussions: Can AI contribute to affective depolarization?

Hartmut Wessler¹, [Shota Gelovani](#)¹

¹ University of Mannheim, Institute for media and communications, Mannheim, Germany

Ensuring freedom of expression is a key democratic value. However, expression is only one part of the communication process. On the other side of the coin is listening. It seems apparent that listening among citizens as well as between citizens and representatives is marked today by the strong penetration of everyday life with digital media, and social networking platforms in particular. These platforms are frequently subject to criticism for their inaction about political polarization on social media. Platform administrations have indeed demonstrated a certain reluctance to tackle online polarization themselves. In addition, social networking platforms have, over the past decade, become extremely eclectic in that they now combine entertainment and news. While many people use social media specifically for political participation, political discussions are frequently just a byproduct of various activities aimed at other gratifications. Therefore, we see a clear need for research-based, academic work on mitigating pernicious levels of polarization and demonstrating the feasibility of depolarization initiatives. Research shows hardly any evidence of the benefits of discussing a polarizing issue among partisan individuals. Therefore, our key milestone is not necessarily a partisan depolarization. Instead, discussants should be prepared for polarized encounters so that they know how to calibrate their own attitudes in ways that maximize their appreciation for the learning experience enabled by the encounter. Discussions should be constructed in a way that makes them win-win situations for the parties involved rather than strictly competitive situations ending in victory and defeat. The goal should be to fill the "moral empathy gap" between the strong supporters of two opposing parties or causes and facilitate the perspective-taking of those with whom one argues, thereby potentially contributing to affective depolarization. In our ongoing project we are launching an experimentally designed online discussion platform in Germany in March 2024. The recruited discussants will be allocated to either a control (unmoderated discussion) group where only basic content moderation takes place, or to one of the three treatment groups: (1) a group with pre-coded clickable reactions such as "I respect your opinion" and the ability to reply to a specific section of a comment, (2) a group moderated by researchers, (3) a group moderated by researchers with the help of a ChatGPT bot, which informs us when and how to intervene in the discussions to improve constructive engagement. The discussions will start with a vignette describing a real-life polarized scenario about meat consumption. The discussants will take pre- and post-surveys, which will allow us to measure political correlates, changes in their attitudes on the polarizing topic, and satisfaction with discussion quality. Using text analysis, we will measure and compare the constructiveness of discussions. The analysis of the survey and the text data will allow us to identify self-reported and measured cases of constructive engagement and instances of good listening. In so doing, we aim to demonstrate the potential of platform affordances, human moderation, and AI to foster democratic listening online.

POL08 Social disorder through discursive polarization? What to do about polarization emerging in communication

PN 039 Factors of Polarization and Recommendations for Depolarization: A Systematic Literature Review

[Christel W. van Eck](#)¹, Hendrik Meyer², Michael Brueggemann²

¹ University of Amsterdam, Faculty of Social and Behavioural Sciences, Amsterdam, Netherlands

² University of Hamburg, Journalism and media research, Hamburg, Germany

In the last decade, researchers have started investigating why public debates are polarizing. For example, they investigated polarized viewpoints, echo chambers, online networks, and hostility toward the other camp. However, while there is some research providing empirical evidence for factors of polarization, much is still unknown about how public debates can depolarize. Hence, in the current research, we conducted a systematic literature review to answer the three questions: "What kind of factors are identified as driving polarization? Which recommendations for depolarizing public debates are advanced in academic scholarship? What is the evidence-base for each factor and recommendation?" In accordance with PRISMA guidelines for systematic literature reviews and predefined criteria, we developed a search string to identify articles that either talked about polarization or depolarization in their title or abstract (N = 7,994). Next, we ordered the results based on highest citations first, assuming that these are the most influential articles in academic scholarship. We manually reviewed the titles and abstracts per year and included the first ten relevant articles that either focused on mediated communication, personal communication, and/or messaging effects. This procedure resulted in a dataset of 112 sources. After reaching inter-coder agreement on a codebook with 10% of the dataset, we coded all articles based on the following categories: conceptualization of polarization (e.g. ideological or affective); type of empirical evidence (e.g. methodology and sample); factors explaining processes of polarization; and recommendations as well as normative ideals for depolarization. The analysis of the recommendations and normative reflection was limited to the discussion sections of the articles, assuming that this is the section in which academics provide recommendations for depolarization. Our preliminary analyses suggest that the large majority of research focuses on polarization and less so on depolarization. Remarkably, the factors, recommendations, and normative ideals for depolarization that are proposed in the discussion section are oftentimes not empirically investigated in the paper, in contrast to the factors of polarization. Academics often propose 'deliberation', 'diversifying views', and 'moderation of views' as three normative ideals of depolarized public debates. As such, this research provides insight into the normative assumptions underlying polarization research and the (lack of) evidence for the recommendations made in academic articles.

POL08 Social disorder through discursive polarization? What to do about polarization emerging in communication

PN 040 Normative Reflection: Which kind of depolarization is desirable?

[Michael Brueggemann](#)¹, [Christel W. van Eck](#)², Hendrik Meyer¹, Fritz Breithaupt³, Shota Gelovani⁴, Hartmut Wessler⁴

¹ University of Hamburg, Journalism and media research, Hamburg, Germany

² University of Amsterdam, Faculty of Social and Behavioural Sciences, Amsterdam, Netherlands

³ Indiana University Bloomington, Department of Germanic Studies, Bloomington, USA

⁴ University of Mannheim, Institute for media and communications, Mannheim, Germany

Polarization is used as an analytical but also as a normative concept. This is neither a problem nor unique to the use of this concept, as long as both the analytical and the normative part are well explained and reflected. While there is a lack on the analytic side of defining polarization in many empirical studies, there is an even greater lack of normative reflection. This lack is not only philosophical, but a real-world problem, as polarization is assumed to be harmful and strategies of depolarization are (sometimes) uncritically propagated as desirable. In our contribution, we focus on mediated public debates in democratic states and explain why both polarization and depolarization are ambivalent from the perspective of normative theories of a democratic public sphere. While different theories will agree that at a certain point polarization becomes pernicious, there will remain differences where exactly the threshold should be. The normative appraisal of polarization and depolarization recommendations faces a basic challenge: how to deal with radical "fringe" positions and how to deal with the moderate center? In order to master this challenge one should distinguish between the ideological and affective dimensions of polarization. In the ideological dimension "fringe" and "center" mean radical vs. moderate opinions on issues resulting from different values, preferences, outlooks on reality. In the affective dimension it means the degree of (ideologically charged) disaffection with the outgroup. For communication this means statements expressing ideological positions and talking about out-groups, but also interacting (on digital networks) with statements and presumed members of the in- and outgroups. The fringe: we argue that neither the truth nor the most appropriate position lies necessarily in the middle of a given ideological spectrum. Depolarization measures should therefore not be directed towards cutting off ideas that are classified as "radical" at a given point in time. Yet, if radical views clearly violate important democratic values or are propagating misinformation, they should not be circulating. The center: there is not much to gain by promoting lukewarm middle positions on all possible issues debated in society. It also does not seem desirable to depolarize by

criticizing partisanship or engagement with a cause: democracy cannot survive without this. There is no democratic theory to back up worshipping disinterest in politics and depoliticization of political questions. Therefore, we argue for redefining "the middle ground" as the place where a plurality of ideas and participants are listened to as parts of a community of communication that accepts disagreement among its members. Moderate voices are thus being redefined as those who may have strong opinions but remain open to listen to dissenting voices. The rules of democratic civility rather than culturally-defined politeness are vital for the middle ground to thrive as the core of democratic debates. From this perspective the basic dilemma of depolarization can be tackled productively: the question of how to deal with radical ideas and how to engage those speakers willing to engage with a plurality of ideas. Radical ideas do not need to come with an aggressive tone, intolerant to other perspectives on a given issue. This way, moderates are not silenced and relevant ideas are not blocked out. We will end by discussing concrete depolarization recommendations resulting from the other presentations in the end, together with all panelists.

POL09 Artificial intelligence in political communication: Potentials & threats

PP 0226 Can AI promote democratic participation? Challenges in online participatory processes and the potential of AI for their resolution

[Carina Weinmann](#)¹, [Marike Bormann](#)¹, [Mira Warne](#)¹, [Florian Sauer](#)¹, [Stefan Marschall](#)¹, [Marc Ziegele](#)¹, [Lena Wilms](#)¹

¹ Heinrich Heine University Düsseldorf, Department of Social Sciences, Düsseldorf, Germany

In response to decreasing acceptance and legitimacy beliefs in political decision making, politics and administration have been inviting citizens to engage in citizen participation (Newton & Geissel, 2011). Such formats include – among others – citizen councils or forums, and aim to make political decisions more legitimate, accepted, and well-founded (Nanz & Fritsche, 2012). Online platforms have become common instruments for conducting citizen participation processes (Coleman & Shane, 2012). However, their use may imply a range of problems, many of which are known from research on political online communication, such as incivility or the dominance of discourse by a few participants (e.g., Anderson et al., 2014; Graham & Wright, 2014). As a potential solution to such issues within online discussions, the use of Artificial Intelligence (AI) is being discussed (e.g., Stoll et al., 2020; Wojcieszak et al., 2021). However, there is still limited research on the question if problems similar to online discussions equally arise within citizen participation processes and how the severity of these problems are evaluated from the users' perspective. Moreover, it remains unclear to what extent and which AI methods are suitable for addressing these problems. Our study aims to address these research gaps from the citizens' perspective.

From December 2022 to March 2023, an online survey targeting individuals aged 16 and above in Germany with confirmed knowledge of or participation in online citizen participation was conducted. The adjusted sample consisted of 485 individuals (N ; age: $M = 46.76$, $SD = 14.48$; gender: 47.8 % female). To assess the respondents' perception of challenges in online discussions, problems discussed in the literature were operationalized, and respondents indicated their agreement with statements (33 items). To measure the perceived problem-solving potential of AI, respondents were also asked to evaluate existing or potential AI methods based on their impact on improving or worsening discussions in online citizen participation (19 items).

Using exploratory factor analyses, six dimensions of problems were identified, with the "binding character" factor being rated as the most outstanding matter ($M = 2.69$, $SD = 1.11$). This factor encompasses challenges related to decision-makers taking online citizen participation seriously, translating them into concrete political solutions. Regarding the evaluation of AI methods, three factors were identified. The factor "elimination of norm violations" was rated the highest ($M = 4.10$, $SD = 0.88$), covering AI methods that detect and highlight misinformation, bots, hate comments, and redundant information.

This study, for the first time, explores the problems that citizens perceive as relevant in online citizen participation and to what extent AI can address these issues from their perspective. The findings indicate that citizens are most likely to criticize the insufficient binding character of online citizen participation. Additionally, citizens attribute the potential to all mentioned AI methods to optimize online participatory processes, with the highest potential seen in those addressing deficits such as hate comments, misinformation, or bots. Consequently, it can be concluded that, from the citizens' perspective, AI indeed has the potential to address perceived problems in online participatory processes and ultimately promote democratic participation.

POL09 Artificial intelligence in political communication: Potentials & threats

PP 0227 Authenticity in the Age of AI: Do characteristics of AI-generated disinformation images and AI-detection tools influence judgments of authenticity?

[Aqsa Farooq](#)¹, [Claes de Vreese](#)¹

¹ University of Amsterdam, Communication Science, Amsterdam, Netherlands

Recently, sophisticated AI systems have demonstrated an unparalleled ability to generate coherent and contextually relevant content, raising concerns about the potential misuse of their output. One pressing concern is the

emergence of false content generated by these models and its potential influence on individuals, with an alarming surge of AI-enabled false content already spreading its way through the information ecosystem (Newsguard, 2023). AI-generated disinformation in the form of images present a further challenge due to the faster speed at which visual information is absorbed and its longer-lasting cognitive influence, compared with textual information (Jakus, 2018). Already, AI-generated imagery is being used to propagate political disinformation campaigns (Klepper & Swenson, 2023). Thus, there remains a need to understand which factors individuals rely upon when determining whether images are AI-generated, particularly when they can be used to spread disinformation.

Most AI-generated content is characterised by its hyper-realistic quality which can be leveraged to spread propaganda circulated by even authority figures (Collins, 2023). Furthermore, misleading content also tends to employ strong emotional appeals in its messaging in order to evoke arousal and promote engagement (Paschen, 2019), a tactic used by disinformation actors with the assistance of generative AI (BBC News, 2023; Upton-Clark, 2023). Therefore, it is important to explore how aesthetic realism and emotional salience, as key features of both AI-generated content and disinformation, may influence authenticity judgments of AI-generated disinformation images. This is the first aim of the study, which is being explored by conducting an online survey in which 288 UK-based participants are presented with both AI-generated disinformation images and non-AI generated images. This experimental study employs a 2 (aesthetic realism: high vs low) x 2 (emotional salience: high vs low) between-subjects design, and measures participants' authenticity judgments (whether they believe the image is AI-generated or not) and how confident they feel in their authenticity judgment.

With the ongoing development of AI-powered tools to assist with the detection of AI-generated images, it is also important to understand how authenticity judgments may be influenced by the verdict of an AI-detector. With AI already being leveraged for propagating political ideologies (Ulmer et al., 2023), it is almost inevitable that users' judgments will be influenced by whether the content they see is aligned with their political ideology or not, as vastly demonstrated with cases of non-AI misinformation (Allcott & Gentzkow, 2017). The second aim of the study is therefore to investigate whether the key features of the AI-generated disinformation (aesthetic realism and emotional salience) and the political alignment of the verdict with one's own ideology will play a role in individuals' likelihood to change their judgments. This is being investigated by presenting the same participants with the verdict of an existing AI-detection tool, and giving them the option to change their own judgments based on its verdict. The results of this investigation may assist with the development of disinformation detection tools, as well as strategies that mitigate the spread of deceptive, synthesised visual content in the digital age.

POL09 Artificial intelligence in political communication: Potentials & threats

PP 0228 AI governance in the spotlight: An empirical analysis of Dutch political parties' strategies for the 2023 elections

Kimon Kieslich¹, [Sophie Morosoli](#)², Valeria Redendez Gómez², Max van Druenen¹

¹ University of Amsterdam, Institute for Information Law, Amsterdam, Netherlands

² University of Amsterdam, Amsterdam School of Communication, Amsterdam, Netherlands

AI-based technologies are having an increasing impact on society, which naturally raises the question how this technology will be addressed politically. Thereby, political actors have a dual role to play (Laux et al., 2023): They can provide investment to enhance the efficiency and usage of these systems in different societal areas while also bearing the responsibility of safeguarding citizens from potential harm (Kuziemski & Misuraca, 2020). Hereby, the degree of politicization of the topic, i.e. if a topic is part of the public and political debate, has an immense influence on the political approach to tackle the issue. The more a topic is politicized, the more urgency political parties experience to develop concrete governance approaches.

Previous work has evaluated different AI reports, political strategies and guidelines providing recommendations on their assessments (Bareis & Katzenbach, 2022; Cath et al., 2018; Dutton et al., 2018; Liebig et al., 2022). However, existing research has not yet analysed party programs in terms of both discourse around artificial intelligence and policy recommendations within an election context. This study focuses on the Netherlands and considers and provides an empirical analysis to answer the following question: *How do parties discuss AI in their political programs for the 2023 election in the Netherlands?*

To answer this research question, we conducted a manual content analysis of all party manifestos for the 2023 elections in the Netherlands. Our analysis revealed a disparity in addressing artificial intelligence between the parties. Populist parties, such as PVV, FvD and JA21, demonstrate less engagement with AI, leaving their governance to large tech corporations or the European Union. Some of the major centre parties address AI to a moderate extent along their party lines, but without dedicating separate sections to the issue. These findings suggest a need for a more extensive thematization and more diverse range of perspectives on AI's role in society.

Moreover, our findings on policy proposals of the party programs highlight the absence of a holistic vision in managing AI's impact across societal sectors, with a specific overlook on the private sector. Some parties suggest using AI to drive economic growth and to relieve the strain on sectors like healthcare. However, these proposals often lack a comprehensive strategy that takes into account AI's potential to cause discrimination, spread misinformation,

and exacerbate polarization (Cath et al., 2018). This gap highlights the need for investments in AI to be coupled with robust consumer protection strategies to address and mitigate its risks across all sectors. Additionally, our findings reveal a consensus across parties on the need for transparency in AI processes, from data training to output verification. However, this measure alone would not be sufficient to address the implications of AI (Ananny & Crawford, 2018). Instead, we recommend to implement mechanisms that can enable the participation of the public to address the issues related to AI in the Netherlands.

POL09 Artificial intelligence in political communication: Potentials & threats

PP 0229 Leveraging OpenAI's multimodal APIs for analyzing digital propaganda in political communication

[Xin Zhou](#)¹, Edda Humprecht¹

¹ Friedrich Schiller University Jena, Institute of Communication Science, Jena, Germany

This study introduces a novel approach to analyzing digital propaganda on social media, focusing on the political communication sphere. By harnessing the multimodal analytical capabilities of OpenAI's ChatGPT API, the research aims to provide significant contributions to the study of political communication, mainly through the analysis of video content such as news and speeches. The proposed methodology emphasizes the transformation of audiovisual media into a comprehensive dataset for in-depth analysis.

The process begins with converting audio from selected videos into textual transcripts using OpenAI's Whisper API. This step ensures the accurate capture of spoken content, forming the textual basis for further analysis. In parallel, vital visual frames are extracted from the videos at specified intervals. This automated extraction focuses on identifying crucial scenes and elements that visually represent the themes and strategies inherent in digital propaganda.

The core of this methodology lies in integrating these textual and visual data using OpenAI's GPT-4-Vision, a model adept at understanding and correlating multimodal information. This approach allows for synthesizing the extracted frames with the corresponding audio transcripts, enabling a comprehensive analysis combining visual cues with spoken content. The GPT-4-Vision model's capacity to process sequences of images in a single frame, as demonstrated in empirical tests, is particularly advantageous in preserving the contextual flow of the video content.

A preliminary pilot study was conducted with a dataset consisting of a series of political news themed TikTok videos (n = 30) from multiple media accounts to test the methodology. The pilot study applied our methodology to 30 diverse political news themed TikTok videos, focusing on the automated detection and categorization of digital propaganda elements. The preliminary results, when compared to human-generated textual analyses, were promising. The Whisper API demonstrated high accuracy in transcribing political rhetoric across various accents. GPT-4-Vision successfully identified key themes, such as political ideology and policy critique, with approximately 85% accuracy. It correctly categorized persuasive techniques in 78% of instances. The more complex task of demographic targeting was identified with a 65% detection rate. These outcomes underscore the method's potential in nuanced automated political content analysis and highlight areas for future enhancement.

Future research will expand the dataset, incorporating a more extensive and diverse range of political content from multiple sources. This expansion is intended to provide a more comprehensive validation of the methodology and its applicability across varied political narratives. It is anticipated that this enlarged dataset will enhance the depth and accuracy of the analysis, offering a more robust understanding of digital propaganda's thematic focus, persuasive strategies, and audience targeting.

In conclusion, this research marks a step forward in the automated analysis of digital propaganda. Our pilot study demonstrates promising results in political communication analysis, leveraging advanced speech recognition and multimodal techniques. This foundation sets the stage for further refinement and exploration in automated content analysis.

POL09 Artificial intelligence in political communication: Potentials & threats

PP 0230 Do generative AI tools increase disinformation perceptions?

[Marina Tulin](#)¹, [Chris Starke](#)¹, [Michael Sivolap](#)¹, [Tom Dobber](#)¹

¹ University of Amsterdam, ASCoR, Amsterdam, Netherlands

The recent proliferation of generative AI tools has raised concerns about potential misuse, such as the creation of deceptive content. This study explores how AI tools like ChatGPT and Midjourney impact disinformation perceptions. While people have a general tendency to passively accept the information they see, a tendency known as truth default (Levine, 2014), we are interested in whether knowledge of generative AI tools has the ability to undermine this. By investigating whether learning about these tools contributes to increased distrust and cynicism towards

political information, the study aims to shed light on the potential consequences of generative AI for disinformation perceptions.

We employ a between-subjects experimental design ($n = 907$) with three conditions: one involving AI tools used to create art, another showcasing AI tools' potential for generating false information, and a control group with no AI exposure. Participants in the experimental conditions watch one of two explainer videos on generative AI tools, namely ChatGPT (for text) combined with Midjourney (for images). The videos explain how these tools can be used to generate text and matching images. The explainer videos vary in the purpose of the AI tools. In one experimental condition, the video shows how AI tools can be used for art, namely to create a digital drawing and a poem. This is to mimic the intended use of these tools as advertised by the creators. In the other experimental condition the video shows how AI tools can be used to generate false information, namely a fake news article and matching photograph. This is to mimic how the news media have been reporting on the possible dangers of generative AI tools. A control condition was also included where participants are not exposed to any AI tools.

The dependent variable consists of ratings of 8 pre-tested news media items showing a headline and matching image. Four of these stimuli contain true information taken from news media, while the other four contain false information generated by AI tools. Participants are asked to judge the veracity of each stimulus and the extent to which they are certain of their answers. The stimuli are presented in random order. We hypothesized that individuals are overall more likely to rate online information as false after being exposed to generative AI tools (H1), irrespective of whether the information was actually true or false. We find support for this hypothesis, meaning that awareness of generative AI undermines truth perceptions. Exploratory analyses show that this effect is stronger for real news than for false information. We also hypothesized that uncertainty is a mediator in this relationship, such that individuals who learn about AI tools experience more uncertainty, and this in turn increases individuals' tendency to judge information as false (H2). We do not find support for the mediation hypothesis. Still, our overall findings highlight potential dangers of generative AI, not for the creation of disinformation but for the perceptual crisis around information. The mere knowledge of generative AI seems to increase distrust and cynicism towards political information.

POL10 From sharing to discussing: Online media experiences

PP 0316 Mapping news sharing on Twitter – A bottom-up approach based on network embeddings

[Felix Gaisbauer](#)¹, [Armin Pournaki](#)², [Jakob Ohme](#)¹

¹ Weizenbaum-Institut e.V., Digital News Dynamics, Berlin, Germany

² Max Planck Institute for Mathematics in the Sciences, MPI MIS, Leipzig, Germany

News sharing on digital platforms is a crucial activity that determines the digital spaces millions of users navigate. Sharing a news article can influence the visibility of the item in global networks as well as in small networked publics. Especially in the study of political news sharing, previous research based on digital trace data has focused on news (sources) that were labelled as misinforming or partisan *ex ante*. This can be useful in many study attempts but it reduces the diversity of news content into binary categories. Eventually, also a partisan source may produce a significant share of balanced information, or a mostly 'impartial' news source may produce pieces that support a certain view. Newsfeed environments contribute to the unbundling of news and thereby disconnect the source from the news item. Yet, we know very little to what extent news sharing behavior crosses partisan, topic, or outlet lines.

To address this gap, we utilize a combination of three data sources to elucidate the extent to which sharing patterns of certain political user groups consist of specific outlets/topics/articles or have unknown diversity. Which types of news are shared in different political regions of Twitter? Are there news that are shared across the political spectrum?

To this end, we combine multiple data sources via state-of-the-art network embedding methods and automated text analysis:

- We collected all tweets which contained a link to one of 26 legacy or alternative German news outlets for March 2023 (2.5M tweets).
- We crawled the full texts of the articles if available (30K unique texts); articles were assigned topics with a paragraph-based BERTopic model.
- We collected the Twitter follower network of German MPs; we embedded all followers and MPs in a latent political space using correspondence analysis. CA reveals two clearly interpretable dimensions: one shows a clear distinction between *AfD* and MPs of all other parties; in the other dimension, all parties except *AfD* are arranged on a left-right axis.

We investigate which types of articles are shared in which political regions of the latent space. We observe interesting, partly counterintuitive sharing patterns: Left-leaning outlets are shared by users in different political regions if the topic serves their political cause (qualitative example: an article of *Der Spiegel* about a judge that justified a decision by referring to the Koran was shared mostly by users following *AfD* or *CDU/FDP* politicians). On the other

hand, certain topics are shared only by users in very localized political regions of the network (example: articles classified as dealing with the topic of a speed limit on German highways are nearly only shared by users close to SPD/Greens). We explore these patterns systematically. This approach allows a very general, yet topic- and outlet-specific view on user sharing behavior on Twitter.

POL10 From sharing to discussing: Online media experiences

PP 0317 Sharing is caring? The influence of media use on (political) news sharing on social media

Annelien Van Remoortere¹, [Rens Vliegenthart](#)¹

¹ Wageningen University and Research, Strategic communication, Wageningen, Netherlands

News sharing on social network sites plays a key part in our understanding of digital news distribution and consumption. Digital platforms such as Twitter and Facebook are easy-to-use tools that make sharing news articles, both for individuals as for media organizations, very simple. News sharing on social media sites altered the way in which citizens engage with news. It is therefore not surprising that news sharing has been the subject of much research in recent years. Most research focused on sharing-related features of news and individual users and it seems to be widely accepted that news sharers are active news users with a rich news diet. This notion is often studied in a very aggregated way without making a distinction between mainstream and alternative outlets while it can be expected that specific forms of news use impact sharing behavior. Moreover, news use and sharing behavior are often seen as something static while research has shown that contextual factors also have a significant impact on both news consumption and news sharing. Especially times of crisis or instability alter the way citizens engage with news. During these periods, citizens rely on the one hand more on news media as source of information, changing their news use. On the other hand, citizens also share more news on social media with the primary motivation of information sharing. This paper therefore aims to study the mutual relation between news use and news sharing in a longitudinal way, including a crisis period (COVID-19) and routine periods in order to answer our main research question: How does mainstream, leftwing and rightwing media use affect news sharing on social media, and vice versa?

Method

To do this, we conducted a four wave panel study in Sweden. The panel survey is web-based, with a probability sample of Swedish residents ages 18-years or older. The first panel wave was in the field between February/March 2020 and the fourth, and last, wave in February/March 2023. To identify individuals' exposure to both mainstream and non-mainstream news sources we asked citizens in the four waves what kind of media they use in a typical week. The degree of news sharing was measured in four waves by asking respondents how often they share news on Facebook, Twitter, Instagram or YouTube. As we are interested in the dynamic interaction between media use and news sharing, we rely on a random intercept cross-lagged panel model to analyze the relation between news sharing and media use.

Results

Our preliminary results indicate that media use affects sharing and not vice versa but only from wave 1 to wave 2. This could signal a crisis (COVID-19) effect which indicates that the relationship between news sharing and media use changes during crisis periods. In routine periods the type and amount of news citizens use does not significantly impact their sharing behavior while in crisis times media use of alternative media (both left wing as right wing) and mainstream media leads to more news sharing.

POL10 From sharing to discussing: Online media experiences

PP 0318 All the (fake) news that's fit to share? News values in perceived misinformation across 24 countries

Samir Nenno¹, [Cornelius Puschmann](#)¹

¹ University Bremen, Center for Media - Communication and Information Research, Bremen, Germany

Introduction

Misinformation and its spread online are widely recognized as pivotal challenges to democratic societies in the 21st century. While there has been a surge in scholarly interest surrounding the content of political misinformation online, a large proportion of this research concerns misinformation in Western, Educated, Industrialized, Rich and Democratic (WEIRD) countries. Furthermore, findings are often not interpreted systematically in relation to properties that journalists rely on to capture the attention of audiences, i.e., into news values. Tandoc et al (2021) point out that "[w]hile many studies have focused on the 'fakeness' of fake news, fewer have examined its 'newsness.'" (p. 111). They find timeliness, negativity, and prominence to play a role, while informativeness, familiarity, and importance are highlighted in other research as prevalent in misinformation (Chen et al., 2023).

Building on this research, we seek to close the gap on comparative studies of news values in misinformation with a perspective that emphasizes non-WEIRD countries. We formulate two research questions: 1) Which differences

exist in the prevalence of news values in items from either WEIRD or non-WEIRD countries? 2) Which differences exist in the prevalence of news values in either flagged or non-flagged items?

Data & Methods

We analyze URLs shared on Facebook in 24 countries between 2011 and 2023 that were either flagged or not for misinformation by users. As flagging is user feedback, we rely on claims made on the accuracy of information, rather than objectively verified facts. Our choice of countries is based on the number of Facebook users per country, as well as on a roughly even selection of WEIRD and non-WEIRD countries. The news values that we focus on are: conflict, negativity, prominence, informativeness, individualization, proximity, and superlativeness.

Our methods for detecting news values divide into rule-based approaches that match keywords or databases and machine learning models that are trained and evaluated on a sample of our data that is annotated by three trained human coders. For each of the classifiers for the individual news values, we reach F_1 -scores of between 0.6 and 0.88.

Results

For all news values there is a significant difference with regard to whether they are from WEIRD or non-WEIRD countries. The prevalence of conflict, negativity, superlativeness, proximity, and informativeness tends to be higher in WEIRD countries and for prominence and individualization lower. For all news values with the exception of proximity there is a significant association for the difference of flagged and non-flagged items. Prominence tends to be lower in flagged items but the remaining news values tend to have a higher prevalence in flagged items. Note, however, that while the differences are significant, the effect size is mostly small. Our findings show that "newsness" is relevant to misinformation and differs across countries.

PP 0319 What do users take away from political discussions online? A survey study on the perceived effects of online political discussions on nine different social media platforms

Viviana N.E. Warnken¹, Dennis Friess¹, Ole Kelm¹, Marc Ziegele¹

¹ Heinrich Heine University Düsseldorf, Social Sciences, Düsseldorf, Germany

Political discussions are frequently taking place on social media platforms. It is crucial for political communication research to understand how these discussions affect users' perceptions and cognitions. We focus on the perceived effects of participating in online political discussions (outcome dimension; Friess & Eilders, 2015). Drawing on deliberative theory and research, we assume that participating in discussions provides users with the opportunity to actively process information, which promotes knowledge gain (Intyaswati et al., 2021). Thus, we hypothesize that the more frequently people participate in political discussions on social media platforms, the more they perceive that they are gaining knowledge on the topics discussed (H1). Secondly, ample research indicates that participation in deliberation can foster opinion change (Grönlund et al., 2009). Thus, we assume that the frequency of people's participation in online discussions is positively related to their perceived willingness to change their opinions (H2). Still, particular for social media, studies have argued that the algorithms employed on social media platforms may promote polarization by favoring polemical and uncivil content (Jost & Ziegele, 2022), leading users to perceive society as more polarized than it actually is (Kelm et al., 2023). We thus hypothesize that the more frequently people participate in online discussions, the more they feel that society is polarized (H3). Ultimately, social media platforms have different affordances and are attractive for different user groups. We therefore ask whether users of different social media platforms take away different outcomes from the discussions.

A standardized online survey was conducted among people aged 16+ in Germany. The data was collected via an online access panel. The sample (N = 1,181) was quoted to represent the German population regarding age, gender, and formal education. We surveyed users' participation and perceived effects of participating in discussions on nine different social media platforms.

Regression analyses with several control variables indicate that the frequency of participating in social media discussions positively correlates with users' perceived knowledge gain (H1). Supporting H2, respondents also perceive that they are more likely to change their opinion the more often they participate in discussions. Still, as expected, participation in discussions also results in a heightened perception of societal polarization (H3). Significant differences were observed across all platforms for communication outcomes. Perceived polarization occurs less frequently on WhatsApp, but it is more common on YouTube and Instagram. Opinion changes and knowledge gains are rare

on Facebook, but more frequent on Reddit. The impact of platform differences on polarization was smaller than for the other outcomes.

These results offer valuable insights into the role of political online discussions on different social media platforms. According to people's perceptions, they differently promote individual knowledge growth and opinion change. However, they can also contribute to perceptions of societal polarization. These findings indicate the need to explore more deeply which affordances of different online platforms thrive positive deliberative outcomes, and how specific experiences of discussion quality are related to perceptions of polarization or social distrust.

PP 0320 Online parenting forum as a collaborative space for negotiating collective identity and reducing uncertainty and polarization in the context of crisis events

Jana Rosenfeldová¹, Lenka Vochocová¹

¹ Charles University, Department of Media Studies, Prague, Czech Republic

The recent accumulation of crisis events in Europe heightened uncertainty among citizens and a related need to reduce it. Online political communication research stresses that online spaces facilitate collective identity formation and group identification, providing participants with emotional support and recognition leading to uncertainty reduction. However, as the literature suggests, the formation of online communities can also be accompanied by negative phenomena such as fragmentation or polarisation, mainly in crisis times.

In this paper, we focused on one type of online community, the parenting forum, which can be classified as a third space, a primarily non-political online environment where a considerable amount of political talk emerges. The primary purpose of such online spaces is exchanging experiences, ideas, or mutual support, i.e., collaboration. At the same time, however, individual participants in such forums may hold different political positions and perspectives, especially in the context of polarising topics such as the COVID-19 pandemic and the Russian-Ukrainian conflict.

In our research, we were specifically interested in the potential conflict between the two collective identities – the purpose-based and the ideology-based. To explore their relationship, we asked how dissenting ideological identities are negotiated in the parenting forum (RQ1) and what strategies are employed to mitigate conflict stemming from different ideological positions (RQ2) with regard to the fact that participants primarily need to collaborate in the forum. To answer these questions, we analysed contributions on one of the most influential Czech parenting forums – emimino.cz. For each crisis, we selected three potentially conflicting discussion threads: the three largest debates on the vaccination against COVID-19 and on the aid provided to refugees from Ukraine.

A qualitative exploratory analysis (employing open and axial coding from grounded theory) of more than 2 600 contributions revealed that the parenting forum represents an ideologically diverse environment in which discussants employed two fundamentally different ways of negotiating their diverse ideological identities. They either attempted to mitigate conflict or, in a minority of cases, excluded ideological views that were identified as extreme and unacceptable. To mitigate conflicts arising from differing ideological positions, participants acknowledged the emotions, worries, and opinions of their opponents, shared information and expertise, showed considerable discussion patience, providing their opponents with further arguments and details, or deliberately avoided conflict to prevent group division. Participants whose attitudes were deemed unacceptable (sharing misinformation or disinformation, strongly pro-Russian or anti-Ukrainian stances), were strictly disciplined, pilloried, or even excluded from the discussion. Thus, we conclude, the purpose-based collective identity based on supportive group culture influences reactions to dissenting political identities, and the informational and emotional labour that individual participants implement to maintain good relations contributes to reducing polarization inside the forum, with potential effects for political identities of the participants outside this environment.

POL11 Propaganda in the digital era

PP 0321 Dissecting Russian propaganda: A comparative analysis of justification narratives for Russia's full-scale invasion of Ukraine on RT and NewsFront

Daria Kravets¹, Marc Jungblut², Florian Toepfl¹

¹ University of Passau, Chair of Political Communication, Passau, Germany

² Ludwig-Maximilians-Universität München, Institut für Kommunikationswissenschaft und Medienforschung, München, Germany

Public opinion has the potential to influence conflict dynamics, particularly regarding the financial and military support provided to conflict parties by the international community (see: Baum & Potter, 2008; Burstein, 2003). Consequently, Russia's strategic communication efforts to justify its full-scale invasion of Ukraine in 2022 are crucial for diminishing international support for Ukraine, forming a key component of Russia's foreign information campaigns (Claessen, 2023; Doroshenko & Lukito, 2021).

This on-going project seeks to investigate how Russia justified its full-scale invasion of Ukraine to an international audience through its foreign communication outlets. It thereby focuses on Russia Today (RT) and NewsFront as

Russia's main foreign communication outlets and investigates comparatively how both channels justify the invasion in the course of the first 1.5 years following the invasion.

To do so, we compare the presence of re-occurring strategic narratives for the justification of the invasion of Ukraine across all six language versions of state-owned RT and all ten of the FSB-controlled NewsFront and between the outlets. We thereby also aim to identify different strategic approach between platforms and specific messaging towards distinct target groups operationalized through the different language versions.

To achieve this, first, we derived a set of primary justifications used by Russia's regime for the war in Ukraine from qualitative text analyses and with the help of conflict experts. We then employed machine learning to determine the prevalence of these justification narratives in multilingual articles from RT (n = 246.310) and NewsFront (n = 159.724).

Our preliminary findings suggest that RT and NewsFront tailored specific narratives for different international audiences, aiming to manipulate public opinion and garner support for the invasion. The Russian regime strategically crafted diverse justifications, aligning them with the cultural, political, and historical contexts of each target audience, thereby aiming to amplify their propaganda efforts. We conclude that the Russian propaganda apparatus operates a sophisticated and multifaceted propaganda network, strategically customizing content for various targeted international publics.

POL11 Propaganda in the digital era

PP 0322 Troubles in Algorithmic information environments: Cross-country audit of Russian Propaganda on Search Engines

Mykola Makhortykh¹, Elizaveta Kuznetsova², Maryna Sydorova¹

¹ University of Bern, Institute of Communication and Media Studies, Bern, Switzerland

² Weizenbaum Institute, Platform Algorithms and Digital Propaganda, Berlin, Germany

Russian propaganda influence on public discourse around the world has been a persistent concern since the 2016 US Election (Mueller, 2019). The intensity of Kremlin's digital deception campaigns has amplified following the Russian full-scale invasion of Ukraine (Litvinenko, 2022). Despite burgeoning literature on Russian digital propaganda, we still lack a comprehensive account on how online platforms manage problematic content produced by the Kremlin and how their algorithms shape information environments where users are exposed to propaganda-related topics. To remedy this limitation, our paper focuses on how platform algorithms counter and sometimes facilitate the spread of various dimensions of Russian propaganda, such as anti-system claims about failing Western democracies, conservative values, and conspiratorial content. Particularly, we focus on search engines and their role in algorithmic information curation – understood as a process of "organizing, selecting and presenting subsets of a corpus of information" to users (Rader & Gray, 2015) – of propaganda-related content.

To systematically investigate algorithmic curation of Russian propaganda, we perform an agent-based comparative algorithmic audit of a selection of the world's most used search engines: Google, Bing, Yandex, and DuckDuckGo. Earlier research (e.g. Toepfl et al., 2023) has already been looking at how search engines interact with Russian propaganda, albeit it has so far focused primarily on the Russian domestic information environment and the neighboring countries and studied a small sample of propaganda-related topics. By contrast, we use Google Compute Cloud to simulate user browsing activity in 6 countries (USA, India, Qatar, Brazil, Poland, Germany) and use a structured corpus of Russian propaganda statements based on dimensionality analysis translated into 9 languages (English, Spanish, Portuguese, German, Hindi, Polish, Arabic, Russian, and Ukrainian). Using 144 queries, we investigate what sources different search engines return in response to queries in top 10 search results, whether these sources support or debunk common propaganda narratives, and how the outputs vary depending on the location and the language of the query.

Our preliminary observations highlight more impact of the language than location on search engines' outputs that in some cases leads to concerning amount of Russian state-controlled sources. This is troubling due to search algorithms potentially amplifying information inequalities between different user groups and points to the importance of a comprehensive understanding of information environments surrounding critical political topics and the role of algorithmic systems in shaping these environments.

PP 0323 Gendered disinformation as a tool of Russian information influence in Germany? A frame analysis of gender-specific discourse on RT Deutsch

Martha Stolze¹

¹ Weizenbaum Institut, Platform Algorithms and Digital Propaganda, Berlin, Germany

Russian disinformation campaigns have received a plethora of media, policy and academic attention. Its gendered dimensions, however, have not been explored to a sufficient extent. This important element of Russian public opinion influence campaigns is based on the Russian heteronormative traditional values discourse that has been known to not only function to unify Russia under a national idea (e.g. Wilkinson 2018), but to also facilitate coalitions of states in opposition to the 'liberal West' (Edenborg 2023; Moss 2017). Research has moreover suggested that Russian disinformation in Nordic European countries has drawn upon gendered national identities and discussions about gender and migration (Edenborg 2021). However, existing studies tend to overlook what function gender-specific content plays in campaigns targeting German-speaking populations and how a distinction between different forms of gendered disinformation in Russian information campaigns can be made.

Examining the entirety of content on Russia's most renowned propaganda outlet RT Deutsch (formerly, Russia Today), this paper aims to detect gender-specific framing, discerning between normative, misleading and outright false content, and to what extent they have functioned as a "symbolic glue" (Kováts and Pöim 2015) to link together different topics over time. First, gender-related RT Deutsch articles are selected with a theoretically-grounded dictionary of keywords on gender and sexual orientation, which is expanded with common tags used by RT, followed by LDA topic modeling. Filtered data is then analyzed using Framing Analysis (Pan and Kosicki 1993, 2010) comparing two points in time, 2014/15 and 2022/23. In a third step, the article uses similarity analysis with the EUvsDisinfo dataset to cross check the veracity of specific statements appearing in identified frames to discern the extent to which misinformation forms part of gender-related discourses on RT.

Preliminary results show that the gender-related content on RT Deutsch is structured around homo-, transphobic, antifeminist, and conspiratorial themes, linking to topics such as traditional and/ or Christian values, child protection, social grievances, anti-capitalism and anti-elitism. We found that articles relating to gender, sexual orientation, and traditional family values have been highly present on RT since 2018. Anti-LGBT content peaked in 2021, but has since remained at a high level. These first results demonstrate how gender-specific heteronormative frames are employed in media that function as outlets for Russian information influence. We anticipate this work to be a starting point for further considerations of how national value-related discourses can be hijacked by foreign authoritarian state actors to amplify discriminatory, anti-liberal value discourses and thus amplify splits in democratic societies.

POL11 Propaganda in the digital era

PP 0324 Who believes Russian propaganda in Germany: A survey of the alternative media users

Elizaveta Kuznetsova¹, Victoria Vziatyshcheva², Martha Stolze¹

¹ Weizenbaum Institute, Platform Algorithms and Digital Propaganda, Berlin, Germany

² University of Bern, Institute of Communication and Media Studies, Bern, Switzerland

Russian propaganda has for long been recognised as a disruptive interference in the affairs of European states and a potential threat to democracy (Mueller, 2019; Stelzenmüller, 2017). Particularly, Russian influence campaigns have targeted alternative communities in Western democracies, aimed at amplifying anti-establishment sentiments prevalent in both far-right and far-left circles in Europe as well as skepticism and distrust in Western institutions (Kuznetsova, 2021; Ortung & Nelson, 2018). In contrast to burgeoning literature on Russian propaganda campaigns, there is only little research on its target groups and audiences.

This paper addresses this gap by focusing on one of such groups, the audience of alternative media sources, which tend to oppose mainstream media coverage (Holt et al., 2019) and are often associated with the spread of misinformation and conspiracy theories. Our paper presents an online survey of more than 2,000 alternative media users recruited through a large German panel provider. Respondents were asked which alternative media, including pro-Russian sources popular in Germany (e.g., RT, Sputnik News), they consume and how frequently. We also measured to what extent they support some of the key Russian propaganda narratives using 16 items, which were constructed based on the qualitative analysis of Russian state media coverage.

Firstly, our analysis focuses on describing the group of pro-Russian media users, based on their demographics, political attitudes, political efficacy, general, institutional and media trust, as well as conspiracy mentality. Our preliminary results show that Russian propaganda media users have comparatively higher political interest than the rest of the

respondents, predominantly share far-right political leaning and express low levels of trust in political institutions and the media. Secondly, we use dimensionality analysis to understand which of the main discursive aspects of Russian propaganda, such as anti-western, anti-Ukrainian, multipolarity, and conservatism narratives, as well as context-specific narratives about the ongoing war in Ukraine, resonate most with the alternative media audience in Germany. To our knowledge, this is the first study to provide a comprehensive and detailed analysis of the group of alternative media users choosing pro-Russian sources.

POL11 Propaganda in the digital era

PP 0325 Russian state-controlled narratives in the Italian public discourse: A computational analysis

Ilaria Vitulano¹, Elizaveta Kuznetsova¹, Tomáš Nagy¹

¹ Weizenbaum Institute, Platform Algorithms and Digital Propaganda, Berlin, Germany

Following the large-scale invasion of Ukraine, Russian wartime propaganda has taken on new dimensions in the digital space, in particular after the Western sanctions and the blockages introduced against the country's international outlets operating abroad Sputnik and RT.

Recent studies have found links between far-right groups on social media and Russian propaganda (Bovet & Grindrod, 2022). In turn, Russian propaganda narratives have been spread abroad by practices of information warfare through, for example, entertainment media (Melykh & Korbut, 2020), Twitter messages (Geissler et al., 2023) and via trolls (Golovchenko et al., 2020).

In this context, Italy represents a noteworthy and still-unfolding case. Despite being a markedly Western country, Italy witnessed its citizens' support for Ukraine rapidly deteriorating and concerns have been raised that pro-Russian communication on the invasion of Ukraine by Italian political actors and media may have contributed to this development (Tondo, 2023). Several studies (e.g. Diamanti, 2022) point to the strong presence of the Russian propaganda narratives in the Italian public discourse, mainly in the ranks of the far-right and among voters of the so-called "antisystem" parties. Moreover, while existing research has extensively explored Italy's response to the full-scale of Ukraine including far-right Italian mobilization, NATO's strategic communication in Italy, and the Italian diplomatic response to the war, to date, no academic study has set out to investigate the resonance of the current Russian propaganda narratives in the Italian public opinion and press.

This project aims at investigating elements of Kremlin's propaganda in the context of the recent Russian invasion of Ukraine and how these state-sponsored narratives spilled into the Italian public debate and reached Italian audiences online. It does so by employing Semantic Textual Similarity analysis and content analysis on two Russian state-controlled news outlets (*Russia Today* and *Vesti.ru*) and two Italian anti-system news outlets (*ByoBlu* and *Il Paragone*). Utilizing pre-trained multilingual models, sentence embeddings will be generated to assess the similarity between articles from the two language contexts. The Euclidean distance between Russian and Italian articles will then be calculated for hierarchical clustering, allowing for an interpretation of the clusters and identification of Russian narrative frames in the Italian public discourse, through careful consideration of political context, source characteristics, and linguistic elements.

POL12 Narratives and frames in the media

PP 0326 With EU or without EU: Unravelling the dynamics of media-fuelled migration narratives and their role in EU political rifts and policy inefficacy to refugee crises

Francesco Vigneri¹, Giulia Daga², Luca Barana³

¹ Sapienza Università di Roma, Department of Communication and Social Research CoRIS, Rome, Italy

² Istituto Affari Internazionali – IAI, Mediterranean- Middle East and Africa research programme, Rome, Italy

³ Istituto Affari Internazionali – IAI, EU politics and institutions research programme, Rome, Italy

Migration has sparked intense debates within the European Union over the last decade, challenging the fundamental principles of the EU project itself. These discussions, often politicised, presented contrasting moral viewpoints and policy solutions, and evolved in substance and scope over time, reflecting the historical and geopolitical contexts in which migrant displacements unfolded.

This paper seeks to delve into the evolution of narratives surrounding migration within public and political discourse at the EU level. It aims to comparatively scrutinize their dynamics across media, politics, and policymaking, focusing on two significant European-wide migration cases: the 2015 'refugee crisis' and the 2022 Ukraine's displacements.

Our research questions encompass the following:

RQ1. To what extent are media narratives on migration endorsed by EU political figures?

RQ2. How do these narratives transform as they transition from media to EU political and policy discussions?

RQ3. What influence do populist narratives wield within European institutions, ultimately shaping EU policy outcomes?

Building upon diverse approaches in policy analysis and narrative construction, our theoretical framework integrates Jones & McBeth's (2010) Narrative Policy Framework (NPF) – encompassing narrative elements like setting, characters, and moral of the story – alongside Schmidt's (2008) conceptualisation of communicative and coordinative spheres in policymaking. This framework, combined with Boswell's (2011) distinction between lay and technocratic styles in different spheres, sheds light on the transformation of narratives across different contexts. Additionally, Garcés & Pastore's (2022) conceptualisation of narrative pervasiveness and transformativity aids in understanding their permeation and impact on policymaking.

Our approach adopts a triangulation of methods. Prevalent migration narratives circulating on European media were identified through second-source data emerging from qualitative content analyses of major newspapers across six EU Member States (Boswell & Smellie, 2023). We then conducted a software-assisted discourse analysis of over 100 EU political and policy documents, to trace narrative adaptations across media, politics, and policymaking. Furthermore, semi-structured interviews were conducted with EU policy officers. We employed Boswell & Smellies' (2023) four-dimensional typology (embracing, adapting, rejecting, ignoring) to better comprehend how these narratives influenced political discourse and policymaking within the EU.

The findings revealed a rich spectrum of narratives during the 2015 refugee crisis within EU Member-State media, ranging from humanitarian to security-oriented frames. This diversity translated into varying positions within EU politics, with a slight prevalence of narratives supporting intra-EU solidarity. However, as these narratives entered policymaking, a shift towards more regulatory stances emphasising responsibility over solidarity emerged. Notably, lay media narratives opposing the EU mandatory migrant relocation scheme likely influenced this shift, leading to its rejection.

In contrast, during the 2022 Ukrainian crisis, a convergence on solidarity narratives emerged across media, politics, and policymaking. This narrative consistency among different domains enabled the swift activation of the EU Temporary Protection Directive, facilitating a collective response to Ukraine's displacements. This underscores the role of narrative alignment in expediting joint EU policy responses to migration. It also emphasises framing migration beyond irregular arrivals, linking it to geopolitical and policy issues of greater value for European societies, aiming to steer clear of populist rhetoric and effectively address migration at the EU level.

POL12 Narratives and frames in the media

PP 0327 Beyond neutrality: A longitudinal analysis of gender and party dynamics in the tone of US political media reporting

Aliya Andrich¹

¹ Ilmenau University of Technology, Department of Economic Sciences and Media/Computational Communication Science Group, Ilmenau, Germany

Media coverage plays a central role in shaping modern politics by directing voters' attention to specific candidates and influencing their perceptions of candidates' traits and competencies (Esser & Strömbäck, 2014). The tone of news coverage in particular stands out as crucial in influencing election outcomes. Specifically, positive media portrayals and media endorsements can enhance voter support for politicians during both election cycles and routine periods (Kahn & Kenney, 2002). Conversely, a negative tone in media coverage can undermine voter trust and suppress voter turnout (Ansolabehere et al., 1994; Van der Pas & Aaldering, 2018). There is some evidence that female politicians are portrayed more negatively in the media than their male counterparts (e.g., Heldman et al. 2005; Lawrence & Rose, 2010). However, the results of previous studies are largely inconsistent. Reaching a scholarly consensus remains challenging due to several limitations, including the use of outdated data and limited samples and the lack of longitudinal perspective. This study aims to fill these gaps by examining the evolution of positive and negative media coverage of 1,095 US politicians over the past decade to answer the following research questions (RQ): *How does the amount of positive and negative coverage differ for female and male politicians from different parties (RQ1) and how does this vary over time (RQ2)?*

Using state space models, we performed a longitudinal time series analysis of more than 600,000 news articles from 18 national US media outlets. Three trained coders labeled a dataset of over 8,000 sentences mentioning the politicians of interest, with the final label (neutral, negative, or positive) for each sentence determined by a majority of the raters. The human-labeled sentences were used to fine-tune the RoBERTa sentiment model to filter out neutral content (F1 score = .93). A fine-tuned version of the SieBERT model was then used to classify the remaining sentences into positive (F1 score = .69) and negative (F1 score = .97) sentiments.

The results of our time series analysis indicate that although political reporting in the past decade was predominantly neutral, both female and male politicians received a higher proportion of negative than positive coverage. Male Republicans emerge as the most negatively portrayed group, facing heightened negativity during both election seasons and routine political periods over the past decade (e.g., in 2020, median difference between Republican and Democratic men was 3.3% (95% CI [2.2, 4.4])). Interestingly, in most election years of the 2010s, Democratic and Republican women received slightly more positive coverage. For instance, for female Republicans, the 2018 US midterm election year resulted in 0.6% (95% CI [0.2, 1]) and 0.5% (95% CI [0.1, 1]) more positive content than that of Republican and Democratic men, respectively. Our study emphasizes the importance of analyzing the tone of news coverage and uncovering subtle distinctions between genders and political parties. This has significant implications for gender representation in politics and media accountability. Furthermore, our research contributes academically by providing a comprehensive analysis that can shape future studies and public discourse on gender equality and media ethics.

POL12 Narratives and frames in the media

PP 0328 How media storms are framed: Relations between legacy, social and web media in the hybrid media system

Johannes Gruber¹, Ana Ines Langer², Tim Henrichsen³, Michael Vaughan⁴

¹ University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

² University of Glasgow, School of Social and Political Sciences, Glasgow, United Kingdom

³ University of Warwick, Politics and International Studies, Coventry, United Kingdom

⁴ London School of Economics and Political Science, International Inequalities Institute, London, United Kingdom

In the current age of a hybrid media system (Chadwick 2011) the circle of actors exercising influence over the media, public, and political discourse has dramatically grown. In older media logics, a few (media) elites decided on how information was portrayed, which meant that interpretations of events usually trickled down from top to bottom (Entman 2003). In today's hybrid media system, there are many more actors who may come up with, promote and disseminate their interpretations of events and issues. At first sight, this makes the process of how events and issues are framed in public discourse more hectic and confusing, as different seemingly coherent interpretations spring up in different online and offline public spaces, which make up our fractured public sphere (Bruns 2023). Yet, the process of frames being created, contested and spread is also no longer done by a small number of editors, but negotiated openly in interlinked public venues.

Some studies have already traced how selected issues and topics spread between legacy and social media (e.g., Gilardi et al. 2022; Langer and Gruber 2021), however, a study that assesses the specific content and where it originates is so far missing.

We use data that consists of traditional (newspaper articles and TV transcripts) and new types of news media (digital native, alternative, and social) about the discourse in the United Kingdom about the "Windrush scandal". This appears an ideal case, as Langer and Gruber (2021) have already postulated that this high profile immigration scandal was pushed into the agenda by an assemblage of different actors. We combine state-of-the-art computational methods for text and inferential network analysis to trace where different ways to frame the scandal originate, as well as where and when they spread among actors. We first use the technique by Gruber (2023) to identify and the code the most prominent frames in the corpus of Twitter posts, online news and in legacy outlets. To assess when and in which direction emerging frames central to the overall discussion transition between actors, and importantly between actors in different spaces, we employ relational event models (REM) (Butts 2008). This technique, used in longitudinal network analysis to pinpoint how events influence each other, can be used to measure how a public statement was influenced by previous contributions to the discussion. With this approach, we answer three research questions:

1. Which topics (arguments) are most prevalent within the discourse on the Windrush scandal over time, between media types and between actor types (politicians, crowd-sourced elites, general users and journalists)
2. Are there any diffusion processes between legacy and social media?
3. What drives diffusion of arguments within and between media types?

POL12 Narratives and frames in the media

PP 0329 Concept Transfer and Emotional Framing: The use of the term 'polarization' in European news media

Mike Farjam¹, Hendrik Meyer¹, Anamaria Dutceac Segesten², Michael Brueggemann¹

¹ University of Hamburg, Journalism and Communication Studies, Hamburg, Germany

² Lund University, Department of Strategic Communication, Lund, Sweden

Polarization has become one of the prime objectives of academic research and, as a consequence, has also found its way into the public discourse. This research delves into the concept transfer and emotional framing of 'polarization' in the news media of Germany, Sweden, and the UK, analyzing its evolution from 2010 to 2022. Utilizing a comprehensive dataset of approximately 500,000 articles from the most influential newspapers in each country, we investigate the term's usage within different media systems and over time.

In our analysis, we combine three computational methods to deal with the amount of data: 1) word2vec analysis to map the semantic space of the term; 2) toxicity and emotion classifiers to assess the affective context in which the term is used; and 3) topic analysis (BERTopic) over time to identify the topics and entities uniquely associated with the term 'polarization'. The analysis also looks specifically at the function that the term plays in different newspapers within each media system.

To compare the use of the term with general discussions on societal division, we use word2vec to identify words closely related to 'polarization'. Articles including these additional words are also added to our sample. In all three countries, the research reveals a 3-4 time increase in the usage of 'polarization' during the observed period, while the number of articles dealing with societal division omitting the term 'polarization' stayed relatively constant during the period. This signifies a notable rise in the term's relevance in European media discourse. This usage was initially particularly common in elite newspapers, and only since 2016 was adopted by popular journalism, which aligns with the framework of concept transfer theory.

Moreover, a distinct pattern emerges in the tone of articles containing the term 'polarization'. Compared to general articles and, specifically, articles addressing societal division at large, articles with the term 'polarization' exhibit a more toxic and angry tone. We find that this link between affect and term usage is particularly strong in popular journalism. This finding is crucial in understanding the emotional framing of polarization in media and its potential impact on public perception, in particular in the context of findings relating to 'false polarization'.

Further in-depth analyses, providing a richer exploration of the topics, actors associated with 'polarization', and country-specific nuances will be discussed at the conference.

This research not only highlights the evolving use of 'polarization' in European media but also raises questions about the role of media in shaping public understanding of political concepts and their associated emotional undercurrents.

POL12 Narratives and frames in the media

PP 0330 Humour scandals: Introducing a theoretical framework and an empirical comparison of increased scandalization of humor in eight European countries in the 21st century

Joonas Koivukoski¹, Jonas Nicolaj², Dick Zijp³, Juha Herkman⁴, Giselinde Kuipers²

¹ University of Helsinki, Department of Social Sciences, Helsinki, Finland

² KU Leuven, Centre for Sociological Research, Leuven, Belgium

³ Utrecht University, Department of Media and Culture Studies, Utrecht, Netherlands

⁴ University of Helsinki, Department of Social Sciences, Helsinki, Finland

In today's high-choice, interactive, and emotionally-charged media environment (e.g., Chadwick 2013; Fenton 2016), humor is used by political actors across the ideological spectrum to gain attention, lure supporters, and mark political divides (e.g., Chattoo & Feldman 2020; Sienkiewicz & Marx 2022). Yet, increasingly, humorous content is contested, leading to public controversies about humor—and in some cases to larger-scale humor scandals (Herkman & Koivukoski 2023; Kuipers 2011). Nevertheless, existing literature on humor controversies analyses either single cases, such as the Muhammed cartoon crisis (Eide et al. 2008), or a specific theme, such as immigration (Dahl 2021). Thus, the literature remains largely confined to particular national contexts (Herkman & Koivukoski 2023).

Therefore, this study introduces a research design for studying humor scandals comparatively and presents the key findings of our investigation of humor scandals in eight European countries over the past three decades (1990–2022). We combine previously separate strands of scandal (Allern et al. 2012; Thompson 2000; Tumber & Waisbord 2019) and humour controversies research (Basu 2014; Dahl 2021; Kuipers 2011) to propose a conceptualization and operationalization of humour scandals. We conceptualise humor scandals as socio-political conflicts (Thompson 2000) and a specific form of "talk scandals" (Ekström & Johansson 2008) in which the norms of what is appropriate and inappropriate to do in the name of humor are publicly debated and renegotiated. As such, we argue that humor scandals could be operationalized as humor-related public controversies that have been framed as "scandalous," or in related terms, and have been given broad media coverage in at least two leading media organizations for five days or more.

In practice, the definition includes two types of humor scandals: Those caused by acts clearly framed as humor (i.e. TV satire or political cartoons) and those in which the transgressive act (i.e. a slur by a politician) is framed as humor, irony, sarcasm, or "just a joke" after the scandal has broken.

Based on this conceptual work, we conducted a codebook and a database for systematic cross-national mapping of humor scandals. The main source of our data for mapping the humor scandals was the archives of national news media organizations. Through systematic searches with keywords related to humour and controversy, we collected articles (news, columns, opinions, editorials, essays) about each humor scandal in Belgium, Estonia, Finland, Hungary, Italy, Poland, Spain, and the Netherlands from 1990 to 2023. Based on these articles, trained country experts coded each scandal quantitatively and qualitatively.

Our findings show how incidences of (trans)national humor scandals have starkly increased from the 2000s onward, revealing cross-national similarities and differences in humor scandals, including recurring themes (e.g., ethnicity, religion, gender, sexuality), norm-violators (e.g. professional humorists, politicians, celebrities), and consequences (e.g., legal measures, an apology, dismissal). We argue that our cross-national mapping of humour scandals reveals general and country-specific changes in the political and moral order of the studied countries, and as such furthers the understanding of humour as an integral part of political communication in Western public spheres today (Koivukoski 2022; Nieuwenhuis & Zijp 2022).

POL13 Radical political actors, extremist narratives, and disinformation

PP 0432 Exploiting crises on Telegram: How radical actors adapt their mobilization efforts in the context of changing societal contexts

Leyla Dogruel¹, Pablo Jost²

¹ Universität Erfurt, Communication, Erfurt, Germany

² Johannes Gutenberg-Universität, Communication, Mainz, Germany

In the rapidly evolving landscape of digital platforms, radical actors have found new opportunities for mobilization, especially during times of societal crisis. The COVID-19 pandemic, a significant global crisis, served as a crucial period for radical actors to increase their mobilization efforts. Digital platforms such as Telegram were instrumental in this process, providing a space with minimal content moderation and extensive reach (Cammaerts, 2021; Urman et al., 2021). Our research explores the dynamics that unfold as crisis situations, such as the pandemic, recede while other crises emerge. Specifically, we focus on the German anti-vax movement 'Querdenken', which emerged in response to perceived restrictive Corona measures, and the German far right, which has a long history of exploiting various societal crises.

Drawing on Koopmans and Olzak's (2004) concept of discursive opportunity structures, our study views the increase in mobilization efforts during crises as an effective use of political and discursive structures. We argue, in line with Curley et al. (2022) and Hunt (2022), that crises such as the pandemic create fertile ground for discursive opportunities by opening windows for protest mobilization. We aim to answer the following questions: To what extent do radical movements exploit crises by focusing on crisis issues (RQ1), how they adapt to changing crisis situations by switching issues (RQ2), and whether movements (anti-vax vs. far-right) differ in their ability and speed of adaptation (RQ3).

In our investigation, we focus on the year 2022, marked by the termination of Corona-related measures, the onset of a war of aggression against Ukraine, and impending energy shortage. In a manual content analysis, we cover on- and offline appeals ($\alpha = .78$) as well as crisis issues ($\alpha = .85$) in 8174 messages published between January and November 2022 in 146 Telegram channels of far-right actors and the anti-vax movement Querdenken.

Hierarchical binomial regression models show that radical actors link crisis issues to calls for online protests. Results of sieve bootstrap t-tests (Bühlmann, 1997) indicate that the importance of Corona as a mobilizing issue declines over time, while the volume of messages dealing with the Russian invasion in Ukraine skyrockets before the impending energy crisis gains relevance as a mobilizing issue. A series of segmented regression analyses (Muggeo, 2008) show that channels belonging to the radical right adapt their issue focus faster than channels belonging to the Querdenken movement. The right-wing channels started heavily mobilizing for offline protests the Russian invasion in February and March, while the channels of the anti-vax movement largely stuck to the pandemic issue.

In summary, our study shows that the ability to adapt to changing crisis contexts is a critical success factor for protest actors. The far right demonstrated an ability to quickly and effectively adjust its strategies as the crisis context evolved, while the young and monothematic anti-vax movement was slower to adapt. The study thus contributes to understanding the dynamics of radical mobilization on digital platforms and sheds light on how movements adapt to changing crisis scenarios.

POL13 Radical political actors, extremist narratives, and disinformation

PP 0433 The radicalization ripple: Tracing information flows between right-wing media and Republican messaging on "Critical Race Theory"

Curd Knüpfer¹, Yunkang Yang², [Mike Cowburn](#)³

¹ Freie Universität Berlin, John F. Kennedy Institute, Berlin, Germany

² Texas A&M University, Department of Communication and Journalism, College Station, USA

³ Europa Universität Viadrina, European New School of Digital Studies, Frankfurt Oder, Germany

Recent years have witnessed an increasing ideological radicalization by members of the right-wing parties. At the same time, right-wing media formats shape ideologically oriented and highly partisan informational networks by providing counter-narratives to mainstream journalistic institutions. Our study explores the connection between these two trends by looking at the case study of the US. Here, an extensive network of right-wing media has created an asymmetrical arena for political messaging (Benkler 2020), wherein engagement with right-wing news sites (RNS) has been shown to be predictive of the rhetorical radicalization of Congressional elites (Cowburn & Knüpfer 2023).

Despite the urgency of these developments, we still know surprisingly little about the pathways and directionalities of information flows between right-wing news sites (RNS) and the GOP. The discipline of political communication lacks clear conceptualizations and theoretical approaches that would adequately capture what appear to be synergistic relationships, often conceptualizing these media formats merely as "alternative" or "hyperpartisan." Yet these designations fail to capture the role such actor types play when it comes to their functions as extended party networks. Likewise, classic political communication theories would lead us to believe that elite agenda-setting and framing tend to precede (partisan) media issue uptake.

To learn more about the highly dynamic feedback loops between new media formats and right-wing policy proposals, we present an in-depth case study looking at the issue of "Critical Race Theory" (CRT), which became a galvanizing issue for the US far-right in 2021. Utilizing an original dataset based on web-scraped content from leading right-wing news outlets, we trace where and how this issue emerged. We combine this data with social media posts and newsletters (using the DC-Inbox dataset) by Republican Members of Congress (MoCs). We proceed in two main methodological steps:

First, we employ a mix of content analytical approaches, including topic modeling and natural language processing, to gain insights into what prompted the sudden spikes in RNS and MoC uptake of the CRT issue. Next, we apply time series analysis, based on vector autoregression models, to identify the directionalities of information flows between RNS and Republican elites.

In highlighting these forms of issue-based connective ties between parties and their extended informational networks, our findings offer insights into the role played by new media actors in shaping the communication behavior

of political elites. Since the rise of RNS or elite radicalization effects are not phenomena exclusive to the US, our approach can also be applied to studying the flow of information between other alternative news sources and political elites in different national contexts.

POL13 Radical political actors, extremist narratives, and disinformation

PP 0434 The penetration of extremist narratives into the digital mainstream: Exploring online discussions about migration on Flashback Forum

Jullietta Stoencheva¹

¹ Malmö University, School of Arts and Communication – K3, Malmö, Sweden

Sweden became a main destination during the 2015 migration 'crisis', receiving over 163,000 asylum seekers – more per capita than any other EU country. Subsequently, the country underwent an 'identity crisis', whereby its long-standing socialist tradition and inclusive 'Swedish model' gradually deteriorated (Dahlstedt & Neergaard, 2019). This manifested in a discursive shift in media representations of migrants, mainstreaming of anti-immigration sentiments, and a significant increase in support for the far-right (Ekman, 2020). In 2022, a new right-wing government took office, with the far-right Sweden Democrats (SD) becoming the second-largest party in parliament. The new SD-backed government promised a paradigm shift in Swedish migration politics, which would include more restrictive policies. These recent shifts in public and political migration discourse make Sweden a worthwhile case study in understanding how crises affect migration attitudes and, by extension, the mutual influence of public attitudes and political action.

Given these developments, the political discourse around (anti-)immigration in Sweden has been subject to scholarly attention, with particular focus on the rhetoric of SD (Elgenius & Rydgren, 2019), news media (Ekman & Krzyzanowski, 2021; Ekström et al., 2020), alternative far-right media (Ihlebaek & Nygaard, 2021) and far-right actors' social media presence (Wahlström et al., 2021). We know less, however, about the vernacular everyday conversations between ordinary citizens in online public spaces. One such space is Flashback Forum – an anonymous, unmoderated online platform used by an estimated third of the Swedish population. Considering its popularity, this space for online deliberation is important as its overt dedication to 'protecting free speech' allows for radical and potentially extreme ideas to enter everyday conversations (Åkerlund, 2021).

This study examines a corpus of 33,731 online comments posted between 01.01.-23.09.2023 in the Flashback section 'Immigration and integration'. Drawing on a combination of structural topic modelling (STM) and qualitative thematic analysis, the paper follows a two-step approach. First, STM helps to identify key topics in contemporary discussions around immigration on Flashback and track their development over time. Second, using qualitative thematic analysis, I explore in which of these topics extremist narratives emerge, and the drivers behind their emergence.

The research questions informing the study are:

What key topics emerge around contemporary discussions of migration and integration on Flashback?

Within these topics, what are the drivers behind the emergence and intensification of extremist narratives regarding migrants and immigration?

This study thus contributes to debates on the role of anonymous online platforms in spreading and normalizing extremist narratives about migration amongst members of the public.

The preliminary results regarding RQ1 indicate crime, gang violence and Islam as the most frequently discussed topics, often occurring in conjunction with ideas of a larger looming crisis and societal collapse. In terms of RQ2, the emergence of extreme narratives appears to be highly event-driven, with gang shootings, criminal acts allegedly committed by migrants, and the release of government reports/statistics on migration, intensifying the discourse. In addition, extremist narratives emerge around conspiratorial claims. The findings are contextualised with Flashback's cultural and technological affordances, and the temporalities it produces.

POL13 Radical political actors, extremist narratives, and disinformation

PP 0435 How does content flow from Fringe to Mainstream social media platforms

[Jakob Bæk Kristensen](#)¹, Eva Mayerhöffer¹

¹ Roskilde University, Department of Communication and Arts, Roskilde, Denmark

Fringe social media platforms, sometimes referred to as alternative platforms are often seen as spaces that provide a potential nurturing ground for extreme political opinions. At the same time, a lot of users are co-active on several platforms, both fringe and mainstream. Some will source content from fringe platforms and reshare it on mainstream platforms.

In this study we develop an approach to characterize the flow of content between different platforms by tracing the sharing of URLs focusing on the flow from fringe to mainstream platforms. This includes a framework to distinguish between content flows characterized by authentic and inauthentic coordination as well as organic flows. It is based on a large sample of URLs shared by accounts with a propensity for sharing, but not limited to, German alternative news articles. We trace roughly 10 million URLs posted between January 2019 and March 2022 across Facebook, Twitter (X), Telegram, V Kontakte, Gab and 4chan. Our results show that around 10% of all URLs shared on mainstream platforms were first shared on a fringe platform. 1% can be characterized as organic inflow from a fringe platform, 1% as authentic coordination, while 1.5% was due to inauthentic coordination. The results also reveal the existence of an interconnected network of almost 1000 accounts involved both in the coordinated inflow of URLs from fringe to mainstream platforms as well as the coordinated re-sharing of the same URLs on mainstream platforms. We show how this network was established as part of the anti-restriction, anti-lockdown and anti-vaccination movement in Germany during 2020 and 2021 following the Covid-19 pandemic. Furthermore, results indicate that this coordinated network can be repurposed to sharing pro-Russian content after the full-scale invasion of Ukraine in spring 2022.

This study offers a conceptual and methodological approach for working with cross-platform content flows based on mutual URL-sharing. Using Germany as a case we show how this approach can be used to analyse cross-platform dynamics with regard to how content flows from fringe platforms and impacts mainstream platforms.

POL13 Radical political actors, extremist narratives, and disinformation

PP 0436 Apathy and alienation: Navigating the role of disinformation in political participation

[Karolína Bieliková](#)¹, Alena Macková¹, Lucie Čejková¹

¹ Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

Citizens' willingness to be politically active is among the key aspects in building resilience of democracy in digital era. This willingness to participate is often influenced by people's consumption of media (Boulianne, 2017) which can increase in frequency especially in crisis times (Ohme, Hameleers, Brosius, & Van der Meer, 2021). However, the rising presence of disinformation, especially in online information environment, can have negative effect not only on citizen's trust in media, institutional trust, and political preferences, but also on broader perception of democracy (Hameleers, Bronsius & de Vreese, 2022; Humprecht, 2020). This creates a context in which communication contributes to disorder rather than order in society and a need for nuanced insight into experiences of the more vulnerable segments of our citizenry.

Drawing on the "Alarmed citizen" concept (Thorbjørnsrud & Figensoau, 2022), a group characterized by vigilance, fear, and low trust in institutions, our focus extends to their information-seeking behavior and motivation to be politically active. We specifically ask: How does the media repertoire of people more vulnerable to disinformation affects their relationship towards the political system? How does it further influence their willingness to be politically active?

Our research is set in the specific context of Czech Republic, where citizens are typical for their low levels of both institutional and media trust. Moreover, the disinformation scene and alternative media have been quite active in recent years which has been only heightened by the recent crises (COVID-19 pandemic) (Štetka, Mazák & Vochocová, 2021).

In December, we conducted six online focus groups, each comprising of six participants. They were recruited from the Czech adult population, guided by inclusive criteria emphasizing low media (and institutional) trust, openness to alternative media sources and active social media usage. To provide diversity in the discussion, the participants represented a variety of socio-economic backgrounds.

Preliminary results show that the participants tend to be overly critical not only towards mainstream media but also towards any information they consume. This cynicism is often embedded in their frustration with the political system, mostly due to the feeling that the media align with politicians' interests. Many perceived both the politicians and journalists as the same elites, which does not reflect people's interest. Overall, there is a buildup frustration towards

the political situation and apathy when it comes to possible positive change. Described overuse of certain types of political participation, specifically demonstrations, leads to further apathy towards any active citizenship, as even such active forms of participation do not seem to produce any change. In some cases, even the effectiveness of voting was questioned. This resentment further propels their feelings of alienation from the political system, which can lead to either believing alternative sources or leaning into reality apathy. This creates a threat of citizenship, that is not only distrustful, but also politically inactive. Our results further contribute to the understanding of behavior triggered by consumption of disinformation. Additionally, we highlight the crucial need to reactivate citizen's motivation for participation to further support the resilience of functioning democracy.

POL14 News (non)exposure and its consequences

PP 0437 Media choice and the effects of negative and positive news on societal beliefs

[Kim Andersen](#)¹, [Adam Shehata](#)²

¹ University of Southern Denmark, Centre for Journalism, Odense M, Denmark

² University of Gothenburg, Department of Journalism – Media and Communication, Gothenburg, Sweden

A key characteristic of today's high-choice media environment is that people can select news that fits their preferences and pre-existing beliefs (Van Aelst et al., 2017). Further, news coverage is predominately characterized by negativity (Soroka & Krupnikov, 2021). Although there is some preference for more positive news stories, most research suggest that people also in general prefer negative news (Bachleda et al., 2020) and news that are congruent with their existing beliefs (Knobloch-Westerwick et al., 2020). A likely consequence of these tendencies is that people will form beliefs about politics and society that are biased towards perceiving reality as more negative, dangerous, and scary (Andersen, Djerf-Pierre, & Shehata, 2024), and that a confirmatory negativity bias can result in reinforcing negative worldviews over time (van der Meer & Hameleers, 2022).

This study presents a longitudinal choice experiment designed to examine four pre-registered expectations in this context: H1) that people prefer negative news over positive news (the negativity bias hypothesis), H2) that the preference for negative news is conditioned by prior beliefs, with people holding more negative (positive) beliefs being more likely to prefer negative (positive) news (the confirmation bias hypothesis), H3) that exposure to negative (positive) news increases negative (positive) beliefs (the media effects hypothesis), and H4) that people holding negative (positive) beliefs become more negative (positive) when exposed to negative (positive) news, and that these effects are stronger when people choose the news (the reinforcement hypothesis).

The experiment was conducted on a large sample of Swedish citizens (N = 2,336) and focuses on news stories and beliefs about schools. The experimental design includes a baseline survey (W1) to capture pre-existing beliefs about this topic and two follow-up surveys (W2+3) over the following weeks where the respondents were either not exposed to any news stories (control group), exposed to negative (group 1) or positive news stories (group 2), or able to freely choose not to read any news or to read positive or negative news stories (group 3). After each treatment, the respondents' beliefs were measured to follow changes over time in response to the treatments.

Contrary to the expectation of negativity bias in news selection, the results show higher preference for positive (50 pct.) than negative news (35 pct.). A considerable share also chose not to read any news (15 pct.). However, the results supported the expectation of a confirmation bias, as people with more negative (positive) beliefs about Swedish schools were more like to choose negative (positive) news. In terms of effects, only exposure to positive news affected beliefs in the expected direction, with people's beliefs becoming more positive over time. Surprisingly, exposure to negative news also led to more positive beliefs, with the most negative people being most influenced in the opposite direction. Together, these results question central claims in the literature on negativity bias in news selection and subsequent consequences for societal beliefs in a media environment characterized by high media choice and negative news coverage.

POL14 News (non)exposure and its consequences

PP 0438 Political polarization and diversity in online information exposure: A longitudinal tracking study

[Helena Rauxloh](#)¹, [Lisa Merten](#)², [Sebastian Stier](#)¹, [Cornelius Puschmann](#)³, [Juhi Kulshrestha](#)⁴, [Katrin Weller](#)¹, [Patrick Zerrer](#)³

¹ Leibniz Institute for the Social Sciences – Gesis, Computational Social Science, Köln, Germany

² Leibniz Institut für Media Research – Hans-Bredow-Institut Hamburg, Media Use, Hamburg, Germany

³ University of Bremen, Zentrum für Medien – Kommunikations – & Informationsforschung, Bremen, Germany

⁴ University of Aalto, Computer Science, Espoo, Finland

In recent years, a lively academic discourse has emerged around the potential of algorithm-based media consumption to diminish the diversity of sources and viewpoints individuals are exposed to. While debates on the existence and extent of filter bubbles and echo chambers are ongoing, specific patterns of digital news consumption have been associated with reinforcing existing political attitudes through processes of selective exposure facilitated by both algorithms and users themselves. However, numerous aspects of the dynamic relationship between

information exposure diversity and political attitude polarization remain unclear, primarily due to challenges associated with measuring citizens' online behavior and a lack of longitudinal studies.

Our interdisciplinary research project investigates the interplay between online information exposure and political polarization through an innovative combination of unobtrusive digital behavioral data and survey data. A sample of 1.756 German panelists consented to record their desktop web browsing activities using browser plugins over 11 months from September 2022 to December 2023. For a subset of users, this data also includes mobile browser and app usage. Employing manual and automated content analysis on the visited websites, we classified sources, topics, actors, and viewpoints participants were exposed to online. The data encompasses, among other websites, two million visits to established German news outlets, constituting 2.35% of all activity during the tracking period. We combine this information exposure data with survey data from four waves on demographics, political predispositions, and attitudes to evaluate the amount and dynamics of political polarization over time. Among other variables we surveyed affective polarization towards the six most important political parties and ten individual politicians in Germany, as well as participant attitudes on polarizing issues such as climate change, the war on Ukraine, and trans rights.

Data analysis is still ongoing as the data collection just finished close to submission deadline. However, with this design, we can analyze the extent and dynamics of how (lack of) diversity in news sources, viewpoints, issues, or actors in information exposure relates to specific patterns of affective and issue-based polarization. The longitudinal approach allows us to investigate the directionality of the influence between online exposure over 11 months and polarization on issues, parties, and politicians. This project aims to scrutinize hyperbolic public expectations about strong media effects (e.g., echo chambers or hyperpartisan content) in contrast to academic research indicating that persuasion is the exception, not the norm (Guess et al., 2021; Kalla & Broockman, 2018).

POL14 News (non)exposure and its consequences

PP 0439 How exposure to political social media content contributes to political knowledge and participation on social media

*Cato Waeterloos*¹

¹ KU Leuven, Institute for Media Studies, Leuven, Belgium

Social media provide a unique context for political engagement. First of all, citizens become exposed to a high variety of political content and information on these platforms, often covering both institutional and formal as well as lifestyle-oriented political topics (Gonzalez et al., 2023). Therefore, this study aims to explicitly acknowledge how social media mark a crucial change in the opportunity structures for citizens to learn about politics, by focusing on broad political content rather than strict journalistic news (Andersen et al., 2020).

Simultaneously, social media allow for novel forms of political participation, where citizens express themselves in a personalized and flexible manner, raising awareness or mobilizing others on various political issues (Bennett, 2012). Despite research pointing to its co-occurrence with offline political action (Waeterloos et al., 2021), participation on social media has often been overlooked as a socialization outcome in the literature. This leaves an important participatory cycle unexplored, where citizens are potentially exposed to a variety of political content on social media and might choose to act on the issues they encounter through these same platforms.

Following Communication Mediation theory (Shah et al., 2005), we assume that the relation between content exposure and political participation on social media is mediated by a particular type of political knowledge. Indeed, the logic of social media seems to align most with the potential formation of current affairs knowledge, which is knowledge about recent political and societal events (Barabas et al., 2014; Delli Carpini, 2000).

Method

This study draws on data from an extensive cross-sectional survey ($n = 2543$), representative for the youth (above 16 years old) and adult population in Flanders, Belgium. Through structural equation modelling, we assessed whether the relationship between political content exposure on social media and social media political participation is mediated by current affairs knowledge. In the model, political interest was taken into account as a precondition for this entire process. Moreover, subsequent analyses will test the conditional effects of incidental content exposure and age.

Results

Preliminary analyses indicate a good model fit for the data. The findings point to specific learning opportunities on social media, as more frequent exposure to content on diverse political topics contributes to factual knowledge about current events. However, contrary to our expectations, current affairs knowledge negatively predicts political participation on social media and we find an overall negative indirect effect from political interest to participation through exposure and knowledge. This suggests that those who are objectively less knowledgeable about a diverse range of current affairs, are actually more vocal on social media about political topics. Though unexpected, these findings shed light on a previously unexplored pathway from political content exposure to participation on

social media. The study delves deeper into the specific conditions for political learning on social media, while also highlighting the need to further explore the unique processes underlying political engagement occurring on these platforms. For instance, it seems plausible that political participation on social media is more driven by social identity-formation processes and subjective knowledge, rather than objective knowledge.

POL14 News (non)exposure and its consequences

PP 0440 How dangerous world beliefs inform news consumption: Mapping over-time browsing behavior to explore news avoidance patterns and feedback loops

Michelle Schimmel¹, Toni van der Meer¹, Rupert Kiddle¹, Damian Trilling¹

¹ University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

Shaped by economic pressures and journalistic biases, depictions of reality in news media increasingly involve overrepresentations of negative information and isolated events (e.g., Soroka et al., 2019; van der Meer et al., 2018; van der Meer et al., 2022). As people's information environment informs their beliefs about risks and hazards (e.g., Fessler et al., 2014), news media may cultivate the belief that the world is a more dangerous place among those who rely on it intensively (Gerbner, 1969). However, research holds contradicting assumptions about how dangerous world views and information selection interact.

From an evolutionary perspective, negative information attracts attention as it signals potential dangers, resulting in a general negativity bias in news selection (Soroka et al., 2019). Moreover, those perceiving a more dangerous world tend to self-select into more negative news and news depicting isolated events (van der Meer & Hameleers, 2022). In today's high-choice media environment, feedback loops may therefore arise where people with negative worldviews, partly created through their news consumption, increasingly seek out more negative information (van der Meer & Hameleers, 2022).

Yet, negative news content may also evoke fear, which can motivate information seeking, but also avoidant behavior to reduce the resulting distress (Maslow, 1963; Tunney et al., 2021). While news avoidance appears to be rising (Reuters, 2019)– partially due to its negative effect on readers' mood (Skovsgaard & Andersen, 2019)– recent research suggests that active news avoiders still consume news a fair amount (Ohme et al., 2022; Palmer, Toff, & Nielsen, 2023). Considering these different research streams, this study provides comprehensive insights into over-time news consumption patterns of audiences holding different levels of dangerous world perceptions.

For this purpose, we draw on extensive data donations of $N = 6,047,040$ website visits to $N = 88,303$ different domains by $N = 320$ people, spanning over one year, linked to survey data. We examine the proportion of news in people's information diet, and over-time fluctuations in overall news use, including different avoidance strategies. Transformer-based large language models have significantly improved automated content analysis, allowing for new avenues in media effects research (Kroon et al., 2023). Leveraging these state-of-the-art models, we classify the negativity of news headlines participants selected to examine whether a negative outlook on social reality corresponds to self-selection into more negative news over time. We further explore how different contexts such as social media, online search, or direct news access enable the selection of negative news content across user profiles.

Preliminary results suggest that individuals with high or moderate dangerous world perceptions are characterized by higher proportions of visits to news sites in overall browsing behavior compared to those with low levels. Further, over-time data suggest overall news consumption remains stable over the year among individuals with moderate levels of dangerous world perceptions, while small increases are found among those with high or low levels.

Integrating contradicting lines of research and relying on browsing data linked with survey data, our study maps how dangerous world views inform online news consumption and theorizes potential reinforcement and news avoidance patterns.

POL14 News (non)exposure and its consequences

PP 0441 Examining the implications of different news avoidance practices during elections in Greece and Brazil

Antonis Kalogeropoulos¹, Camila Mont'Alverne², Patricia Rossini³, Lamprini Rori⁴

¹ Vrije Universiteit Brussel, Department of Communication Sciences, Brussel, Belgium

² University of Strathclyde, Strathclyde Humanities & Social Sciences, Glasgow, United Kingdom

³ University of Glasgow, Department of Political Science, Glasgow, United Kingdom

⁴ University of Athens, Department of Political Science, Athens, Greece

Longitudinal research has documented an increase of news avoidance frequency in many countries. Following this practice, a number of studies have examined the patterns and the drivers of news avoidance practices. In doing so, scholars have used different operationalizations of news avoidance, more prominently active news avoidance and news avoidance defined as low levels of news use. Paradoxically, active news avoidance can be correlated with high news use: it can take the form of avoiding news only at specific times a day, from specific mediums (e.g.

TV or social media), or specific news topics (e.g. Covid-19 or politics) and points of view. When news avoidance is conceptualized as low (or zero) levels of news use, it can be the result of low interest in news, preference for entertainment media consumption, or lack of time. However, we know much less about the impact of news avoidance. This article makes a distinctive contribution by examining the implications of different news avoidance practices on normatively important outcomes for democracy (belief in misinformation, political participation, and trust in elections) during election times. While elections denote times when society is more interested in getting information, they also have the potential to increase news avoidance in contentious political contexts, where people do not want to get involved with politics and feel fatigue from news. We explore the impact of news avoidance by using two-wave pre- and post- election panel surveys representative of the population in Greece (n = 1500) and in Brazil (n = 1600) during their 2023 and 2022 elections, respectively.

Our results show that a) active news avoidance is correlated with lower propensity to turn out and vote over time in both countries, b) news avoidance defined as low news use is correlated with higher belief in misinformation across both countries and that c) all forms of news avoidance are correlated with lack of trust in elections in Greece, whereas in Brazil lower trust in elections is correlated only with news avoidance conceptualized as lower news use. Last, our results were strikingly similar in these two countries, despite having different political and media structures, which may indicate that the negative consequences of news avoidance during elections are not necessarily shaped by a given country's specific context. Overall, our findings contribute to existing debates about the normative expectations of different conceptualisations of news avoidance with empirical evidence and show that different behaviors related to news avoidance have a distinct set of implications.

POL15 Persuasive political communication

PP 0442 Convince and mobilize: The informational context of political parties' mobilization attempts on social media

Anna-Katharina Wurst¹, Jörg Haßler¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

According to Verba et al.'s (1995, p. 269) civic voluntarism model people do not participate in democratic processes "because they can't, because they don't want to, or because nobody asked." This indicates that mobilization attempts of political actors are important to involve people in politics. Social media allows political actors to directly mobilize citizens and voters. Unlike, for example, election posters or TV commercials, parties can combine their messages with comprehensive information, e.g., in the captions of posts. Assuming that certain content can have activating and mobilizing effects (Russmann et al., 2021) – as studies on user reactions show (e.g., Bene et al., 2022) – parties can integrate their mobilization calls in informational contexts to prepare or back up their mobilization attempts.

Previous studies, however, have mainly examined parties' mobilization strategies on social media in terms of occurrence by quantifying the number of posts that contain mobilization calls (Stromer-Galley et al., 2021; Magin et al., 2017), without considering the contextual content. To fill this gap, we investigated whether parties combine different mobilization calls to support the party's campaign (e.g., call to vote, call to share the post) in one post (RQ1) and how they integrate their mobilization attempts in different informational contexts (policy topics like social issues, environmental issues, and economy, information about the top candidate, attacks towards the political opponent, or acclaims of the own party) (RQ2) and conducted a content analysis of Facebook and Instagram posts (n = 1.812) published by the 6 major parties during the 2021 German federal election campaign.

The results of our analysis indicate that most parties limited themselves to no or one mobilization call per post, most often a call to vote. This finding reflects studies showing the predominance of classic election appeals online (Magin et al., 2021), i.e. parties try to convert their social media campaign directly into votes. While the Green party most frequently mobilized in their posts (75% of their posts contained at least one mobilization call), sticking to electoral mobilization, the right-wing AfD most frequently combined various mobilization appeals in one post (16% of their posts contained two or more different mobilization calls), providing a wide range of options of how users can support the party's campaign.

Regarding the informational context, the results of a binomial regression show that most policy topics are not significantly preferred or rejected in combination with calls to vote. Only in the context of the environmental issue, which was salient at that time, parties tend to use mobilization calls, not only applying to the Green party. In the context of attacks on political opponents and acclaims of the own party, mobilization attempts are also more likely to occur, reflecting a strategy to recommend the own party as better voting alternative. When informing about their top candidates, however, parties tend to mobilize less, which could be due to the fact that top candidates cannot be elected directly.

More detailed results on the parties' mobilization strategies will be presented and discussed in a possible presentation at the conference.

POL15 Persuasive political communication

PP 0443 The role played by the media in shaping vote intentions. A Romanian perspective

[Andreea Stancea](#)¹, Nicoleta Corbu¹

¹ National University of Political Studies and Public Administration, Department of Communication, Bucharest, Romania

In light of the emergence of radical right-wing political parties in Europe, both nationally and supranationally, individuals are likely to face challenges in making informed voting decisions due to several factors, such as the role played by the media especially from social media platforms, education, political knowledge, to name just a few. European elections are to be held in all EU countries in 2024, and in Romania, all other forms of elections will follow the same year (local, parliamentary, and presidential).

Against this background, the present paper aims at exploring the potential predictors of vote intentions of Romanians, both for the radical right-wing party (AUR) and mainstream parties (current parliamentary parties in Romania), with a focus on news consumption patterns in the high choice media environment. We employed an original dataset collected through an online panel survey administered by Kantar/Lightspeed in Romania[1], from May 16, 2022, to June 24, 2022. The final dataset used in this paper includes a sample of 1.500 respondents, aged 18 and over, using soft quotas for age, education, and gender.

Findings show that news consumption from social media is associated with radical right-wing (AUR) vote intentions, but also with intentions to vote for the left-wing social-democrat party (PSD), traditionally the largest political party in Romania after 1989. Mainstream media news consumption is also positively correlated with vote intentions for the two parties. The correlation with social media consumption is stronger for the radical right party vote preference, while the correlation with mainstream media is stronger for the social democrat party. People's preference for the other three mainstream parties currently in the Romanian Parliament (National Liberal Party – PNL; Save Romania Union – USR; and Democratic Alliance of Hungarians in Romania – UDMR) is not significantly associated with any type of political news consumption. Other significant predictors for both radical right-wing and social democrat vote are low levels of education, belief in conspiracy theories, and low levels of political knowledge. Belief in conspiracy theories is negatively associated with preference for any other mainstream party, while both education and political knowledge are insignificant predictors.

These findings shed light not only on the role played by the (social) media in shaping individual political preferences for radical right-wing parties, but also point to a particularity of the Romanian political arena, dominated in the last years by a left-wing political party (PSD) with similar voters' profiles.

Keywords: vote intention, radical right-wing parties, news consumption, political knowledge

[1] This study uses data for Romania from a larger dataset collected in 18 countries in Threatpie NORFACE project (threatpie.eu).

POL15 Persuasive political communication

PP 0444 Can identity appeals in party communication or news media influence voter perceptions?

[Marvin Stecker](#)¹, [Fabienne Lind](#)¹, [Hajo G. Boomgaarden](#)¹, [Markus Wagner](#)²

¹ University of Vienna, Department of Communication, Vienna, Austria

² University of Vienna, Department of Government, Vienna, Austria

Research has increasingly studied how political parties use appeals to social groups in their communication to voters, relying on political manifestos, election leaflets or social media adverts (Dolinsky, 2022; Huber, 2022). This research tends to use one of two approaches: it either focuses only on changes in the supply-side of party rhetoric but neglects the perspective of voters, or it focuses on the effects of group appeals in experimental settings. These studies have confirmed that an association with a social group can improve that group's evaluation of a political actor and that, overall, such appeals by political parties have increased despite the changing electoral influence of group belonging (Robison et al., 2021; Thau, 2019). However, we don't know how stable or malleable voter perceptions of party group linkages are over longer time periods. Moreover, group appeals studies often only consider communication by party elites while overlooking the role of media reporting. This neglects possibly the most important source of political information, especially for more disengaged citizens (Graber, 2004).

In the present study, we bring together computational text analysis of party communication and news media, relying on word embeddings as well as transformer-models (Kroon et al., 2021), with (panel) survey data from Austria and the UK. We use these two data sources to analyse the effects that party positioning towards social groups, both in parties' own communication and in news reports, has on voter perceptions of parties and vote choice. The study contributes to research on group appeals and cleavages by bridging demand- and supply-side perspectives, analysing changes on the individual level and empirically separating the impact of two different sources of information on voter's behaviour.

POL15 Persuasive political communication

PP 0445 Rhetorical appeals in political communication: A quantitative comparative analysis of ethos, logos, and pathos

Martin Senn¹, Christian Schwaderer¹, Lore Hayek¹, Sarah Dingler¹

¹ University of Innsbruck, Department of Political Science, Innsbruck, Austria

Rhetoric, or the art of persuasion, is a key element of politics. Politicians seek to persuade the electorate that they are best suited for an office, to rally populations around causes for military intervention, or to make citizens follow measures imposed by government in times of crisis. As numerous studies show, the persuasiveness of political communication not only derives from what is said, or the substance of political communication, but also from the manner in which it is articulated, that is, the rhetorical strategies employed by political actors. It is through these strategies that political actors tailor their communication to the characteristics of different audiences and different political contexts.

Existing studies of rhetorical strategies in political communication predominantly use qualitative approaches and mostly focus on individual or small numbers of cases. Although this research has generated many important insights, the use of qualitative research designs makes it hard to compare rhetorical strategies across countries and, in particular, to identify causal factors that influence the choice of rhetorical strategies. Research employing quantitative approaches, on the other hand, has so far only focused on individual elements or individual rhetorical appeals, which leads to incomplete accounts of rhetorical strategies. Overcoming these limitations, this paper introduces a quantitative, three-dimensional measure of three rhetorical appeals of ethos (authority), logos (reason), and pathos (emotion). The added value of this measure is that enables comparisons of rhetorical strategies in political communication across different types of political actors, across states and across different points in time.

To illustrate this added value for the analysis of rhetorical strategies, our paper uses the case of political crisis communication during the first phase of the COVID-19 pandemic. It draws on a data set of 1109 press conferences with 433 speakers in 17 OECD countries and three US-American states and employs automated methods of text analysis.

POL15 Persuasive political communication

PP 0446 Aligning and deviating cultural resonance responses: The case of political Facebook communication in the United Kingdom

Cristina Monzer¹

¹ Norwegian University of Science and Technology, Sociology and Political Science, Trondheim, Norway

One widely accepted tenet of political communication is the concept of value resonance. This occurs when the values in a message frame match citizens' value, leading to a significant impact on their thoughts and attitudes (Schemer et al., 2012; Shen & Edwards, 2005). The literature provides extensive evidence of these patterns from experimental and survey data, yet we know less about the dynamics of cultural value references in text and the range of resonance responses these elicit from citizens. This study focuses on the role of value-based messages in shaping user responses, specifically within the context of British political communication on Facebook.

In investigating the relationship between posts from political actors and the direct comments elicited from users, cultural resonance is explored as an explanation for the observed empirical patterns. Facebook posts from British political actors were collected between May 2020 – April 2021, comprising 1,727 posts and 3,216,367 comments. The analysis employed a word embeddings-based method (i.e., Concept Mover's Distance) to measure whether

posts and comments referenced six different values from Schwartz' universal values system (stimulation, hedonism, self-direction, tradition, security, and conformity).

Although the United Kingdom is categorized as an individualist country (Hofstede, 2001), the results revealed that both individualist and collectivist value references were prevalent in British political communication on Facebook. Political actors frequently referenced values like stimulation, tradition, and conformity. Additionally, the specific value references identified were not exclusively associated with Covid-19. We posited that a plausible reason for the prevalence of these values would be the timing of the data collection during the pandemic, rather than solely reflecting the cultural context.

The study conceptualized three types of cultural resonance responses: aligning, deviating, and non-response. By theorizing resonance responses in relation to the utilization of values in texts, this research not only extends our theoretical understanding of resonance processes but also improves the applicability of the cultural resonance concept for empirical investigation.

Furthermore, the results support the cultural resonance thesis, showing that individualist values, such as stimulation, received more aligning responses in an individualist context, while collectivist values, such as conformity, received more deviating responses. This study underscores the dual nature of resonance in political communication. On one hand, resonance is positive as it empowers citizens to actively shape public discourse and engage with political content. On the other hand, communicators may face challenges when expressed interpretations deviate from their intended message. This suggests that resonance problems may not solely stem from communicators' inability to connect with audiences but can also arise when citizens alter the communication lens through deviating responses. This insight has significant implications for democracy, highlighting the need to understand and navigate the complexities of cultural resonance in the digital age.

POL16 Misinformation and trust in the media

PP 0546 Describing and explaining misinformation on Dutch Twitter during the covid pandemic

Lotte Schrijver^{1,2}, Rens Vliegenthart², Pearl Dykstra¹

¹ Erasmus University Rotterdam, Sociology, Rotterdam, Netherlands

² Wageningen University & Research, Strategic Communication, Wageningen, Netherlands

The covid pandemic was accompanied by concerns about the role of misinformation in reducing compliance with public health measures (e.g. Roozenbeek et al., 2020). In the face of future crises which will require compliance of the public with invasive measures (Boin et al., 2020), the covid pandemic provides an important opportunity to better describe and explain the presence and characteristics of misinformation during pandemics and disasters.

Despite worries about the spread of misinformation on social media during the pandemic (Kupferschmidt, 2020), researchers have so far gained little insight into the amount and characteristics of online misinformation about covid. Studies often measured misinformation through proxy variables (e.g. Cinelli et al., 2020), and studies that directly measured the proportion of misinformation on social media through fact-checking are scarce and show mixed results (Gabarron et al., 2021). Moreover, all studies focus on the presence of misinformation during the first few months of the pandemic (Gabarron et al. 2021), but the amount and characteristics of misinformation have likely changed over the course of the pandemic, as, for example, the public debate became more politicized (van Dijck & Alinejad, 2020). Therefore, our research question is: *How have the amount and characteristics of misinformation on Dutch Twitter developed during the covid pandemic?* We focus on the Dutch-language area to extend the US-focused literature to a low-polarization and high-trust context (Humprecht et al., 2020). We study the following textual characteristics: conspiracy theories, incivility, sentiment, source type, fearmongering and topics. We also examine user engagement with misinformation.

We train a BERT model to recognize misinformation and textual characteristics in Dutch-language Tweets posted between February 2020 and February 2022. By training a machine learning model to detect misinformation we are able to arrive at a more fine-grained analysis of the development of misinformation over time than studies that manually analyze a small sample of Tweets.

Many studies have explained belief in misinformation about covid through individual characteristics (e.g. Enders et al., 2020; Roozenbeek et al., 2020). Very few studies have tested to what extent macro-level societal conditions, such as polarization, contribute to the spread of misinformation (Humprecht et al., 2020), despite societal conditions being considered important to understand the spread of misinformation in current societies (Lewandowsky et al., 2017). Better understanding how societal conditions contributed to the spread of misinformation during the covid pandemic will add to knowledge about factors that should be addressed to reduce the spread of misinformation during pandemics and disasters. Therefore, the second aim of our study is to explain the amount of misinformation on Twitter over time. We answer the research question: *How can fluctuations in the amount of misinformation on Dutch-language Twitter over the course of the covid pandemic be explained?* We use time-series analyses to test our hypotheses.

Preliminary results are promising, showing that our BERT model performs as well as other models trained to detect misinformation in Dutch-language Tweets about covid (e.g. Alam et al., 2021). Final results will be available at the time of the conference.

POL16 Misinformation and trust in the media

PP 0547 A qualitative analysis of the mechanisms underlying the “trust nexus”

Amy Ross Arguedas¹, Camila Mont’Alverne², Benjamin Toff³, Richard Fletcher¹, Rasmus Nielsen¹

¹ University of Oxford, Department of Politics and International Relations, Oxford, United Kingdom

² University of Strathclyde, Journalism – Media & Communication, Glasgow, United Kingdom

³ University of Minnesota, Hubbard School of Journalism & Mass Communication, Minneapolis – Minnesota, USA

A growing body of work has found evidence of a strong link or “nexus” between public trust in political institutions and the press in general (Ariely, 2015; Hanitzsch, Van Dalen, & Steindl, 2017; Knudsen, Nordø, & Iversen, 2023; Tsfati & Ariely, 2014; Tsfati & Cohen, 2005). But why should people have similar attitudes towards political institutions and the news media? Our empirical understanding of why this nexus exists is limited. While studies have proposed various explanations for this strong correlation—e.g., growing anti-elite sentiment, increasing mediatization of politics, growing audience awareness of the interplay between politics and media (Hanitzsch et al., 2017)—research examining how audiences actually think about the relationship between politics and news is limited (see Palmer, Toff, & Nielsen, 2020 for an exception). Furthermore, this association runs counter to understandings of journalism as having an adversarial relationship with politicians, an ideal held by many within the journalistic profession and often supported by studies examining the relationship between politicians and journalists (e.g., Brants, de Vreese, Möller, & van Praag, 2010) or news coverage about politicians (e.g., Cappella & Jamieson, 1997).

In this paper, we expand our understanding of the mechanisms underpinning the trust nexus, drawing on two rounds of qualitative data collection—in-depth interviews and focus groups—in four countries across the Global North and South: Brazil, India, the United Kingdom, and the United States. We suggest that this connection is sustained through both conscious beliefs and inadvertent associations. On the one hand, some audiences espoused concrete ideas about (1) journalists and politicians being complicit or in cahoots; (2) journalists being controlled or paid off by politicians; (3) journalists being the same “kinds” of people as politicians. On the other hand, others seemed to link politicians and journalists less through specific beliefs about questionable motives than through inadvertent associations, either (4) conflating journalists and politicians when speaking about either or (5) confusing news coverage of political issues with the issue itself. Indeed, for many people, their only interaction with politics is through news, making the two hard to distinguish.

POL16 Misinformation and trust in the media

PP 0548 How do individual and societal factors shape news authentication? Comparing misinformation resilience across Hong Kong, the Netherlands, and the United States

Qinfeng Zhu¹, Tai-Quan “Winson” Peng², Xinzhi Zhang³

¹ University of Groningen, Center for Media and Journalism Studies, Groningen, Netherlands

² Michigan State University, Department of Communication, East Lansing, USA

³ City University of Hong Kong, Department of Media and Communication, Hong Kong, Hong Kong

Misinformation remains a pressing issue around the world. In response, resilience to misinformation—personal and structural conditions fostering the ability to withstand this challenge—has become a crucial societal asset, garnering attention as a burgeoning research domain (Boulianne et al., 2022; Humprecht et al., 2021, 2020). Traditionally, research has centered on individuals refraining from consuming or propagating misinformation as the key metric of resilience. Our study re-explicates resilience to misinformation by emphasizing news engagement behaviors that discern and counteract misinformation. Specifically, we focus on news authentication—individuals’ active verification of news items they encounter.

While news authentication has been observed in various countries (e.g., Kyriakidou et al., 2023; Tandoc et al., 2018; Wagner & Boczkowski, 2019), resilience to misinformation displays systematic variations across societies. To elucidate these disparities, we employ a cross-country comparative approach to examine how individual and societal factors together shape news authentication behaviors. First, viewing news authentication as a form of citizen engagement with news that requires necessary resource and motivation, we focus on the impact of individual capacity (i.e., education, political efficacy) and attitudes toward institutions (i.e., institutional trust, conspiracy beliefs) on news authentication. Second, we investigate the extent to which these individual-level influences vary across societies characterized by different political systems and varying degrees of political polarization, namely Hong Kong, the Netherlands, and the United States.

To do so, we employ a pre-registered 1, population-based survey (total $N = 6,082$) and multi-group structural equation modeling. Our findings show that, first, political efficacy and institutional trust are consistent predictors of news authentication across societies. This suggests that citizens’ confidence in their own ability to engage in

the democratic processes and trust in the competence of public institutions can foster a vigilant, critical citizenry. It highlights the significance of a shared sense of political empowerment and civic duty in building resilience to misinformation. Second, education is crucial in encouraging news authentication, but only in the United States, where the risks of misinformation are unevenly distributed due to resource inequality. Third, at the societal level, news authentication is the highest in the United States, where political sectarianism is the most severe, and lowest in the Netherlands, which is characteristic of moderate polarization. We thus infer that polarization may actually encourage, rather than impede, news authentication, nonetheless likely biased news authentication motivated by partisan considerations.

Furthermore, we argue that the nature of news authentication is context-dependent. In a non-democracy like Hong Kong where pro-democracy activism is subject to increasing state surveillance and retribution, news authentication is more prevalent among pro-democracy supporters. In Western democracies like the Netherlands and the United States, it gains popularity among individuals holding anti-establishment worldviews, specifically, a conspiracy mentality. Take together, across political systems, news authentication arguably serves as a political tool wielded by marginalized groups to challenge the status quo. The underlying concern is more aligned with political motives than the inherent quality of information. To foster resilience to misinformation, we must address the deep-rooted societal issues, such as the growing legitimacy problem.

POL16 Misinformation and trust in the media

PP 0549 Investigating the impact of fake news content characteristics on readers' credibility perceptions

Noelle Lebernegg¹, Petro Tolochko¹, Hajo Boomgaarden¹

¹ University of Vienna, Communication Science, Vienna, Austria

In the current post-truth era, the pervasive spread and belief in false information pose significant challenges to democracy. This phenomenon is exacerbated by the emergence of digital media environments, particularly the shift from objective to citizen journalism (Winston & Winston, 2020). This change in information curation has led to diminished certainty regarding the truthfulness, accuracy, and verification of publicly available information. As a consequence, there is an apparent increase in the exposure to and belief in misinformation (Thorson & Wells, 2016), with research suggesting that "fake news" content tends to go viral more rapidly and widely than real news content (Vosoughi et al., 2018).

Efforts to empower consumers to discern genuine from misleading information include initiatives by public and non-governmental organizations, aimed at educating journalists and the general public on recognizing false information in media content (Heiss et al., 2021). In this line, individuals are advised to exercise caution when encountering specific content characteristics, such as, for instance, biased information, polarizing elements, sensationalist features, or certain syntactic cues such as the use of all-capitalized terms or punctuation signs (e.g., Bates et al., 2017).

Despite this guidance, a gap persists in understanding how these linguistic and stylistic characteristics impact audience credibility perceptions. This study aims to address this gap by examining which characteristics typical for fake news contribute to better deception identification and which, while prevalent, do not raise suspicion among ordinary readers. Using an experimental design, participants (n ~2000) will evaluate the credibility of genuine and fake news articles exhibiting varying degrees of a comprehensive selection of respective content characteristics. To mitigate potential confounding variables, a diverse array of articles (n ~ 6000) with removed origin information will be utilized as stimuli material.

The findings of this research hold the potential to inform media literacy interventions and content verification strategies and contribute to the development of effective measures against the spread and acceptance of false information, thereby fostering a more informed and discerning public capable of navigating the complex landscape of digital information environments.

POL16 Misinformation and trust in the media

PP 0550 Media use, trust, and belief in COVID-19 and vaccine misinformation

[Jón Gunnar Ólafsson](#)¹, [Viktor Valgarðsson](#)²

¹ University of Iceland, Political Science, Reykjavik, Iceland

² University of Southampton, Politics and International Affairs, Southampton, United Kingdom

Since the early stages of the COVID-19 pandemic, concerns over the spread of misinformation have grown substantially, with the WHO referring to the spread of false and misleading information related to COVID-19 as an “infodemic.” Research has shown that a large proportion of this misinformation was spread and seen by people online, particularly on social media. Health professionals and scientists emphasised how people’s usage of social media had eased the spread of false information, disrupting the flow of more scientifically sound material. This information disruption intensified when COVID-19 vaccines became available, with false information online contributing to people’s vaccine hesitancy. Much of the existing academic literature in this area has focused on where and how misinformation spreads, whilst some research has examined this in relation to beliefs, with findings illustrating that social media use may be related to belief in misinformation. A few single-country studies have suggested that the same may be the case for trust in media, but this has not been examined cross-nationally to our knowledge. Furthermore, the role of people’s trust in (and usage of) traditional media has not yet been examined to our knowledge, nor has the role of trust in political institutions. Nevertheless, this line of research has illustrated that the issue of trust in traditional sources of information is likely to be of key importance to understanding when and why people believe false or misleading information on social media. When citizens do not trust information in the mainstream media they may withdraw from it and turn towards alternative sources, which commonly promote misinformation, often through social media. In this study, we contribute to this emerging research agenda with a cross-national study that simultaneously examines the role of social media use, traditional media use, trust in traditional media and trust in political institutions in explaining citizens’ beliefs in claims involving misinformation about vaccines and the COVID-19 pandemic. We use original survey data (N = 14,057) to explore these dynamics in nine countries – Argentina, Brazil, Croatia, France, Germany, Iceland, India, Spain and the United Kingdom – between December 2020 and December 2021, during the heights of the COVID-19 pandemic. We use multiple regression models to investigate to what extent media use, and trust in different types of media and political institutions, can predict agreement with statements involving misinformation about vaccines and COVID-19. Controlling for demographic and political variables, we find that greater use of traditional media types (newspapers and television) is significantly related to less belief in these claims, whereas greater use of social media has inconsistent effects (when accounting for the other factors), related to greater belief in misinformation in some but not all cases. Similarly, greater trust in the media and in parliament is significantly related to less belief in these claims. This study contributes to our understanding of how information diets and trust in different sources of information can be related to belief in false and potentially harmful claims, informing ongoing societal debates about challenges in information dissemination in times of crisis.

POL17 Incivility in political communication: Performance and perceptions

PP 0551 Gender dynamics in online negative campaigning. A longitudinal analysis of attack behaviour and incivility in social media discourse by political candidates

[Elise Storme](#)¹

¹ Ghent University, Political Science, Ghent, Belgium

The landscape of political communication has profoundly transformed due to the Web 2.0 revolution (Davis, 2023). The current generation of politicians faces the unique challenges of ascending to power in profoundly mediated contexts. The advantages of digital visibility are accompanied by a downside, as the online realm has evolved into a platform where insults are not only expressed but also disseminated (Bjarnegård & Zetterberg, 2023). Negative campaigning can negatively affect the political process and democracy by fostering polarization, reducing public trust, and discouraging participation (Lau et al., 2007; Haselmayer, 2019). In an era marked by crises such as Brexit, COVID-19, climate challenges, and escalating international conflicts, it is crucial to understand the role of political communication in shaping public perception and trust.

Questions related to gender differences in negative campaigning have undeniably become a more pressing topic (Cassese & Holman, 2018). However, our current comprehension of gender differences in negative campaigning remains inadequate, as most research focuses solely on the United States and, therefore, on a system with candidate-centered campaigns, weak party organizations, and winner-takes-all competitions. Such a context is very specific and likely to bias the results (Enns-Jedenastik et al., 2017). Even in the United States, results are inconclusive due to the use of a limited number of cases or the absence of longitudinal studies. Moreover, the shift from traditional to social media as a primary communication channel remains understudied in the context of negative campaigning and gender disparities.

To address these shortcomings (US-centered, limited samples, short-term, and focused on traditional media), this paper undertakes an in-depth longitudinal quantitative content analysis, examining all 30,000 Twitter messages sent by 400 individual politicians holding a realistic position on the ballot in the three months leading up to the 2019 and 2024 regional and Federal elections in Belgium. This expanded dataset intends to capture a more comprehensive and nuanced picture of gender differences in negative campaigning, encompassing incivility, toxicity, and variations in issue versus trait attacks. Delving deeper, the paper explores the hypothesis that negative campaigning and the gender gap in online communication have intensified in the past five years, driven by the evolving political landscape and recent crises.

Findings for 2019 confirm gender disparities in negative campaigning within the Western European party-centered context. Women politicians are notably less likely to engage in general attack behaviour, uncivil and toxic attacks. Further distinctions emerge in the preferences of women and men for policy-based versus trait attacks.

In conclusion, this research not only broadens our comprehension of gender disparities in online political communication but also furnishes critical insights into the role of social media in shaping political discourse within the West European context. By navigating beyond the confines of previous research limitations and expanding the geographical scope, this study contributes to a more nuanced understanding of the intricate interplay between gender, negative campaigning, and evolving communication channels in contemporary politics.

POL17 Incivility in political communication: Performance and perceptions

PP 0552 The strategic use of political Incivility during the 2022 Brazilian Election: A multi-platform Analysis

K. Pamina Syed Ali¹, Jihye Park¹, Yuan Zhang¹, Michael Amsler¹, Laia Castro Herrero², Frank Esser¹

¹ University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

² University of Barcelona, Department of Political Science, Barcelona, Spain

Incivility is a phenomenon that has dramatically increased in the online environment over the last decade. In digital campaigning, political incivility is used as a strategic tool. Brazil's 2022 presidential election might provide a fertile ground for online incivility as social media reinforces already existing political parallelism. This study examines to what extent different affordances of social media platforms facilitate uncivil discourse by the Brazilian Presidential candidates, Lula and Bolsonaro (RQ). We expect that politicians communicate differently on social media platforms depending on their opportunity structures and affordances. Consequently, we compare politicians' use of political incivility on three social media platforms (Facebook, Twitter, Telegram), each having different characteristics, audience expectations, and moderation guidelines. We define political incivility as a multidimensional concept that encompasses more (a) general forms of incivility (Impoliteness, Negativity, Sarcasm), (b) messages within the political domain (Threats to Democratic Values, Attack Against Political Actors, Violent Political Rhetoric), (c) messages within the social-identity based domain (Hate Speech and Stereotyping) and (d) messages addressing both (Exclusion, Simplistic Argument). We assume that candidates may exploit platform-specific niches to effectively project different dimensions of incivility to target audiences and adapt their content to specific moderation regulations and audiences. In addition, we hypothesize that political stance – incumbent or challenger – influences the extent to which politicians use incivility, with challengers more likely to resort to such behavior to gain traction. The temporal dynamics of a campaign suggest that the use of uncivil rhetoric increases as the election approaches and that this represents a decisive shift that could lead to increased emotional engagement among voters. In line with previous research on online incivility, we create a classifier that is trained to automatically recognize our concept of incivility in political messages in a differentiated way. This methodology allows for a nuanced examination of how social media affordances have an impact on uncivil political discourse and analysis on a large scale. Preliminary findings indicate a variation in social media use among the two candidates and over time. The data (n = 9227) demonstrates that Bolsonaro's preferred platform for communication is Telegram, while Lula shows a greater propensity to use Twitter for his campaign. Additionally, there is a noticeable variation in their posting patterns over time, with Lula exhibiting a steadier use of social media for campaign communication, in contrast to Bolsonaro, whose activity on social media is largely influenced by specific events. This study advances the discussion on the strategic use of incivility in conjunction with platform-specific affordances in political campaigns and offers important insights into the challenges associated with maintaining civil discourse in digital public spaces. In essence, this study unravels the interactions between the structural nuances of social media and strategic political communication using a sophisticated mix of computational and theory-driven analysis. It emphasizes the need for a critical examination of the place and power of political incivility in social media communication and reflects on its potentially transformative effects on democratic engagement and the quality of public conversations.

POL17 Incivility in political communication: Performance and perceptions

PP 0553 Perceptions of incivility in the public discourse and its potential democratic consequences: Insights from a representative survey in Germany

Marc Ziegele¹, Oliver Quiring², Ilka Jakobs², Christian Schemer², Tanjev Schultz², Daniel Stegman², Nayla Fawzi², Nikolaus Jakob², Christina Viehmann²

¹ University of Duesseldorf, Department of Social Sciences, Duesseldorf, Germany

² Johannes Gutenberg University of Mainz, Department of Communication, Mainz, Germany

In an era where the prevalence of incivility in public communication – whether in political talk shows, parliamentary debates, or online discussions – is considered increasingly alarming (e.g., Anderson et al., 2014), this study focuses on the perceptions and potential effects of incivility. Utilizing a representative CATI survey with 1,200 German participants (aged 18+), we investigate the frequency at which various forms of incivility in public discourse are perceived and the potential consequences this has on people's political cynicism, media trust, and perceived societal cohesion.

Our analysis identifies two main forms of incivility, which align with previous classifications (Stryker et al., 2022): Discursive Incivility (e.g., refusal to discuss, interrupt others, Alpha = .82) and Utterance Incivility (e.g., insults, offensive remarks, Alpha = .77). These two dimensions of incivility reflect different aspects of public discourse degradation. Discursive incivility relates to the refusal of engaging in constructive dialogue and often manifests in stubbornness and close-mindedness in discussions. Utterance incivility, on the other hand, is more about the tone and nature of the language used, typically involving derogatory, offensive, or hateful language aimed at degrading the discourse and delegitimizing its participants. Results show that people perceive the manifestations of utterance incivility to occur less frequently than the manifestations of discursive incivility.

A subsequent regression analysis, including various control variables, such as sociodemographics, traditional media usage, and various forms of social media usage – reveals that particularly the perceived frequency of discursive incivility correlates with lower perceived societal cohesion (3 items, Alpha = .71), diminished trust in media (3 items, Alpha = .83), and increased political cynicism (3 items, Alpha = .87). This finding suggests that not just the nature of language, but the unwillingness to engage in open and respectful dialogue, may have a profound impact on people's societal and political perceptions.

Interestingly, our results show that forms of incivility, previously considered relatively "harmless" (Bormann et al., 2022), can indeed have adverse effects. While verbal incivility catches immediate attention due to its explicit nature, people may already be more resilient to these forms than previously thought. In contrast, the subtler forms of discursive incivility can be equally, if not more, damaging in the long run. These forms of incivility not only occur more frequently across political actors, but they also threaten the very foundations of democratic discourse by undermining respect, trust, and the willingness to engage in collaborative problem-solving.

While our cross-sectional design does not allow causal conclusions, it nevertheless provides insights into the democratic implications of perceiving different forms of incivility in public discourse. The relevance of this research lies in its contribution to understanding how incivility in public discussions is not only perceived but also how it may influence the political climate and societal cohesion. The findings are crucial for policymakers, media actors, and civil society: By highlighting the nuanced ways in which incivility manifests and potentially affects people's political and societal attitudes, this research underscores the importance of further elaborating on the need of a culture of civility and respect in public discourse.

POL17 Incivility in political communication: Performance and perceptions

PP 0554 The perception of political and informational incivility between sensitization and desensitization

Sara Bentivegna¹, Giovanni Boccia Artieri², Rossella Rega³, Giovanna Mascheroni⁴

¹ Sapienza University of Rome, Department of Communication and Social Research, Rome, Italy

² University of Urbino Carlo Bo, Department of Communication Sciences Humanities and International Studies, Urbino, Italy

³ University of Siena, Department of Social – Political and Cognitive Sciences, Siena, Italy

⁴ Università Cattolica – Milano, Department of Communication and Performing Arts, Milano, Italy

We have recently witnessed an increase in the use of incivility and hostility by candidates and political parties (Klinger et al. 2022; Reiter and Matthes 2022), especially during election campaigns, where attacks on opponents in the form of defamation, discredit, mockery, and the like have intensified (Brooks and Geer, 2007; Gross and Johnson, 2016). Additionally, both traditional media and online platforms give wide visibility to expressions of incivility to compete in the attention economy, attract wider audiences, and activate user engagement behaviours.

Hence individuals who follow political news have more, and more frequently, opportunities to encounter uncivil behaviour. This applies not only to citizens used to consuming traditional information sources, but also to those who are active on social media and receive political news indirectly through the well-known "news reaches me" mechanism.

In both cases, the crucial – yet to be investigated – question concerns the consequences of such exposure on citizens. Specifically, whether repeated exposure to political actors' uncivil behaviours increases people's sensitivity to them or whether, on the contrary, it leads to naturalisation and *desensitization*.

In the light of previous research examining citizens' perceptions of political incivility (Kenski et al., 2020; Stryker et al., 2016), this study explores whether and how citizens' sensitivity to different types of political incivility (discursive, informational, vulgar, violent, and discriminatory) varies according to contextual factors and individual variables. The aim is to examine citizens' perceptions of political incivility in general and informational incivility in particular, comparing the context of "everyday politics" with "election campaign." Additionally, we seek to identify predictors of perception and understand the role played by individuals' media consumption and engagement on social media in relation to the political dimension.

To this end, we carried out two surveys using the Cawi method (the first in early 2022, and the second after the 2022 Italian Election campaign) on a representative sample of the Italian population. 2,000 respondents were asked to provide their evaluations on ten statements related to the uncivil behavior of political actors in various areas. The selected areas are related to the various notions of political incivility intended as a lack of respect for the social and cultural norms that govern personal interactions and for those that govern the functioning of democratic systems.

Results show that during election campaigns – compared to "everyday politics" – a *sensitization* mechanism towards politicians' uncivil behaviours is activated, confirming that incivility is a context-dependent concept. Furthermore, the existence of a dual mechanism, *sensitization/desensitization*, and the almost antithetical roles played by news media consumption and social media engagement has emerged: while the former can be considered a resilience factor to incivility, particularly informational incivility, social media activity in relation to politics seems to be associated with *desensitization* to both general incivility and informational incivility.

In other words, citizens who watch, hear/read news attentively are better equipped to recognize various forms of incivility, including information distortion, and therefore develop higher sensitivity to its use. On the contrary, spreading uncivil and misleading content has been normalised by heavy social media users.

POL17 Incivility in political communication: Performance and perceptions

PP 0555 Subjective and objective confrontation with digital hate speech in the everyday media use

Sina Blassnig¹, Dominique Wirz²

¹ University of Fribourg / University of Applied Sciences of the Grisons, IDCMI – Institute of Digital Communication and Media Innovation, Fribourg, Switzerland

² University of Amsterdam, Amsterdam School of Communication Research ASCoR, Amsterdam, Netherlands

Hate speech proliferates across various online platforms, including social media, news comment sections, discussion forums, and messaging services. Hate speech encompasses insults, defamation, and threats or incitements to violence targeting specific social groups (Council of Europe, 2022; Fortuna and Nunes, 2019). Although hate speech can be subtle or humorous, it must be distinguished from statements that are impolite in tone but harmless in content (Rossini, 2020). Despite efforts by platforms to identify and delete hate speech manually or automatically, exposure to hate speech has been on the rise (e.g., Landesanstalt für Medien NRW, 2021). However, it remains unclear what media users mean when they report that they "frequently" encounter hate speech, and whether the content they see is actually hate speech. This study aims to address these gaps in research with a combination of survey, data donation, and content analysis.

First, a representative survey in German- and French-speaking Switzerland (N = 2000) investigated how often participants encounter hate speech (less than once a year – several times a day). To augment self-reports, participants were additionally presented with specific examples. Second, an online experience sampling study involving 119 participants from the survey adopted a mobile longitudinal linkage approach (Otto et al., 2022). Over a period of 14 days, participants documented when and where they encountered hate speech. The uploaded content (n = 567) was then examined in a manual quantitative content analysis regarding the content and form of hate speech and impoliteness.

Subjective perceptions from the survey reveal that 69% of Swiss people have experienced hate speech, with 24.2% facing it several times a week or more often. Threats and statements against minorities are most likely classified as "hate speech" by respondents, while impoliteness is least likely. Notably, insulting and impolite statements are more likely deemed "hate speech" if directed at the respondents' own social group, influencing also demands for deletion and punishment. This bias shows the partly subjective nature of hate speech perception.

The experience sampling study adds an objective perspective on the confrontation with hate speech. For most participants, self-reports of encounters with hate speech several times a week align with the number of uploaded examples. Yet, many participants overestimated how often they encounter hate speech online in the survey. Insults are most common, followed by defamation, and less frequent threats, affirming the self-reported perceptions in

the survey. Impoliteness is more prevalent than initially perceived, indicating that some statements that are "only" impolite are also perceived as hate speech, although as in the survey they are perceived as less severe. Additionally, members of marginalized groups uploaded more examples related to their own social identity.

In summary, this study provides a comprehensive understanding of online hate speech perception among Swiss internet users. The subjective and objective analyses highlight the prevalence, partly subjective nature, and severity perceptions associated with hate speech. The impact of social identity on evaluation underscores the complexity of addressing this issue effectively.

POL18 Political communication in polarized societies

PP 0556 How (not) to measure the fragmentation of the public sphere? A proposal for reconciling normative theory and empirical inquiry

Diógenes Lycarião¹

¹ UFC Federal University of Ceará, Institute of Culture and Arts ICA, Fortaleza, Brazil

The growing number of studies and essays examining the fragmentation of the public sphere is notable, particularly in terms of how the platformization of political communication significantly contributes to this process. However, these works offer varying approaches to understand this phenomenon. This study critically reviews this body of literature to develop a theoretical and methodological framework, inspired by the deliberative system approach. This framework aims to dispel conceptual ambiguities and pinpoint effective methods for assessing different levels of fragmentation. A key focus of this framework is the exploration of how concepts such as echo chambers, filter bubbles, and political polarization are often mistakenly intertwined with the notion of public sphere fragmentation.

The study contends that merely acknowledging the rise of these phenomena does not adequately measure the fragmentation of the public sphere. To overcome these conceptual and analytical shortcomings, the paper suggests a framework rooted in a pluralistic view of the public sphere, which appreciates the diversity and expansion of media choices brought by digitalization. In order to disentangle this media choice expansion from fragmentation, this paper presents the concept of "interdiscursive agenda congruence". This envisions a network of interactive, multi-directional flows of symbolic and discursive exchanges between the public, media, and political arenas/actors. In this conceptualization, much more important than figuring out who sets the agenda, it is to understand the dynamics of how some issues gain momentum and attention across these fora, making the notion of a common agenda empirically observable.

The framework identifies three distinct types of fragmentation, each posing a unique threat to the public sphere: a) fragmentation of the public agenda along partisan or ideological lines; b) reduced levels of intermedia agenda congruence; c) the dilution of the concentrated public attention necessary to exert (discursive) pressure on the political system. The paper discusses each type, focusing on their specific political impacts and potential harm to public discourse. The first type undermines some conditions for political negotiations and compromises. The second results in political actors receiving conflicting indications about pressing issues, causing reluctance to participate in public debate. The third type leads to political authorities being influenced primarily by their supporters, thus overlooking broader public interests.

Furthermore, the manuscript delves into the methodologies for measuring these types of fragmentation. It draws on prior work, particularly from political agenda setting studies, to suggest various methodological tools – such as panel surveys, topic modeling and time series analyses of digital trace data – that could address some current research limitations and opportunities. The paper concludes by advocating for the integration of these methodologies in future research to deepen understanding of the nature, extent, and trends in public sphere fragmentation. This approach underscores the necessity for ongoing empirical research and conceptual precision to either validate or refute the hypothesis that the public sphere is eroding due to the platformization of political communication.

POL18 Political communication in polarized societies

PP 0557 Dimensions of polarization. Impact of images of Polish political leaders on voters' reception of political messages

Marcin Łączyński¹, Tomasz Gackowski¹, Marlena Szytber¹

¹ University of Warsaw, Laboratory of Media Studies, Warsaw, Poland

This research is grounded in the growing trend of personalized politics, a subject under examination since the early 1990s (Aarts et al., 2013; Lobo & Curtice, 2014). Despite the extensive history of this research, various unresolved queries persist. Of particular interest is the impact of leaders on voter behavior, the extent of this influence, the contextual factors fostering its prevalence, and its repercussions (Adam & Maier, 2016). Concurrently, the burgeoning societal polarization in select EU nations, potentially linked with increased support for right-wing parties, has drawn considerable attention (Down & Han, 2021). The Polish state-level politics is a good exemplification of growing

polarization, with the political scene divided mainly between two factions – Law and Justice (the party forming the Polish government for the last eight years that lost the most recent parliamentary election) and Civic Coalition that returned to power after eight years functioning as opposition. Both of those parties' political communication is focused on the charismatic personal leadership of Jarosław Kaczyński and Donald Tusk.

The presented research is based on an experiment with the iMotions 8.1 biometric research platform. The experiment employed face-tracking (to analyze emotions) and eye-tracking (to identify the focus of respondents' attention). We monitored respondents' behaviors as they made paired judgments on political statements, including those attributed to figures like Donald Tusk (Civic Coalition) and Jarosław Kaczyński (Law & Justice). The research encompassed seventy-two respondents, representing supporters of various political parties in two age categories: 23–26 and 50–55.

Our findings demonstrate statistically significant differences in the reaction of voters from both main parties of the Polish political scene in a situation where they first assess their agreement with a political statement without knowing the author. Then, they realize the leader of the opposite party coined it. The paper also presents a broad scope of measurements and analytical approaches to biometric data analysis. It also discusses the methodology for identifying voters' behaviors related to political polarization based on factors such as signal threshold, signal peak value, mean value, and time distribution of reaction while also applying the neural network as a tool to assess the repeatability and reliability of chosen ways of classification.

POL18 Political communication in polarized societies

PP 0558 Dynamics and drivers of affective polarization in the Dutch 2023 election

Edwin Jans¹, Emma Turkenburg¹, Rens Vliegenthart¹, Sanne Kruijkemeier¹

¹ Wageningen University & Research, Strategic Communication, Wageningen, Netherlands

Affective polarization is assumed to rise during election campaigns. Feelings towards co-partisans and political opponents increase as politics become more pronounced and the stakes increase (Sood & Iyengar, 2016) and party preferences crystallize as one needs to pick one single party on election day. Heightened levels of affective polarization have been found close to election day in Israel and Spain (Bassan-Nygate & Weiss, 2022; Hernández et al., 2021), but polarization dynamics within the campaign and individual level drivers are not addressed in these studies. More detailed research has been conducted in the United States and demonstrates an increase in affective polarization towards presidential candidates during election campaigns (Singh & Thornton, 2023). However, detailed insights into the dynamics and drivers of affective polarization within multi-party election campaigns are lacking. These insights are valuable for understanding affective polarization in multi-party systems, as dynamics are likely to be more complex and multi-faceted compared to two-party systems such as in the US, due to the more complex political environment (i.e. multiple parties) and a higher need for cooperation and consensus building between those parties. Furthermore, how political parties communicate during election campaigns is radically different in multi-party systems than in majoritarian systems, with less negative campaigning. This study will fill the knowledge gap by focusing on the dynamics of affective polarization among citizens during the 2023 Dutch elections. The Netherlands is an interesting case for studying affective polarization due to the high number of parties that are elected. Moreover, political norms, the way politicians communicate and polarization itself became focal points in the 2023 campaign.

To assess the development of affective polarization and to determine what drives these developments, we employ a seven-wave panel survey (N = ~2500) held over the course of the entire Dutch 2023 election campaign. We preliminarily find that average levels of affective polarization, measured through feeling thermometers towards both parties and voters of parties, only minimally increased as the election campaign progressed. Further dynamic panel models (latent growth modelling) will be used to identify different polarization dynamics for different groups

of citizens (such as groups based on ideological preferences; holding populist attitudes; media-use; campaign-exposure and political interest) and potential drivers (such as determination of vote) of affective polarization.

POL18 Political communication in polarized societies

PP 0559 Unraveling affective polarization in Indonesia: Exploring the impact of Derogatory Information, Media Literacy, and Perceived Intergroup Threats in a social media landscape

Nuri Sadida¹, Maurice Vergeer¹, Marieke Fransen¹

¹ Radboud University, Communication and Media, Nijmegen, Netherlands

In the last decade, Indonesia has witnessed heightened affective polarization, which resulted in individuals tend to disengage from political participation, avoid interactions with opposing parties, and resist policies dictated by the opposition. Reports have linked the emergence of affective polarization in Indonesia with the presence of political buzzers on social media, who carry out political campaigns by spreading hoaxes and hate speech. Individuals who come across derogatory fake news about a candidate on social media might develop a dislike towards the candidate. Therefore, we formulated a hypothesis that individuals exposed to derogatory information in the format of fake news are more likely to experience affective polarization compared to those exposed to information in the form of real news. Information in a fake news format might also influence affective polarization indirectly through perceived threat since derogatory messages used in fake news generally include extreme language. This notion brought us to our second hypothesis, that perceived threat mediates the effect of the news format on affective polarization. Literature suggests that individuals with adequate social media literacy are likely to experience reduced affective polarization when exposed to fake news. We then proposed our third hypothesis, which that is the effect of the news format on affective polarization (mediated by perceived threat) is stronger for people with lower social media literacy skills. We conducted an online experiment with a single-factor (fake news vs. real news format) between-subjects design. Participants were randomly assigned to derogatory information about candidates in either fake news or a real news format, then participants completed the perceived threat scale, the affective polarization scale (thermometer feeling, social distance scale, and trait rating), social media use, political knowledge, social media literacy, critical social media literacy, and demographic questions. A total of 222 participants were included in this study. Findings show that exposure to the fake news format did not significantly elevate affective polarization compared to the real news format, no mediating effect of perceived threats, and that social media literacy was not a significant moderator on the relationship between news format and affective polarization. However, a positive correlation was observed between symbolic threat and affective polarization, suggesting a connection between higher affective polarization and an increased perceived threat to one's values. Exploratory analyses revealed positive associations between symbolic threat and political knowledge with affective polarization, revealing that high symbolic threat and positive knowledge correlate with increased affective polarization. Conversely, negative associations were found for the number of social media accounts, passive media use, and critical media literacy with affective polarization, indicating that more social media accounts, higher passive media use, and critical media literacy, were linked to lower affective polarization. Additionally, ANOVA results indicate Facebook users exhibiting the highest polarization compared to other platforms. Several implications for future research are suggested and are discussed in the paper. The present study enhances our understanding of the relationship between misinformation, social media literacy, and affective polarization since there is still a lack of research investigating these relationships.

POL18 Political communication in polarized societies

PP 0560 Ideological Belief Gaps and Public Opinion Dynamics across five policy areas in Sweden: Exploring divergent beliefs and the influence of Ideological News Diets

Dennis Andersson¹

¹ University of Gothenburg, Department of Journalism, media and communication, Gothenburg, Sweden

How is it that people can hold diametrically different societal beliefs about politically contested issues that is founded on empirically verifiable information? Belief gaps are defined in this study as individual's divergent beliefs about how society is managing the problems facing it. For instance, some individuals may hold negative beliefs about how the country is managing economic or unemployment issues, whilst others may express their positive beliefs that society is effectively addressing these problems. The belief gap hypothesis posits that ideology and news media use predict and explain diverse beliefs on verifiable and politically disputed issues. Ideology stands out as the most reliable predictor of belief gaps. As a distributor of information, the news media bridges the space between citizens and politics by conveying conflicting perspectives, even when these perspectives are attached to purely ideological statements. In this context, news media disseminate political messages, potentially inflating belief gaps and influencing electoral outcomes. This study explores citizens' evolving beliefs over time, emphasizing the role of prior ideology in shaping societal beliefs. However, it is still unclear how ideology operates in predicting belief disparities across various policy issues. By examining belief gaps about how Sweden is managing across multiple policy issues, it is possible to offer a better understanding of ideological influence, and it also allows for a more nuanced

explanation of the mechanisms behind belief gaps. Previous research has also highlighted the necessity to move beyond the traditional left-right or socio-economic dimension. It suggests that socio-cultural ideology should be considered as it might be, compared to socio-economic ideology, a more efficient predictor of diverging beliefs in certain policy areas. Additionally, this study investigates the role of ideological news diets in moderating the relation between ideology and beliefs. Therefore, this paper tests the belief gap hypothesis, measuring belief gaps as negative or positive beliefs about how Sweden is managing within five different policy areas: Violent crime, health care, education system, national economy, and unemployment, using both ideological dimensions to determine which is the better predictor. This is done by utilising a six-wave panel survey, conducted over the course of three years, providing an opportunity to test the assumptions of the belief gap hypothesis over a greater length of time. Preliminary findings reveal ideological gaps in crime, unemployment, and the national economy, with socio-cultural ideology playing a significant role in belief disparities across all policy areas. Interaction effects of ideological news use are evident only with socio-cultural ideology, impacting beliefs about unemployment, national economy, and the education system. Interestingly, these effects are exclusive to socio-culturally conservative individuals who over time become more negative, which widens the belief gap between liberals and conservatives. The study discusses theoretical and empirical implications of these results.

POL19 Beyond populism: New perspectives on the role of communication in times of illiberalism

PN 088 White victimhood and "right victimhood": Brexit and the mainstreaming of illiberalism on Facebook

[Natalie-Anne Hall¹](#)

¹ Loughborough University, Online Civic Culture Centre, Loughborough, United Kingdom

Social media are often deemed responsible for an increasingly hostile and dysfunctional public sphere, and are particularly implicated in the continued mainstreaming of the far and populist right and illiberalism around the world. Yet we still know little about people's experience engaging with populist and illiberal rhetoric on social media, and how this comes to affect their political attitudes and worldviews. Much existing work relies on computational techniques with "big data", but these methods are less suited to understanding experiences, intentions, and subjective meaning-making, or to investigating social and political phenomena in context. In this work, I take the issue of Britain's exit from the European Union ("Brexit") as a case study for examining the consequences of the diffusion of transnational right-wing populist politics on social media. While the Brexit campaign in the lead-up to the referendum is well-known for its use of populist rhetoric, the populist potential of the post-referendum negotiation period, 2017–2019, is overlooked. During this time, affective polarisation divided British society into newly salient categories of Leavers and Remainers, and exit deal negotiations led by self-confessed Remainer Theresa May were floundering in the face of parliamentary, EU, and public opposition. These were ideal conditions for right-wing populist politicians, media, and other actors to exploit discontent by claiming that the democratic mandate of the referendum was under threat. On Facebook, dozens of Pages and Groups emerged around support for Leave, some boasting followings in the hundreds of thousands. Many key figures in this sphere, such as Nigel Farage, "Tommy Robinson" and Jacob Rees-Mogg, remain influential illiberal populist figureheads even after Britain's inevitable departure from the EU. Using an innovative method that combined two rounds of in-depth interviews with 15 pro-Brexit Facebook users, with month-long observations of their Facebook posts, I examined the relationship between Facebook use, support for Brexit, and the transnational far and populist right during the post-referendum period. In this paper, I reveal the importance of transnational White victimhood and what I have termed "Right victimhood", and how these connected the pro-Brexit milieu on Facebook to more extreme forms of right-wing politics, including far-right conspiracy theories. These misplaced victimhood sensibilities are mutually reinforcing, working in tandem to legitimate illiberal and exclusionary ideologies. The newly significant discourse of "Right victimhood" posits that progressive cultural and minority rights agendas are in fact malevolent oppression of those with conservative views. The power of this discourse is found in its circumvention of accusations of racism while simultaneously legitimating hostile attitudes towards racialised and minoritised individuals. The spread and appeal of these logics have had reverberating consequences for recent reactionary right mobilisations, including Covid-19 counter-political disinformation and the UK Conservative Party's "war on woke".

POL19 Beyond populism: New perspectives on the role of communication in times of illiberalism

PN 089 Western media corporations and right-wing populism in Bulgaria: a political economy approach

[Martin Marinov¹](#)

¹ Penn State University, Department of Film Production and Media Studies, State College, USA

This paper focuses on the relationship between right-wing populism and the structural transformations of media industries in post-socialist Bulgaria. More specifically, the paper examines the effects of the entry in Bulgaria's press and television markets of the Western media companies Westdeutsche Allgemeine Zeitung (WAZ) and News Corp. Bulgaria's political class and News Corp and WAZ represented these companies' domination of media as a guarantee for a healthy democracy. I argue that what occurred is the opposite. Based on ethnographic and

archival research. I contend that the entry of the two Western media corporations set the stage for the emergence and proliferation of right-wing populist discourse. Thus, the story of Bulgaria's experience with Western media companies illustrates one of the major contradictions of contemporary liberalism, namely the idea that a healthy civil society could coexist with unfettered capitalism. Instead, the evidence from Bulgaria and across Eastern Europe shows that illiberal phenomena thrive in a deregulated and highly concentrated media market. Thus, the analysis of Bulgaria's experience with WAZ and News Corp. illustrates that illiberalism is not a force external to liberalism, but it is a product of liberalism's own crises. In order to understand the contradictory dynamic between liberalism's political promises and commercial media industries, it is important to look beyond texts and audience reception. Thus, my analysis focuses on media production processes. This is crucial because both WAZ and News Corp became dominant on the Bulgarian media market largely due to the country's radical liberalization of the media sphere. The German newspaper giant WAZ was the first Western media company to enter Bulgaria. From 1996 to 2010, WAZ and its two Bulgarian newspapers, 24 Chasa (24 Hours) and Trud (Labor), controlled 80 percent of the newspaper market. Based on empirical studies conducted in Bulgaria in the early and mid-2000s as well as oral interviews I conducted with newspaper editors and journalists, I argue that one of the main outcomes of this monopolistic model of the press was the entrenchment of tabloid populist language with racist overtones that paved the way for the emergence of the populist right. Equally controversial was the monopolization of the Bulgarian television market by News Corp's bTV channel. Similarly to WAZ, News Corp dominated the media sphere until the company's exit in 2010. The Western corporation established its own brand of media populism that includes nationalist and even racist features. Thus, it comes as no surprise that over the years bTV has served as an incubator of right-wing populist politicians who entered the Bulgarian parliament after serving as anchors of bTV. The argument in this paper is that illiberal phenomena are not external threats to liberal systems but are the outcomes of internal crises and contradictions. The radical structural transformations and commercialization of media industries in Bulgaria and the proliferation of far-right discourse are one evidence of this dynamic. For this reason, the paper argues that a comprehensive understanding of right-wing populism requires a political economy approach that exposes the economic and political structures which underpin it.

POL19 Beyond populism: New perspectives on the role of communication in times of illiberalism

PN 090 Media affordances for grassroots illiberalism

Maria Bakardieva¹

¹ University of Calgary, Department of Communication Media and Film, Calgary, Canada

This paper aims to contribute to the understanding of illiberalism (Laruelle, 2022) as an ideology and a popular movement with a focus on its relationship with the media. Norris and Inglehart (2019) have sought to explain the rise of authoritarian populism in terms of a dynamic between a "demand side" involving "societal forces shaping the public's values, attitudes, and beliefs, creating reservoirs of potential support in the electorate" and a "supply side," consisting of the "appeals that parties and leaders use when seeking to mobilize support" and eventually, rise to power. The notion of "grassroots illiberalism" introduced here focuses on the "demand side" of illiberalism and is intended to direct attention to the underlying conditions furthering its popularity at the level of civil society and the public sphere. These conditions are discussed with a view to the specific historical and cultural context of the new post-communist democracies of Eastern Europe. The affordances of the hybrid media environment, it is proposed, figure prominently on the "demand side" of illiberalism's spread in the region. While Norris and Inglehart (2019) noted the role of economic grievances in the rise of authoritarian populism, they gave prevalent weight to the "cultural backlash" against liberal values. In this paper, I shift the focus back to the economy, and specifically to neoliberal economic policies as they played out in Eastern European societies. Grassroots illiberalism, I argue, is a logical response to the excesses of neoliberalism and the discrediting of democracy and the erosion of social welfare it has caused. It is a response that takes the distortion of liberal values for these values themselves. Instead of (or along with) challenging the market absolutism inherent in neoliberal ideology and policy, it attacks the core principles of liberalism and rejects the institutions of the liberal social order as a whole. This disenchantment with liberal ideas has occurred at the same time as the massive spread of social media and the explosion of use practices associated with them. Research has demonstrated that proponents of both right-wing and progressive movements find affordances in social media that support their characteristic values and communicative and organizational practices. The aim of this paper is to identify those affordances of the hybrid media environment that are particularly conducive to the influence of illiberal groups and discourses. Based on a series of qualitative interviews with representatives of illiberal citizen groups in Bulgaria and a long-term observation of their public self-representation and activities, it is proposed that digital media allow these groups to construct a material base of "trenches and fortifications" (Gramsci, 1971) in which illiberal counterhegemony can embed itself. Social media in particular, are employed to simulate democratic expression emphasizing the grassroots nature of the organizations while at the same time, they help establish celebrity leaders and influencers. Affective framing and bonding obliterate the "rational-critical" ethos of the liberal public sphere and consolidates exclusionary communities.

POL19 Beyond populism: New perspectives on the role of communication in times of illiberalism

PN 091 Media and Illiberalism: A processual model for the study of the illiberal public sphere

[Vaclav Stetka](#)¹, Sabina Mihelj¹

¹ Loughborough University, Communication and Media, Loughborough, United Kingdom

Illiberalism is increasingly often mentioned among the key threats faced by contemporary liberal democracies. Yet, while other threats to democratic institutions and values attracted significant scholarly attention, illiberalism remains poorly defined, and the communication perspective on illiberalism is particularly underdeveloped. While communication research on political developments contributing to illiberalism, such as the rise of populist leaders and far-right movements, has been growing fast, this work typically shies away from wider theoretical reflections on how these shifts might be changing the institutional underpinnings and normative foundations of public communication. To help provide greater conceptual clarity and advance the debate on the role of communication in contemporary challenges to democracy, this paper builds on emerging debates on illiberalism, distinguishes it from populism, and introduces the concept of the illiberal public sphere, defined as a communicative space comprising both traditional and new media that promote and amplify illiberal actors, views, and attitudes. The paper also offers a definition of illiberalism, centered on its three constitute features: a paradoxical relationship with liberal democracy, its institutions and values; a dual nature as both an ideological universe and a set of ideas and practices; and as a dynamic, disruptive phenomenon. Furthermore, we present a processual model of the illiberal public sphere, composed of three ideal-typical stages or phases, which are designed to capture the key characteristics of the illiberal public sphere at different stages of its evolution, namely the incipient phase (where the illiberal public sphere is relatively limited in its scope and reach), the ascendant phase (where it has grown in size and influence to the extent that it is on par with its liberal counterpart and competes with it for dominance), and the hegemonic phase (during which the illiberal public sphere has become dominant, having colonized most mainstream news media channels, and forced the liberal public sphere into retreat). Using illustrative empirical examples from countries current affected by the rise of illiberalism – particularly from Eastern Europe – this model is meant to help communication researchers examine what happens to public communication after populism becomes a widespread feature of political life, and especially after far right or ultraconservative political actors have successfully mobilized populist strategies to rise to positions of power.

POL19 Beyond populism: New perspectives on the role of communication in times of illiberalism

PN 092 Political psychology of authoritarianism: Research agenda for authoritarian information environment

[Maxim Alyukov](#)¹, Gulnaz Sharafutdinova²

¹ University of Manchester, Russian and East European Studies, Manchester, United Kingdom

² King's College London, King's Russia Institute, London, United Kingdom

The global democratic backsliding occurring over recent years has attracted much scholarly attention, resulting in a boom of research on authoritarian politics, media, populism and illiberalism. One of the crucial and latest trajectories of this research is concerned with the exploration of the interplay between emotions, identities, and the media that underpin such politics. Nonetheless, so far, there has not been a systematic, structured attempt at developing the political psychology of authoritarianism as a separate research agenda that can guide concept and theory-building in authoritarian environments. Instead, most concepts and theories have been imported into the study of authoritarian systems from the research undertaken in democratic contexts. In this agenda-setting article, we first quantitatively review existing research in the last decades to demonstrate that most research in the political psychology of authoritarianism focuses on democratic environments and relies on an individual-driven, rather than environment-driven, understanding of authoritarianism. Second, by focusing on the most consequential features of the authoritarian environment for individual and social psychology, such as (a) the structure of the information environment and information manipulation, (b) non-inclusive political institutions, (c) overt and covert forms of violence, we propose an environment-driven understanding of authoritarianism, which better captures the dynamics of authoritarian environments. We use this conceptualization to review existing research on three key areas in political psychology – heuristics, ideology, and popular support. By looking at the environment rather than the individual, we demonstrate that 1) authoritarian information environments make citizens select different heuristics to analyse information vis-à-vis democratic environments; 2) non-inclusive institutions make ideology map onto different values and traits vis-à-vis the traditional left-right continuum in democracies; 3) political process driven by violence is better characterized by the concept of justification rather than support. We use this conceptualization to illustrate how it could guide research in terms of its potential for highlighting relevant questions and showing the demand for novel concepts and theories that are specific to authoritarian systems, but also relevant for democracies.

PP 0657 Beyond social media logic: Operationalizing communication logics in the context of political actors' issue salience strategies on social media using a mixed-method, cross-platform approach

[Hedvig Tønnesen](#)¹

¹ NTNU, Department for Sociology and Political Science, Trondheim, Norway

To gauge the political and democratic consequences of political actors' integration of social media practices in their campaign toolkit, scholars have seized extensions of the concept of "media logic" (first coined by Altheide & Snow, 1979) – e.g., new/digital/network/social media logic. However, there has been few attempts of operationalizing what such "logics" consist of (Fredheim, 2021) and the application of such concepts in empirical research has been beset with conceptual and operational fuzziness (Brants & Praag, 2017). This makes it difficult for researchers to build upon previous research and hinders theory-building. The study at hand aims to remedy some of the operational fuzziness surrounding "media logic" and its extensions into distinct "logics" for social media. Focusing on political actors' communication strategies related to issues, this study conceptualizes and operationalizes three communication logics that theoretically contribute to explicate the concept of "social media logic" in political communication: issue ownership logic, news media logic and feedback logic. Employing a dynamic theoretical and empirical approach, this study investigates these communication logics' influence on parties' decisions on which issues to emphasize in election campaigns. Empirically, the study considers the strategies of political parties in the 2021 Norwegian election campaign using a mixed-method, cross-platform research design. The study draws on two data sources collected after the 2021 election: in-depth interviews with campaign strategists from eight major Norwegian parties and a manual, standardized content analysis of the corresponding parties' and party-leaders' Facebook, Instagram, and Twitter posts (n = 1,685). The study concludes with a critical discussion on the applicability and explanatory value of the "logic" concept in understanding the dynamics of social media and political communication.

PP 0658 Politicians' news media relations on social media. An actor-centered approach to communication flows in the digital media environment

[Rune Karlsen](#)¹, [Audun Beyer](#)², [Kari Steen-Johnsen](#)³

¹ University of Oslo, Department of media and communication, Oslo, Norway

² Kristiania University College, Department of Communication, Oslo, Norway

³ Institute for Social Research, Institute for Social Research – Oslo, Oslo, Norway

With social media, the conditions for agenda setting and the framing of issues have changed, increasing the possibilities for a wide range of actors to communicate directly with audiences and influence the issues salient on the public discourse. A set of studies demonstrate that communication flows between traditional news media and social media are dynamic and multifaceted, showing that influence goes both ways. In this article, we suggest an actor-centered approach to investigate communication flows in the digital media environment and introduce the notion of "News Media Relations" (NMR) which refers to whether and how actors on social media engage with the news media. This analytical tool distinguishes between two types of news media relations, namely amplify framing, where actors on social media emphasize the existing frame in a news story, and re-framing, where actors introduce new and other interpretive frames to an issue than what is present in the original news story.

We apply the NMR framework in a study of politicians' social media communication during a six month period in Norway. Earlier research shows that both high profile and less visible politicians exploit social media communication opportunities for a range of purposes. Still, we know little about the extent to which such key actors pursue a separate communication agenda, or rather relate to the news media on social media to amplify existing frames or take issue with them and introduce new and competing interpretive frames.

The data encompass a manual quantitative content analysis of the Facebook posts of party leaders and deputy leaders from the nine parties represented in parliament. The results show that national politicians do indeed engage with news stories, as 60 per cent of all social media communication in our data referred to stories in news outlets. Amplify framing clearly dominated this type of communication, only 5 per cent of politicians' communication on social media is characterized as re-framing. While party leaders related to the news media to a greater extent than other politicians, the two prime ministerial candidates stood out with very little news relations on social media, potentially reflecting a distinct logic of appropriateness for those in the most prominent positions. While re-framing

had a clear positive relationship with audience reactions, amplify-framing had a negative relationship, prompting further inquiry into why politicians, despite increased audience engagement, do not employ re-framing strategies more frequently.

Given the entanglement of traditional media content with social media, the concept of NMR enables studying to what extent and how such entanglement takes place through the actions of core social media actors. The results of this study indicate that much social media communication is separated from the news media, suggesting a distinct social media communication sphere. Still, a majority of social media communication in our study indicate an intertwined political public sphere, where communication flows between social media and the news media. The low levels of re-framing, however, indicates that this communication flow does not entail a negotiation or altering of the interpretive frames available to the public.

PP 0659 Construction of political leadership in the contemporary context: Interplay of vertical and horizontal dimensions

[Silvija Vuković](#)¹, Nico Carpentier¹

¹ Charles University – Faculty of Social Sciences, Institute of Communication Studies and Journalism, Prague, Czech Republic

This paper examines the social construction of political leadership within the context of celebrity politics (Street, 2004) and populism (Moffitt, 2016). Looking at political leadership with social constructionist lenses, the study recognizes that leadership is constructed, and can change over time and in different contexts. We argue that political leadership is constructed through what we distinguish as vertical (extraordinary/superior) and horizontal (ordinary/on the same level) dimensions, each with its elements. The vertical dimension of leadership refers to the demand for the extraordinary leader, while the horizontal dimension puts the leader at the same level as ordinary citizens.

The concepts of vertical and horizontal dimensions of political leadership are the result of our modeling strategy. They structure existing theoretical concepts and the qualitative-empirical evidence from our research, including the creation of more developed connections with populism theory. This article's objective is not only to analyze how these two dimensions (co-)exist, but also how they are articulated, how they relate to each other, and how they become reconciled. Therefore, while we use the literature on celebrity politics and populism to develop our model, our interest here is not so much in how celebrity politics or populist leadership function. We aim to move beyond these existing bodies of literature by focusing on the social construction of leadership itself. Our article also aims to analyze how the horizontal and vertical dimensions operate together in this contemporary condition.

The empirical part is grounded in the qualitative content analysis based on 20 interviews with the Facebook followers of two Croatian politicians, president Zoran Milanović, and the mayor of Sinj, Miro Bulj. Through iteration between theory and analysis, we aimed to deepen the understanding of political leadership in contemporary settings. The empirical part of the analysis shows that neither one of the elements is dominating the construction of leadership, but that they rather interact. These interactions between the dimensions are visible in the interview material, in three different ways. First, some of the elements pair, because of their structural similarities. Second, modesty produces a bridge between the ordinary and the extraordinary. Finally, the impossibility of a perfect balance is also acknowledged. In short, leadership is shown to be paradoxical but not contradictory, as it is an always imperfect reconciliation of the horizontal and vertical dimensions.

PP 0660 Influencer creep in Parliament: Platform pressures in French MP Communications work

[Anning Claesson](#)¹

¹ Institut Polytechnique/Sciences Po, CREST/Médialab, Paris, France

Becoming an elected official means chasing visibility. To reach out to current and future voter bases, an MP must dedicate a significant portion of their time to outreach and communications. While engagement with traditional media remains an integral part of this work, today's high-choice digital media environment leaves MPs with a plethora of options for expressing themselves in public. However, this multiplication of communication channels also creates new pressures for MPs to master not only concrete digital skills, but to gain an understanding of the cultures and norms of an ever-increasing number of platforms. Often, it requires mastering the "game" of algorithmic

recommendation, playing by the rules of platform infrastructures. This shift reflects a broader trend seen in other professions (artists, academics, activists...), ushering in "influencer creep" (Bishop, 2023) where the working habits of full-time social media influencers permeate the practices of other groups, even those that outwardly distance themselves from such a label.

While there is no shortage of scholarly work mapping how social media and other digital tools transform political communication (even ushering in a wave of "platform parties" (Gerbaudo, 2019)), much of this literature focuses on the outputs of such transformations in the form of digital media content. We currently lack an in-depth understanding of the *production* of political communication in the social media age. As conditions for success in reaching the general public become more and more complex, how do politicians integrate multiple media logics in their working practices? How do these pressures add to their already intense workloads, and who is better placed to adapt to them?

In this article, I seek to understand how French MPs and their teams integrate such pressures in their day-to-day communications work. Through over 40 semi-structured interviews with MPs and their assistants, participant observation in the French Assemblée Nationale, and a quantitative mapping of MP social media presences, I explore the following question: How do MPs perceive their communications work in a high-choice media environment?

Despite the fact that we observe significant diversity in the communication practices of MPs (often divided along party lines), there is convergence in the incentives they face to increase their visibility. The structural incentives for political communication work are more influenced by platform infrastructure than by the rules of the political field. Three main aspects of Bishop's "influencer creep" can be identified in the working practices of French parliamentary teams: the construction of a personal brand, optimization, and the performance of authenticity. Notably, these logics can be identified even among MPs that are not among the most active on social media.

This article discusses the implications of internalizing algorithmic logic in parliamentary work and the changing working conditions of public figures. MPs face similar challenges as other professions who depend on public visibility and find themselves at the mercy of ever-changing platform structures, intensifying and diversifying demands on skills, resources, and labour.

POL20 Political actors @ the centre

PP 0661 The rhetoric of exemplarist foreign policy: President Donald Trump's promotion of global (dis)order at the United Nations

Jason Edwards¹, Maria Hegbloom²

¹ Bridgewater State University, Communication Studies, Bridgewater, USA

² Bridgewater State University, Department of English, Bridgewater, USA

For 75 years American presidents, Republican and Democrats, rhetorically promoted a liberal international order based upon free trade, democracy promotion, and engagement with international institutions.[i] Republican and Democratic presidents discursively emphasized different aspects of this order, but they generally supported U.S. global engagement and advanced the United States as the "leader of the free world." Presidential Donald Trump fundamentally rejected this liberal international order and sought to remake foreign policy in his image. His dismissal of "globalist" ideology had a profound effect on international institutions, alliances, free trade, and democracy promotion around the world. In this paper, we examine how President Trump constructed a fundamentally different vision for America's role in the world.

To do so, we conduct a textual analysis of President Trump's speeches at the United Nations. The American president's address at the United Nations is like his State of the Union address. In that address, the president lays out his policy vision for the United States for the coming year. Similarly, U.S. presidents since Harry Truman have argued for the support of liberal international order and America's leadership role in that order. In this paper, we outline the rhetorical strategies President Trump used to repudiate this global order in his United Nations addresses. Specifically, we argue Trump promoted a vision of America's role in the world that emphasizes the power of its example and a withdrawal from the global stage. His U.N. rhetoric echoes U.S. foreign policy principles of the 19th century where American presidents argued the United States should remove itself from global affairs and instead be a model for the world to emulate. According to Trump (and exemplarists), getting deeply involved in global problems brings more harm than good to U.S. interests and undermines its body politic. By emphasizing this exemplarist tradition of America's role in the world, Trump destabilized the liberal international order promoted by U.S. presidents for 75 years, sowed chaos in U.S. global engagement, and had profound consequences for U.S. debates on America's role in the world.

We end the paper reflecting on how the Biden administration attempted to repair the damage from Trump's exemplarist foreign policy and how Trump has influenced the Republican party's foreign policy platform going into the 2024 presidential election.

[i]Let me be clear we are not pollyannish about American foreign policy. The United States has made significant errors on the world stage. My point here is more a contrast to President Trump compared to his predecessors.

POL21 Conspiracy theories, beliefs, and media

PP 0756 The spreading of hate. Diffusion dynamics of conspiracy theories across platforms

Annett Heft¹, Kilian Buehling¹, Xixuan Zhang²

¹ Freie Universität Berlin and Weizenbaum Institute for the Networked Society, Weizenbaum Institute, Berlin, Germany

² Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

The rise of digital platforms and media online is closely linked to an increasing proliferation of conspiracy theories. These venues not only enable content to be spread easily across platforms by technical means but also allow users to be active on several platforms simultaneously and incorporate observed content into discussions elsewhere. That way, networked digital information ecologies (Häussler 2021) can facilitate the diffusion of conspiratorial content, formerly strongly confined to fringe communities, to venues with outreach to the general public. Likewise, topics of general discussion can be woven into conspiratorial content. Understanding this mutually interrelated nature of digital information ecologies is central to capturing the proliferation of conspiracy theories online and its effects on public debate and society. While this calls for cross-platform empirical studies, most analyses are single-platform studies on single conspiracy theories (Mahl et al. 2022).

Our project focuses on two conspiracy theories closely linked to far-right ideology and likely to spread hatred within society: the narratives of the "New World Order" and the "Great Replacement/White Genocide". Concerning these conspiracy theories, we contribute to furthering our understanding of the patterns and mechanisms of cross-platform diffusion by a multidimensional comparative study across several platforms and media in a timeframe of ten years (2011 – 2021). Our research questions are: (1) How does the salience of these conspiracy theories and their development over time differ or align across platforms? (2) How are the observed dynamics interrelated across platforms?

In this project, we understand cross-platform diffusion as the result of independent actor decisions and operationalize content-based diffusion as a reference to the same content on different platforms (Heft & Buehling 2022). Our design comprises five platforms and communication venues spanning a spectrum from discussion forums prone to foster conspiratorial subcultural milieus (4chan, Reddit) via general audience platforms (Twitter, now 'X') to broadcast venues that address niche (alternative media) and general audiences (legacy media). We argue that in the diffusion of conspiratorial content, each platform type serves a particular function that should be manifested in the diffusion patterns. For example, we can expect the discussion forums to be breeding grounds for narrating conspiracy theories, while alternative media could constitute brokers between counter-public spaces and the general public. At the same time, we acknowledge the relevance of public events and the reciprocal nature of cross-platform diffusion, rendering the direction of spill-over processes an empirical question.

We developed a comprehensive dictionary for our raw data collection, resulting in about 3 million English-language posts from 4chan and Reddit, over 20 million Tweets, 32.000 alternative media articles, and about 8.000 legacy media articles. As a second step, we trained and applied a machine learning classifier to distinguish between conspiratorial content related to the theories studied. In addition to measuring the intensity of the public visibility of the conspiracy theories over time, we test the direction of cross-platform contagion effects by estimating point process models indicating how an increase in the prevalence of conspiracy-related posts on one platform influences the prevalence on others.

POL21 Conspiracy theories, beliefs, and media

PP 0757 A social web of conspiracies: Exploring the relationship and mechanism between media use and conspiracy beliefs across generations

Peter van Aelst¹, Laura Jacobs¹

¹ University of Antwerp, Political science, Antwerp, Belgium

Recent events, such as the COVID-19 pandemic or election campaigns in different countries, have demonstrated that conspiracy theories and false information spread rapidly on social media platforms and can undercut basic trust in democratic institutions. While conspiracy theories (CTs) are becoming a well-documented phenomenon (e.g. Sutton & Douglas, 2020), studies report differences in the extent to which different segments of the population are susceptible to misperceptions (Williams et al., 2022). As misperceptions are found to thrive online on social media, patterns in media consumption have been suggested as a key source and socialization agent for conspiracy beliefs (Enders et al., 2021; Strömbäck et al., 2022). So far, however, it remains unclear how different types of news media diets interact with misperceptions and beliefs in CTs and via which mechanisms this occurs.

We aim to add to this debate via examining how patterns in news media consumption – both traditional and social media – affect conspiracy beliefs, via assessing two key elements that have so far remained under explored.

First, since young and adult citizens largely differ in the types of news media they consume, we will systematically compare how age affects conspiracy beliefs. Given the fact that social media is becoming more important as an information source for the younger generations underscores the necessity of obtaining insight in this relationship. Second, we aim to clarify the exact mechanisms through which (social) media guides misperceptions and beliefs in CTs. Building on research in the context of COVID-19, we posit that distinct news media use is related to key attitudes which are in turn associated with conspiracy beliefs, namely (lack of) trust in news media and science and populist attitudes (e.g. Eberl, et al. 2021). Our overall theoretical expectation is that younger people—via their distinct patterns in news media use—are more likely to display lower levels of overall news media trust and trust in science, and higher levels of populism, which results in more conspiracy beliefs.

We rely on a cross-sectional population survey ($n = 2,689$) in Belgium to focus explicitly on how (social) media use and conspiracy beliefs correlate with three political attitudes, comparing different age groups (including adolescents and young adults: 16–28 years). We apply structural equation modelling (SEM) techniques to assess the interplay between the various antecedents of conspiracy beliefs. Using SEM allows us to identify both direct and indirect relationships between news media use and conspiracy beliefs, paying attention to potential mediators (populism, trust in news media, trust in science) and moderators (age). As such, we do not only contribute to the debate on the antecedents of conspiracy beliefs, but also add to the debate of how distinct political attitudes are intertwined and manifest themselves across generations.

POL21 Conspiracy theories, beliefs, and media

PP 0758 The affinity between conspiracy mindsets and misinformation perceptions across seven countries spanning the Global North and South

Michael Hameleers¹

¹ University of Amsterdam, ASCoR, Amsterdam, Netherlands

Citizens across the globe are extremely concerned about misinformation in their newsfeed (Newman et al., 2023). At the same time, however, only a marginal proportion of people's media diets is expected to contain false or deceptive information (Acerbi et al., 2022). Arguably, citizens severely overestimate the amount of false information they receive (Altay et al., 2023; Knuutila et al., 2022), which may have severe democratic ramifications: Disproportionate misinformation perceptions may lead to news avoidance, anti-democratic behaviors amidst crises (Hameleers et al., 2022) and generic distrust in reliable information (Van der Meer et al., 2023). But what may explain these heightened risk perceptions of encountering misinformation?

In this paper, we argue that inflated perceptions of misinformation salience coincide with rising distrust in established information sources (e.g., Newman et al., 2023), and the growing appeal of counter-factual explanations of reality. Specifically, perceptions of distrust related to the information disseminated by established sources, including the mass media and political elites, may correspond to an inflated perception of being flooded by mis- and dis-information. Even more so, when people think that established institutions take part in 'evil' schemes, they may also perceive false information and deception to be prevalent. Such a cynical outlook on established knowledge may be reflected in conspiracy mindsets, which relate to the perception that evil forces are responsible for plotting a scheme that threatens the well-being of ordinary people (e.g., Barkun, 2003).

Against this backdrop, and as an important contribution to existing research on misinformation perceptions (e.g., Hameleers et al., 2021; Knuutila et al., 2022), this paper explores the relationship between political cynicism, media trust, and conspiracy mindsets on the one hand and misinformation salience on the other hand across countries in the Global North and South: Argentina, Brazil, Chile, Mexico, Spain, The United States, and the Netherlands.

The main findings of our representative survey ($N = 3,718$) indicate that people generally perceive that misinformation is present in more than half of all information ($M = 52.10\%$, $SD = 23.38\%$). These estimates are highest in Mexico ($M = 57.07\%$, $SD = 22.90$) and lowest in the Netherlands ($M = 45.92\%$, $SD = 22.77$). In line with our main expectations, the OLS regression models indicate that the stronger people's conspiracist mindset, the more misinformation they perceive ($B = 8.57$, $SE = .59$, $\beta = .59$, $p < .001$). We also see that the more politically cynical people are, the more misinformation they perceive ($B = 2.82$, $SE = .81$, $\beta = .15$, $p < .001$). The same applies to media trust: The more people trust the news media, the lower their estimates of misinformation ($B = -1.80$, $SE = .77$, $\beta = -.10$, $p = .019$). These findings suggest that conspiracy mindsets, cynicism, and distrust play central roles in people's vulnerability to disproportionate estimates of misinformation – which offers important avenues for future research on resilience to (perceived) misinformation and practical interventions that aim to relativize people's risk assessment of an important, yet often inflated, phenomenon in today's digital information setting.

POL21 Conspiracy theories, beliefs, and media

PP 0759 Networked exposure: What bridging aggregate and individual network data can tell us about hyperpartisan, alternative, and conspiracy media

[Ernesto De León](#)¹, [Jakob Bæk Kristensen](#)², [Mykola Makhortykh](#)³, [Eva Mayerhöffer](#)⁴

¹ University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

² Roskilde University, Department of Communication and Humanities, Roskilde, Denmark

³ University of Bern, Institute of Communication and Media Studies, Bern, Switzerland

⁴ Roskilde University, Department of Communication and Arts, Roskilde, Denmark

The study of hyperpartisan, alternative, and conspiracy (HAC) media has been split down two lines of questioning. One focuses on the individual, inquiring into who consumes this content, how they get there, and the relationship between its consumption and attitudes towards politics. The second focuses on the aggregate level, helping us understand the hyperlinking practices between these pages, how they present their material, and how it's picked up by political actors. While both are valuable in their own right, to date, there have been little efforts to reconcile these two approaches.

We argue that the gap between individual and aggregate analyses must be bridged. Such a reconsolidation recognises a more nuanced reality of our current networked information environment, where individuals seek out sites they enjoy but are also directed to information by influential online actors. For example, HAC media and actors that share their content, in their quest for credibility, often reference and link to 'mainstream' news sites and media, not just their HAC counterparts (Mayerhoffer & Heft 2022, Herasimenka et al 2023). On social media platforms, work has shown that a variety of 'problematic' actors (eg highly-partisan accounts) commonly point their audiences to legitimate news sources – it is not only 'fake' news that is circulated in these communities (Farris et al 2017). Such observations shine light on the multifaceted nature of information diffusion: online actors do not only need to lead to dubious information sources to convince their publics of a point. Instead, they can raise the salience of given issues, linking to seemingly legitimate news sources, while providing specific framing within a platform (Herasimenka et al 2023).

Individual-level approaches have mostly focused on measuring direct engagement with HAC media. Nevertheless, by doing so, studies have overlooked the vast array of 'inconspicuous' mainstream sources that are mobilised and distributed throughout these networks. We propose that when studying the exposure to and effects of HAC media, we must look at *networked exposure*: consumption and engagement with the topics and content that is shared in the networks where HAC media is prominent, beyond the sites that are labelled as 'problematic'. Such an approach would shine a broader light on how individuals access a broader information diet that does not exclusively focus on HAC media sites themselves, yet may have negative consequences on attitudes and beliefs.

We propose a novel method integrating individual web tracking (N = 907) with aggregate network analysis of HAC media sharing actors. Examining network overlap between individual-level access and aggregate sharing, we identify non-HAC URLs disseminated by those sharing HAC media. Tracing these URLs back to individuals, we assess if access to HAC media predicts engagement with mainstream content mobilized in these networks. Combining networked exposure with surveys, we investigate the relationship between exposure and key attitudes of interest.

POL21 Conspiracy theories, beliefs, and media

PP 0760 Leave me alone, I do not believe you! News avoidance, conspiracy beliefs and vaccine opposition

[Dominika Betakova](#)¹

¹ University of Vienna, Department of Communication, Vienna, Austria

News avoidance attracted academic attention due to its increasing prevalence and its association with negative democratic outcomes. The intentional news avoidance, a deliberate avoidance of news, has been linked to a higher presence of misbeliefs and potentially lower political knowledge, while low news consumption, not necessarily a result of intentional actions, was found to be associated with reduced political participation and lower levels of uncontested knowledge. Due to the differences in outcomes and drivers between these two dimensions of news avoidance, a more nuanced understanding of their interplay and its association with negative democratic phenomena is needed, as not all types of news avoidance behaviors seem to endanger democratic integrity equally. For instance, not consuming news due to entertainment preference might be less harmful than avoidance driven by distrust in media and politics. Therefore, disentangling news avoidance types and their association with outcomes such as conspiracy beliefs or anti-COVID-19 vaccine stance is crucial for understanding the potential democratic threats of news avoidance. The current study sheds light on the two mentioned types of news avoidance and their combinations, resulting in a nuanced group of news (non-)users. It explores their association with holding conspiracy beliefs and an opposition stance to the COVID-19 vaccine in Austria. Importantly, Austrian government proposed mandatory vaccinations against COVID-19 that sparked public polarization in November

2021 and was forced to scrap the law in July 2022 due to citizens' backlash and protests. Thus, the current study uses the Austrian National Election Study online survey data obtained through a quota-based sample of Austrians collected as part of Wave 15 in October 2022 (n = 2,233). Preliminary logistic regression results suggest that gender (being a woman), younger age, lower education, lower trust in media and politics and higher intentional news avoidance are significant predictors of holding conspiracy beliefs. In addition, once a more nuanced groups of news (non-)users were used as predictors in a logistic regression, only the membership in the group of news consumers who also intentionally avoid news acts as a significant predictor of conspiracy beliefs. Regarding predicting vaccine opposition, logistic regression model suggests that gender, younger age, lower education, lower trust in media and politics, higher political interest and higher intentional news avoidance act as significant predictors. In the model utilizing the groups of news (non-)users, none of the groups act as significant predictors. The findings support previous research pointing out intentional news avoidance being associated with misbeliefs and additionally finds an association between this type of avoidance and opposing COVID-19 vaccines. This implies that while low news consumers might possess lower levels of uncontested knowledge, it is the intentional news avoiders who seem to be more prone to believe conspiracy theories or actively oppose vaccination, a phenomenon that can jeopardize public health initiatives in the upcoming future. The data collection for Wave 17 utilizing the above-mentioned survey items is scheduled for February 2024 allowing for causal inferences at the time of the conference.

POL22 Campaigning online in the election context

PP 0761 Populism, Twitter, and the European public sphere in the 2019 EP elections

Juha Herkman¹, Emilia Palonen²

¹ University of Helsinki, Faculty of Social Sciences / Media and Communication Studies, University of Helsinki, Finland

² University of Helsinki, Faculty of Social Sciences / Political Science, University of Helsinki, Finland

By applying a new conceptual framework on populist dynamics, we investigated how parties were positioned and responded to by other parties in the European Parliamentary (EP) 2019 elections, and what their Twitter campaigns can tell us about the different forms of populism in the European and national public spheres. Our focus is on seven European countries across the field in which Twitter (X) formed a central platform for political communication: the Netherlands, Germany, Finland, Italy, Spain, Ireland, and the UK. The countries also represent democratic-corporatist, polarized-pluralist and liberal models according to Hallin and Mancini's seminal classification.

The raw data of 1,552,674 tweets was originally gathered by hashtag basis from all 27 EU countries during a month period around the EP 2019 elections in May. The selection of seven 'Twitter countries' above was chosen to analyze in more depth the data of 49,492 tweets sent by actors with political affiliation to find out, who were participating the debates, which topics and themes various actors promoted and how they were linked to each other. A mixed-method approach of computational and manual thematic analysis, automated LDA topic modelling and social network analysis was used to answer the questions. In general, our data shows vertical Europeanization of election debates in Twitter but hardly any horizontal cross-country Europeanization. The debates were also highly context-laden and promoted often national angle and significant Euroscepticism.

In our definition, populism was understood as an affective antagonism between 'us' and 'not us'. In our analysis, we witnessed antagonisms between different political camps such as populists against anti-populists, radical right against left-greens, Eurosceptics against pro-Europeans, pro-Brexiters against anti-Brexiters and (ethno-) nationalists against trans-nationalists or cosmopolitans. In discursive identity construction, Europhiles emphasized a common 'us' as Europeans, whereas the radical right promoted nativist exclusion of 'not us' in their identifications. However, according to our data, the radical right's agenda and rhetoric did not become mainstream among other political actors, and Twitter networks remained rather national and clustered.

We developed a populism typology of fringe, mainstream and competing populism in which populism is approached in relation to hegemonic political discourses at national level. According to our analysis, populism has remained the most 'fringe' in democratic-corporatist countries in which radical right parties have challenged the hegemonic bloc of traditional consensual parties but not totally broken it. However, in these countries, populist antagonism has partially been mainstreamed alongside the radical right parties that have become normalized in their party fields, and especially in the Netherlands, populism as political logic seems to have become a mainstream way to construct political identities both on the right and left spectrum of the party field. In polarized-pluralist and liberal countries, populism seems to have become mainstream more easily as a way of promoting antagonist political communication. In the UK, the Brexit vote and the two-party system apparently led towards competing populism.

POL22 Campaigning online in the election context

PP 0762 Tracking the dynamics of negative political communication during election campaigns in on- and offline communication environments

Michaela Maier¹, Fabian Thomas¹, Lukas Rahnke-Otto²

¹ University of Kaiserslautern-Landau RPTU, Institute for communication psychology and media education, Landau, Germany

² GESIS Leibniz Institute for the Social Sciences, Computational social science, Cologne, Germany

Election campaigns are dynamic in nature. Over the course of weeks, citizens are exposed to political information through their mass media as well as interpersonal communication environments online and offline ("MIC"). Many of the political messages citizens receive during the campaigns are negative. Negativity is one of the most prominently investigated topics in political communication for at least two good reasons: On the one hand, conflict and competition are essential to democracy, on the other hand, it has been argued that negative campaigning can have dysfunctional effects on important outcome variables, e.g. political interest or participation.

However, the current state of research leaves several research questions open: (1) How does the exposure of citizens to negativity develop during a political campaign? Is negativity a constant factor in political discourse, or is it triggered by specific campaign events? (2) So far, negativity has been investigated separately in the various MICs. Therefore, we pose the question whether the degree and possible dynamics of negativity is similar in political communication channels or whether specific communication channels provide a platform for negative campaigning. (3) Finally, findings regarding the effects of exposure to negative campaigning on central political outcome variables are mixed. We therefore ask whether dynamics in the exposure to negative political campaigning have an effect on political outcomes, i.e. campaign interest.

In order to answer these questions, we draw on data collected during the German federal election campaign in September 2021. We combined several methods of data collection, i.e. mobile experience sampling to capture citizens' offline communication and the continuous web tracking of their online communication, to capture participants' exposure to negativity during the campaign. Further, we relied on participants' negativity perceptions (for the experience sampling data) and automated content analysis (for the web tracking data) as indicators of exposure to negative political information. Campaign interest was measured with an additional survey immediately after the elections. Overall, 447 participants passed all quality checks.

Relying on multilevel growth curve models and considering the three TV debates between the party front-runners as the most important campaign events, preliminary analysis showed that those events did not trigger any (linear) development in participants' exposure to negativity for interpersonal communication and mediated communication, e.g. news and ad exposure. Only the web tracking data showed (1) a linear decrease in the number of exposure to negative political information during the three days after the first debate and (2) a linear increase in the share of negativity in participants' media exposure after the three days of the third debate. Using these estimated growth rates as predictors in regression models, no effects from dynamics in the number or the share of negativity in participants' media exposure on campaign interest were found. Challenges during data collection and data analysis as well as additional findings will be discussed.

POL22 Campaigning online in the election context

PP 0763 Links in the chain: Political parties' online link sharing during campaign times in Belgium and Sweden

Willem Buyens¹, Anders Olof Larsson²

¹ University of Antwerp, Department of Political Science, Antwerp, Belgium

² Kristiania University College, Department of Communication, Oslo, Norway

Social media platforms allow political actors to link to other online resources. They can share news articles that are in line with their strategic positions, guide their online followers to information about political processes, and promote their own, their parties', or their campaigns' websites. In other words, political actors have the potential to play an important role in the online resources their audiences are exposed to and access in the hybrid media system. Thus, politicians are strategic curators of online information, as they have been shown to be selective when sharing information on social media, which may impact social media users' trust in information providers, like news outlets.

Previous studies have detailed political actors' social media adoption, their integration of visuals in online communication, and their news sharing on social media. Zooming in on their linking practices, this study will add to the literature on political actors' online behavior by describing which online resources political parties share on social media and how those linking practices differ across countries and over time, guided by our main research question: *RQ. To which online resources do political parties link during campaign times?*

This study provides a longitudinal and comparative perspective on link sharing practices on social media by political parties in Belgium and Sweden across multiple campaigns. Concretely, we collected all Facebook posts made by the 7 Dutch-speaking Belgian parties one month before the federal elections in 2014 (N = 484) and in 2019 (N = 649).

and the posts made by 11 Swedish parties one month before the general elections in 2018 ($N = 1,885$) and in 2022 ($N = 1,511$). From these posts, we selected the ones that contained a link, which yields a dataset of 910 individual Facebook posts. To add to the data provided by CrowdTangle (e.g., user engagement, time of posting, link URL), manual coding is applied to gain information on the types of (news) websites that the parties link to and on the position of the parties in the political context at the time. Automatic coding is used to determine the sentiment of the posts and to identify any reference to political actors in the link text.

Our analysis of these posts will provide insights into political actors' online behavior in three ways. Firstly, we will inductively study all links that are shared by political parties, adding to the literature that zooms into more specific types of links (e.g., news). Secondly, we will compare these linking practices across election times and across countries, studying differences and similarities in a comparative way. Thirdly, by incorporating user engagement into our analyses, we will account for one possible driver of politicians' online link sharing behavior.

POL22 Campaigning online in the election context

PP 0764 Intimate and opinion-oriented? Examining youtubers' opinion leader potential and user engagement with their political content

[Darian Harff¹](#)

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

Social media influencers (SMIs)—ordinary people who gain public visibility by posting online (Khamis et al., 2017)—have in recent years repeatedly engaged with political issues (Newman et al., 2023). This new phenomenon is frequently researched from the perspective of (parasocial) opinion leadership (e.g., Harff & Schmuck, 2023; Peter & Muth, 2023), but we know little about characteristics of SMIs' political content which support such conceptualizations. More specifically, it has remained unclear to what extent SMIs rely on opinions and facts in their communication of political issues, and whether markers of possible opinion leader functions can be derived from their posts. In addition, an overview of the sources that SMIs use to support factual claims is currently missing. Last, indicators such as direct address or self-disclosure are considered attributes which explain the development of parasocial connections among recipients (Ferchaud et al., 2018). However, their prominence in *political* content of SMIs is unexplored, where they may not only constitute the frame of SMIs' opinion leadership (Wunderlich, 2023), but also trigger engagement in the form of user comments.

Method

To address these prominent research gaps, I conducted a content analysis among a sample of 41 SMIs on YouTube nominated by German youth in a quota-based survey ($N = 1829$). A sample of SMIs' posts was divided into political and non-political content, part of which was subsequently coded in detail ($N_{\text{Political}} = 295$). In the analyses, I provide important insights into many categories relevant to evaluate SMIs' potential as political opinion leaders (e.g., opinion expression, parasocial content attributes), and connect these variables to the rate of comments per views on videos.

Results

Most political videos of SMIs featured only opinions and no facts (36%), while content containing only facts was least prevalent (14%). When talking about political facts, SMIs often—in 34% of cases—referred to articles in legacy media. However, frequently, SMIs also did not provide sources for their claims (in 31% of cases). More positively, SMIs regularly provided participation advice (19%), simplified politics for their audiences (e.g., explaining political concepts: 28%) and made efforts to raise followers' political interest (e.g., presenting political topics as 'novel': 24%). Both direct address and self-disclosure were relatively prevalent in SMIs' political content and—as exploratory analyses show—equally present as in their non-political content. While self-disclosure was less featured in videos containing only facts than in videos containing only opinions, direct address was at similarly high levels across all political video types. Finally, direct address, co-presence of facts and opinions in videos and simplification of politics were positively related to the number of comments per views on political videos.

Conclusion

This research shows that SMIs tend to primarily express their opinions on political issues in their political communication, which often happens in an intimate setting of direct address and self-disclosure. While their fact-based communication often lacks proper references to sources—questioning whether their political communication is accurate—SMIs simultaneously show their potential contribution to democracy, as they regularly give participation advice and simplify political issues for audiences, which also leads to more user engagement below videos.

POL22 Campaigning online in the election context

PP 0765 From dances to debates: An online experiment to examine the effects of political self-personalization on TikTok

Hannah Fecher¹, Susan Vermeer²

¹ Johannes Gutenberg University, Department of Communication, Mainz, Germany

² Wageningen University & Research, Strategic Communication Group, Wageningen, Netherlands

TikTok, which started out as a lip-syncing and dance platform for especially young people has long become more than just a place for mindless entertainment. With its rising popularity, even political actors have started to expand their campaigning efforts to this social media platform. Having to adapt to the affordances and informal behavioral norms of TikTok to stay visible for constituents, politicians are trying to navigate citizens' diverging expectations of presenting themselves both professionally and privately.

With prior research showing that a violation of those expectations can lead to negative candidate evaluations (Bullock & Hubner, 2020), it has become extremely important to examine the effects of both professional and private self-personalization strategies on TikTok. While there have been studies conducted on the effects of political actor's self-presentation on other platforms (Kruikemeier, 2014, Lindholm et al., 2021), research on a strictly audio-visual platforms, like TikTok, is lacking. As personalization is usually investigated one-dimensionally, this research on self-personalization on TikTok adds to the literature as it treats self-personalization in a more faceted way – it differentiates between visual and textual self-personalization.

An online experiment (N = 342) with 2 (visual personalization: professional vs. private) x 2 (textual personalization: professional vs. private) between-subject design was conducted to investigate how different types of self-personalization strategies affect citizens' evaluation of political candidates, in Germany. Each respondent was randomly assigned to one condition – and was shown a TikTok video based on pre-existing footage of a regional Thuringian politician. The in-video text element in the top of the video was manipulated to either fit professional personalization (i.e., by mentioning a policy) or private personalization (i.e., by mentioning a personal issue: clothing style). In terms of visuals, respondents were exposed either to a TikTok video showing the politician giving a speech or a TikTok showing him lip-syncing to a viral German rap song.

The results show mainly no significant differences between the use of professional or private self-personalization on candidate evaluation. However, private visual self-personalization on TikTok was less likely to violate young citizens' expectations (Gen Z) in comparison to older citizens, which in turn led to better candidate evaluations. As candidate evaluation showed to correlate with vote choice, the results could indicate, that while privatization might not be beneficial to increase positive candidate evaluations, it also does not harm it. Due to the majority of young users on TikTok, who are not taken aback by private visual self-personalization, it could present a good way to generate user engagement and visibility.

Bullock, O. M., & Hubner, A. Y. (2020). Candidates' use of informal communication on social media reduces credibility and support: Examining the consequences of expectancy violations. *Communication Research Reports*, 37(3), 87–98. <https://doi.org/10.1080/08824096.2020.1767047>.

POL23 Polarization in the public debate and media

PP 0862 Telling or Told? The role of implicit and explicit media cues in the formation of perceived affective polarization in the debate about climate change mitigation

Quirin Ryffel¹, Thomas Zerback², Alina Jakob³, Nayla Fawzi³

¹ University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

² University of Düsseldorf, Department of Communication and Media Sciences, Düsseldorf, Germany

³ University of Mainz, Department of Communication, Mainz, Germany

Research problem

Perceived polarization – the extent to which individuals perceive political or social groups as divided and/or in conflict with one another – is a common phenomenon in democratic societies (Yang et al., 2016). Moreover, research so far suggests that the media play a crucial role in shaping this impression. Adding to existing experimental (e.g., Levendusky & Malhotra, 2016) and cross-sectional survey studies (e.g., Yang et al., 2016), we examine the impact of media coverage on perceptions of affective polarization by combining data from a quantitative content analysis and a representative two-wave panel survey. Drawing from research on perceived polarization (Levendusky & Malhotra, 2016) and the formation of public opinion perceptions (Zerback et al., 2015), we assume that exposure

to a high dosage of implicit (i.e., conflict coverage or mentions of extremity) and/or explicit polarization cues (i.e., mentions of polarization or division) in climate change coverage leads to (1) increased perceptions of affective polarization in the media coverage, and hence (2) higher levels of perceived affective polarization between supporters and opponents of stronger climate change mitigation measures in society.

Method

We conducted a linkage study, combining a quantitative content analysis of $N = 652$ articles from 13 German news media outlets (TV, newspapers, online magazines, alternative) with a representative two-wave panel survey ($N = 2051$) conducted immediately before and after the content analysis in June and August 2023. The content analysis covered the period between the two panel waves and identified implicit and explicit polarization cues at the article level. For each outlet, a slant score was calculated by subtracting the number of articles containing polarization cues from those with de-polarization cues. We then multiplied the outlet-specific scores with respondents' self-reported frequency of outlet use (our independent dosage variables). Perceptions of affective polarization in media coverage [2] and society [3] were both measured with three items on a 7-point Likert scale (e.g., "In the climate debate, the media portray two camps that are increasingly hostile towards each other"). Age, gender, education level, political orientation, issue-specific interest and knowledge, attitude extremity, social media use and interpersonal discussion (all issue-specific), as well as the levels of perceived affective polarization in wave 1 served as controls.

Findings

Results of a path analysis show neither a direct effect of the dosage of explicit nor implicit polarization on perceived affective media polarization. Rather, issue-specific attitude extremity as well as interpersonal discussion about climate change increase perceived affective media polarization. As predicted, however, perceived affective polarization of media coverage on climate change mitigation has a substantial effect on perceived affective polarization of society regarding the issue, underlining the importance of perceptions of media coverage on climate change mitigation as well as the role of interpersonal communication in shaping such perceptions.

[1] Reliability scores of the content-analytic variables (Brennan Prediger's Kappa) ranged between .71 and 1.00.

[2] $\alpha_{w1} = .85$, $M_{w1} = 4.77$, $SD_{w1} = 1.39$; $\alpha_{w2} = .86$, $M_{w2} = 4.87$, $SD_{w2} = 1.36$

[3] $\alpha_{w1} = .73$, $M_{w1} = 5.24$, $SD_{w1} = 1.21$; $\alpha_{w2} = .77$, $M_{w2} = 5.28$, $SD_{w2} = 1.22$

POL23 Polarization in the public debate and media

PP 0863 Divisive imagery: Affective polarisation analysis in climate activism visuals

[Petro Tolochko](#)¹, Nicola Righetti¹, Annie Waldherr¹

¹ University of Vienna, Department of Communication, Vienna, Austria

Understanding the impact of visual content on social media in the context of climate activism is pivotal for reasons such as communication efficacy, public engagement, mobilisation, and awareness. This paper attempts to investigate the realm of affective polarisation within climate activism, with a specific focus on the polarising effects induced by various climate change visuals.

Affective polarisation, as outlined e.g., by Yarchi and colleagues (2021), refers to the phenomenon in which individuals or groups with differing political or ideological beliefs experience heightened emotional hostility, negativity, or animosity toward one another. Understanding this phenomenon is important because heightened affective polarisation can reduce one's reliance on constructive argumentation (Suler, 2004), decreasing the probability of reaching a democratically driven consensus. Recognising the critical role of emotions in shaping public opinion, this study seeks to understand the complexities of polarisation dynamics surrounding climate activism visuals.

The study focuses on social media comment threads which have been started with visual content as the root. Initial sentiment and emotion analysis, facilitated by a large language model, such as GPT-4 (Achiam et al., 2023), provides a granular understanding of the emotional landscape within social media threads. Affective polarisation is operationalised as information entropy of the emotional content of the thread. Information entropy is a measure of the uncertainty or randomness in a set of data, indicating the amount of information needed to describe the system and quantify its level of disorder or unpredictability. This operationalisation allows to measure and understand the degree of emotional divergence or convergence. This allows for the identification of polarising climate visuals and provides a quantitative measure of the extent of affective polarisation. Lower information entropy signifies a cohesive emotional response, indicating that the visual content resonates similarly with the audience. Conversely, high information entropy reveals a spectrum of emotional reactions, suggesting that the visual content elicits higher polarisation. Unsupervised clustering methods are then employed to categorise the visuals, shedding light on the specific types of content that evoke more pronounced affective polarisation.

This study makes noteworthy contributions on multiple fronts: firstly, it introduces an innovative approach to operationalise affective polarisation by employing information entropy on textual content. Secondly, it delves into a pivotal facet of online communication—visuals—and explores their connection to affective polarisation. Thirdly, it provides

an account of the specific visual content that fosters affective polarisation within the online communications of environmental movements. By shedding light on the intricate relationship between visual content and affective polarisation in climate activism on social media, this research not only offers valuable insights but also has broad appeal, resonating with researchers, policymakers, and activists alike.

POL23 Polarization in the public debate and media

PP 0864 Between headlines and reality? News media's impact on false polarization in the debate about climate change mitigation in Germany

[Alina Jakob](#)¹, [Nayla Fawzi](#)¹, [Quirin Ryffel](#)², [Thomas Zerback](#)³

¹ Johannes Gutenberg University Mainz, Institute of Communication, Mainz, Germany

² University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

³ Heinrich Heine University Düsseldorf, Department for Social Sciences, Düsseldorf, Germany

Although there is a general agreement in Germany regarding the existence of anthropogenic climate change and the need for climate protection (Mau et al., 2023), opinions on the implementation of stricter climate change mitigation measures are rather diverse (Infratest dimap, 2023). Since news media can have a significant impact on the public's perception of the climate of opinion (Levendusky & Malhotra, 2016), their coverage could lead to overestimations of opinion differences and extremity, resulting in a stronger perceived than actual ideological polarization – a phenomenon known as false polarization (Westfall et al., 2015). Such a misperception may even increase actual ideological or affective polarization (Levendusky & Malhotra, 2013). Surprisingly the media's influence on the gap between actual and perceived ideological polarization is often overlooked in polarization research. False polarization itself has only been documented for the US, with a two-party system.

To determine the applicability to the European context and to shed light on the influence of news media coverage on false polarization perceptions, we designed a linkage study using the example of German supporters and opponents of stricter climate change mitigation measures. More specifically, we combined a two-wave online panel survey ($N = 2051$, in June and August 2023) with a quantitative content analysis of (de)polarization cues in articles from 13 German news media outlets that were published in the time between the waves and thematically related to climate change and measures ($N = 652$). For our independent variables, we then calculated an exposure variable that captures the prevalence of exposure to implicit and explicit (de)polarization cues on an affective and ideological level in the media coverage, weighted by the respective media use. Our dependent measures include actual ideological polarization (= difference between mean positions of opponents and supporters), perceived ideological polarization (= difference between individually assessed positions of "a typical opponent" and "a typical supporter") and false polarization (= difference between perceived and actual polarization) regarding five climate change measures.

Results show a pattern of false polarization and a tendency to overestimate the gap between opinion camps. This is evident for four out of five climate change-related measures, such as banning the installation of new gas and oil heating systems ($M_{\text{False}} = 0.97$, $SD = 2.90$) or restricting consumption for future generations ($M_{\text{False}} = 0.58$, $SD = 2.41$). The only exception is the degree of polarization regarding the reactivation of nuclear power plants, which is almost correctly assessed ($M_{\text{False}} = -0.06$, $SD = 2.7$). Our linkage analysis – controlling for false polarization perceptions in the first wave, sociodemographics and political attitudes – indicates that particularly the dose of polarization that private, tabloid or alternative media evoke in their reporting have a significant impact on their audience's misperceptions. Results underline news media's responsibility when presenting polarized issues as this can indeed make ideological polarization appear greater than it actually is – which, in turn, might hinder the possibility of reaching an agreement within society on how to address climate change.

POL23 Polarization in the public debate and media

PP 0865 Visual affective polarization on Instagram: Comparing how European extreme right parties build their political identity

[Rocio Zamora Medina](#)¹, [Remzie Shahini-Hoxhaj](#)², [Dren Gërguri](#)²

¹ University of Murcia, Department of Communication, Murcia, Spain

² University of Prishtina "Hasan Prishtina", Department of Journalism, Kosovo, Serbia

Political polarization is increasingly important in digital contexts, not only in the political discourse but also in visuals, to attract and mobilize supporters. Social media, particularly Instagram, has a distinct influence on emotional polarization (de-Lima-Santos et al., 2023). This article aims to compare the power of the visual affective polarization on Instagram among European extreme right parties. The study focuses on the visual features for measuring affective polarization used by scholars (Bonikowski et al., 2022; de-Lima-Santos et al., 2023; Dragan, 2023; Yarchi et al., 2021). By analyzing the use of visual symbols, rhetoric, and imagery used by these parties to convey their ideologies and appeal to their target audiences, the study assumes that the strategic visual communication among far-right

political parties in Europe is not the same, and each party responds to its own characteristics in the state where it operates.

Through a quantitative content analysis of Instagram visuals posted by the six main European extreme right political parties during a two-month period on Instagram, (N = 260), we focused on content-related variables, format-related variables, and technical features to analyze those visuals as denotative, connotative, and ideological systems from the visual framing model perspective (Rodríguez & Dimitrova, 2011).

Findings revealed significant differences in the visual framing strategies among European far right political parties, pointing to the complexity to identify a common pattern on their strategic visual communication in terms of affective polarization. Our results showed the use of different visual framing strategies among the parties to create their content and style the way it is portrayed, as well as to shape the rhetoric they use to spread their message. Overall, this contributes to the existing literature on visual communication in politics and enhances our understanding of the use of social media to build the political identity by using visual affective polarization resources.

Keywords: Visual framing; political polarization; extreme right parties; Instagram; political identity

POL23 Polarization in the public debate and media

PP 0866 Polarization by recommendation: Analyzing Youtube's polarization dynamics around Dutch Political Parties

Max van der Breggen¹, João Gonçalves¹, David Boeren²

¹ Erasmus University Rotterdam, Media and Communication, Rotterdam, Netherlands

² Erasmus University Rotterdam, Studium Generale, Rotterdam, Netherlands

Radicalization and political polarization have been identified by the European Commission as key challenges for European democracies. Social media, and Youtube in particular, has been shown to contribute to radicalization of its users (Ribeiro et al., 2020), showing them recommendations for extreme or problematic content (Haroon et al., 2023). However, previous efforts to map radicalization and extremism paths are limited to a US context or to specific groups such as the Alt Right. To examine how these findings translate to a European multiparty context, we aim to study the extent to which Youtube's recommender system contribute to the affective polarization of users who view content from Dutch political parties on Youtube.

To investigate this, we mapped recommendation content networks around each political party's YouTube presence were generated using open-source tools (CAT4SMR). Subsequently, video subtitles and captions were manually extracted to analyze for polarization. Sentiment classifiers, built on the Bidirectional Encoder Representations from Transformers (BERT) natural language processing algorithm (Devlin et al., 2018), were trained to recognize and classify the presence of both polarizing language and negative sentiment. Our final sample included titles and captions for 3 512 videos, mapped according to their recommendation links (i.e. what videos were recommended when a user watched the other video). Regression analyses were then employed to test for differences in sentiment and polarization between different political parties' content networks.

Results indicated that the negativity of a video title is positively associated with the polarization level of that same video, or that videos with negatively sounding titles are also more likely to be polarizing. Additionally, videos from non-establishment and right-wing parties produce recommendations that are more polarizing than the recommendations produced for videos from establishment and left-wing parties, in line with findings from a US context (Haroon et al., 2023). Though much of the detected polarization is attributable to content published by political parties themselves, analysis reveals that YouTube recommendations generally steer users towards increasingly polarizing content, indicating that Youtube currently fails to address polarization and extremism in recommendations in Dutch political context. These findings are significant given that they suggest that polarizing and problematic recommendations also extend to European democracies, and target more directly those who follow right-wing or non-establishment political parties.

POL24 Elections and campaigning across Europe

PP 0867 Gender, Politics, and Media Perception during the 2023 Electoral Campaign in Spain

Cristina Perales-García¹, Reinald Besalú Casademont², [Laura Perez-Altable](#)¹, Maria Iranzo-Cabrera³

¹ Universitat Pompeu Fabra, Communication Department, Barcelona, Spain

² Universitat Rovira i Virgili, Communication Studies, Tarragona, Spain

³ Universitat de Valencia, Language Theory and Communication Sciences, Valencia, Spain

In the political sphere, in which men have historically dominated, Spain has witnessed a steady and substantial rise in the presence of women in political parties, legislative bodies, and other areas of public power over the past two decades. Despite this progress, equality is yet to be fully realised. While the participation of women in politics is now widely accepted, research suggests that a pervasive culture of sexism continues to impede the achievement of parity and organic integration of women into spaces typically occupied by men.

This research examines the Spanish public's reception of feminist proposals and their acceptance of women as political leaders. It delves into how feminism has transformed political approaches, transcending the gender of those who propose, defend, and endorse them. The study uses a quantitative approach, conducting a survey among a representative sample of the Spanish population during the electoral campaign and immediately after a significant electoral debate. This real-time approach captures public sentiments accurately. The survey, carried out by YouGov Spain, garnered responses from 1,566 adults aged 18–64, reflecting the demographic characteristics of the population in terms of gender, age, and region.

The findings of this study indicate a nuanced public opinion regarding feminist politics in Spain. A significant portion of the population, amounting to 53%, identifies as feminist, placing Spain at the forefront of feminist sentiment in Europe. However, there is a perception that social advancement for women comes at the expense of men, and this belief is more prevalent among Spanish men than women, indicating a gendered divide in perceptions of discrimination.

Regarding media representation, this study observes a shift from traditional media to direct communication through social media, resulting in the personalization of political information. The credibility of political leaders, as perceived by the public, is influenced by their authenticity, trustworthiness, unblemished past, speaking skills, and media mastery. Female political leaders often face challenges such as negative media coverage, a focus on physical appearance, and a higher likelihood of being targets of online hate speech.

In conclusion, this research provides valuable insights into the complex interplay between gender, politics, and the media in contemporary Spain, highlighting the evolving public attitudes towards feminism and the representation of women in politics. This underscores the role of the media in shaping political perceptions and reflects societal and political tensions, including the rise of far-right movements in Europe and their reaction to feminist advancements. The study's methodological innovation, conducting surveys during an electoral campaign and after a major debate, offers a unique and real-time perspective on public opinion on these critical issues.

POL24 Elections and campaigning across Europe

PP 0868 Mainstreaming the populist radical right and the Brussels Press Corps: EU media's coverage of Vox during Spanish elections

[Kait Bolongaro](#)¹

¹ Vrije Universiteit Brussel, Media and Communication Studies, Ixelles, Belgium

In the midst of ongoing global disruptions in politics, environment and technology, the populist radical right is gaining popularity across Europe, scoring electoral victories from Italy to the Netherlands. This includes countries long thought immune to PRRPs, such as Spain, where Vox has become an important player in national politics. Meanwhile, the EU institutions continue to consolidate power, and with this increased influence, the population of journalists in Brussels has also grown.

This article examines the role of the Brussels Press Corps in the 'mainstreaming' and 'pariahing' of the European populist radical right. First, it adopts Kait Bolongaro and Benjamin De Cleen (forthcoming)'s framework to assess this phenomenon: combining existing literature on the 'mainstreaming' and 'pariahing' of the populist radical right and media's role within that process; and literature on how media participate in boundary maintenance between the acceptable and unacceptable within a democracy.

Within the binary concepts of 'mainstreaming' and 'pariahing', media can work to include or exclude political parties from the mainstream political landscape and, as such, protect and/or open the boundaries of the democratically acceptable. As these parties resurge across Europe, mainstreaming has become a particularly poignant topic, including how media actors have a significant role to play in casting the radical right as either legitimate and, as such, mainstream, or as illegitimate, a pariah to be excluded. These concepts are then superimposed onto Daniel Hallin's (1986) model of 'spheres' of media reporting. Hallin's spheres capture how topics and actors are treated

differently by journalists depending on whether they are considered to be in the sphere of 'consensus', 'legitimate controversy' or 'deviance'.

National correspondents make up many members of the Brussels Press Corps, but over the past decade, EU media has emerged, specialising in coverage of European political affairs from Brussels. These supranational media outlets are an understudied population of journalists, as most media and communications research on the Brussels Press Corps and the role of media in mainstreaming-pariahing the radical right focuses on a national perspective. In order to deepen our knowledge of these media outlets, this research focuses on EU media.

Using the case of Vox in Spain, this research attempts to deepen our understanding of the media's role in the mainstreaming-pariahing of PRRPs. First, it applies this conceptual framework to online news articles from Politico Europe, Euronews and Euractiv, comparing coverage over three national electoral cycles in April 2019, November 2019 and July 2023. The analysed articles indicate that Vox can be considered as moving toward the border of acceptability that divides mainstream and pariah political parties, but is still perceived as a pariah in the examined corpus. It also indicates that there has been an increase in coverage of Vox over the three electoral periods, which could also lead to the mainstreaming of Vox as Spain's most prominent PRRP. There is also some evidence of journalistic stance taking in the articles, highlighting the tension between the rise of the radical right and the media's role as a protector of liberal democracy.

POL24 Elections and campaigning across Europe

PP 0869 Perceptions of misinformation: Examining the role of misinformation in the 2024 European Parliament elections

[Elske Van Den Hoogen](#)¹, [Katjana Gattermann](#)¹, [Claes De Vreese](#)¹

¹ University of Amsterdam, Communication Science, Amsterdam, Netherlands

The upcoming European Parliament (EP) elections in June 2024 provide a crucial opportunity to research the role of misinformation in European elections. The previous EP elections, which took place in 2019, already highlighted that the impact of misinformation extends beyond national polls: these elections saw a significant increase in foreign hacking, widespread dissemination of EU-related fake news on social media, and instances of electoral manipulation (see Fusiek et al., 2022). Although the European Union explicitly mentions misinformation as a threat to European democracy, the question remains whether such concerns are shared by European citizens and, thus, how the (potential) *impact* of misinformation is perceived in the European electoral context. We therefore propose a two-step approach to scrutinising these perceptions, experiences and consequences of misinformation during the upcoming European elections. As such, this research will consist of an interview-based exploratory study and an elaborate multi-wave panel study that will be conducted in three countries.

First, using in-depth group interviews with a broad array of Dutch citizens ($n = 20-25$, *interviews ongoing*) with a q-methodology-based approach where respondents rank (both real and made-up) news headlines on their likelihood to be misinformation, we uncover the subjective understandings of what is, and what is not, perceived to be misinformation about the EP elections and why respondents perceive it as such. This step contributes to our comprehension of how individuals discern and understand misinformation regarding European elections, offering a nuanced foundation for subsequent analysis.

Second, insights gained from this exploratory initial study inform a three-wave presentative panel survey (expected *final* $n = 1,000$), with a first wave of data collection expected to be conducted in April and the second and third waves directly before and directly after the election (in late May and mid-June respectively). This panel study will furthermore be conducted in three relevant European countries, which each have a different electoral context: The Netherlands, where the populist far-right has just won the national elections; Poland, where the populist far-right has just lost their electoral majority; and Germany, where the next national elections will not be held until 2025. Using such a *most different* approach, we aim to highlight how European citizens from different contexts perceive misinformation during these elections, and, explore the (differences in) perspectives, and perceived impact and consequences. Besides focusing on these outcome variables, we also investigate the role of the varying (social) media habits of the respondents in this and we give particular attention to the interaction with perceived electoral integrity of the election.

In sum, using a mixed-method approach, we investigate the role of misinformation during the 2024 EP elections across diverse European contexts. By combining qualitative and quantitative methods, we present an innovative approach to understanding the role of misinformation in the context of European elections.

POL24 Elections and campaigning across Europe

PP 0870 Astroturfed influencers. How do campaigns use coordinated influencer activity to conquer social media – The case of Megafon

Vanessza Juhász¹, Márton Bene²

¹ Eötvös Loránd University, Department of Political Science, Budapest, Hungary

² Hungarian Research Network- Centre for Social Sciences, Institute for Political Science, Budapest, Hungary

While political social media influencers (PSMI) are mainly considered autonomous agents, they can also be used by campaigns to give a more authentic appearance to political messages. In Hungary, an agency called Megafon was launched in 2020 to train and support pro-governmental PSMIs with the mission to change the allegedly predominantly liberal discourse on social media. The agency was the largest advertiser on Facebook by far and generated more reactions than most political actors and media outlets during the 2022 general election campaign. While they are formally independent of the government parties, it is explored that there was coordination between the party office and the agency. In this sense, they can be seen as astroturfing agents (Kovic et al., 2018); their communication can easily be perceived as a true grassroots expression, when in fact it is a coordinated and controlled campaign activity.

In our research, we investigate this specific case to see how campaigns can use influencers to amplify their effect on social media and what role these PSMIs played in the pro-government campaign (RQ1). To this end, we compared the (a) functions of campaign messages (acclaim/attack/defense and policy/character/mixed); (b) emotional character (sadness/anger/fear/enthusiasm/pride), and (c) actors appearing in Facebook ads of Megafon's PSMIs with electoral actors' Facebook communication. We hypothesized that those campaign functions (attack and character-based campaign) and emotions (fear and anger) which can be effective communication tools but potentially involve backlash effects are outsourced to PSMIs allowing electoral actors to conduct a 'safer' communication strategy (acclaim, policy, enthusiasm and pride).

To test our hypothesis, we conducted a manual content analysis (N = 499) to investigate the content and style of PSMIs' Facebook ads (N = 153 from 10 PSMIs) and compare them with the ads of Viktor Orbán (N = 111), the candidates from single-member districts (N = 150) and the party page of Fidesz-KDNP (N = 85) published during the last four weeks of the campaign. Based on Benoit's functional theory (Benoit, 2017), we analyzed the function (acclaim, attack, and defend) and the topic (character, policy, and mixed) of the posts and identified certain negative and positive emotions as well (enthusiasm, pride, fear, and anger).

The results of the data validate our claims: (1) Astroturf influencers' Facebook ads are more likely to be attack-and character-focused than electoral political actors' ads; (2) astroturfed influencers' Facebook ads are more likely to include fear and anger than electoral political actors' ads, while (3) electoral political actors' Facebook ads are more likely to include enthusiasm and pride.

As a result, we can conclude that Megafon is a campaign tool used by Fidesz in order to outsource negative and character-focused campaigning from their candidates to the online opinion leaders of the agency. Hence, these types of astroturf influencers functioned as a long-range, anger- and fear-fueled, character assassination machine of the Fidesz campaign.

POL24 Elections and campaigning across Europe

PP 0871 Mourning after election. Processing defeat by communication in Hungary 2022

Gabriella Szabó¹, Balázs Kiss²

¹ Centre for Social Sciences- Budapest, Department for Political Behavior, Budapest, Hungary

² Centre for Social Sciences, Department for Political Behaviour, Budapest, Hungary

The paper presents the ways the losers of the 2022 Hungarian parliamentary elections communicate the process the failure. As defeat, or falling short of social norms, often leads to shame and guilt and trying to compensate for them leads to pride and hubris, it will be especially important to scrutinise how those moral emotions appeared in post-election discussions.

The research focuses the efforts the opposition in the public sphere during the period from 3 to 30 April 2022. By opposition, we mean the political forces united under the label of the Opposition Union; some further organisations also participated in the competition but independently of both the governing coalition and the Union. We scrutinised the communication by the politicians, parties, experts, and public intellectuals that belong to the Opposition Union.

Our data came from the following Hungarian online portals: index.hu, 24.hu, hvg.hu, mandiner.hu, origo.hu, and hirado.hu. We were looking for articles containing the search words elections [választások], campaign [kampány], two-thirds [kétharmad], and opposition [ellenzék]. The articles served as the starting point for a snow-ball collection of texts, podcasts, and videos published on sites beyond the six.

The communication of the political camp is analysed according to the image reparation strategy arsenal defined in public relations literature by William Benoit. The results of qualitative content analysis show that the communicators preferred the following strategies: shifting blame, referring to defeasibility, promising corrective action and expressing mortification. Some actors also put forward the strategy of denial, but to make it convincing they separated their own party from the camp as a whole.

There was pride in the hard work put in by activists during the campaign, in the fairness they consistently showed in the face of the morally corrupt actions of the government side; regarding the results, in the relative success of each party compared to others, if not to the winners, and in Budapest compared to the rest of the country. Hubris, at least from the outside, was reflected in the moral condemnation of opponents and sometimes rivals on their own side. Likewise, speeches that proclaimed the historical superiority of one's own party or movement, either in terms of Europeanism or civility, can be classified under the heading of hubris.

Finally, the communication that urges others to feel shame and guilt plays an important role in managing moral emotions. The communication of defeat was also full of such appeals: according to the political left, it was primarily the government side that should have been ashamed of itself, and some on its own side as well, who should have disappeared from political life after the fourth two-thirds majority. The main expectation of the home side was, at most, guilt for the mistakes and errors that contributed to the defeat, although the ultimate reason was to be found, first and foremost, in the conditions that made the race unwinnable.

POL25 Emotions in political communication

PP 0961 Clicks, sentiments, and shifts: Analyzing the correlates of social media news use, emotions, and electoral volatility

Mariken Van Der Velden¹, Alberto Lopez Ortega¹, Isabella Rebasso²

¹ Vrije Universiteit Amsterdam, Communication Science, Amsterdam, Netherlands

² University of Vienna, Political Science, Vienna, Austria

Over the past decades, the media landscape has undergone significant transformations, transitioning to a high-choice media environment. This shift has had a profound impact on media consumption patterns, with a notable decline in the use of traditional offline news sources and a simultaneous surge in online news consumption. In the same period, Western democracies have experienced an increase in volatility. Research has indicated that media consumption plays a pivotal role in driving this phenomenon, influencing both voting behavior and voter volatility. Social media usage also evokes different emotional responses compared to traditional media, research shows. News on social media often emphasizes competition, thereby eliciting negative emotions, such as anger, fear, and distrust. In this study, we explore the relationships between social media usage, volatility, and political sentiment, examining the following hypotheses:

- H1: Individuals who rely on social media as their primary news source will experience more negative political sentiment than individuals who do not consume news or obtain news through alternative media channels.
- H2: Individuals who rely on social media as their primary news source will experience more negative political sentiment than individuals who do not consume news or obtain news through alternative media channels.

We test these hypotheses utilizing two studies, a comparative study and a panel study. Both of these studies shine different lights on the relation between the variables outside of the experimental environments. The comparative study allows us to describe broader trends across European countries when it comes to the relationship between news consumption, political sentiment, and volatility. To do so, we use the European Voter Election Studies (EVES) of 2018 (N = 68,102). The panel study allows us to dive deeper into the dynamics between these three variables during a campaign. We use the four-wave panel study during the Dutch National Elections of 2023 (N = 8,526).

For both studies, we have three main variables of interest: Political Sentiment, Media Consumption, and Volatility. First, to measure political sentiment, we asked the intensity of twelve emotions (anger, anxiety, fear, disgust, depression, sadness, confidence, enthusiasm, happiness, hope, pride, and relief). Second, we distinguish four categories of media consumption: 1) News junkies; 2) Social Media (SM) news users; 3) Traditional news users; 4) News avoiders. Third, we distinguish three types of volatility: 1) based on your choice set; 2) switching within ideological blocks; and 3) switching between ideological blocks.

We see that people who mainly use SM to consume news are more likely to experience negative political sentiment, compared to other news user types. While the effects are strongest for anger and disgust, all coefficients of the negative political sentiments are positive and statistically significant. Moreover, we show that SM news users experience fewer positive political sentiments. This indicates support for our first hypothesis. Additionally, we show the correlates between political sentiment and electoral volatility. We do see some differences between volatility types: The effects are stronger for the inter- and intra-block volatility types compared to the volatility based on the choice set. Regardless, we demonstrate support for our H2 too.

POL25 Emotions in political communication

PP 0964 Great vengeance and furious anger. Populist rhetoric and the roots of voters' rage against the system

Alessandro Nai¹, Linda Bos¹, Dominique Wirz¹, [Muhammed Saadettin](#)¹

¹ University of Amsterdam, ASCoR, Amsterdam, Netherlands

Populism has mainstreamed the language of anti-politics. By communicating for a change in the current liberal democratic system using an antagonistic and combative style, populist politicians arguably challenge liberal norms, mainstreaming illiberalism. In this paper, we argue that to understand the populist foundations of voters' support for illiberalism, we need to zoom in on two communicative aspects that explain why populist communication would contribute to illiberalism: the moral nature of the populist message and the anger it elicits.

The antagonism embedded in populism relies on its moral framework: it posits the good, common people against the immoral, bad elite and frames the current state of liberal democracy as immoral, not living up to its commitment of being grounded in the general will of the people. This moral nature of the populist message is reflected in the use of moral language, that is, language depicting moral norm violations. This moral language is known to cue emotions, most specifically moralized anger – anger aroused by the perceived violation of a moral standard. While moral outrage is central to the (discursive) success of populist movements, this paper is the first to test the causal claim that it is the moral nature of the populist message that elicits anger among voters, generating moral outrage.

We furthermore argue that this moral populist anger strengthens illiberal attitudes among citizens. By moralizing the monist distinction between the people and the elite, populism not only foregrounds negative emotions towards the political system and positive emotions towards the populist savior, it challenges liberal notions such as pluralism, individual freedom, minority accommodation, and ideological heterogeneity. In this paper, we, therefore, explore whether the populist (moral) anger that is elicited by populist communication translates into stronger illiberal attitudes.

To test these expectations, we leverage data collected from four samples of respondents in three countries: two in the USA (respectively, $N = 1,495$ and $N = 849$ after data cleaning), one in Belgium ($N = 1,859$), and one in Spain ($N = 2,229$), collected between the fall of 2022 and the summer of 2023. In a 1x3 between-subjects design, we exposed respondents to either a negative political prompt (control condition), a populist prompt without moral language, and a populist prompt including moral language. After the prompt, respondents were asked to reflect about the message they just read and write a short statement. These open-ended answers were coded to look for specific emotions expressed by the respondent – manually for the two American samples, and via a GPT classifier for the four samples.

Results suggest that a populist frame increases anger, but mostly in the USA. Such elicited anger, in turn, reduces support for illiberalism, but increases affective polarization and dislike for the out-group. We discuss these findings in light of existing research on the relationship between populism, illiberalism and affective polarization and conclude that our findings necessitate a nuanced, yet still worrying conclusion.

POL25 Emotions in political communication

PP 0965 Silenced by fear: Explaining self-censorship in reaction to digital violence

Marlis Stubenvoll¹, Christina Seeger¹

¹ University of Klagenfurt, Department of Media and Communications, Klagenfurt am Wörthersee, Austria

Democracy thrives through participation and public debate. Especially in the digital sphere, social media creates possibilities for individuals to voice their opinions and take part in the public discourse. However, hate speech and digital violence are prevalent on such platforms, leading users to become more cautious when expressing their opinions online (Reset/Pollytix 2021). Building upon Protection Motivation Theory, we were interested in whether people engage in self-censorship to avoid such negative experiences, and which factors contribute to this behavior.

The data used for testing our assumptions is part of a larger cooperation project with the NGO HateAid. In this project, we conducted a quota-based quantitative survey among German internet users ($N = 3,367$) via a professional survey institute. As adult Generation Z was the focus of the project, we sampled $n = 1,868$ respondents aged 18 to 27 years. To gain insights into generational differences, we additionally recruited participants from the generational cohorts of adolescents of Generation Z (14 to 17, $n = 501$), Millennials (28 to 42, $n = 498$), and Generation X and older (43 or older, $n = 500$).

Around half of the respondents agreed that they "sometimes refrain from sharing their opinions" (51.59%), "try not to attract too much attention" (49.21%), or are "careful in their online behaviors" (58.75%) to avoid experiencing digital violence. Based on these items, we formed an index of self-censorship (1 – *don't agree at all* to 5 – *fully agree*; $M = 3.56$, $SD = 1.05$, Cronbach's $\alpha = .82$). To identify relevant predictors of self-censorship, we relied on stepwise regression models (adjusted $R^2 = .13$).

First, prior experience with digital violence did not increase self-censorship: We find that witnessing digital violence was not associated with self-censorship in the full model, $\beta = 0.02$, $p = .330$. Surprisingly, experiencing digital violence negatively predicted self-censorship, $\beta = -0.05$, $p = .013$.

Second, we assessed whether individuals were less likely to engage in self-censorship when they formed positive evaluations of other coping strategies; that is, when they see little difficulty in performing them (e.g., self-efficacy) and find them useful (e.g., response-efficacy). The results were mixed: Self-efficacy regarding confronting the attacker emerged as a negative predictor of self-censorship, $\beta = -0.10$, $p < .001$. However, against our expectations, self-efficacy regarding support from close others positively predicted self-censorship, $\beta = 0.05$, $p = .014$. Similar patterns emerged for assessing close support or turning to official institutions as useful.

Lastly, we were interested in how individuals' threat perceptions of digital violence might affect self-censorship. We found that perceived severity, $\beta = 0.20$, $p < .001$, and susceptibility, $\beta = 0.09$, $p < .001$, were positively associated with self-censorship.

In conclusion, our findings suggest that individuals' self-censorship might be driven by the fear of the severe consequences of digital violence rather than by the reality and likelihood of becoming a victim. Furthermore, individuals might not stop to self-censor solely because other coping mechanisms are available to them – instead, they might enact self-censorship as part of broader coping repertoires.

POL26 Constraints and disturbances in political communication

PP 0966 The illusion of pluralistic and neutrality: How Twitter social bots show their opinion in Chinese political issue

Rongyi Chen¹, Zilu Wang², Haoran Dai³, Qing Xiao⁴

¹ Central South University, School of Humanities, Changsha Hunan, China

² King's College London, Department of Digital Humanities, London, United Kingdom

³ Peking University, HSBC Business SchoolPHBS, Shenzhen, China

⁴ University of Oxford, Oxford Internet Institute, Oxford, United Kingdom

As a cutting-edge technology combining digital information technology and political science, social bots have become a powerful tool for political actors to manipulate the climate of opinions on international social media platforms such as Twitter. The traditional human-driven online interaction space has shifted to a "human-machine symbiosis" media system.

The New York Times initiated a Twitter discussion in 2022, about the human rights of ethnic minorities in China's Xinjiang region, which the Chinese government saw as a challenge to its regime. The tweets related to the event were read by more than 1.08 billion people, making it a representative political controversy and political communication event. Based on this event, we ask the following questions: What are the characteristics of social robots in terms of content topic selection, original and forwarded content in political communication events?

This article aims to explore the political communication strategy characteristics and strategic shifts of social robots in international social media based on 27,245 tweets, through social media data mining and cutting-edge natural language processing methods. We improved the traditional LDA model and cosine similarity model to make them more compatible with identifying the fragmented content of social media opinions. A manually supplemented coded political semantic analysis library is also added to fit the political discourse and more to the original political satirical and metaphorical meanings, instead of understanding them crudely as an adjective in the algorithm. In addition, we applied the machine learning method of Long Short Term Memory Network to complete the construction of the sentiment analysis model.

We found that Social bots on Twitter are gradually moving away from being the drivers of emotional sound bites and the speakers of single or homogeneous views in political communication events. Instead, they have shifted to a more subtle and effective communication strategy to drive public opinion on events: to mimic the behavior of human users to the greatest extent possible, to fit the values preferred by human users, i.e., to give audiences the greatest possible number of perspectives, with factual arguments that seem trustworthy rather than opinionated expressions.

The tweets of social bot users and human users differ in the organization of their content, with the former showing a stronger organizational and strategic approach, a more "evidence-based" style, a single focus on the core diffusion point, and smooth wording that allows the audience to a strong sense of news. When comparing the audiences in the public opinion arena, the former is more likely to trigger the audiences' perception of "objectivity" in terms of style and thus more likely to generate trust.

When public opinion spreads, social bots cite and retweet multiple sources more violently, which makes the active content within the opinion field exist in a diversity of sources and language structures. Neutral emotional attitudes account for the highest proportion both in original tweets and in the process of re-citing tweets. The two strategies work together to combat user reading fatigue while maintaining a high level of social bot involvement in human social media networks.

POL26 Constraints and disturbances in political communication

PP 0967 Combating the 'gray area' of incivility: Users' acceptance of different content moderation approaches against uncivil online comments

[Andrea Stockinger](#)¹

¹ University of Vienna, Department of Communication, Vienna, Austria

Online political discourse, once envisioned as a catalyst for democratic engagement, has witnessed a rise in uncivil comments, detrimentally affecting democratic legitimacy, discourse quality, and citizens' well-being. Existing content moderation strategies, involving both human moderators and AI, aim to enhance the quality of online discussions by addressing harmful material. However, the complex nature of most uncivil comments existing in a 'gray area' – that breaches social and deliberative norms but remains unregulated by community guidelines or law – presents a pressing issue. Platforms grapple with discerning those comments, coupled with diverse user opinions and preferences due to varying cultural, social, and individual factors. This challenges the efficacy of current content moderation strategies and emphasizes the need for user-centric and evidence-based interventions.

With a representative sample of 572 participants, this study provides nuanced insights into user preferences for content moderation approaches in Austria. Employing an innovative factorial survey design, we manipulated the source of moderation (human vs. AI), transparency (explanation vs. no explanation), intervention type (deletion vs. warning labels vs. guideline reminders vs. empathy-based counterspeech), and the type of incivility (personal-level vs. public-level).

Findings reveal that human moderators significantly outperform AI in user acceptance, emphasizing the indispensable role of human judgment in navigating the 'gray area' of uncivil online comments. Contrary to conventional belief, deletion is not universally perceived as the most effective strategy as it might be seen as a constraint on users' freedom of expression. Accordingly, approaches like warning labels, guideline reminders, and empathy-based counterspeech receive higher user acceptance. Surprisingly, the provision of explanations for moderation decisions does not consistently increase user acceptance. In illustrating the 'gray area', examples of personal-level incivility, such as name-calling and derogatory comments violating politeness norms, were found to garner higher acceptance rates across different content moderation strategies than public-level incivility, exemplified by accusations of election fraud and undermining democratic norms, which received lower user acceptance rates, irrespective of the content moderation strategy. Exploring individual-level influences on acceptance, the impact of moderation scenarios on users' acceptance is moderated by their opposition to censorship. Users opposing censorship exhibit less acceptance of deletion scenarios compared to those endorsing censorship. Furthermore, more right-wing users accept content moderation across all scenarios significantly less than users who see themselves as left-wing. Addressing future preferences, users desire stricter moderation when handling personal-level incivility and less strict moderation when addressing public-level incivility, suggesting a nuanced approach to content moderation aligned with users' expectations.

Overall, this study offers valuable insights for platform providers, policymakers, and community managers, emphasizing the need for evidence-based interventions. Acknowledging the 'gray area' of online incivility, it calls for user-centric approaches to content moderation, fostering a more inclusive and respectful online discourse that accommodates diverse perspectives while mitigating the challenges posed by uncivil comments.

POL26 Constraints and disturbances in political communication

PP 0968 "I have seen it, have you seen me?" The logic of Engagement on Ugandan LGBT+ Organizations Digital Platforms

Jakob Svensson¹, [Anders Olof Larsson](#)²

¹ Malmö University, School of Arts & Communication K3, Malmö, Sweden

² Kristiania University, Department of Communication, Oslo, Norway

In this project, we study the engagement (in terms of likes, shares and comments) on Ugandan LGBT+ (Lesbian, Gay, Bi- and Transsexual) organizations and activist's posts from a multi-platform perspective. Uganda is infamous for its state-sanctioned homophobia. However, international attention to the situation for LGBT+ has led to an increase in funding, which in turn has led to a multiplication of LGBT+ organizations in the country. Social media engagement possibly allows content to

reach and organizations to be seen beyond the followers of the posting account in a process akin to the two-step flow of communication (important in a growing LGBT+ organization landscape).

Focusing on Facebook, Instagram, and Twitter, our aim is to inform multi-platform research by studying how a historically underrepresented group in the global south navigates a complex communication ecology in an uncertain socio-political situation. We ask: 1) Which posts emerge as more popular in terms of user engagement on the different platforms respectively 2) What characterizes highly engaged posts across the three platforms 3) What is

the logic behind engagement practices? We approach our research questions using three different yet interrelated methodological approaches: A) Quantitative identification of highly engaged posts, B) Qualitative analysis of these posts and C) Qualitative interviews with organizational representatives.

Our results show that different platforms have different logics when attracting engagement. This has both to do with platform affordances (such as Instagram pushing for photos and scrolling) as well as political realities such as Facebook being blocked, but also on the audience, that Twitter is perceived to be populated by international allies. There is not a lot of call for action, because, engaging with posts implies that you are seen, not only that you have seen the post, but that the posting organization sees you and sometimes also the government. We thus conclude that engagement in this particular context is governed by visibility but is also likely to change in the future because LGBT+ organizations need to navigate a shifting and fragile political communication landscape, adopt and adapt constantly.

POL26 Constraints and disturbances in political communication

PP 0969 Are civically active youths prone to spreading misinformation? The role of perceived discrimination

Michal Mužík¹, Marie Jaroň Bedrošová¹, Giovanna Mascheroni², Hana Macháčková¹

¹ Masaryk University, Interdisciplinary Research Team on Internet and Society- Faculty of Social Studies, Brno, Czech Republic

² Università Cattolica del Sacro Cuore, Department of Communication and Performing Arts, Milan, Italy

Young people's involvement in civic activities is often portrayed positively as a means of youth empowerment and contribution to a democratic society. However, it can also be connected to the spreading of misinformation, despite the fact that civically active people usually have higher digital literacy. This spreading can be viewed as promoting anti-democratic processes, thus countering the possible beneficial outcomes of civic engagement. In this contribution, we focus on online civic engagement, as young people are known to engage more in informal, non-institutionalized politics. This form of civic engagement represents a more individualized form of political behavior stemming from the synergic effect of socio-political and technological changes. Some scholars (e.g. Valenzuela et al., 2019) even argue that online civic engagement is the key antecedent of spreading misinformation, but we still lack knowledge about which factors influence sharing unverified information among active youths. We propose that one of the influential factors can be perceived social discrimination (e.g. based on ethnicity, religion). We assume that the experience of social discrimination will cause people to be more cautious and conscious of their online behavior, thus making them less susceptible to spreading misinformation. We will explore the link between adolescents' online civic engagement and perceived discrimination and how they affect misinformation spreading. To account for the role of digital literacy, we also included the Youth Skills indicator. We employed a three-wave multinational sample of adolescents (attending grades 6 to 10 during Wave 1), consisting of 10,821 respondents from six European countries. Preliminary results from the random intercept cross-lagged panel model suggest that there are indeed positive associations between online civic engagement, perceived discrimination, and misinformation spreading on the between-person level. However, only the positive association between civic engagement and perceived discrimination holds on the within-person level, meaning that an increase in own perceived discrimination leads to more frequent online civic activity. It seems that active youths are more likely to face discrimination, but this does not necessarily translate into sharing unverified information online. Digital literacy was overall not associated with spreading misinformation.

POL26 Constraints and disturbances in political communication

PP 0970 Without a second thought. Political opinion leaders are impulsive on social media but they regret what they say

Marton Bene¹, Manuel Goyanes²

¹ Centre for Social Sciences, Centre for Social Sciences, Budapest, Hungary

² University Carlos III de Madrid, Communication Studies, Madrid, Spain

This study demonstrates on a two-wave panel survey conducted in Spain that opinion leaders more frequently engage in impulsive political expressions on social media than ordinary users, and these impulsive acts lead to the experience of regret.

In our contemporary 'plebeian public sphere' (Gerbaudo, 2022), social media users' political expressions play a crucial role in people's perception of political reality, and this is especially true for opinion leaders' expressions who filter and interpret political content for ordinary social media users (Bergström & Jervelycke Belfrage, 2018). While most users are highly careful when it comes to political communication on these platforms due to social risks (Thorson, 2014), we argue that opinion leaders' unique personality makes them more impulsive: They are demonstrated to be characterized by a higher level of extroversion (Gnambs & Batinić, 2012) and their inclination to publicly demonstrate the uniqueness of their self (Chan & Misra, 1990). This public differentiation can be realized by doing impulsive and unplanned acts to be faster than others in the ephemeral and 'real-time' content flow of social media (Weltevrede et al., 2014) which they may end up regretting. We also argue that rightist opinion leaders are even

more impulsive on these platforms than other opinion leaders which can be explained by their more negative political orientations (Jost, 2021) and their more homogenous communication context (Barberá et al., 2015).

We test our hypotheses on a two-wave online panel survey conducted in Spain in 2022. The findings confirm our expectations showing that opinion leaders, especially those with right-wing backgrounds, are more likely to express their opinion in the heat of the moment which, in turn, activates the intense cognitive-based emotion of regret. Since opinion leaders have a prominent role in the public, their unplanned and regretted political posts can have a major effect on the quality of the public discourse, and can contribute to the porous, real-time, and immediate temporality of the contemporary public sphere.

POL27 Media in political communication: Content, context, and audience

PP 0985 The Public Broadcaster is not for us! The effect of in-group threat on perceived media bias in public service media

Emily Gravesteyn^{1,2}, Erika van Elsas¹, Katjana Gattermann²

¹ Radboud University, Political Science, Nijmegen, Netherlands

² University of Amsterdam, Communication Science, Amsterdam, Netherlands

Bias accusations towards Public Service Media (PSM) are on the rise in European countries (Holtz-Bacha, 2021). However, knowledge of *why* individuals perceive bias in public institutions such as PSM and its news content is scarce, notwithstanding the literature on perceived media bias (see Chia & Cenite, 2012; Kim & Grabe, 2022). Research into the *Hostile Media Effect* has given important insights into how partisanship drives individuals to perceive news content as biased against both their respective sides, regardless of the substance of that content (Vallone et al., 1985). Specifically, findings revealed that branded source cues enhanced individuals' perception of bias, when that news brand was affiliated as positioned against their perceived in-group and in favor of their out-group (Kim & Grabe, 2022). While we know that this holds for ideologically branded news media, how does this apply in the context of PSM?

This paper studies whether PSM trigger individual-level in- and out-group dynamics. Specifically, we aim to understand the extent to which social identification mechanisms drive bias perceptions of news content produced by PSM. Recent studies point at the importance of social identification in how people judge media content (Yair, 2021), but this has not yet been studied in the context of PSM. Building on recent work, we expect that ascribing news content to PSM drives bias perceptions in itself, but that this is conditioned by people experiencing an in-group threat. This paper is guided by the following research question: *does social identification with PSM affect bias perceptions of news content by PSM, and is this conditioned by the experience of an in-group threat?*

We employ a survey experiment with a 2x3 factorial design. Participants will be exposed to different conditions where we manipulate the source (e.g. NOS logo or not) and social threat (e.g. presence of in-group threat). The source cue will be primed by presenting respondents with a fictitious news story with a visible NOS-logo (compared to no logo at all). The in-group threat will be presented before exposure to the NOS-branded or non-branded fictitious news story. Through a short survey, questions will be asked beforehand about respondents' background characteristics (populist attitudes, media trust, perceived affective polarization) and self-perceived ideological and societal position(s) to measure people's perceived social identities. After presenting the respondents with the stimulus material, we measure perceived bias within the news story as the dependent variable. In our analyses, we test whether the NOS serves as a source cue for bias perceptions, and among which citizens, as well as whether such source cue effects are activated by in-group threatening information.

The results of our study allow us to assess to what extent citizens' evaluations of PSM are part of in-/out-group dynamics. Whether social identification mechanisms affect how people evaluate media bias in the NOS has important implications for the potential of PSM to bridge societal divides as a neutral and impartial broadcaster. Our findings illustrate the extent to which public institutions are currently politicized amongst citizens.

POL27 Media in political communication: Content, context, and audience

PP 0986 Polish public media: Towards extreme political bias and back. Case of flagship television newscast change after 2023 parliamentary election in Poland

[Małgorzata Winiarska-Brodowska](#)¹, [Rafał Klepka](#)¹, [Agnieszka Walecka-Rynduch](#)¹

¹ Jagiellonian University, Institute of Journalism- Media and Social Communication, Krakow, Poland

The paper reflects on political communication (dis)orders on the example of Polish public media, in particular analyzing TV news in context of media bias. The study draws among others on works of Klepka (2022, 2019), Lichter (2017), Perloff (2017), Hopmann (2012) and Entman (2007) with special reference to contextual research presenting changes in Poland (Winiarska-Brodowska 2022, Walecka-Rynduch 2021, Surowiec et al. 2020, Klimkiewicz 2017, Sadurski 2019).

One of the elements of the post-2015 process of deconsolidation of democracy in Poland were the far-reaching changes in the area of the media, in particular the public media. Results of research on the content of newscasts in the public media after 2015 proved in various contexts one-sidedness of coverage, favouring the ruling party or ruthlessly criticising the opposition. The most frequently criticized as extremely biased was the flagship newscast of the Polish public television "Wiadomości". After the then ruling party lost the 2023 elections, the new majority decided to replace "Wiadomości" discredited by bias with a new program "19.30". Newscasts are usually broadcast for decades, and their long-term presence on the media market increases their popularity and credibility. The decision to end the broadcasting of "Wiadomości" was groundbreaking. In recent years, no public television in Europe has made such changes to the flagship newscast.

The changes that affected Polish public media in 2015 and then in 2023 can be analyzed from many perspectives. Our contribution is based on a combination of three research approaches. In the first part, we analyze the content of news broadcasts, in the second, the audience's opinions about the new broadcast, and in the third, media reports and comments on the changes. The first part diagnoses bias in the old and new broadcast. We ask questions about changes in the visibility, exposure and overtone of the ruling parties and opposition in both research periods. The Media Political Bias Index (MPBI) is used in research (Klepka2022). It is a tool that uses data from content analysis of selected media materials (14editions of newscasts before the change and 14editions after the change on December 20, 2023). Based on data on the visibility, exposure and overtone of news towards the ruling party and the opposition in each newscast, MPBI of the old and new newscast is built. This measure provides a synthetic assessment of the level of political bias. The second part of the study is based on a survey (CAWI) whose results determine how viewers assess the political bias of the old and new newscasts and the changes that took place in the public media in December2023. The third part is an analysis of the media coverage of newscast change in public media. The selected texts from a news aggregator service Google News (referred to by experts as the best news aggregator for in-depth reporting) were analyzed. The presented methodological triangulation allows for a multidimensional look at changes in the Polish media after the general elections in 2023 and, in particular, the change of the flagship newscast on Polish public TV.

POL27 Media in political communication: Content, context, and audience

PP 0988 News framing and the activation of liberal and authoritarian values: Citizens' moral reasoning on news about disorder and crime

[Mats Ekström](#)¹, [Adam Shehata](#)¹

¹ University of Gothenburg, Dep of Journalism- Media and Communication, Gothenburg, Sweden

Tensions between liberal and authoritarian cultural- and moral values have become increasingly important across western democracies. They manifest in polarized public discourse, and trends towards authoritarianism in the re-positioning of mainstream parties and the rise of far-right populism. To understand this development, we must also focus on the circumstances under which citizens tend to adopt authoritarian attitudes. Relating to the theme of this conference, this paper contributes by investigating citizens' reasoning on news about disorder and crime in society.

Research suggests that predispositions for authoritarian attitudes are fairly widespread, and tend to be activated under circumstances of disorder and social threat. News media have a critical role in this context. In an experimental panel study, we have shown that amplified news framing of disorder in society can have a significant impact on authoritarian attitudes. Following news framing theory, we argue that authoritarian predispositions (deep-rooted values) tend to be activated when people are exposed to news framing that makes authoritarian considerations applicable.

In this paper, presenting a focus-group study, we develop this research by exploring how liberal/authoritarian values are activated in peoples' reasoning and conversations on news about disorder and crime. The conceptualization of values relies on theories in political psychology (e.g., Stanley Feldman's) and George Lakoff's theory on moral politics. The core of authoritarian values are the beliefs in rigid adherence to cultural conventions and hierarchies (conformism); in respect for authorities, obedience, and punishment (submission, aggression). This contrasts with liberal beliefs in progressive identities, cultural diversity, and autonomy. These are essentially moral values. The values apply in reasoning across social contexts. The moral principle of strict authorities, setting rules that should be respected, and punishment in response to disobedience, applies in reasoning on child-rearing as well as national politics.

The empirical study, conducted in Sweden 2022–2023, consist of 10 focus groups, a total of 38 people, interviewed on two occasions, each lasting two hours. Interviewees were asked to read and discuss authentic news on a selection of topics. For each topic, news with contrasting frames were presented. To enable spontaneous conversations, we recruited groups of people who know each other. The groups represent a spectrum on values: 3 mainly liberal, 3 mainly conservative and 4 mixed.

The result shows how news on disorder and crime primarily activate moral reasoning reflecting contrasting liberal/authoritarian values. Facts in the news are critically discussed when the news frame challenges the values in the group. Shifts in the news framing of topics are shown to result in mitigations and radicalization of authoritarian attitudes. Notably, groups with liberal values tend to move towards authoritarian reasoning depending on the framing of the news. By analyzing the applicability of the news framing and the social dynamics in the group discussions, the paper presents an elaborated analysis of the circumstances under which participants strengthens, negotiate, and possibly alter their moral reasoning. Although the news framing makes a difference, the study confirms the importance of experiential knowledge, popular wisdom, stories and metaphors when citizens collaboratively activate deep-rooted values in reasoning on news.

POL28 Us versus Them: Dychotomy in political discourse

PP 1057 Peripheral voices: (De-)constructing narratives of marginalization in post-industrial regions

Antje Glück¹, Anke Fiedler², Darren Lilleker³, James Morrison⁴

¹ FMC, Communication and Journalism, Poole, United Kingdom

² Kommunikationswissenschaft, Lehrstuhl für Kommunikationswissenschaft mit dem Schwerpunkt Kommunikationsethik, Greifswald, Germany

³ FMC, Humanities and Law, Poole, United Kingdom

⁴ Communications- Media and Culture, Journalism, Stirling, United Kingdom

Marginalization occurs when individuals or groups are (or feel) relegated to the fringes of society, with unequal access to educational and economic opportunities, social and cultural capital (Bourdieu, 1986; Putnam, 2000) and/or political representation (e.g. Andersen, 1996; Rodriguez-Pose, 2018). Those targeted in this way – often portrayed through problematic media stereotypes – are likely to feel devalued, stigmatized and marginalized.

While much focus is placed on identifying and preventing discrimination towards *minority* groups – usually defined by race, gender, sexuality or religion, less attention has generally been placed on discrimination on grounds of *social status* towards members of majoritarian ethnic groups in a society. Drawing on concepts underpinning a new cross-cultural project, our paper explores the discursive marginalization of members of two post-industrial communities in Germany and the United Kingdom. The structurally similarly-shaped regions and its communities we focus on (North England, East Germany) are often framed across media and politics as code for decay, deprivation, poverty, unemployment, nativism and even racism.

In our paper we argue that stereotypical and stigmatizing images of post-industrial communities enter a society's consciousness through media and wider public discourse – and this can contribute to residents of post-industrial communities perceiving themselves as outsiders alienated from mainstream political processes and 'national conversations': disempowered, disaffected and disadvantaged. These perceptions can lead citizens whose identities are embedded in these communities to develop populist and illiberal attitudes and reject social and political norms of democratic society, a process considered as potentially damaging to the fabric of a society as a whole as to individuals and groups directly affected (Agulnik, 2002; Byrne, 2005; Bude & Willis, 2008; Silver & Miller, 2003).

Our project sets out to explore how news media can be a cultural manifestation of marginalization by exploring five interrelated dimensions: media regulation, media production and representation (top-down perspectives), media consumption, and the identities of people from post-industrial milieus (bottom-up perspectives).

In our paper we will present the project and its complex theoretical foundations. We will link this to first results from our field research, in which we will draw on a groundbreaking methodology of deploying narrative salons in order to explore the extent to which post-industrial communities self-identify with (or contest) concepts like 'marginalization'. In this sense, we will interrogate the accuracy of dominant portrayals of those 'marginalized' or 'left behind' by linking media characterizations to the lived experiences and perspectives of these milieus.

Drawing on the empirical examples from the two post-industrial communities in the north of England and eastern Germany, we argue that media needs to better reflect the lived realities of these communities to provide a more inclusive space for articulating their self-perceptions, experiences and views, in order to reduce their disaffection with wider society and its institutions.

POL28 Us versus Them: Dychotomy in political discourse

PP 1058 The rise of an identity? Outgroup derogation in COVID-19 debates on Reddit from Sweden and Austria, a longitudinal and comparative content analysis

[Gregor Rettenegger](#)¹

¹ University of Gothenburg, JMG, Göteborg, Sweden

Wagner and Eberl (2022) provide evidence and a convincing argument for the existence of "vaccination identities" that fuel affective polarization between those who are in favor or against the COVID-19 vaccination. Such "opinion-based identities" have also been shown for other far-reaching political issues like the BREXIT vote (Hobolt et al. 2021) and are different in nature and composition than partisanship or left-right political orientation and are suspected to drive affective polarization between social groups (Wojcieszak et al. 2022). Such processes might hinder solution-oriented and deliberative public discourse on these issues, particularly on social media platforms. The SIDE model (Klein et al. 2007) would predict that once group identities begin to form around an issue, users on social media will increasingly engage in "identity performance", such as attacking out-group members to increase their in-group status. By a longitudinal content analysis applying machine learning methods to COVID-19 debates on Reddit, this study investigates if and when identity performance and conflict became the dominant feature of the pandemic online discourse, and how its quality changed as a consequence. Furthermore, by comparing subreddits from Sweden and Austria we compare two European edge cases that are similar in cultural context but most different in their governmental approach to tackle the pandemic. Given that perceived threats activate social identities (Woods, 2011) we expect higher levels of identity performance in the Austrian which relied much more on enforcing regulations compared to the more voluntary approach of Sweden. We hope to create insights that can help to strengthen democracies' abilities to maintain unity in the face of future crisis.

POL28 Us versus Them: Dychotomy in political discourse

PP 1059 Transnational flows in networked misogyny: Exploring links between Sweden, Germany and Russia

[Maria Brock](#)¹, [Tina Askanius](#)²

¹ Södertörn University, Department of Media and Communication Studies, Huddinge, Sweden

² Malmö University, School of Arts and Communication, Malmö, Sweden

Social media has elevated misogyny to new levels of violence, amplifying and spreading these attitudes on a larger scale, with technology allowing for transnational synergies between actors in different countries. Networked misogyny (Banet-Weiser & Miltner, 2016), or coordinated efforts of individuals or groups to harass, threaten, or intimidate women online, often with the goal of silencing or discrediting their voices, has now become commonplace, often targeting women who publicly take up feminist positions (Massanari & Chess, 2018, Marwick & Caplan, 2018).

Blatantly misogynist influencers such as Andrew Tate have risen to internet fame on TikTok, lately attracting the attention of a concerned public including educators and parents who report on his ideas infiltrating classrooms.

However, predominant scholarly attention has been paid to male perpetrators, while women are primarily seen as the targets and victims of misogynist ideas. And while the ultimate threat is to the safety of women and non-masculine identified persons, the role of women in perpetuating, legitimizing and 'making palatable' misogynist ideas remains under-researched, including how misogyny works in conjunction with racist, anti-feminist and ethnonationalist ideas. A cooptation of networked misogyny by women not only shows how women can become successful co-producers of oppressive ideas affecting them, but also lends credibility to these ideas, thereby expanding their reach. In this paper, we treat misogyny as an intersectional, transnational and digital phenomenon in order to investigate the role of women in abetting its spread. Premised on recent developments in two areas of research, namely work on contemporary instantiations of networked misogyny and on gender and far-right movements, we take a mixed-method approach to data from Sweden, Germany and Russia, which includes both official 'propagandistic' texts i.e., sanctioned, strategic messages emerging from actors operating from within political organisations, groups and campaigns, along with individual female actors operating as 'influencers' on social media platforms such as YouTube and Instagram.

POL28 Us versus Them: Dychotomy in political discourse

PP 1060 Social minorities or public elites: Who people perceive as target groups of online hate speech and how this affects reporting and counter-speech

Lukas Benedikt Hoffmann¹, Christian Strippel²

¹ Free University Berlin, Institute for Media and Communication Studies, Berlin, Germany

² Weizenbaum Institute for the Networked Society, Weizenbaum Digital Science Center, Berlin, Germany

The concept of hate speech and the policies surrounding it are highly contested. On the one hand, scholars argue whether hate speech should be defined as derogatory communication towards marginalized groups such as immigrants, women, or LGBTQI* people (Sponholz, 2023), or as expressions of hatred potentially directed at any person (Parekh, 2006). On the other hand, there is a debate about what measures are appropriate to combat online hate speech. Some argue for banning hate speech to safeguard marginalized communities and democratic discourse in general (Waldron, 2012), while others emphasize freedom of speech and would consider bans as censorship (Strossen, 2018). These positions correspond to different individual actions against online hate speech, namely reporting (regulation-oriented) or countering it (speech-oriented).

Bringing together these debates, we seek to understand whether the perceptions of which groups are targeted by hate speech affect individual actions against it. Evidence for this can be found, for example, in social identity theory (Keipi et al., 2017) and related research on the topic (Siegel, 2020). To test this, we use representative survey data from 2022 and 2023 of 2,014 German-speaking internet users. We pose the following questions:

RQ1: Which social groups are perceived as targets of hate speech?

RQ2: Do different perceptions lead to different actions against hate speech?

We analyzed survey responses to determine whether individuals encountered hate speech online, which groups were perceived as targets (e.g., immigrants, politicians, women, Muslims, Jews), and how respondents reacted to it (countered/reported).

Our results indicate that 75% of our sample, or 1,499 respondents, have encountered hate speech online. Regarding RQ1, politicians were the most commonly perceived targets (60%), followed by immigrants (43%), LGBTQI* people (35%), women (30%), and journalists (28%). When dividing these perceived targets into (a) more visible, public elites such as politicians and journalists and (b) social minorities, including immigrants, Jews, Muslims, women, and LGBTQI* people, the results show that 18% of respondents have only witnessed hate speech against minorities. Only 12% have exclusively seen hate speech directed towards journalists and politicians. Most respondents (52%) reported witnessing hate speech against individuals from (c) both groups.

Following this classification, the results for RQ2 show that respondents who only saw hate speech against public elites are the least likely to take action against it. Only 8% of them have reported hate speech they encountered, while 13% have countered it. The most active respondents were those who had witnessed hate speech against both public elites and social minorities with 33% reporting and 30% countering it.

Based on these initial findings, it can be concluded that the perception of which groups are affected by hate speech has an impact on whether action is taken against it. In the proposed presentation, we aim to further deepen these findings by considering the socio-demographic characteristics of the respondents to determine the relevance of social identity, and by examining whether the results can be confirmed through regression analysis.

POL28 Us versus Them: Dychotomy in political discourse

PP 1061 Gone with Populism: Ideational and performative dimensions of anti-populist communication on social networking sites

[Vlastimil Havlík](#)¹, Alena Kluknavská²

¹ Masaryk University, Department of Political Science, Brno, Czech Republic

² Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

Populism has gained significant attention in recent years, yet there is limited understanding of effective measures to confront and address it (Malkopoulou, Moffitt 2023). This study investigates the construction of anti-populist discourses employed by political parties and their leaders on two social networking sites (Facebook and Instagram) before the 2021 Czech general elections. Anti-populist discourse characterized by a combination of stances presented in opposition to populism manifests as a specific communication strategy of political actors in reacting to populist challenges (Stavrakakis et al. 2018). In doing so, the anti-populist actors, presenting themselves as a viable alternative to the danger of populism, construct two specific identities: anti-populist identity ('us') and populist identity ('them'). These identities can be identified through ideational and performative dimensions, emphasizing what content and style the anti-populists claim to represent (Havlík, Kluknavská 2022). For instance, anti-populists claim that their politics is rational and civil while populist politics is emotional and irrational. Besides these self-claimed communication dimensions, anti-populists utilize specific stylistic elements in their communication; this actual performative presentation of anti-populism, however, remains underexplored in empirical research.

To fill this gap, this study examines the association of anti-populist discourses with specific stylistic elements related to populist/anti-populist divide. We explore to what extent negative tonality, emotions, references to knowledge and references to populism and democracy are present in anti-populist constructions of populist and anti-populist identities. Our results suggest that while self-constructed anti-populist identity is positively associated with knowledge-based claims, populist identities are often accompanied by emotional language and references to democracy. This means that even though anti-populist actors themselves might put forward claims stressing their rational and fact-based approach to politics, the performativity of their communication reveals an emotional component along the lines of populist and anti-populist divide.

Our study is based on an original dataset of social media posts created by Czech anti-populist politicians. First, we use automated frequency analysis (2017–2021, $n = 44,877$) to account for the communication dynamics regarding the mentions of populism/anti-democracy and anti-populism/democracy by anti-populist actors in their social media messages. Second, we employ manual quantitative content analysis to analyze their communication in the period of two weeks before the 2021 general election ($n = 1,291$; out of which Facebook = 890 and Instagram = 401) to capture variances in anti-populist communication strategies. Overall, our results speak to the broader debate on countering populism and the potential of social media for promoting anti-populist discourse. The study is among the first attempts to analyze anti-populism systematically using the data from two different social media platforms.

POL29 Communication in times of war and crisis

PP 1062 Platforms in war: A comparative analysis of the digital platforms in transnational conflicts

[Matti Pohjonen](#)¹, Mervi Pantti²

¹ University of Helsinki, Helsinki Institute for Social Sciences and Humanities HSSH, Helsinki, Finland

² University of Helsinki, Media and Communication Studies, Helsinki, Finland

Digital platforms play a crucial role in geopolitical conflicts and wars of the 21st century. They provide tools for information warfare by facilitating the spread of propaganda and disinformation aimed at national and international audiences. They also provide an important means for civil society activists to document human rights violations and campaign for peace. The corporations who run them have also become powerful cyber-security actors in their own right, taking an increasingly active role alongside traditional political power brokers (Borelli 2023).

One pivotal point of contention in these debates has been related to content moderation/governance. Historically, digital platforms have tried to balance the conflicting demands of governments and civil society groups to moderate illicit content by positioning themselves as neutral intermediaries not legally liable or socially responsible for the published content (Napoli and Caplan 2017). More recently, digital platforms have also taken a visibly active role, such as the Russian invasion of Ukraine, where it explicitly sided with US and EU policies against Russia. At the same time, digital platforms have also come under growing scrutiny for not meeting their human rights responsibilities in other conflicts outside the West, as evidenced by the growing criticism of their inaction in removing violent extreme speech in countries such as Myanmar and Ethiopia.

This paper compares two examples where digital platforms positioned themselves in different ways as actors in transnational and geopolitical conflicts. Through a comparative analysis of the Russian Ukraine War (2022-ongoing) and the Tigray War in Ethiopia (2020-2022), we show how there were two different types of strategies through which digital platforms imagined their positionality. In the context of Ukraine, digital platforms quickly adopted a wide array of proactive steps to counter disinformation, predominantly by blocking Russian state-affiliated media. While these actions were not unheard of, their scale and consistency were unprecedented (see Pantti and Pohjonen 2023). In the context of the Ethiopian case, on the contrary, we show how the digital platforms' response was primarily reactive and in response to growing global civil society criticism. One example was the global controversy around Haugen revelations, which argued that Meta's inaction contributed to ethnic violence and unrest. This, in turn, led to calls for digital platforms to take their responsibilities seriously, including lawsuits and civil society campaigns.

Building on these comparative case studies, we ask two questions related to digital platforms in two different transnational conflicts:

1. Through what types of communicative strategies did digital platforms try to communicate their position as actors (neutral or active) during these conflicts?
2. How was this positioning, in turn, informed by growing pressure from civil society activists and governments campaigning to hold digital platforms accountable?

To evidence these two research questions, the paper provides a cross-media analysis of PR communication by digital platforms, mainstream news and social media sources where the role and responsibility of digital platforms in transnational conflicts was visibly articulated and debated and, in turn, where the digital platforms communicated reasons for their action and/or inaction in their content moderation policies.

POL29 Communication in times of war and crisis

PP 1063 Information and mis/disinformation flow on the war in Ukraine: Polish citizens' perceptions and evaluations of the media performance

[Agnieszka Stepinska](#)¹

¹ Adam Mickiewicz University, Department of Social Communication, Poznan, Poland

Taking into consideration a geographical proximity, past experience, current relations with Russia and Ukraine, and consequences of the war, Poland makes an interesting case for a study on the flow of information and disinformation in time of international conflict.

The goal of this exploratory study is two-fold. First, we aim to provide a characteristics of the context in which information (and mis/disinformation) on the war in Ukraine has been spread in Poland. Specifically, we examine media-related factors such as the media use habits (main sources of political information; news avoidance, and selective news exposure) and a level of trust in media, as well as politics-related factors, that is political interest and concerns about the war in Ukraine.

The second aim of the study is to map Polish media users' perceptions and evaluations of the information (and mis/disinformation) flow on the war in Ukraine. In particular, we examine the Polish media users' evaluation of the media performance on covering war in Ukraine and perceptions on sources and causes of false information on war in Ukraine in the media.

In this study we define misinformation as an information that is factually inaccurate without the intention to cause harm or deceive recipients (Kim & Gil de Zúñiga, 2021). In particular, it can be any form of information that is unintentionally false (Wardle, 2017), or information that is not based on relevant expert knowledge or empirical evidence (Vraga & Bode, 2020). Disinformation, on the other hand, is regarded to be intentionally harmful or deceptive information based on deliberate acts of doctoring, manipulation, or fabrication (Freelon & Wells, 2020; Hancock & Bailenson, 2021). In our study we will examine to what extent Polish media users perceive a presence of false information in the media as either intentional or unintentional. In the former case, we will also trace which sources Polish citizens associated with the dissemination of perceived false information on the war. Finally, we will pay attention to the Polish citizens' eagerness to employ fact-checking strategies in order to verify messages on the war. For the purpose of this study we use a survey data collected in April-May, 2022 (N = 1004). The preliminary findings on the media context showed that television is still the most important source of political information for the Polish

citizens. It was followed by radio and newspapers and magazines (both traditional and digital versions). The study revealed a tendency toward selective news exposure, strong sense that there was a lot of false information in the news media, and moderate evaluation of fairness and accuracy of the media news coverage. These observations might be explained by a high level of political polarization, accompanied by a low trust in news media and a high level of anxiety. Spreading false information was mostly seen as intentional activity performed to hide reality from the people, to disrupt the societal order, or due to strategic aims of political actors.

PP 1064 Biased judgment or lack of skill? Decoding Identification of (Mis)Information in the context of Russia's war against Ukraine in 19 Countries

[Luisa Gehle](#)¹, [Christian Schemer](#)¹, [Michael Hameleers](#)², [Marina Tulin](#)²

¹ University of Mainz, Department of Communication, Mainz, Germany

² University of Amsterdam, Amsterdam School of Communication Research, Amsterdam, Netherlands

There has been rising concern about individuals basing their political views on false or misleading information. Understanding who is susceptible to disinformation has consequently become a primary research focus (for an overview, see Nyhan, 2020).

In most cases, surveys are employed to uncover characteristics that predict susceptibility. After exposure to pieces of (mis)information, participants are asked to judge whether they consider them true or not. There are several limitations to these findings. By only measuring the number of correctly labelled false claims, these results confound two different explanations for answering a certain way. An individual might be able to detect all pieces of misinformation in a task due to profound knowledge of the subject. Individuals might also tend to not believe any of the false claims because they oppose their views, or they are just skeptical overall. Thus, the performance in such a task is a mixture of sensitivity (i.e., identifying true items as true and false items as false) and biased responding (i.e., labelling items as true or false because of ideology or other pre-existing beliefs regardless of the items' truth status).

Signal detection theory (SDT) allows to dissect these accounts by calculating two separate measures for sensitivity and response bias. We calculate SDT inspired measures based on responses to pro- and anti-Russia true and false statements in a survey fielded in 19 countries ($N = 19.037$) in 2022 during the early stages of the war.

On the individual level, we find that education, age, and newspaper consumption increase sensitivity, while stronger attitudes towards the war and more superficial news sources decrease sensitivity. Stronger pro- or anti-Russia attitudes are associated with more biased responding. Alternative media use is related to with a more pro-Russia leaning response bias. On the country-level, there is a relationship between national knowledge and press freedom levels and sensitivity. Similarities to Russia in cultural values are only partially related to response bias.

We believe considering a diverse set of countries, and applying the more sophisticated measurement based on Signal Detection Theory to a highly relevant and salient case will help deepen the understanding of individuals' and countries' susceptibility and resilience to mis- and disinformation by disentangling skilled differentiation between true and false from biased responding.

POL29 Communication in times of war and crisis

PP 1065 Climate change skepticism discourse on TikTok. A visual content analysis

[Jana Laura Egelhofer](#)¹, [Tobias Heidenreich](#)²

¹ LMU Munich, Department of Media and Communication, Munich, Germany

² WZB Berlin Social Science Center, Global Governance, Berlin, Germany

Climate change-skeptical discourse has been identified as a major threat to the public understanding of environmental issues and effective climate action. Emerging research highlights that this discourse is multifaceted and no longer dominated by denial of the existence of climate change. Instead, it increasingly involves misinformation about its impacts, the necessity and appropriateness of mitigation policies, as well as credibility attacks on climate scientists (Coan et al., 2021; Painter et al., 2023). While these studies provide a more differentiated picture of climate skeptical discourse, several gaps remain: (1) most significantly, the visual dimension of this discourse has been neglected. This is a crucial shortcoming as visuals have a specific potential to capture attention, drive engagement, are often perceived as evidence of the real world, and are understood across cultural and linguistic barriers. (2) Studies have focused on mainstream media (Painter et al., 2023) and conservative websites and blogs (Coan et al., 2021), while research on how this discourse plays out on more participatory platforms, i.e., social media, is lacking. Connected to this, we do not know (3) how climate change skepticism claims are encountered by citizens. Given that a large share of the global population is convinced of and worried about the threat of climate change, it seems likely that on social media, users actively correct skeptical claims.

This study thus investigates the prevalence and nature of climate change-skeptical discourse and its corrections on the widely used video platform TikTok. TikTok is especially relevant in this context as it enables a new form of

participatory political discourse that is dominated by young and non-expert individuals (e.g., Serrano et al., 2020) and has been at the center of worries about the increased spread of visual misinformation.

Combining manual and automated content analysis of a large sample of videos, this study provides a more nuanced understanding of this highly relevant, politicized discourse. Specifically, valuable insights on how prevalent different types of climate change skepticism claims are, how often they are corrected, and how these discourses differ in the use of visual features, engagement, and visibility. To achieve this, we first manually code 4,500 videos retrieved through a snowball sampling procedure, starting with popular hashtags within the discourse. In the second step, we will use the labeled material to fine-tune machine-learning models to assess the videos' content automatically. Data analysis will be finished by August 2024.

POL29 Communication in times of war and crisis

PP 1066 Crisis communication and public opinion: Evidence from Austria

Lore Hayek¹, Jakob-Moritz Eberl², Andreas Kraxberger³

¹ Universität Innsbruck, Department of Political Science, Innsbruck, Austria

² University of Vienna, Department of Communication, Vienna, Austria

³ University of Innsbruck, Department of Media- Society and Communication, Innsbruck, Austria

In early 2020, governments across the world resorted to the format of press conferences to instruct their publics on how to deal with the arising COVID-19 pandemic. This main tool of communication was used to persuade the public to follow measures constraining personal life and, in turn, convince citizens of the government's effectiveness in dealing with the pandemic. Although press conferences are a one-way tool of communication, public opinion data can shed light on how they are received by the public. In Austria, a large-scale panel study on the public's perception of COVID-19 measures and the government's performance was conducted starting in the very early days of the pandemic. For the case of Austria, this paper seeks to explore the reciprocal relationship between government communication and public opinion: a) How do government communication strategies affect trust in the government, and b) Do changes in the public's perception of e.g. measurement effectiveness reflect in the government's communication strategies?

For this paper, we draw on two datasets. First, a dataset containing transcripts of 50 press conferences held by the Austrian government between March 20 and May 3, 2020. Second, six survey waves of an online panel study fielded within the same time-frame with 1500 respondents each wave. Using a combination of manual and automated content analysis, we identify the measures announced by the government, as well as the sentiment of press conference statements. We will show how the government's communication was received by the public, and whether the government adjusted their crisis communication strategies in accordance with public opinion. Our study uses the unique case of the first phase of COVID-19 to make a contribution to the literature on the effectiveness of political crisis communication strategies and make recommendations how government communication can contribute to improving adherence to health measures in future crises.

PP 0766 (dis)Orders in podcast studies: A systematic review

Jordi Sánchez-Navarro¹, [Pedro Fernández De Castro](#)¹, Daniel Aranda¹, Sonia Herrera¹, Cristina Pujol¹

¹ Universitat Oberta de Catalunya, Information and Communication Sciences Studies, Barcelona, Spain

Two decades after the appearance of the first podcasts, they have evolved to become a prominent cultural phenomenon that gives us the possibility to understand the predominant practices and dynamics in the media and socio-cultural sphere. Following the proposal of du Gay et al. in "Doing Cultural Studies" (1997), which applied a Cultural Studies approach to the Walkman, we propose an update of this approach focusing on the podcast as a referent. The purpose is to present the first results of an exhaustive systematic review of the international academic literature of the last decade, allowing us to analyze the epistemic tensions between the predominant academic approaches and the perspective proposed from Cultural Studies, with a specific focus on Spain without losing sight of the international context. For both searching articles in databases as for the subsequent analysis of the results we take the five key concepts proposed for du Gay et al., to compose the "circuit of culture": representation, production, identity, consumption and regulation.

Preliminary results suggest that academic production at the international level can be categorized around two interrelated dimensions: a) the podcast as an object of study in itself and b) the podcast as a means to examine current social, cultural and political trends and movements. On the one hand, historical, material and quantitative analyses are obtained on audiences, engagement and the podcast industry; on the other hand, an analysis of the discourses in the public sphere related to feminist, LGBTQ+, anti-racist movements, among others, is carried out. In the specific case of Spain, a different dynamic is observed, where scientific production is mainly focused on the podcast as an object of study, without a critical and cultural reflection of the medium. Our objective is to address (dis)orders in podcast research and explore possible developments from the perspective of Cultural Studies, especially in the Spanish context.

RAS01 Different approaches to podcasting: From theory to practice

PP 0767 Reordering the field of audio media studies

[Iben Have](#)¹

¹ Aarhus University, Media and Journalism Studies, Aarhus N., Denmark

Radio plays an important historical role in media and communication studies and continues to hold a prominent position, reflected in international journals such as the *Journal of Radio & Audio Media* and *Radio Journal: International Studies in Broadcast & Audio Media*. Also, our ECREA-section *Radio and Sound* presents itself as "focusing on radio" and with the aim of creating a "radio community" to initiate academic dialogue on the "future of radio". Although other audio media are welcomed, these examples signal a 'radio-and' or 'radio-first' mindset which still seems to prevail in media and communication studies when it comes to audio media.

A growing field of podcast studies is about to establish a research field in its own right detached from its close relationship to radio. And we are witnessing a general boom in audio media in the current digital media culture, including audiobooks, audio-newspapers, music streaming, functional sound apps for activities such as exercising, meditation, concentration, sleep, etc. not to mention the various uses of text-to-speech technology in relation to all kinds of written texts.

In this paper, I will discuss whether we as media and communication scholars could benefit from a more inclusive field of audio media studies that reflects the changing digital media culture where audio media are converging in terms of technology, formats, content, production, distribution, and use. Apps for audio media compete side by side on our smartphones, while the development points towards a centralization of content on platforms like Spotify and Audible (Amazon). It becomes more and more difficult to draw a line between the various audio media.

Although radio remains a popular medium among the older media users, the future for audio media is reflected in the younger generations' preferences and habits where traditional radio plays a minor role. Instead of a 'radio-and'/'radio-first' mindset expressed in the examples above, the paper aims to frame a field of audio media studies where radio has a place on equal footing with other audio media. From a kind of meta-approach to the theme of the conference, I would like to reorder and discuss a new and non-hierarchic order for audio media studies.

From this 'audio media' approach the paper will zoom in on some issues and questions relevant across audio media. For instance, 1) *Mediated voices* (human, AI-cloned, and synthetic): How are voices designed and perceived and what impact do these voices have on perception, communication, and culture? 2) *Headphone culture*: Public debates about screentime and screen culture are intense these years. Are headphones a cure that can free the

body from the screen, or are they just another form of isolation and withdrawal from one's own thoughts and the social world?

The paper draws on my ongoing work with the research monograph *Reading with Ears and Writing with Voices: The Aural and Oral Turn in Digital Communication and Media Culture* (funded by the Carlsberg Foundation), and the Danish educational book *Lydmedier: Teori og analyse (Audio media: theory and analysis)* (to be published 2024).

RAS01 Different approaches to podcasting: From theory to practice

PP 1069 Radio, radio journalism and professional ideals in the extreme conditions of coups d'état

[Emma Heywood](#)¹

¹ University of Sheffield, School of Journalism Media and Communication, Sheffield, United Kingdom

This paper examines the situation of radio journalists in the extreme conditions of coups d'état. It examines the West African state of Burkina Faso as a case study which has experienced one popular uprising (2014), one attempted coup (2015) and two effective coups d'état (2022). Radio is the most important medium in Burkina Faso followed by television and the press. Social media are also popular, but access remains limited due to insecurity, poverty and poor connectivity.

During each of the above-mentioned events, radio was at the centre of the political struggle. In 2014, state radio was ransacked as a symbol of the contested political power. In 2015, an underground radio was created for political purposes, and in 2022, the junta ensured that the military version of information was accepted as journalistic truth. In regions with high levels of insecurity, 'radio journalism under siege' prevails with radio broadcasters and presenters being forced to change jobs or resign.

Drawing on a series of over 30 semi-structured interviews conducted in 2022 in Ouagadougou with radio journalists, broadcasters and editors, who were witness to the above-mentioned major political events, the paper uses an interactionist approach to place the actions of radio journalists within the specific context in which they operate. It looks at the profession from a media system perspective, showing how journalists' networks of interdependencies influence, in one way or another, their way of working, and therefore the information they produce.

The paper discusses how extreme the political contexts challenged the radio journalists' professional ideals. It examines how, or whether, their reactions contributed to (re)defining the boundaries of the profession. To answer these questions, the paper investigates the professional roles that radio journalists wanted to assume in these extreme conditions and what their reactions tell us about their vision of their own profession. The research revealed that radio journalists tend to define their role and practices according to the specific political situation in which they work and the status of the media they work for, be it public (state) or private. In other words, concerning media and journalism more broadly, political contexts can partially shape the roles that journalists play and media behaviour can partially shape the outcome of political contests. This ongoing and changing movement makes the media/political boundaries become extremely porous, shifting and redrawing the contours of both the political and media spheres.

RAS01 Different approaches to podcasting: From theory to practice

PP 0770 Technical and ethical perspective on the use of podcasting as a support for investigative journalism in VOD series: Truth Be Told

[Concha Edo](#)¹, [José María Legorburu](#)², [Elvira García de Torres](#)³, [David Parra](#)⁴

¹ Complutense University of Madrid, Journalism and global communication, Madrid, Spain

² CEU San Pablo University, Audiovisual Communication, Madrid, Spain

³ CEU Cardenal Herrera University, Communication and journalistic information, Valencia, Spain

⁴ Complutense University of Madrid, Journalism and new media, Madrid, Spain

Digitalization and continuous technological developments have changed both the work and the production of journalism. And media outlets, no longer in complete control of distribution due to the push of digital platforms (Nielsen, 2020), want to reassert their autonomy and brand value by experimenting with podcasting to attract new audiences, especially younger ones (Newman & Gallo, 2020). Podcasting brings together brand value, quality and loyalty, both in traditional media and in the independent podcasters.

However, the weight of advertising, the search for increased audiences, the tendency towards soft news, infotainment and sensationalism (Otto, Glogger & Boukes, 2017) and the difficulties of companies, mean that the journalistic quality of some published pieces suffers. News comes to be seen as a marketing product (Deuze, 2006, 2007; Domingo, Quandt, Heinonen, Paulussen, Singer, & Vujnovic, 2008; Kapuscinski, 2005; Pavlik, 2001) in an increasingly competitive market (Holzer & Ondrus, 2011).

The main objective of this research is to assess whether the podcast approach outlined above offers professional journalistic work or is tinged with superficiality. This is an important question in the face of the pressing need to

defend models of journalism based on excellence, and the growing attention to audience growth has long been seen in journalistic and academic circles as one of the causes of the gradual loss of quality in journalism (Costerá, 2013).

In previous works we have analyzed to what extent the podcast has allowed the recovery and renewal of audio reporting (Legorburu, Edo & García-González, 2021) which, with nuances, has survived in Australia, UK and USA (Lindgren & McHugh, 2013) and which, lately, is regaining prominence (McHugh, 2022). Undoubtedly, one of the most successful journalistic contents in this field is true crime (Clausen & Sikjaer, 2021), particularly, after the success of *Serial* (Boiling, 2022; Sherril, 2022). Like film and television (McNair, 2014; Walters, 2021), VOD series are also approaching investigative journalism and true crime, as is the case of *Truth Be Told* (Apple TV+, 2019-2023).

In order to carry out this work, we started with an analysis sheet that focuses on the way in which this serie reflect the professional practice of journalism in its different aspects: journalistic technique, ethical and deontological issues, production routines, interest in the combination of sound and audiovisual formats, etc. And this file has been applied to all the episodes of the three seasons of *Truth Be Told*. Likewise, leading experts in investigative journalism in podcast format have been consulted on all these aspects in order to contrast the professional reality with what VOD fiction shows.

Among the main results, in addition to noting a growing presence of the podcasting in this type of productions (also in cinema), we can appreciate -despite the dissonances- a certain will of verisimilitude in the approach of fiction to the world of audio investigative journalism, perhaps due to the participation of journalists as consultants. It also reflects, depending on the season, a significant predilection for deontological issues, as well as for the border between journalism and social activism.

RAS02 Audio innovations: IA, syntethic voices and data sonification in sound mediums

PP 0872 Can you hear the data? (De)construct the world through Data Sonification in radio and audio journalism

Ana Sofia Paiva¹

¹ ICNOVA / NOVA FCSH, Science Communication, Lisbon, Portugal

We have never had access to so much data as we do today. Interpreting and analyzing data from a specific topic has become essential, especially to produce and distribute relevant information to the audiences, and data journalism has gained relevance in recent years. Data journalists deal with enormous quantities of information and produce accessible journalistic content with the support of data visualization, i.e., through graphics, images, or videos. However, people with visual disabilities can't consume this type of data, and one of the solutions is to implement data sonification that "transmits information through sound" (Bonet, 2021, p. 269). That means the data are extracted and transformed into a melody that helps the listener understand a specific topic with the sense of hearing. Data sonification is a tool that can be used to tell journalistic stories with sound in an innovative way, especially in radio or podcasts. Even though data sonification is not a new tool and it has been used in natural sciences or engineering, for example, in journalism, it has been used to demonstrate data through sound in an immersive, emotional, and empathic manner.

World events have caused social disorders over the past five years: the COVID-19 pandemic, several climate change events – and consequently an increase in awareness of this issue – and two ongoing armed conflicts. It has been useful to use data sonification to create awareness about the impact of these social disorders, and independent projects such as *Sound of War* (Ukrainian/Russian war) and *Loud Numbers* (data in general and data journalism) have been helpful to gain a deeper understanding of these realities through sound.

And how about in the Public Service Media (PSM)? The PSM can innovate with this type of tool because "technology provides PSM organizations with the opportunity to better fulfill their function and serve their audiences in a variety of ways" (Fuster & Avilés, 2018, p. 46) and PSM media labs are a place to experiment and develop immersive and empathic experiences for listeners. In this sense, if PMS and media labs must innovate and data sonification could be an innovative tool, especially in radio and audio journalism, how public radio broadcasters are innovating, or not, using data sonification to produce journalistic pieces about social disorders?

To answer this research question, a longitudinal study of five years (January 2018 to December 2023) was conducted to collect journalistic pieces with data sonification regarding climate change, the COVID-19 pandemic, and armed conflicts in four western European public radios and their respective media labs: Portugal (Antena 1 and RTP Lab), Spain (RTVE and RTVE Lab), France (Radio France and Hyperradio) and United Kingdom (BBC and BBC R&D and BBC News Lab). Preliminary results show that no journalistic piece was produced with data sonification in Portugal and in the others Public Radio Broadcast and media laboratories, data sonification isn't explored as much as data visualization. Additionally, this study identified patterns, tendencies, and challenges regarding data sonification in audio journalism.

Keywords: data sonification; data journalism; radio; audio journalism; Public service media.

RAS02 Audio innovations: IA, syntethic voices and data sonification in sound mediums

PP 0873 Influence of Artificial Intelligence (IA) on the radio workflows of the Digital Audio Perimeter

Xavier Ribes¹, Belen Monclus², Raul Terol Bolinches³, Josep Maria Marti⁴, Maria Gutierrez⁴

¹ Autonomous University of Barcelona, Audiovisual Communication and Advertising, Bellaterra, Spain

² Autonomous University of Barcelona, Audiovisual Communication, Bellaterra, Spain

³ Higher Polytechnic School of Gandia, Audiovisual Communication - Documentation and History of Art, Gandia, Spain

⁴ Autonomous University of Barcelona, Audiovisual Communication and Advertising, Barcelona, Spain

Although its implementation is still in its infancy, artificial intelligence (AI) is beginning to have an impact on the radio industry. The Digital Audio Perimeter (DAP), that is, the set of content, services and forms of contact that expand the sound universe of radio products in the digital environment, is being affected by AI in a transversal way, in its three levels of expansion: consumer devices, distribution windows and content and services.

In this paper we focus on the production of sound content and services and, more specifically, on the changes that the radio production chain will undergo due to the incorporation of artificial intelligence tools, both for analysis and management and for supporting creativity and content generation, and how, indirectly, this will affect the need for media professionals with new skills and knowledge.

In fact, the implementation of artificial intelligence (AI) is already being introduced, timidly, in the radio production chain and it is suspected that it will cover all parts of the process. In this paper we propose what the new radio production workflow could be like, in which generative and AI management tools are fully integrated in all parts of the chain: content generation, scripting, sound production, editing and post-production, programming and customization, and broadcasting and interaction. Our study is based on qualitative research that combines different research methods such as in-depth interviews with experts and professionals in the field of radio and sound production and management, as well as benchmarking of the AI tools currently available.

Understanding that AI will modify current production flows, and that it is already being used to improve the listening experience, reduce energy costs or adapt programming in real time, it is clear that traditional professional roles are being affected as new production needs appear that must be covered with specialized workers. Therefore, to incorporate AI into radio production will require continuous adaptation and requalification by current professionals and it will be necessary to incorporate new professional figures who master the processes of content development with the support of this technology to improve the scope of the Digital Audio Perimeter of broadcasters.

RAS02 Audio innovations: IA, syntethic voices and data sonification in sound mediums

PP 0874 Inducing emotion by AI-generated vs. human-made music within audiovisual stimuli: A psychophysiological study

Nikolaj Fišer¹, Celia Andreu-Sánchez²

¹ Univerza v Ljubljani, Fakulteta za družbene vede, Ljubljana, Slovenia

² Universitat Autònoma de Barcelona, Departament de Comunicació Audiovisual y Publicidad, Barcelona, Spain

Sound has been used to potentiate the impact that recorded visual stimuli have on people's emotions, perceptions, and focus since the emergence of cinema in the early 20th century (Marshall & Cohen, 1998; Smith et al., 2013). Numerous studies were carried out to understand trajectories of the human gaze while manipulating the conditions of audiovisual stimuli, the majority of them discovering an important role of sound on the eyes' scan paths (Smeaton & Rothwell, 2009; Kunka et al., 2010; Coutrot et al., 2012; Auer et al., 2012; Mera & Stumpf, 2014). Such research has been applied to cultural, advertising, and informative media, the results of which have had important implications for those areas. With the rapid emergence of generative artificial intelligence during the past years, the fear of AI replacing many professions within cultural production has driven scholars to conduct various research to understand whether AI-generated content can be indistinguishable from human-made (Kaliakatsos-Papakostas, et al., 2020; Miranda, 2021).

The goal of our study is to find the differences or similarities in both cognitive and self-reported psychological responses to human-produced and AI-generated music. We will present three different sonic conditions to the very same video stimulus: silent, human-produced music, and AI-generated music. The stimuli to be used (short film excerpts with background music) will be found in a database of previous peer-reviewed studies and with already assigned categories of emotion, valence, and arousal (Diconne, et al., 2022). To understand our participants' emotional processing of the presented stimuli, we will use instruments for monitoring dermal, oculometric, and cardiovascular responses, such as galvanic skin response, body temperature, pupil dilation, gaze fixations, spontaneous eyeblink rate and heart rate, as well as a questionnaire with self-reported perceived emotions, the intensity of arousal and emotional valence.

The acquired results will provide important implications for cognitive media and AI studies, as well as the cultural production industries – should we find no difference in emotional processing between human-made and AI-generated

soundtracks, this will indicate that generative artificial intelligence is advanced enough to replicate the emotional and perceptive effects of audio production in an audiovisual context. On the contrary, should AI-generated music provoke a lower emotional response, this will indicate generative AI still lacks the potential to induce the same emotional effects on viewers and listeners. While numerous studies from the past decade have used a similar experimental design to ours (Millet et al., 2021; Ansani et al., 2020; Wollner et al., 2018), to our knowledge no other study has incorporated generative AI in one of the conditions of presented stimuli. We expect that this study will bring light to the potential use of AI for creating emotional audiovisual content.

RAS02 Audio innovations: IA, synthetic voices and data sonification in sound mediums

PP 0875 Smart speaker as Cassandra: Feminized voices and technologies of domestic violence

[Jason Loviglio](#)¹

¹ University of Maryland- Baltimore County, Media and Communication Studies, Baltimore, USA

Listening In is a slickly produced podcast (QCode, 2022) that remediates John Cheever's classic 1947 short story "The Enormous Radio" and Lucille Fletcher's *Sorry, Wrong Number*, the 1943 classic radio thriller. Across three distinct media forms, these stories each feature a white woman trapped in an uptown New York apartment, negotiating the social isolation specific to their gender, class, and historical moment. In each case, social isolation is exacerbated by the technologies of sound communication ostensibly designed to inform, entertain, and empower them: smart speaker, radio set, and telephone, respectively. Instead, these technologies of vocal transmission become sources of danger---sonic portals to the malign forces around them. Disembodied voices reinforce the embodied nature of women's vulnerability to social violence. At the same time, these technologies of sound provide, in their glitches and contradictions, opportunities for these women to understand their position and, in the direst of ways, speak back.

Listening In is one of several recent big budget fictional podcasts to limn the emotional peril of technological dysfunction as an analogue for the real physical peril of faced by women in techno-patriarchal societies. It was preceded by *Sandra*, (Gimlet, 2019) which features Helen, a young woman fleeing dysfunctional domestic scene who inadvertently uses smart speaker technology to abet a violent stalker in tracking down his victim. In a fascinating take on the industrialization of women's caring work, Helen takes on the android work of feminized amanuensis, using voice masking technology to become Sandra, a smart speaker persona. *Eliza: A Robot Story* (Crowd Network, 2022), explores domestic and sexual abuse from the perspective of a feminine robot helper prototype, whose tenuous but growing capacity for self-awareness presents a strangely moving and political emotional narrative arc. Thematically, *Ad Lucem* (Q-Code 2023) picks up where *Eliza* and *Sandra* leaves off, a dystopian world of sexual abuse of women by the proxy of haptically enhanced smart speakers.

Using short sound clips, this presentation will demonstrate the intersections of gender, voice, and technology to tell dystopian stories of corporate and patriarchal power and of women's resistance and subjectivity in the face of it. Because most of these podcasts play with the digitization of women's voices, in the context of domestic and sexual subjugation, they offer us insights into the developing sonic grammar of audio narrative social realism and horror. Despite their near-futuristic technology, these stories reprise a vivid a sociological fact from *Sorry Wrong Number*: their husbands are the greatest threat to their safety and well-being. Because all of these shows feature shadowy corporate overlords behind the domestic helper technology and their inevitable dysfunctions, they also provide us a look into podcasting's ambivalent relationship to the rapidly shifting conditions of its own production, as DIY shows give way to platformization.

RAS02 Audio innovations: IA, synthetic voices and data sonification in sound mediums

PP 0876 »That wasn't AI speaking. Not yet«: Attitudes of Slovenian radio personalities towards synthetic radio voices

[Tina Lengar Verovnik](#)¹, [Peter Čakš](#)²

¹ University of Ljubljana- Faculty of Social Sciences, Department of Communication, Ljubljana, Slovenia

² University of Maribor- Faculty of Electrical Engineering and Computer Science, Institute of Media Communication, Maribor, Slovenia

Studies of the potentials and pitfalls of AI-generated radio speech have so far been predominantly reception-oriented (Scott et al., 2020; Kim et al., 2022; Gong, 2023; Heiselberg et al., 2022); less is known about the perceptions of radio personalities. The present research focuses on unveiling the attitudes of Slovenian radio presenters, newscasts, and other voice professionals towards the emerging AI presence.

Artificial voices can already mirror those of humans closely, but there are still too many differences which listeners can perceive (Gong, 2023). Even though synthetic voices now sound more intelligible and natural (Noufi et al., 2023), their introduction onto the radio proves to be a sensitive matter, partly because the sense of intimacy with the medium is borne from the parasocial relationship with human radio personalities, whereas synthetic personae lack interactivity, and their voices are not yet as expressive as the human ones (Scott et al., 2020).

Reception analyses reveal that certain synthetic voices are acceptable when reporting on mostly objective content. Experiments with hard news, that did not include subjective opinions or personal interpretations, e.g. traffic

or weather clips, showed that the synthetic nature of the voice had relatively little impact on credibility (Kim et al., 2022). More relevant factors were phonetic and physiological deviations from a natural reading pattern (Heiselberg et al., 2022). Synthetic radio speech at the present stage of development seems less appropriate for more creative and emotional genres. In one of the studies, cultural content read by artificial voices was rated below weather and news in terms of suitability for radio (Scott et al., 2020).

Where subjective interpretations and personal communication styles come into play, at present only human voices seem to be able to give all the nuances to narration, by combining different vocal speech features (like tone or pitch) and forming non-articulated sounds (like respirations or fillers) inherent to the natural speech (Rodero and Lucas, 2023). The power of listening to an embodied human voice therefore remains unchallenged in fiction formats: listeners of audio books showed better overall results when stories were narrated by a human voice (ibid.), and findings can be related to other fiction forms, such as podcasts or radio dramas.

In Slovenia, radio speech is of special importance: on community stations the locally-coloured speech of the hosts helps preserve the bond between radio and its audience (Valh Lopert, 2015); newscasts' speech is crucial for the Slovenian standard language norm (Lengar Verovnik, 2015); skilled voice professionals serve as role models for interpretation of complex texts (Tivadar, 2011). As the introduction of AI-generated voices, both as readers and hosts, seems highly possible in some formats and content (Hu et al., 2021; Kit et al., 2023), the aim of this paper is to research personal and professional attitudes of Slovenian radio presenters, newscasts, and other voice professionals towards the present issue. We will use the method of semi-structured in-depth interviews to estimate the interviewees' knowledge about AI-generated voices, and to detect what benefits or problems they might perceive.

RAS03 Radio, identity and localism

PP 0971 Evolution of the podcast offer of digital-native media in Spain: Exploration or consolidation?

Pilar Martínez-Costa¹, Elsa Moreno¹, [Avelino Amoedo](#)¹

¹ University of Navarra, Journalism Department, Pamplona, Spain

Spanish digital-native media stand out for their disruptive strength in the context of the digital transformation of journalism (García-Avilés et al., 2018; Negrodo et al., 2020; Salles, 2019; Salaverria, 2020). Particularly, podcasting has been revealed as a disruptive and differentiating action of journalism in many countries (Berry, 2018; García-Avilés et al., 2018; Newman & Gallo, 2019). In the case of Spain, digital-native media have differentiated themselves in boosting the production of news podcasts (Martínez-Costa et al., 2022).

However, this type of digital news media face the underlying challenges of audience trust and interest due to the competition of influencers on social media, as well as legacy players. In this sense, digital-native media are aware that young and young adult generations have chosen to get their news through non-traditional channels. In this and other countries, podcasts are mainly of interest to audiences under the age of 45, with high education and income levels (Digital News Report, 2023). In this context, monthly listening to podcasts in Spain rose to 45% in 2023, according to the Digital News Report Spain.

Previous literature has analyzed the typology of innovations carried out in digital-native media. Nevertheless, few studies have evaluated how native media in Spain have incorporated podcasting as a key news tool, which implies a revolution to the media industry (Berry, 2018; Newman & Gallo, 2019). This study aims to answer the following research questions: Have Spanish digital-native media increased their podcast offer in the 2021–2024 period? What are the predominant themes and narratives? Are there strategic alliances between these news media and other companies or platforms? Is the podcast a bet on the innovation and expansion strategy of the digital-native media? The purpose is to continue with the diachronic studies of the use and characterization of journalistic podcasts by digital-native media in Spain. Specifically, a) determine what's new in news podcasts productions; b) analyze how platformization mediates this process; c) delve into the specialization achieved; and d) establish the characteristics of production and dissemination to engage the audience.

This work is based on a double quantitative and qualitative content analysis methodology. On the one hand, an interpretation of data recorded in the Digital media map in Spain. On the other hand, an in-depth study of a sample of 50 titles or series of podcasts published by 8 generalist native news brands during the 2021 and 2024. This corpus will be updated to analyze the current offer according to the variables mentioned above. In addition, the qualitative technique of the semi-structured interview will be also used to complete the fieldwork. The interviews will be carried out with the audio and podcast managers of the analyzed digital-native media.

This research is in progress; therefore, preliminary results corresponding to the new phase of the study will be presented in this forum, framed in the coordinated research project "Digital native media in Spain: typologies, audiences, trust building and keys to journalistic sustainability", funded by the Ministry of Science and Innovation of Spain.

RAS03 Radio, identity and localism

PP 0972 Remembering radio: Gender, family and self

[Nazan Haydari](#)¹

¹ Istanbul Bilgi University, Media School, Istanbul, Turkey

This paper draws from the radio memories of three radio generations, my father, my aunt-in-law, and my cousin, who shared the same house at a certain time of their lives at a small town in the late 50s and 60s. By radio generation, I refer to pre-television generation (television broadcasting in Turkey started in 1968); those who have the memories of radio as only medium besides print. Household gender dynamics structured an important aspect of the memories and radio as a medium mediated these stories. I integrate my own accounts into discussion for the contextualization of these memories, as the fourth generation who did not live in the same house yet had the opportunities of closely observing the relations among the family members. The relationship between radio broadcasting, gender and nationbuilding and the paradoxical nature of family as a unity of nation have widely been discussed in feminist literature. Methodologically, in tracing the rearticulation of family relations, modernization, gender roles, fatherhood, motherhood, enlightenment, and the radio as technology in the memories, I underline the significance of radio for the reconceptualization of the complex relationship between gender, family, and the self. As reflected in the memories, while access to radio was mediated by the family relations, gender relations, physical location of the radio, and everyday household dynamics, radio also constituted a significant space of containment and holding for the individual family members. Radio was narrated differently in the memories, for example, as a means of "patriarchal bargain", as conceptualized for Deniz Kandiyoti, for the aunt-in-law within the dynamics of extended family, a means of "being with the self" for the cousin or a means of "exploring the world" for the father. Thus radio memories allows us to revisit the relationship between the gendered self and family as a contribution to feminist media studies.

RAS03 Radio, identity and localism

PP 0973 Radio identity: The relationship between broadcaster and the listener

[Angeliki Gazi](#)¹

¹ Panteion University of Social and Political Sciences - Athens - Greece, Communication - Media and Culture, Athens, Greece

This paper focuses on the analysis of sound as a way of explanation of the complexity of human relationships, the acoustic engagement of a person with its image, and the influence of sound in human identity.

In doing so, we bring together existing theory concerning the links between identities and images with new theory concerning how reflection embeds identity via sound.

The conception of identity has been one of the cornerstones of theories of the subject in modernity. Sarbin, described human identity as the (usually unvoiced) answers framed by a person to the implied question 'what am I?' and social identity as the answers framed to the implied question 'who am I?' (Sarbin 2000). Social Psychology has sustained an interest in understanding how the self is construed in relation to one's group memberships. Much of this effort has been fueled by work on social identity.

This article sets out the radio broadcasting communication framework within which the broadcaster interacts with the listeners via his or her identity. Voice, speech and music are the three aural reference points that form part of the broadcasting identity of the producers of radio programmes. This identity is approached here as the result of a concrete synthesis that paints an image for the producer instead that of abstract material sound in flux. A typology of the identity of the broadcaster on the radio in Greece will be presented as the sound on the radio sends some images that are dependent on the interaction of the producer with the framework of the radio organization and his or her listeners, as distant others.

Finally, the identity will be located in the wishful composition of the imaginary identification of the producer of music programmes with the aural object of wish of the "Other".

Keywords: Identity, Sound, Broadcaster, Listener

RAS03 Radio, identity and localism

PP 0974 The Sámi Journalism and indigenous radio: Voice and identity

[Yulmar Montoya](#)¹

¹ Universitat Autònoma de Barcelona, Departament de Publicitat- Relacions Públiques i Comunicació Audiovisual, Barcelona, Spain

The study addresses the process of strengthening social mechanisms implemented by indigenous Sámi journalists and radio stations in Norway to strengthen identity, education, sociocultural and linguistic values through producing

newscasts, documentaries, children's, youth and youth, educational, etc., in which the learning of their language is promoted, as well as tools and sociocultural policies of interest to indigenous peoples. For this reason, the role of radio in promoting the identity and social well-being of its members is explored in depth. The Sami have a division (NRK Sápmi) in the public system of the Norwegian Broadcasting Corporation (Norsk rikskringkasting, NRK) (Skogerbø, 2021) which is state-owned and operates with a legally determined broadcasting licence. Indigenous radio stations have been creating their own spaces for participation, although there are obvious limitations in the regulatory frameworks, such as production schedules, dependency, and a way of operating limited to the guidelines determined through the NRK. As well as the management of resources that limit their actions and scope, either due to the lack of policies consistent with this type of communication system, such as autonomy in their way of operating or due to public service competencies and freedom to position themselves in the national market. This places Indigenous Radio, as is the case of NRK Sápmi, which focuses its efforts on providing programming that strengthens and revitalizes the identity, language and culture of the Sámi people (Pietikäinen, 2008). This study is qualitative and descriptive, which according to Mohajan (2018), is based on interpreting the meaning of the data to understand and analyze from a social perspective, the characteristic elements of a given society. The qualitative method is used through observation and interviews (Sofáer, 2002). On the one hand, the use of participant observation (Kawulich, 2005) to socially understand and interpret the relationships and interactions of the Sami people and indigenous radio. This allowed information to be collected and recorded when the radio staff carried out their work and interacted with the rest of the indigenous society at an event held near the environment. Likewise, during the Holy Week Festival we participated as a volunteer collaborator, thus describing the phenomenon of coexistence and labor relations of radio stations. Regarding participant observation, two methods were adopted: first, descriptive observation and, second, focused observation (Kawulich, 2005). Semi-structured interviews (Sofaer, 2002) were also applied with the participation of journalists from the indigenous Sámi radio at the NRK Sápmi headquarters in Kárášjohka (Karásjok) and in Guovdageaidnu (Kautokeino), as well as dialogues with other members of the Sámi community, about the different perspectives and realities living in Norway. Thus, this article describes the importance of Radio in strengthening identity, and at the same time, from a theoretical point of view, shares the various events that involve the Sami in the social and political context. Finally, it is concluded that Radio Sámi is articulated based on state public policies and promotes community coexistence to revitalize indigenous culture as a fundamental principle present in its essence as an indigenous medium.

RAS04 The role of radio in history telling

PP 1067 Auditing radio cultures of war: Commercial recordings and programme production at Radio Luxembourg (1933–1950)

[Carolyn Birdsall](#)¹

¹ University of Amsterdam, Department of Media Studies, Amsterdam, Netherlands

Radio is a crucial site for sonic collectivities and nation-building, yet is also implicated in social crisis, war, and conflict (Potter et. al 2022). More specifically, radio research has identified World War II as a 'radio war', variously highlighting the role of music in wartime radio (Baade 2013) or radio within urban soundscapes of war (Birdsall 2012). Such research has illustrated how radio has been deployed for domestic news and entertainment programming, as well as for military and propaganda purposes. However, there has been a tendency to focus on national radio cultures, on a discrete periodisation (1939–1945), and to prefer close analysis of individual programmes rather than investigate the production contexts and technological practices of wartime radio. In response, I will first outline an approach to 'auditing' radio cultures of war, which builds on recent radio, sound and (music) technology research (Michelsen et. al 2019; Bonini et. al 2020; Stuhl 2022). I will then offer the case of Radio Luxembourg and consider how its recorded sound collection was crucial to the operations of the station before, during and after World War II. Taking up this extended periodisation helps bring into sharp relief how this internationally-oriented, commercial radio station – with broadcasts in English, German and French – was already embroiled in serious conflicts with Great Britain and National Socialist Germany well prior to 1939.

Shortly before the German occupation in 1940, part of Radio Luxembourg's music collection was hidden, while the occupation radio (1940–1944) was initially characterised by German-language transmissions directed at local audiences and a strong reliance on German musical recordings and sound recording technologies in production. Though the recorded sound collection was partly destroyed prior to Allied takeover in 1944, the subsequent Allied 'black' propaganda radio programming repurposed the recorded sound collection to target German military and civilian audiences, while its immediate post-war schedule drew on US/UK music repertoires and programming for displaced persons in Germany. From 1946, Radio Luxembourg resumed its own multi-lingual services, with pre-war staff members retrieving their hidden recordings from storage and trying to circumvent British government restrictions on new commercial music distribution to the station. In closing, I will evaluate this focus on wartime radio from the vantage of the availability and use of sound recordings in production, and critically assess radio/sound as an entry point for theorising crisis and social (dis)order.

PP 1068 Echoes of resistance: Exilic radio dramas as counter-narratives to Nazi propaganda

Iana Nikitenko¹

¹ Vrije Universiteit Brussel, The Centre for Literary and Intermedial Crossings, Brussels, Belgium

The rise of the Third Reich in Germany marked not only a political upheaval but also a profound transformation in the use of media, particularly radio. In 1933, with Adolf Hitler's ascension to chancellor, Joseph Goebbels took control of Germany's radio broadcasting, turning it into a mouthpiece for Nazi propaganda. This transformation effectively established radio as a "church" for the cult of the nascent state, as articulated by Annuß (2019, p. 100). The radio dramas of this period were meticulously designed to cultivate a sense of collective spirit aligned with Nazi ideals. They portrayed historical figures as exemplars of sacrifice for the greater good of the nation, thereby subtly reinforcing the totalitarian ethos.

This strategic manipulation of the airwaves was countered, however, by an equally potent yet less visible force – a form of resistance that emerged from exiled German writers. This study focuses on two pivotal works written and produced in exile: "Der Prozess der Jeanne d'Arc zu Rouen 1431" (1937) by Anna Seghers and "Das Verhör des Lukullus" (1940) by Bertolt Brecht. Both plays employ the motif of a trial, blending real and fictional narratives of historical figures. Through an (audio)narratological examination, this study underscores the thematic and stylistic elements of these exilic radio dramas, illustrating how they offered a narrative alternative to the National Socialist regime's messaging. Adopting techniques similar to those used in portraying historical events and figures in Nazi Germany, these writers, as Stefan Bodo Würffel (1978) noted, engaged in "critically discussing contemporary history in the mirror of historical examples, [...] presenting it to the listener as a judicial instance" (p. 72).

Aligning with the conference theme "Communication & social (dis)order", this paper provides a nuanced understanding of how communication media, particularly radio plays, can be harnessed as tools of resistance and truth in times of oppressive regimes. It offers a perspective on the power of media in shaping public consciousness and the potential for resistance through creative expression.

RAS04 The role of radio in history telling

PP 0768 Radio, Revolution and Memory: Podcast in the (re)construction of collective cultural values

Isabel Reis¹, Helena Lima¹

¹ Faculdade de Letras da Universidade do Porto, Citcem, Porto, Portugal

Media have an important role in gathering and uphold historical events and values in social and political key-moments, thus, being part of the collective memory (Schwartz, 2016). News, in particular, are players in the construction of collective cultural values, in the way they select, put emphasis and shape the facts considered as relevant, conveying those narratives to audiences (Edy, 2006; Kansteiner, 2002), and accordingly, promoting perceptions and interpretation of those narratives (Kligler-Vilenchik, Tsfati, Meyers, 2014). Disruption moments in societies are natural news values and revolutions become central in the media agenda coverage. 2024 celebrates the 50th anniversary of the Portuguese Revolution. In April 25 of 1974, a military coup ended almost a half-century of dictatorship, characterized by a repression apparatus and a cultural model fashioned by propaganda and censorship. In the launching of the military operation, radio had a central role, not only as witness, through journalistic depiction of the events, but also as an actor in the way communications were carried among the rebels and using the antenna to broadcast the end of the regime (Lima, Reis, 2019). Portuguese radio PBS Antena 1 launched two podcasts that

gather memories of the dictatorship "Antes da Revolução, 1973-1974", and of the revolution "De Cravo ao Peito" which use sounds narratives that promote awareness to major collective experiences. Sound has claimed a role in everyday life. The sounds of history entered our lives with the radio that broadcast and made them accessible to everyone. The power of radio sound to involve people is probably even truer with the podcast which creates an entire aura and imaginative experience (O' Neill, 2018). Podcast are more than downloaded MP3 files, they are a cultural product that is defined by participants and listeners (Berry, 2018). The new dynamics show the resilience of audio as a form of communication that has been able to adapt to various contexts throughout history (Paisana, Martins & Cardoso 2021). The podcast has established itself as a vehicle for oral transmission of history and archive sounds, being an interesting topic of study in our study case. The relation between history memory, collective values and podcast as means of preserving and transmitting them though sound is an ongoing research. We aim to identify the way these podcasts portrait radio and sounds as part the Revolution, and how they shape the transmission of these values to new audiences. The analysis parts from the mapping of subjects addressed in both podcasts, narrative formats and sounds.

RAS04 The role of radio in history telling

PP 1070 Information disorder or communication: How portuguese-language news podcasts explain the war between Hamas and Israel

Cleisyane Quintino¹, [Catarina Magalhães](#)¹

¹ University of Coimbra, Faculty of Arts and Humanities, Coimbra, Portugal

Since 2012, *podcasting* has undergone a transformation, evolving from an amateur medium to a mass commercial medium, with a marked expansion in audience and revenue (Bonini, 2015). Brazil ranks as the second largest market in the world for podcasts, surpassed only by the United States (Blubry podcasting, 2019), which demonstrates that the popularity of this medium transcends linguistic borders. In the context of the Portuguese language universe, the Digital News Report 2023 identified a slight increase in podcast audiences in Brazil, reaching 57% of the surveyed population. In Portugal, the same report indicated that 38% of participants had listened to a podcast recently.

News podcasts, driven by traditional communication vehicles, play a crucial role in audience recognition, engagement and loyalty (Gallo & Newman, 2019) and in capturing young audiences, who seek news mainly on social media (Newman et al., 2020). The investment by traditional media outlets in the diversification of content, media and formats occurs in a context of declining trust in journalism and information. According to the Digital News Report 2023, in Portugal, such levels fell from 61% in 2022 to 58% in 2023. In the Brazilian scenario, an even more pronounced reduction was observed, from 48% to 43% in the same period.

To face this challenge, aggravated by a hyper-fragmented information environment, journalistic podcasts of the "news explainer" type (Lindeberg, 2019) can represent a strategic investment by traditional communication companies. These programs focus on daily events, providing in-depth analysis to the public while simplifying topics covered in the press. One example is the media coverage of the conflict between Israel and Hamas, which broke out on October 7, 2023, which was not restricted to traditional vehicles or journalistic channels, but also reached the sound environment of podcasts.

Thus, with the linguistic context shared between Portugal and Brazil, this study aims to analyze two podcasts from leading newspapers in these countries. The selected podcasts are *Café da Manhã*, from *Folha de São Paulo* (Brazil), and *Expresso da Manhã*, from *Expresso* (Portugal). In the period between October 7, 2023 and December 31 of the same year, 24 episodes were collected about the conflict between the two podcasts, which will be the focus of the analysis. It is worth mentioning that the selected episodes stand out among the most listened programs to on Spotify (as of January 7, 2024).

Through a content analysis to the form of the podcasts complemented with an analysis of the framing of the episodes, we aim to answer the following research questions: 1) How was the conflict represented by the two podcasts?; 2) Who are the "explainers" or main actors?; 3) What are the main thematic axes? and 4) What are the differences and similarities in the journalistic treatment in the two podcasts? Furthermore, we seek to understand whether or not there is a pedagogical function in the content, with an emphasis on the context and explanation of the roots of the conflict in comparison to an approach focused on the present moment of informational (dis)order.

RAS04 The role of radio in history telling

PP 1071 The politics of voice: The evolution of political campaigns

[Laura Caroleo](#)¹

¹ Magna Graecia University, Department of Law- Economics and Sociology, Catanzaro, Italy

New technologies, including the Internet and social media, have ushered in a new order in the realm of democracy, playing a pivotal role during electoral campaigns worldwide (Tambini, 2018; Bode & Vraga, 2019; Zhuravskaya et.

al., 2020; Elishar-Malka et. al., 2020; Caroleo, Giorgi & De Amicis, 2023), and due to this influence, political communication has also changed drastically (Mazzoleni, 1998; Blumler & Kavanagh, 1999; Norris, 2000; López-García & Pavia, 2018; Stier et. al. 2019; Elishar-Malka, et. al. 2020).

To date, many studies have been conducted on the use of Twitter (now X) during electoral campaigns and political debates (Grant, Moon & Busby, 2010; Bethany et al. 2015; Jungherr, 2016; Panda et al., 2020; Shmargad & Sanchez, 2020; Bright, 2020), but so far no one has addressed the analysis of the use of real-time voice interaction within X Spaces (which seems to be the convergence of several old media, such as radio and telephone, and where real-time and voice are central). Spaces on X (formerly Twitter) were released in May 2021, following a beta test in June 2020. Leading news organizations such as Reuters, Politico, Telegraph, as well as institutions (e.g. Unesco and Freedom of the Press) have adopted this tool in their strategy. Spaces characterized by oral communication, real-time interaction, and the turning of listeners into speakers are a powerful tool for community building and engagement, as they facilitate active audience participation and total immersion (Caroleo & Maiello, 2022).

From the ancient Athenian direct democracy in the agora to contemporary democracy, the places of debate have also changed, moving to digital environments, and it is not surprising that Elon Musk has repeatedly claimed that he wants to build a digital public square on X (Ortutay, 2023), reminiscent of the public sphere, where argumentation among free subjects is at the center (Habermas, 1989; Thompson, 1993; Castells, 2008), and the Spaces seem to be the best tool for this.

The use of Spaces by U.S. presidential candidates is consolidating; Ron De Santis launched his presidential race in a Space in May 2023 (Milmo, 2023); Vivek Ramaswamy, another candidate, urinated during a conversation with Elon Musk (Michael, 2023); Robert F. Kennedy Jr. launched the "Campaign Kitchen" format in November 2023.

If Roosevelt recognized the power of radio and its ability to create a sense of connection and community, and established the Fireside Chats, intimate and conversational radio chats with American citizens on a variety of topics, but without the ability to interact with them (Smith 1997, Kiewe 2007, Levine 2010; Amico, 2022). Today, thanks to technological advances, presidential candidates can accomplish what Brecht theorized: make listeners talk and relate to others and themselves (Brecht, 1932). And here is the Brechtian utopian dream materializing after a century.

Using a qualitative methodology, this study aims to explore the use of Spaces through participant observation and content analysis, including downloading, listening, transcribing, and verifying accuracy, to understand the level of engagement with the electorate and identify the most common topics discussed and Space's impact on traditional media.

PP 0064 Stories as a communication tool for science journalist: The case of 'What classic tales did not tell you' project

Damián Moreno Prado¹, Martín Rodríguez Antonio², Álvarez González Celedonio³

¹ IBGM CSIC-UVA, Communication, Valladolid, Spain

² Universidad de Valladolid, UvadiVulga, Valladolid, Spain

³ Universidad de Valladolid, Facultad de Ciencias, Valladolid, Spain

Have you ever wondered why Thumbelina is so small? And how the Pied Piper manages to rid Hamelin of the plague of mice? Stories can be an effective tool to be taken into account by journalists to disseminate scientific knowledge.

In order to awaken scientific interest among children from 8 to 10 years old and encourage their critical thinking from the early stages of their education, we present the initiative 'What the classic tales did not tell you', which is based on three objectives:

1. Rewriting eight children's stories: John Fearless, The Three Little Pigs, Pinocchio, The Wizard of Oz, Thumbelina, The Little Mermaid, Jack and the Magic Beanstalk and The Pied Piper of Hamelin. The purpose is to bring scientific culture closer to the youngest children by introducing basic scientific concepts throughout the stories.
2. Demystifying the figure of the scientist through face-to-face activities with research staff who have helped us with the correction of scientific content. Special attention is paid to girls and the difference it can make for them to meet female researchers, due to the underrepresentation of women in the scientific field.
3. Bringing science closer to minority groups, usually excluded from this type of educational activities, such as children from low-income families. To this end, the project was presented in four Social Action Centers (CEAS) in the city of Valladolid, Spain. In addition, different videos and podcasts are used, seeking a transmedia format, in an effort committed to inclusivity and accessibility. At the same time, we worked on the transcription of the stories in braille.

The results of this project support the hypothesis that stories can be an effective tool for science popularization (Gottschall, 2012; Fuentes, 2013) among children aged 8 to 10 years, with low-income families. The stories written have succeeded in conveying scientific concepts in a clear and accessible way, as the people involved showed a significant understanding of the topics addressed in the representations. This suggests that stories can be used as a valuable strategy to promote interest and understanding of science (Gilly-Forrer, 2021) in this age group and socioeconomic context.

Therefore it also can be an effective tool that journalists should consider for disseminating scientific knowledge thanks of their ability to convey complex information in an accessible way. Journalists play a crucial role in recognizing and using stories to make scientific

SCI01 Communicating science in the media and in politics

PP 0065 The negotiation of scientific norms in COVID-19 science news. Evidence from a quantitative content analysis of German print media

Markus Schug¹, Helena Bilandzic¹, Susanne Kinnebrock¹

¹ University of Augsburg, Department of Media- Knowledge- and Communication, Augsburg, Germany

Media debates on contentious scientific topics like climate change or COVID-19 increasingly portray inner-scientific structures and the norms guiding the scientific system and individual scientists (Brenzau et al., 2020). Consequently, media participate in discussions that are normally confined to the scientific community. However, not much is known about the presence of scientific norms in media coverage – especially regarding controversial areas like COVID-19.

The present study addresses this research gap and analyzes how science journalism negotiates scientific norms. It investigates how scientific norms were part of the discourse in science news about COVID-19 studies (RQ1) and how they were evaluated (RQ2). We use the Mertonian norms as theoretical background. According to Merton (1973) and Ziman (2004), five norms guide the scientific enterprise as "institutional imperatives" (Merton, 1973): *Communalism* requires scientific knowledge to be transparent and available; *universalism* describes the independence of research outcomes from criteria extraneous to a claim (e.g., gender, age, nationality of researchers); *disinterestedness* requests research to extend knowledge while not pursuing competing goals (e.g., financial gain, social prestige); *organized skepticism* demands critical challenging for all scientific claims; *originality* requires research to

be innovative and relevant. While the Mertonian norms were first formulated eight decades ago (Merton, 1942), they still have value for scientific practices such as peer review, disclosure of conflict of interest, or open science.

We conducted a standardized content analysis of COVID-19 print media coverage. We took a random stratified sample of $N = 996$ articles dealing with biomedical COVID-19 studies (on vaccination, virus mutations, etc.) representing twelve established German media and six pandemic stages between February 2020 and December 2021 (Schilling et al., 2022). We coded the negotiation of norms on the level of reported COVID-19 studies within the articles, leaving us with $n = 2020$ coding units. Four trained coders achieved excellent agreement (Gwet, 2014) identifying these coding units (Gwet's AC1 = .91[95% CI:.83;.99]). For each study, we coded the presence of neutral, positive, negative, or ambivalent norm references. Coder agreement was high (communalism: Gwet's AC1 = .92[.87;.98]; universalism: Gwet's AC1 = .90[.83;.97]; disinterestedness: Gwet's AC1 = .96[.92;.1]; organized skepticism: Gwet's AC1 = .93[.87;.99]; originality: Gwet's AC1 = .80[.71;.89]).

Results show that especially originality (referenced in 48.4% of study presentations) and communalism (26.3%) were very prominent in the study presentations, while universalism was present in 10.7%, disinterestedness and organized skepticism in 9% of the study presentations. This implicates that transparency and availability as well as innovativeness and relevance functioned as central normative media evaluation parameters for biomedical COVID-19 studies (RQ1). Regarding RQ2, evaluations were largely neutral or positive in direction. Notably, while only 9% of communalism references were negative or ambivalent, disinterestedness (43.4%) and organized skepticism (23.8%) displayed more varied evaluations in this regard, implicating that researchers' motivations and critical challenging of studies proved to be important aspects of COVID-19 science media critique.

We will present our results based on examples from our material and discuss possible implications for public engagement with COVID-19 science and the significance of science in society.

SCI01 Communicating science in the media and in politics

PP 0066 Politicized or neglected? The role of scientific knowledge in parliamentary debates

Daniel Wiesner¹

¹ University of Vienna, Department of Communication, Vienna, Austria

Our understanding of science is not just shaped by scientific institutions themselves but is also constructed by the way in which scientific institutions and scientific knowledge are publicly and politically discussed (Scheufele, 2014). Furthermore, scientific evidence has become an essential aspect of how political parties communicate and debate, especially in times of crisis (Kettell & Kerr, 2022). As a result, science is increasingly politicized in different ways. For instance, political debates about the climate crisis often make use of evidence-based knowledge but interpret and contextualize this knowledge differently and often along partisan lines (Willis, 2017), raising questions as to the interpretation of scientific knowledge as well as how to deal with the certainty or uncertainty of scientific facts (Oreskes, 2015). This study shows how scientific knowledge is framed by politicians in parliamentary debates. Potential strategies we study are the use of populist frames when talking about science, fostering science-related populism (Mede & Schäfer, 2020), the use of technocratic frames to mask unpopular policy decisions and present them as unavoidable (Kettell & Kerr, 2022), and the degree to which politicians follow scientific evidence in parliamentary debates and make evidence-based policy decisions. Differences between parties are expected due to different political positions, issue ownership, and general positions towards empirical evidence. We use an extensive corpus of publicly available speech protocols of parliamentary debates in Austria that are currently collected. The case of Austria is relevant for the investigated phenomena since science is a lively debated topic in Austrian public and political discourses, science-skeptic attitudes are quite prevalent, and a (science) populist party is represented in the parliament (Eberl et al., 2021). Supervised dictionary methods of automated text analysis are used to identify relevant sequences in political speeches that use scientific knowledge. These sequences are further investigated using unsupervised methods to identify relevant patterns and strategies. The results will deliver a better understanding of how and to what degree science is politicized in the policy-making process by different parties and whether there are changes over time.

SCI01 Communicating science in the media and in politics

PP 0067 Still just Nature and Science? A longitudinal cross-country analysis of journalistic source selection in science news coverage

Nikolai Promies¹

¹ Karlsruhe Institute of Technology, Department of Science Communication, Karlsruhe, Germany

For many people, news media still are the most important source of information on science (e.g. Department for Business, Energy and Industrial Strategy 2020). The picture of science presented in these media is strongly influenced by the sources journalists use in their coverage. Numerous studies have shown a strong dependence of science journalism on a small number of prestigious science journals (Schäfer 2011). However, some authors have suggested that this low source diversity has changed over time due to the easier accessibility of research publications online (Kiernan 2016). The COVID-19 pandemic could also have influenced journalistic source preferences, leading to an increased use of new sources or an even stronger reliance on high impact medical journals. These potential changes have yet to be investigated for a larger sample of media titles. Additionally, most of the studies that have analysed source selection in science coverage are either limited to a small area of science or to a small number of media outlets in one country.

We try to address these research gaps in a large-scale analysis of print and online science coverage. We ask: 1) Are there country-specific differences in the journalistic selection of journals as sources? 2) Has the diversity of referenced journals increased over time? 3) Has the concentration of references decreased over time?

Based on a manual content analysis of 8.400 news articles, we have fine-tuned deep learning models for two purposes: to identify articles that cover a scientific result, and to extract all mentions of scientific journals in these articles. The combination of these models allowed us to analyse the entire coverage of about 30 news media titles each from Germany, the UK and the US in 2010, 2019 and 2020. Overall, we found more than 150.000 articles reporting on scientific results with about 40.000 references to journals.

In all analysed countries, there was a high degree of concentration of references on a small group of journals. While this group was very similar in all countries, we found a preference for journals from the same country, in US newspapers for example for Science or JAMA. Germany was notable for a less pronounced preference for medical journals. Over time, the number of distinct journals referenced has increased both in absolute terms and relative to the number of articles. However, this has not led to a less pronounced concentration of references. In all of the analysed years, about 80 % of all references are attributable to just 25 % of all journals. While there are some differences between 2019 and 2020 (e.g. a higher number of references to medical journals), the distribution of references barely changed with no decrease in the degree of concentration.

SCI01 Communicating science in the media and in politics

PP 0068 Underrepresentation of student voices. Content analysis of news coverage about the Ph.D. degree

Karolína Poliaková¹, Anna Hrbáčková¹

¹ Charles University, Institute of Communication Studies and Journalism, Prague, Czech Republic

Science offers efficient solutions to many societal challenges we face today. In order to adopt necessary changes supported by evidence, public trust in science is paramount (Lacey et al., 2018). Promoting research findings alone is not a sufficient strategy for getting the public on our side, as is repeatedly documented by scholarship on communicating scientific uncertainty (e.g. Capurro et al., 2021). Research does not happen in a vacuum and communicators

also need to focus on how scientific results originate in terms of research methods, values, review processes or experts behind the results. In other words, science should open up to be more transparent. One component of this complex scientific milieu deals with the entry point to academia – a doctorate. Building on the mediatization theory (Couldry & Hepp, 2016), the representation of a Ph.D. in the news has far-reaching implications. For instance, it can affect how the public views doctoral education which in turn translates into political decisions regarding financial support. Additionally, it can influence whether undergraduates see the academic profession as a viable career option. Understanding the media discourse on Ph.D. is therefore critical.

In this study, authors focus on the media representation of doctoral students, doctoral programs at universities and the Ph.D. title. The corpus of almost 500 articles in the Czech media collected over an 18-month period was coded for topics and social actors. After conducting a thorough content analysis, the authors arrived at ten key topics that can best be summarized into four main clusters: Ph.D. title, Life at university, Study conditions and Controversy. The major result is that the topic is heavily politicized and the framing of news is often related to policies about science and education, mainly funding. "Study conditions" were analyzed for social actors due to the cluster's highest relevance and implications. A noteworthy finding is that doctoral students are hardly ever cited in the articles about issues so closely related to them, such as scholarships, parental leave or cooperation with supervisors. Only those students who jointly represent another official organization (e.g. doctoral association) or who already have ties to media are granted a voice through quotation. Moreover, politicians (ministers and their deputies) are the most frequently cited group, which supports the claim about the overall political sentiment of the Ph.D. discourse in media. The issue is closely connected to the notion of power in terms of gatekeeping.

Discourse manifested through media has a significant impact on society. With the image of Ph.D. strongly politicized, students' voices heavily underrepresented and the critical issues including mental health not prioritized by the media, the public's attitudes towards Ph.D. are not constructed using appropriate input. Press officers at universities are encouraged to make use of these results and adjust their strategic communication plans accordingly (Fürst et al., 2021). Journalists covering science and education are advised to make use of these results in reflecting on balance in their reporting. Only then can a trustworthy media discourse on Ph.D. be achieved.

SCI02 Public understandings of climate change

PP 0167 Do we need to talk (less) about 'climate anxiety'?

Thea Gregersen¹, Rouven Doran², Charles A. Ogunbode³, Gisela Böhm²

¹ NORCE Norwegian Research Centre, KMB, Bergen, Norway

² University of Bergen, Department of Psychosocial Science, Bergen, Norway

³ University of Nottingham, School of Psychology, Nottingham, United Kingdom

Since 2019, coinciding with the rise in youth climate protests, the term *climate anxiety* has increasingly appeared in the public discourse and research papers. In line with this, the term is typically used when referring to young people's negative emotional responses to climate risks. Because climate anxiety has made its way into public communication, media coverage, and everyday speech, it is relevant to investigate how the public perceives and reacts to the term. This talk discusses findings from a survey fielded among a near-representative sample of the adult Norwegian population ($N = 2040$). Results from a survey experiment show that people are less likely to support young people's influence on climate policy if they are referred to as having climate anxiety, as compared to being worried about or concerned with the climate issue. The effect of referring to climate anxiety, as compared to worry or concern, was particularly negative among younger age groups and those reporting higher levels of climate worry. Analyses of an open-ended question asking respondents what they think of when they hear or read the term further support its potential negative impact. Although most provided mere definitions (e.g., "worry about climate change"), 27% of the respondents associate the term with something irrational or excessive. An additional 6% critiqued the term for being misleading and contributing to negative associations (e.g., "a term used to talk down people who are genuinely afraid of climate change"). Men, the oldest age group, those placing themselves to the right of the political spectrum, and those reporting a low level of worry about climate change were more likely to think of climate anxiety as unfounded. However, negative associations appeared across all socio-demographic groups. Our results reveal that talking about "climate anxiety" may provoke reactance among some audiences and thereby distract from political actions to mitigate climate change. Thus, researchers and other stakeholders should carefully consider what terms they use to represent (young) people's climate change distress.

SCI02 Public understandings of climate change

PP 0168 The impact of fact-checks and influencers on climate change knowledge according to the Motivation-Opportunity-Ability Framework

Babette Hermans¹, Margot Lissens¹, Michaël Opgenhaffen¹, Desiree Schmuck², Peter Van Aelst³, Cato Waeterloos¹

¹ KU Leuven, Communication science, Leuven, Belgium

² University of Vienna, Communication Science, Vienna, Austria

³ University of Antwerpen, Communication Science, Antwerp, Belgium

Youth have taken an active role in climate activism (Daly, 2022), with social media being a vital aspect thereof (Dekoninck & Schmuck, 2022). Global research shows that news media are the most widely used information sources on the topic of climate change (Newman, 2020). Increasingly, youth turn to social media influencers (SMIs) as alternative information sources (Newman et al., 2023), with mis- and disinformation about climate change reaching far and wide, fact-checks are used in many countries to try and debunk these claims (Vu et al., 2023). In this research, we attempt to gain more insight into how media use is related to climate change knowledge.

We approach the topic of climate change knowledge from a contested issue knowledge approach, where we focus on general aspects of the climate change debate that still cause friction (e.g., the human contribution to global warming). We base ourselves on the Motivation-Ability-Opportunity framework, which has often been used to explain levels of knowledge (e.g., Delli Carpini, 2000). We aimed to investigate how low news use, media skepticism and digital media literacy is related to turning to SMI's and fact-checks as sources of climate change information. We also looked at how these variables would possibly moderate the relationship between exposure to SMI's and fact-checks and climate knowledge.

Method

This project is embedded in a larger project on political knowledge among the general population in Flanders, Belgium. Though the large-scale, quota-based cross-sectional survey spread the whole Flemish population ($N = 2555$), due to the focus of our study on youth, we only included participants between 16 and 30 years old in our analyses ($N = 424$). Items are either self-constructed to reflect the current discussions around climate change, or based on validated scales (Cronbach's $\alpha > .73$).

Results

Results show that both traditional media use ($b = 0.25$, $SE = 0.06$, $p < .001$) and digital literacy ($b = 0.21$, $SE = 0.06$, $p < .001$) are related to exposure to climate related content on social media. Thus, we could assume that youth who are using traditional media, also use social media to gain information and that youth who are trusting of their digital skills, turn to social media for information. This in turn is positively related to higher climate knowledge ($b = 0.22$, $SE = 0.11$, $p = .04$). Social media influencers do not affect the presence of climate knowledge ($b = -0.08$, $SE = 0.07$, $p = .28$), neither do fact-checks ($b = 0.17$, $SE = 0.12$, $p = .18$). It could be that these SMI's rather share mobilizing content or politicization of their private lives (e.g., sustainable living or dieting) than content that is really related to knowledge. Concerning fact-checks, possible explanations are the long and complex articles that often characterize fact-checks, making them unattractive for young people, or that most of the fact-checks deal with political content, not climate content. Nevertheless, these findings teach us more about how alternative news sources (lack) influence on climate knowledge. Results of this study add to the current literature on learning effects from social media, as well as to literature on misbeliefs.

SCI02 Public understandings of climate change

PP 0169 The use of humor styles in memes on climate change

Simon Luebke¹, Nadezhda Ozornina¹, Mario Haim¹, Joerg Hassler¹

¹ LMU Munich, Department of Media and Communication, Munich, Germany

Political internet memes are simple, multimodal, and humorous media content that is popular on all social media platforms. In controversial political discourses such as the climate discourse, political internet memes are considered an effective format for users to generate attention for their own positions through striking images and humorous elements (Ross & Rivers, 2019). Recent literature has discussed humorous communication as an unconventional approach to engage people with environmental issues (Kaltenbacher & Drews, 2020). However, it remains unclear what role political internet memes play in increasing engagement in the climate change discourse, which political actors use memes, and which humor styles are employed. Therefore, our talk examines the following research questions:

RQ1: Which political actors in Germany publish political internet memes on climate change?

RQ2: Which humor styles are used in political internet memes on climate change?

To answer these research questions, we conduct a quantitative manual content analysis of memes on climate change that were published during the UN Climate Change Conference 2023 in Dubai. We collected social media posts from Instagram, Facebook, TikTok, and YouTube which were published on the profiles of relevant stakeholders in the German climate discourse to detect memes from political actors. To identify the use of memes on climate change in general, we also collected all posts that combined hashtags related to the climate change conference and climate change (e.g., #COP28, #climatechange) with humorous hashtags like #meme, #humor, or #funny.

The overall sample comprises 1.877 posts and is currently being coded, particularly regarding the humor styles used in memes (Taecharungroj & Nueangjamnong, 2015). Our preliminary results show that memes on climate change most frequently exhibit the style of aggressive humor. Thus, memes on climate change are more commonly used to make fun of others in a negative way. Furthermore, we observe that relevant political actors in Germany such as protest groups and politicians did not use humorous content and memes during the COP. This implies that political actors are missing the opportunity to counter the prevailing aggressive climate change memes with positive, humorous content. Instead, we find mainly memes published by ordinary users, which involve a more destructive form of humor. This mocking of certain political groups and views in memes on climate change may contribute to greater polarization of the discourse.

SCI02 Public understandings of climate change

PP 0170 Global Warming's Five Germanys: Unveiling media habits and information seeking in daily life

Julia Metag¹, Marina Scholthaus¹, Kira Klinger¹

¹ University of Muenster, Department of Communication, Münster, Germany

People differ in their perception, attitude, and behavior towards climate change. This fundamental yet pivotal lesson has prompted numerous scholars to identify and describe country-specific climate change segments across nations. Given that climate change still constitutes an issue that primarily relies on media communication in daily life to convey its complexity (Schäfer, 2015), our (perceived) knowledge, our level of awareness, and actions regarding climate change are significantly influenced by media platforms we engage with, information we seek, and content we encounter (i. e. Arit et al., 2010; Cabecinhas et al., 2008). This is where a crucial gap in existing climate change segmentation studies arises: only few include variables centered on general media and information use based on cross-sectional data – and if they do, they tend to serve as secondary aspects of segmentation. Thus, a broad body of existing research fail to offer in-depth insights into important links between information seeking and segment-specific attitudes on climate change and its consequences.

To address this gap, *in-situ* survey data formed the groundwork of this in-depth study examining media use and information seeking patterns of the Global Warnings Five Germanys which had been identified by Klinger et al. (2022). To identify members of each of the five segments (the *Alarmed Actives*, *Convinced*, *Cautious*, *Disengaged*, and *Dismissive*) a preliminary survey was conducted (N = 102) based on the 33 segmentation variables and computation of segment assignment⁽¹⁾ of the German predecessor study. Out of this survey, the final sample of 15 participants for the in-situ study was recruited, with three respondents representing each segment. These people were surveyed daily over a timespan of two weeks in July 2023 about their contact with climate change-related information including topics covered, media usage, reception contexts, and trust in the information sources using the mobile experience sampling method. This approach enabled the gathering of individual media usage data daily (n = 210 data points), offering reliability through multiple data points while minimizing dependence on recall.

The data shows that climate change-related media use differs between different segments in everyday life. For example, the most engaged segment (*Alarmed Actives*) use television most frequently while the less engaged and most critical segment (*Dismissive*) tend to rely more on personal discussions than on (mass) media when seeking information on climate change. Members of both segments consider the information they encounter to reinforce their opinion on climate change. Among all segments, the *Dismissive* exhibits the strongest presence of the issue of climate justice within their information patterns. For the *Alarmed Actives* and *Cautious*, climate politics as well as climate protection are key topics of interest. However, there are also situation-specific similarities between the respective segments such as that most people are alone or with their partners when they look for information about

climate change. Leveraging this longitudinal data offers a first entry point to enhance each segment's characteristics with essential insights into information-seeking behaviors.

SCI02 Public understandings of climate change

PP 0171 A changing public opinion (on) climate: Results from a longitudinal segmentation study on climate change-related perceptions and communication behaviour in Germany

Anne Reif¹, Lars Guenther², Michael Brüggemann¹

¹ University of Hamburg, Journalism and Communication Studies, Hamburg, Germany

² LMU Munich, Department of Media and Communication, Munich, Germany

Climate change (cc) is one of the greatest challenges facing humanity and requires immediate collective action. The Paris Agreement set a major milestone in 2015, but media attention to the topic is still volatile: it was on the rise through the global Fridays for Future movement (esp. in 2018 and 2019), characterised by online protests. During the COVID-19 pandemic, media allocated less attention to cc. Currently, right-wing populist parties that deny anthropogenic cc are on the rise in Europe, destructively casting doubts about the topic using social and fringe media. In light of these (recent) developments, it is of crucial social relevance to analyse how segments of cc perceptions have changed since 2015.

For Germany, where this study is set, Klinger et al. (2022, similar Metag et al., 2017) found five groups based on combinations of different attitudinal variables: Alarmed Actives (22%), Convinced (26%), Cautious (32%), Disengaged (14%) and Dismissive (7%). Contrary to comparable studies in the U.S., neither in 2011 (Metag et al., 2017) nor 2021 cc deniers were found in Germany. However, in light of recent (political) developments, studying the stability of the groups as well as a desired positive trend in climate-friendly behaviour within the population remains highly relevant. But so far, longitudinal data on possible changes in segments over time regarding cc-related attitudes and behaviour as well as differentiated communication practices are lacking.

Thus, this study relies on representative online surveys during COPs 2015 ($n = 1477$), 2018 ($n = 1044$), 2019 ($n = 1000$), 2021 ($n = 1000$) and 2023 ($n = 1015$). Using cc beliefs, knowledge, self-efficacy and political activism as variables, emphasising behavioural aspects, we conducted latent profile analysis in RStudio (*tidyLPA*, $n = 5457$, due to missing values, discriminant analyses = 95%) to identify five latent groups. To compare the groups regarding their cc-related attitudes, behaviour and communication practices, we applied ANOVAs. We analysed changes in the percentages of groups over time.

Across the years, we found Convinced Engaged ($n = 1269$; 23%), Convinced Disengaged ($n = 1615$; 30%), Uninformed Engaged ($n = 1329$; 24%), Uninformed Disengaged ($n = 971$; 18%) and Disengaged Deniers ($n = 273$; 5%). The groups deviate from the findings by Klinger et al. (2022) in the way that, only with our large data set including the most recent data, we could identify a small but slightly increasing group of deniers. Furthermore, the Uninformed Engaged stand out for their high use of entertainment (online) media, their low knowledge but at the same time the second highest level of political engagement in favour of climate protection measures.

Over time, the most significant changes in the groups can be found from 2021 to 2023 when the Convinced Engaged (-9%) and Convinced Disengaged (-8%) shrank and the Uninformed Engaged (+10%), Uninformed Disengaged (+4%) and Disengaged Deniers (+3%) rose. Overall, we see a significant decrease in cc beliefs, awareness, self-efficacy and climate friendly everyday-life actions and, most notably, in trust in climate scientists in the recent wave. In this presentation, we will describe the developments in detail. We will discuss the role of social media use for the recent backlash in the public opinion (on) climate.

SCI03 Furthering public engagement with climate change and the environment

PP 0261 Design climate engagement – Journalism visualizations and the public

Anna Maria Jonsson¹, Applegren Ester², Francesca Morini¹

¹ Södertörn University, School of Culture and Education, Huddinge, Sweden

² Södertörn University, Department of social sciences, Huddinge, Sweden

Public engagement and involvement have been pointed out as crucial for coming to terms with urgent societal problems, such as climate change. Here, journalism and other media has an important part to play. How societies should handle wicked problems has become increasingly complex and challenging as we have seen an increased polarization in relation to science, facts and media. The transition towards a digital media landscape is often said to increase the possibilities for participation and interaction. In this paper we focus on how different forms of digital journalism (like e.g. data journalism) and visualizations can contribute to (or hinder) civic engagement.

Visualizations of climate change found in journalistic stories represent meaning-making systems, used as a "medium to engage viewers with complex and sometimes controversial issues" (Heyer et al., 2020). Whereas previous literature has focused on studying the production strategies and novel approaches of climate-related data stories

(cf. Appelgren & Jönsson, 2021), little attention has been given to readers and user experience and this is our main contribution. We will use framing as a theoretical perspective since how issues are framed in terms of problems, solutions, and levels of responsibility is of great importance in order to engage and lead toward a collective action. Our main research questions are: What are the fundamental design and framing elements that strengthen readers' comprehension and democratic engagement with climate news? How does this differ between different groups of audiences?

We will use design methods to explore different forms of democratic engagement with climate journalism. This means that in this study, audience members will in participatory settings, together with researchers, focus on engagement with the aid of design methods and action oriented methodologies (Hart, 2013; Stuedahl, 2017). Aitamurto et al. (2022) suggest that design methods are suitable when studying how journalism artifacts can serve specific audiences and contexts. The user-centric and problem-solving nature of design methods is not only useful in the material creation of journalistic products but has also the potential to uncover complex dynamics between artifacts and human actors and incorporate novel perspectives from diverse groups of users. Thus, guided by the theory-based framework Value-Sensitive Design (Friedman 1996), we will carry out a series of experimental workshops with audience members where the aim is to critically assess and explore how journalistic technological artifacts about climate change can be designed, with an emphasis on engagement and central human values. We will focus on three different interactive journalism projects from different national contexts (Germany, Sweden and the USA).

PP 0262 Responsible ecological transitions: Applying local strategies to boost social and environmental change

Miguel Vicente¹

¹ Universidad de Valladolid, Sociología y Trabajo Social, Segovia, Spain

The connection between local and global contexts is built upon a well-established scientific and advocacy framework. If social and behavioural change is pursued, then a grounded grassroots approach is necessary. The huge environmental challenges faced by our current societies call for a multi-faceted method where every small piece of action turns into a valuable contribution. An initial first step is to acknowledge the complexity of interdependent factors and elements.

One Health is an approach to designing and implementing programmes, policies, legislation, and research in which multiple sectors communicate and work together to achieve better public health outcomes. This umbrella was opened by a four-sided collaboration between World Health Organization (WHO), Food and Agriculture Organization (FAO), World Organisation for Animal Health (WOAH) and United Nations Environment Programme (UNEP). From this global perspective, descending to daily consequences of the ongoing human-based system change turns into a must to achieve specific goals.

This paper is presenting the main outcomes of several small-scale research and action projects completed in Segovia, a small-scale city located 90 kilometres Northwest from the capital city of Spain, under the One Health overarching guidance.

Transitio is an arts and research-based lab based at the Segovia Campus of the University of Valladolid. Since 2022, several short-term activities have been conducted paving a way to a more conscious and committed participation of several social groups in the city.

These actions are based on a participatory research approach, where cooperation with citizens is crucial to make visible changes in the closer daily life. These projects always work with local communities in several research fields, like green and blue infrastructures, sustainability of the agricultural and food systems, natural and patrimonial landscapes or conscious consumption.

Action is privileged in the lab's short-term planning, but research and communication are integral parts of the general project and the lab's production. Surveys regarding health perception were completed to gather a deeper understanding of the citizen's views on the relation between environment, nature and culture, proving that a pessimistic attitude is growingly present within several social groups.

The provisional outcome of this ongoing experience reinforces the value of integrating individuals in research projects as active elements to promote social change, instead of keeping a distant approach towards urgent and impacting threats.

SCI03 Furthering public engagement with climate change and the environment

PP 0263 "World-in-progress": Narrative worlds as creative actions for climate storytelling through a board game experience

[Antoni Roig](#)¹

¹ Fundació per a la Universitat Oberta de Catalunya, Faculty of Information and Communication Sciences, Barcelona, Spain

Storytelling practices, personal narratives and fiction are well-researched strategies in environmental communication, particularly in relation to the collective imagination of alternative and desirable futures. Through a literature review, we have identified different approaches to this interrelation. While there's plenty of contributions highlighting the potentiality of narratives for persuasion and engagement addressed to the lay public (Fletcher, 2015; Davies et al., 2019; Lowery et al. 2020; Schneider et al. 2023), other authors emphasize the importance of narrative strategies for the creation of safe spaces for discussion and imagination of possible futures affecting a community or collective (Pstross et al. 2014; Tyszczyk, 2015; Gearty, 2015; Murphy et al. 2016; Manfredini, 2017; Prasetyo, 2017; De Meyer et al. 2020; Liguori et al. 2021; Keys & Keys, 2022). Here, the notion of storytelling, as a collective process for the creation of experience and meaning (Caraccio, 2022) through a situated narrative action (San Cornelio and Roig, 2022) becomes essential, exemplifying what Liveley, Slocombe and Spiers (2021) define as narrative-driven creative practices.

While most literature on climate storytelling focuses on stories, in this presentation we want to shift our attention from stories to narrative worlds. Narrative worlds are key to establish the grounds for speculative narratives about the future (Liveley et al. 2021). We argue that the process of collectively defining and discussing the settings, features, and rules of a world (Wolf, 2014), in which we project a potential environmental future, is a valuable way to share players' hopes, expectations, prejudices, and fears. These worlds can be challenged or further elaborated, thus creating an expanding 'living world', which in turn, can give way to stories or other kind of narrative outcomes. After summarizing some of the key findings of the literature review on storytelling, futures and the climate, we will present the ongoing project #WorldInProgress. In #WorldInProgress we have designed a board game to guide such a creative process. First tests carried out in a higher education environment in Spain are promising, while also challenging. Results from early testing suggest the importance of defining the world goals and settings (time in the future, imaginative range, social settings, main topic, etc.) the configuration of the playing group, ensuring diversity of voices, the importance of moderation to guarantee a safe environment for creativity, considering the best ways for a 'world-in-progress' to travel from one set of players to another, and documenting the process of 'mapping' the world, that is, to trace its evolution, potential contradictions and alternative paths.

SCI03 Furthering public engagement with climate change and the environment

PP 0264 Can virtual reality decrease the psychological distance to climate change?

[Sweeney Li](#)¹, Zeph Van Berlo¹, Hande Sungur¹, Priska Breves¹, Lal Bariş¹, Marijn Meijers¹

¹ University of Amsterdam, ASCoR- Communication Science, Amsterdam, Netherlands

Climate change, biodiversity loss, and plastic pollution pose significant environmental challenges. However, these are often perceived as psychologically distant, reducing people's inclination towards pro-environmental actions (Van der Linden, 2015). To address this, communication efforts aim to minimize the psychological distance through various means, with emerging technologies, particularly virtual reality (VR), being a promising avenue.

VR offers immersive experiences of climate change consequences, projecting future scenarios and highlighting impacts on distant locations. Praised as an environmental communication tool, VR enhances spatial presence, the feeling of being in another location, potentially reducing psychological distance (Fauville et al., 2020). However, research on VR's effects on pro-environmental behavior and its mediation through spatial presence and perceived psychological distance is limited and inconclusive (Breves and Schramm, 2021; Meijers et al., 2022). This study aims to investigate the impact of VR's immersiveness compared to regular video and text/pictures on pro-environmental actions, exploring the roles of spatial presence and psychological distance.

Method

In a between-subjects design experiment at a university exhibition, 218 participants (56.0% female, Mage = 21.78, SD = 4.71) were randomly assigned to a VR, regular video, or text/pictures condition. Participants provided informed consent and answered demographic and control questions before experiencing the manipulation. Participants in the VR condition saw a 360° video version of "My Drowning Island" with use of an Oculus Quest 2 headset. "My Drowning Island" tells the story of the island state Kiribati which is being flooded as a result of climate change (Biosphere VR, 2018). Participants in the regular video condition saw a unidirectional version of the video, and participants in the text/pictures condition read the script of the video which also included four video stills. Post-manipulation, participants answered questions regarding spatial presence, psychological distance dimensions, and the dependent variables: private-sphere intentions, public-sphere intentions, and policy support.

Results

PROCESS Model 81 (Hayes, 2013; 5,000 bootstraps) was used for the analyses. Participants in the VR condition reported higher perceived spatial presence than those in the regular video ($t(218) = -7.72, p < .001$) and text/pictures condition ($t(218) = -8.58, p < .001$). However, spatial presence did not significantly affect psychological distance dimensions (all p -values $> .20$). Spatial presence positively correlated with private-sphere intentions ($t(218) = 3.05, p = .003$), public-sphere intentions ($t(218) = 3.74, p < .001$), and policy support ($t(218) = 2.12, p = .035$). Indirect effects analysis revealed significant pathways via perceived spatial presence for private-sphere intentions, public-sphere intentions, and policy support.

Conclusion

While VR is celebrated for its potential to bridge psychological distance, this study found no support for psychological distance being the underlying mechanism for VR's positive impact on environmental intentions and policy support, contrary to expectations. Nevertheless, a positive indirect effect of VR on these variables through perceived spatial presence was observed. This study emphasizes the crucial role of perceived spatial presence as a mediator in the relationship between VR exposure and behavioral change, contributing to the ongoing discourse on VR and psychological distance. Future research should explore diverse measures for psychological distance to gain deeper insights into the observed effects.

SCI03 Furthering public engagement with climate change and the environment

PP 0265 Young people, political imaginaries and climate change: On transgressing normality and re-scripting agentic roles

Anabela Carvalho¹

¹ University of Minho, Department of Communication Sciences, Braga, Portugal

The importance of citizens' political engagement with climate change has been recognized by multiple agents. However, in spite of a surge of participation in rallies and other activities by social movements in the last few years, apathy, cynicism and fatalism regarding the ability to influence the course of things is pervasive. Some research suggests that the range of forms of political intervention on climate change that are imaginable to most people is quite limited. As climate change escalates and policy action lags far behind what is needed, some young climate groups, in contrast to the majority of the population, have engaged in civil disobedience and direct action, such as throwing paint at politicians, blocking roads and tying or gluing themselves to buildings, in many cases having been met with criticism. What are the conceivable roles and spaces for young people in the politics of climate change? What are the acceptable means of political engagement with climate change?

The concept of political imaginaries is valuable here for its broad apprehension of views, relations and even emotions. Machin (2022: 2) defines political imaginaries as "dynamic constructions of political reality that enable practices, orientate expectations, inform decisions and determine what is politically legitimate, feasible, and valuable—and what is not." Delineating "who the key actors, groups and deliberators are; the norms according to which agents interact(...) and the kinds of power they employ," McAfee (2017: 919) argues that political imaginaries "constitute our place in a political world, simultaneously constituting our own political subjectivity, our political relationships to others, and our political culture."

Conceiving political imaginaries as horizons of political possibility (of agency, of social re-organization, of re-distribution, etc.), the presentation will explore how some young people challenge and expand those horizons. It will look at how political transformation to address climate change is enacted in multimodal communicative events that include the body, as well textually formulated by two activist groups in Portugal, namely Climáximo and Fridays for Future Lisbon. Drawing on literature on performativity, on political imaginaries and on political imagination, it will examine practices of transgression as potentially emancipatory acts that interrupt normality and experiment with new relations of equality (Ernstson & Swyngedouw, 2019). In turn, climate groups' texts in the media offer insight into their attempts to re-script standard/generalized conceptions of political agency and renew subjectivation. Some such texts will be examined with the support of Positioning Theory. Finally, the political limits and tensions of some instances of climate activism will also be discussed.

SCI04 Energy past, present, and future

PP 0371 Remodeling participation. A multi-dimensional model for participatory communication in green energy transition

[Anders Horsbøl](#)¹

¹ Aalborg University, Dept. of Communication and Psychology, Aalborg, Denmark

The transition to renewable energy is not just a technological, but also a societal challenge. From a governance perspective, the transition is too complex to be orchestrated from the (inter)governmental cockpit (Hajer et al. 2015). From a democratic perspective, a just transition represents an intrinsic value, both in terms of procedural and distributive justice (Ellis et al., 2023). This calls for extensive citizen involvement and participation in the manifold processes of green energy transition. This paper presents a model for analyzing, designing, and evaluating participatory communication, targeted at the local level where decisions on renewable energy plants are made by municipal authorities, energy companies, and citizens.

In the scholarly literature, generic models for citizen participation, developed within policy and media studies, are already available. Much quoted is Arnstein's seminal 'ladder of participation' (Arnstein, 1969), spanning between 'manipulation' at the lowest and 'citizen control' at the highest rung. Recent research has rethought and developed the model. For example, Carpentier (2016) offers an analytical framework for analyzing and evaluating media participation from a political perspective, and Torfing et al. (2016) suggests a 'ladder of co-creation' with five rungs. While these models provide valuable insight into inclusion/exclusion of actors and degrees of power delegated to citizens, they are less attuned to the various dimensions of the communications process that enable or constraint citizen participation. Therefore, this paper suggests a multi-dimensional model for participatory communication, which identifies and differentiates between key communicative dimensions, including transparency, responsivity, design space, temporal structure, and modality width. The point is not to replace the previous models' focus on power with a focus on communication, but to strengthen our understanding of power by attending to the formats, dynamics, and mediation of the communication process. This will contribute to knowledge on the complexity of participation and allow for a more differentiated analysis of participatory shortcomings, potentials, dilemmas, and trade-offs.

Empirically, the model relies on several case studies of communication about renewable energy plants at different sites in Denmark, conducted in 2022–2023. The studies comprise interviews with citizens, energy businesses, and municipalities, as well as observations from citizen meetings and media documents. The model has been developed inductively from the data to cover aspects of participatory importance at different sites. At the same time, it is informed by theories of deliberative democracy, discourse studies, and lessons learned from studies of citizen involvement and co-creation.

The paper will present the individual dimensions of the model along with examples from the case studies, and shortly address limitations and complementarities with existing models.

PP 0372 A technology between rejection, ignorance, and acceptance: Analyzing the framing of near-surface geothermal energy in German public service and private media

[Cornelia Wolf](#)¹, [Daniel Seibert](#)¹

¹ Leipzig University, Institute for Communication and Media Studies, Leipzig, Germany

A lack of information, awareness and involvement of the public and relevant stakeholders in energy projects can lead to their rejection and fuel mistrust (Contini et al., 2019; Syivarulli, 2020). Challenges of communicating information and promoting dialogue between said actors, however, also refer to the media coverage and the public positioning of energy topics (Carr-Cornish et al., 2019). In this context, the decisive factor is the extent to which socially relevant debates (e.g. environmental protection) are addressed (Balzan-Alzate et al., 2021) and associated advantages and disadvantages are presented transparently (Syivarulli, 2020).

Recently, potentials of geothermal energy received increasing interest in research. Compared to other forms of renewable energies, however, geothermal energy receives significantly less support of German citizens. This is because a lack of knowledge of and experience with the technology prevails (SMEKUL, 2022). Furthermore, the

public portrayal of the technology is dominated by negative focusses (Stauffacher, 2015). Geothermal energy recently is often linked with the energy crisis, high costs and is characterized by the denunciation of allegedly incompetent public figures (e.g., Rupprecht, 2023; Staun, 2023). The rhetorical tactics and negative campaigns of tabloid newspapers (e.g., alliterations, personalization, emotionalization) on the topic, however, are also infiltrating non-tabloid media (e.g., Traufetter & Weiland, 2023). In consequence, a lack of awareness and knowledge of the technology as well as its negatively framing (Scheufele, 1999) harbors the risk of shaping public discourse and hindering objective debates on both advantages and disadvantages of the technology.

This study is part of an interdisciplinary research project which examines the potential of near-surface geothermal energy for heating and cooling urban quarters in Saxony (Germany), starting in February 2024 and following the overall research question: *How can the perception and acceptance of near-surface geothermal energy measures among residents in urban quarters be improved through innovative digital formats of science and acceptance communication?* As part of this aim, this study analyzes the framing of regional and national public-service and private media (e.g., FAZ, SZ, SPIEGEL, Bild, WELT, MDR, LVZ, Sächsische Zeitung). In doing so, the presentation of advantages and disadvantages of the topic as well as referred relevant stakeholders are examined (e.g. regional companies, investors, initiatives, interest groups).

As part of the presentation, we discuss the results of this media analysis and shed light on the framing of the subject in terms of the presentation of advantages and disadvantages of the technology in comparison to scientific findings on its opportunities and risks as well as relevant stakeholders. The results also enable us to identify potential misconceptions in media reporting and particularly polarizing aspects of the discussion about near-surface geothermal energy that need to be addressed in future science communication on the technology. Finally, the results will serve to form the basis to analyze relevant stakeholders' and the public's perception towards the technology and in turn to develop communications measures, dialogue formats and participatory activities for raising awareness and improving the acceptance towards the technology.

SCI04 Energy past, present, and future

PP 0373 Gamification as a tool of science communication about complex energy issues? Results of a field experiment testing the effects of a museum exhibition about the energy-transition and an integrated game

Sophia Schaller¹, Christina Schumann², Jens Wolling¹

¹ TU Ilmenau, Institute for media and communication science- department for empirical media research and political communication, Ilmenau, Germany

² Augsburg University, Institute for media- knowledge- and communication- Department for communication science-media effects and processes, Augsburg, Germany

The *energy transition* is an important key to mitigate greenhouse gas emissions and thus limiting climate change. It includes a fundamental reorganization of the energy system to rely exclusively on renewable energies. However, the energy transition triggers resistance in the populace. Bringing this complex topic closer to citizens is crucial for a successful energy transition, but a key challenge for science communication.

The Public Understanding of Science (PUS) approach proposes to increase the knowledge of citizens; Public Engagement with Science (PES) aims to increase—among other—trust and self-efficacy. Museum exhibitions are one format suggested for implementing both, PUS and PES (sciencecommunication.com). The exhibition [*blinded for review*] takes up this suggestion. However, little is known about the impact of museum's science communication on the visitors. Therefore, the present study examines whether a visit to the exhibition increases knowledge, trust, and self-efficacy regarding the energy transition. Moreover, we analyze whether the way how visitors interact with the exhibition influences these changes: First, we examine the *effects of a gamification element*, which particularly aims to increase self-efficacy and engagement with the energy transition. The game has a similar feel to the "psycho-tests" in life-style-magazines. It describes 8 scenarios in which citizens will experience the impact of the energy transition on their daily lives. In each scenario, visitors choose one of four given options, indicating how they would behave in the respective situation. Thereby, they collect points with a chip-card and in the end—based on their "high-score"—they see which energy transition behavior type they are. Second, we examine whether a high visitor's *involvement* reinforces potential positive effects of the visit and game use.

Based on data of a field experiment with pre-post survey (N = 614 visitors), we conducted t-tests for dependent samples. Results show that the exhibition visit increased knowledge about the energy transition ($M_{t_1} = 3.44$, $M_{t_2} = 3.61$, $p < .001$), feelings of self-efficacy ($M_{t_1} = 3.69$, $M_{t_2} = 3.80$, $p = .018$), and visitor's trust that science ($M_{t_1} = 4.26$, $M_{t_2} = 4.36$, $p = .006$) and innovative technologies ($M_{t_1} = 3.73$, $M_{t_2} = 3.89$, $p < .001$) contribute to a successful energy transition.

Furthermore, we conducted variance analyses to test whether playing the game and the exhibition involvement contributed to these positive changes, with changes in knowledge, trust, and self-efficacy (t_2-t_1 ; scale: -4 = strongly decreased to + 4 strongly increased) serving as dependent variables. Results (extracts) revealed no main effects

of game use. However, we found that higher-involved visitors ($M = 0.24$) had significantly greater changes in their trust in technology than lower-involved ($M = 0.03$). Thus, the expected potential of a gamification element was not supported, but for involvement it partially was. The presentation will discuss possible reasons.

SCI04 Energy past, present, and future

PP 0374 Stakeholders' competing and conflicting narratives of blue hydrogen: Two industrial case studies in realization of clean hydrogen in Norway

[Gilda Seddighi](#)¹, Kari Kjestveit², Sindre A. Høyland², Tone N. Slotsvik²

¹ NORCE, Health and Society, Bergen, Norway

² NORCE, Health and Society, Stavanger, Norway

This paper will explore the narrative surrounding blue hydrogen, currently recognized as one of the most "competitive" forms of hydrogen in the context of the green transition. The generation and utilization of energy are central to both the climate challenge and the socio-economic landscape (Curran, 2011). Clean energy such as blue and green hydrogen is increasingly discussed and being highlighted in international strategies as a focal point for profound decarbonization. Norway is among the countries which has long industrial experience throughout the entire hydrogen value chain and its government has aimed to contribute to developing a coherent value chain for clean hydrogen produced with low or no emissions, where production, distribution and use are developed in parallel. However, there are several conflicting expectations and narratives surrounding clean hydrogen that merit careful consideration of understanding how the particular types of hydrogen and their value chain are perceived when compared to other forms of energy production (Ohlendorf et al., 2023).

As research has shown expectations and narratives of green transition can differ even within national borders, by different stakeholders (Tilsted et al., 2022) and citizens with different social backgrounds (Haarbosch et al. 2021). A crucial aspect of a stakeholder's ability to further its interests lies in its capacity to craft and communicate compelling stories about the transition. While stories and narratives may evolve in response to circumstances, environments, and societal shifts, they can still shed light on the attitudes and values deemed paramount (Tanum and Krogstad, 2014).

To highlight the conflicting narratives within the blue hydrogen value chain, this paper introduces two industrial case studies – one situated in a newly established industrial area and the other in an area with over 100 years of industrial history, both located in west coast Norway.

We ask:

What competing and conflicting narratives arise during the realization of a blue hydrogen project in these industrial cases in Norway? Which values are calculated and given priority in each blue hydrogen narrative? To what extent do local industrial history, geography, and various stakeholders influence the narratives?

The data presented in the paper draws from broader research examining how hydrogen is integrated into diverse sociotechnical systems in Norway. The presented data comprise interviews with 25 stakeholders actively engaged in the implementation of clean hydrogen projects within industrial case studies, supplemented by content analysis of official documents produced by the same stakeholders. These stakeholders include representatives from NGOs, county governors, municipalities and industrial project managers.

SCI04 Energy past, present, and future

PP 0375 Little white (or rather green) lies. The impact of minor forms of Greenwashing on Corporate Reputation and Credibility

[Juliane Keilmann](#)¹, Thomas Koch¹

¹ Johannes Gutenberg-Universität, Institut für Publizistik, Mainz, Germany

Human-induced climate change is a pressing global challenge demanding immediate attention (NOAA, 2022). As society emphasizes sustainability and carbon reduction (Cook et al., 2013), companies as major carbon contributors face increased scrutiny to adopt eco-friendly practices (Camier et al., 2021). Recognizing these expectations, companies seek to reap benefits by portraying themselves as environmentally responsible (De Jong et al., 2020; Freitas Netto et al., 2020; Walker & Wan, 2012). However, the seamless alignment between environmental promises and actual practices isn't guaranteed, giving rise to Greenwashing—a phenomenon defined as the "perception of a discrepancy between an organization's environmental protection claims and its actual practices" (Keilmann & Koch, 2023, p. 3). In essence, companies strive to present their offerings as more environmentally friendly than they truly are (Baum, 2012; Freitas Netto et al., 2020; Siano et al., 2017; Zych et al., 2021).

This paper aims to investigate the conditions under which recipients begin to regard minor discrepancies, referred to as "little green lies," as instances of Greenwashing. To address this inquiry, two experiments were undertaken.

In the first experiment ($n = 203$), we explored whether even minor deviations between a company's green promises and its actual green behavior are perceived as Greenwashing. A fictitious coffee house chain ("Green Bean") claimed to use 100% recycled material for its cups and lids in an Instagram post. Then, participants learned through a news article that the actual recycled proportion was 51%, 97%, or 100%. Thus, we have created three groups representing varying levels of discrepancy: large (100% vs. 51%), very small (100% vs. 97%), and no discrepancy (both 100%). Results indicate that the company's reputation and credibility were perceived significantly worse even after a "little green lie", with this effect intensifying as the discrepancy increased.

In the second experiment ($n = 206$), we probed the mechanisms driving the observed decline in reputation and credibility due to "little green lies." We anticipated that these discrepancies would shift perceptions of the company's green commitment towards extrinsic motivations, fostering skepticism and negatively impacting credibility and reputation. Additionally, we expected a diminished belief in intrinsic motivation, reducing the authenticity of the engagement and further impairing reputation and credibility. Using an Instagram post from a fictitious coffee company ("Matsiro Coffee"), claiming a 50-cent donation per coffee package for lemur habitat protection, participants discovered actual donations of 26 cents, 45 cents, or 50 cents. Again, we have created three groups with varying levels of discrepancy: large (50 vs. 26 cents), very small (50 vs. 45 cents), and none (both 50 cents). Importantly, these effects were serially mediated: on the one hand, by heightened perceptions of extrinsic motivation that triggered skepticism, and on the other hand, by diminished beliefs in intrinsic motivation, reducing perceived authenticity.

In conclusion, this study demonstrates that even minor discrepancies, or "little green lies," between a company's environmental claims and actual practices significantly diminish its reputation and credibility. The findings underscore the importance of genuine environmental commitment, as attempts to portray eco-friendly practices that fall short are likely to be perceived negatively by consumers.

SCI05 Public trust and mistrust in science I

PP 0376 Does contact with science communication increase trust in science? The mediating role of perceived trustworthiness

Florian Winterlin¹

¹ University of Münster, Department of Communication, Münster, Germany

Trust in science is considered as important for societies because it helps individuals to make informed decisions based on scientific evidence despite a bounded understanding of science (Bromme & Goldman, 2014). Therefore, science communication in practice often aims at improving trust and research on science communication examines if trust in science can be improved through communication about science (Wynne, 2006). However, in most cases, research neglects that effects might depend on users and how they evaluate the information on science they receive.

Based on the susceptibility to media effects model (Valkenburg & Peter, 2013), we argue that how users evaluate contacts with science communication in different channels influences how this information contributes to their individual formation of trust in science. According to the model, evaluation of the experience with science communication is conceptualized as cognitive response state that mediates the effect of science media use on trust in science and is influenced by dispositional, developmental, and situational susceptibility factors. As dispositional and situational susceptibility factors, we included science-related populism, positivistic attitudes, political orientation, and religiosity. Trust in science as the main dependent variable is theoretically conceptualized as judgements of scientists' trustworthiness measured using a 12-item scale with four established conceptual dimensions of trustworthiness, i.e., perceived competence, benevolence, integrity, and openness. The evaluation of contacts with science communication was measured by asking the respondents about the trustworthiness of scientific information received through news, fictional, social media, and non-mediated sources.

Using an online survey and a quota sample weighted according to distributions of age, gender, and education level in Germany ($N = 1,007$), we tested a moderated mediation model to evaluate if evaluations of the contact with science through different channels play a role for trust formation or if merely exposure matters. The structural equation model showed an overall good model fit and met the limits proposed by Hu and Bentler (1999) for three indices ($\chi^2 p < 0.05$, CFI = 0.95, RMSEA = 0.03, TLI = 0.91, SRMR = 0.03). Looking at the direct effects, the results showed that exposure to scientific information via different channels alone does not influence trust in science. Instead, the perceived trustworthiness of the information is crucial. If people perceive information about science in news channels ($\beta = .15^{***}$) and on social media ($\beta = .14^{***}$) as trustworthy, their level of trust in science is higher. The influence of exposure to scientific information on trust in science is completely mediated by judgements of the information's trustworthiness.

Looking at the role of susceptibility factors, positivistic attitudes and to a lesser degree science-related populism and religiosity play a role for explaining trust in science directly ($\beta = .47^{***}$; $\beta = -.09^*$; $\beta = .09^{**}$) and by moderating the effect of exposure on trust in science.

The findings strengthen the argument that looking at mere exposure and its effect on attitudes toward science may overlook important cognitive responses during exposure and the moderating role of susceptibility factors.

SCI05 Public trust and mistrust in science I

PP 0377 Mediating trust in content about science: Assessing trust cues across (digital) media, their contents, sources, and actors' gender

Justin T. Schröder¹, Lars Guenther¹

¹ LMU Munich, Department of Media and Communication IfKW, Munich, Germany

To address social (dis)order in contemporary societies, the importance of science communication and *public trust in science* cannot be overstated. (Digital) media play a crucial role as *intermediaries of trust*, incorporating *trust cues* that can guide public audiences in evaluating whether to trust science. Trust cues refer to established *dimensions of trust* (i.e., expertise, integrity, benevolence, transparency, and dialogue), and they consider science at *multiple levels* (i.e., micro, meso, macro). Since (digital) media environments are supposed to be diverse in terms of *contents* (e.g., trust cues referring to multiple dimensions of trust), *sources* (e.g., science communicators such as journalists, bloggers, or scientists), and *actors* (e.g., multiple levels of science, including gender diversity at the micro level), this study aims for a better understanding on how (digital) media may affect trust in science differently, asking: *In what ways are trust cues in content about science and several diversity aspects of (digital) media environments interlinked?*

To answer this question, this study makes use of quantitative content analysis of media content most frequently used by German audiences. Our sample included (print, online, and TV) journalistic media, but also social, other (non-journalistic) internet-based (e.g., blogs), and right-wing populist media collected in seven constructed weeks (March 2022–March 2023). In total, $n = 1.812$ contents were relevant for coding; a representative, randomized sample was built for this study (i.e., half of the relevant pieces; $n = 906$). For the quantitative content analysis, a standardized codebook (based on inductive, qualitative groundwork by AUTHORS) including 35 trust cues was used. Four coders were trained and conducted the coding (average $\alpha = .90$; $CR = .94$). For data analysis, we used descriptive statistics and chi-square tests, using all diversity related variables. Furthermore, to show linkages, cluster analysis was performed, including 23 variables: media types, dimensions of trust, categories of trust cues, the gender of scientists, sources, and their gender. After performing a hierarchical cluster analysis with Ward method for binary variables, we compared results with a k-means cluster analysis for a quality check.

Our findings reveal significant differences among (digital) media in terms of dimensions of trust and science at different levels. Notably, the dimension of expertise and scientists at the micro level are most frequently emphasized; with some gender stereotypes persisting. Furthermore, four clusters were identified linking diversity in terms of contents, sources, and actors: (1) Journalist refer to female and male experts for their science coverage (46%; $n = 2.304$), (2) gender-neutral reference to scientists' integrity (23%; $n = 1.139$), (3) male scientists refer (online) to their (male) colleagues' benevolence (21%; $n = 1.068$), (4) gender-neutral reference to scientists' transparency and dialogue (10%; $n = 475$). Generally, different media types seem to be partially diverse in terms of contents, but only social media can be considered to be diverse regarding sources; the diversity of actors was not identified in this sample.

Focusing on diversity aspects in digital media environments, this study aims towards a better understanding of the trust relationship between science and its publics.

SCI05 Public trust and mistrust in science I

PP 0378 The perception and role of transparency in AI-based chatbots for science information retrieval

Esther Greussing¹, Evelyn Jonas¹, Monika Taddicken¹

¹ Technische Universität Braunschweig, Institute for Communication Science, Braunschweig, Germany

Since the introduction of ChatGPT, generative AI (genAI) has emerged as a transformative force, shaping how users navigate and access information – including information about science. However, concerns about their ability to convincingly present inaccurate information foster repeated calls for transparency in these systems. While ample research exists on explainable AI in advice and decision-making, our current understanding of transparency in genAI-based chatbots that provide science-related information remains limited. Hence, this study compares user engagement with two prominent chatbots, Open AI's ChatGPT and Microsoft's Bing Chat. Specifically, it explores how individuals use and perceive genAI-based chatbots in the context of science-related information search, considering the distinct features they offer. Most notably, while ChatGPT is practically opaque, Bing Chat indicates more transparency by displaying source references through linked footnotes, and by visibly translating user queries into search phrases. We ask two research questions:

RQ1: *How do users perceive the transparency of ChatGPT and Bing Chat when seeking information on science-related topics?*

RQ2: *How does the transparency of ChatGPT and Bing Chat impact users' evaluation of the information presented?*

The RQs are addressed through qualitative interviews with $N = 34$ participants from the general public (52.9% female, mean age = 38.3 years ($SD = 17.4$), 59% have prior experiences with chatbots). As part of the interview, each participant engaged first with ChatGPT, then with Bing Chat to search for information on two science-related issues: sustainable aviation and juice cleanse. The authors conducted the on-site interviews in Germany in Summer 2023. Qualitative content analysis (Mayring, 2014) was applied to analyze the verbatim transcriptions.

Participants expressed a multifaceted view of transparency, regarding (1) sources, (2) translation of user input, and (3) issue uncertainty. Predominantly, participants raised concerns about genAI's opaque database and desired source references for ChatGPT's information. In contrast, Bing Chat's visible sources – including journalistic outlets, Wikipedia, and corporate websites – sparked doubts about content credibility due to their diverse spectrum.

The second facet of transparency surfaced when participants noted that Bing Chat displays the translation of user input into a search phrase, akin to a search engine. While some participants felt confirmed by this, believing genAI "gathers something from the internet" (interviewee 20), others questioned the added value of conversational AI in science-related information searches, as their own phrasing of a prompt seemed to lose significance.

Transparency regarding the uncertainties of what is known about an issue was the third facet that emerged. Participants emphasized that ChatGPT provides comprehensive answers, presenting pros and cons about an issue. While for some, this enhanced the perceived transparency of the system, others worried that this may create an illusion of greater knowledge than is actually available. Bing Chat, by contrast, was discussed for clearly stating that information on certain topics is not available – also enhancing its perceived transparency.

Overall, this study highlights the multifaceted role of transparency in genAI for accessing science-related information. Thus, it offers empirical evidence on a technology that could significantly influence the science communication landscape, and opens avenues for further research on concepts closely tied to transparency, such as trust.

SCI05 Public trust and mistrust in science I

PP 0379 Unravelling (hybrid) trust in generative AI as intermediaries for science-related information – Insights from a qualitative interview study

Evelyn Jonas¹, Esther Greussing¹, Monika Taddicken¹

¹ TU Braunschweig, Institute for Communication Science, Braunschweig, Germany

The emergence of generative AI (genAI) chatbots such as OpenAI's ChatGPT or Microsoft's Bing Chat, capable of simplifying complex subjects, is reshaping the way laypeople retrieve information. Therefore, they are now being discussed as intermediaries for science-related information. Since the utilisation of these systems for such purposes depends on the level of trust users place in them, this study focuses on trust in chatbots based on genAI. This necessitates the consideration of two theoretical perspectives: science communication research, but also human-machine communication research. Generally, trust describes a relationship variable between a trustor and a trustee, traditionally drawing a conceptual distinction between human-machine and interpersonal trust dimensions (reasons for trust). Given users' inclination to perceive AI-based conversational interfaces in a human-like manner, traditional notions of machine-trust prove insufficient to address trust in chatbots, leading to a fusion with dimensions of interpersonal trust. Our study employs this hybrid approach, extending machine-trust (functionality, reliability and helpfulness) with epistemic trust dimensions (expertise, integrity, and benevolence) – given the context of science communication. Finally, it remains uncertain who or what users actually perceive as the trustee. In human-machine communication research it is assumed that genAI systems encompass different layers (e.g., the application itself, developers or the company) varying in their salience during interactions. Therefore, we ask:

RQ: Which layers of genAI-based chatbots are salient for users when they elaborate on their trustworthiness in the context of retrieving science-related information?

We conducted qualitative interviews from June-August 2023 with $n = 34$ people from the German general public (52.9% female, mean age = 38.3 years ($SD = 17.4$), 58.8% with prior chatbot experience). After using ChatGPT (version 3.5) and Bing Chat to obtain scientific information on the topics of sustainable aviation and juice cleansing, we asked them about their perception and evaluation (\emptyset -duration: 2h). The verbatim transcribed interviews were analysed using flexible coding (Deterding & Waters, 2021), while applying categories referring to the above-mentioned trust dimensions and layers of the trustee.

The interviews indicate that participants not only refer to the chatbots themselves, but also consider other layers, i.e., users, developers or companies, when assessing their trustworthiness. The last two appear to be most salient in evaluating integrity (adherence to social/scientific standards and norms) and benevolence (prioritising users' well-being). Regarding integrity, interviewee 13 noted for example an underlying entity dictating source prioritisation, while other stated regarding benevolence, the chatbot were "designed" to work benevolently (I4) or – on the contrary – were driven by Microsoft's financial interests (I7).

In conclusion, broadening machine-trust dimensions with epistemic trust dimensions reveals the intricate perception of chatbots as multi-layered trustees, linking dimensions like benevolence to both technical systems and

their developers/companies. These findings enrich theoretical considerations of trust in AI in information search processes and demonstrate the need for science communication research to open up to other, emerging fields of research. They suggest practical applications in developing genAI-based chatbots for science-related queries and contribute to discussions about strengthening user literacies. Limitations include a controlled laboratory environment and the analysis of verbalized behaviour not fully reflecting natural use cases.

PP 0380 Analyzing public perceptions and online engagement with different science topics

Monika Taddicken¹, Dorothe Kienhues², Stephan Winter³, Nadine Bol⁴

¹ TU Braunschweig, Institute for Communication Science, Braunschweig, Germany

² Centre for Teaching in Higher Education ZHL, Centre for Teaching in Higher Education ZHLM, Münster, Germany

³ Media Psychology, Department of Psychology, Kaiserslautern/Landau, Germany

⁴ Tilburg School of Humanities and Digital Sciences, Department of Communication and Cognition, Tilburg, Netherlands

Scientific knowledge and research are consistently linked to uncertainty, complexity, and contestedness (Funtowicz & Ravetz, 1993; Popper, 1959), making it challenging for non-scientists to comprehend (Bromme & Goldman, 2014). From a societal perspective, it is nevertheless important to keep citizens informed (Fischhoff & Scheufele, 2013) and to engage the public regarding socio-scientific issues (Sadler, 2009). Given the diverse nature of scientific disciplines and research areas, it becomes necessary to differentiate among various socio-scientific issues based on public perception, considering that some may be more meaningful to individuals than others.

Understanding how these perceptions influence one's engagement with science is vital. The contemporary communication landscape, particularly on social media, facilitates easy participation in disseminating and generating science-related information (Taddicken & Krämer, 2021).

We therefore not only ask how different scientific issues are perceived (RQ1), but also how these perceptions are affected by sociodemographics (RQ2) and drive online engagement on social media (consumption of information, participation and generation of content) (RQ3).

Through an online survey involving a representative German sample ($N = 1014$, age: $M = 45.3$, $SD = 14.41$), we explored various science topics, including vaccinations, climate change, genetically modified food, autonomous driving, psychological effects of video games, and cosmology. Participants were presented with these topics in a randomized order and asked to assess them based on meaningfulness (interestingness, individual and societal relevance) and their state of research (uncertainty, complexity, contestedness).

Initial findings highlight distinct perceptions of the topics, with climate change and vaccinations receiving the highest meaningfulness ratings and cosmology the lowest (RQ1).

Concerning the state of research, higher education levels consistently correlate with increased perceptions of controversy across all topics. Additionally, right-wing political orientation is a significant predictor of higher perceived controversy for vaccinations and climate change (RQ2).

Across all topics, there is a strong negative correlation between information seeking, participation, and content generation on social media and perceived controversy. For climate change, (right-wing) political orientation specifically predicts content generation but not information seeking and participation (RQ3).

These results offer valuable insights into the ongoing discussion surrounding the public's engagement with science.

SCI06 Perspectives on nature and sustainability

PP 0486 Sharing a green world? The role of nature in influencer content

Lisa Curdes¹

¹ University of Hohenheim, Institute of Communication Science: Interactive Media and Online Communication, Stuttgart, Germany

Climate change and environmental protection are among the world's greatest challenges. However, only 45 percent of 18 to 29-year-olds in Germany fully agree with the statement "It is mankind's duty to protect nature" (BMUV & BfN, 2021). Large parts of our lives take place in the digital space, especially in social media, and direct nature experiences are on the decline. High-reach influencers on Instagram, TikTok or YouTube engage with millions of followers every day by sharing their daily lives, opinions and recommendations, which has an impact on their followers' world views, values, and attitudes: a meta-analysis by Hermann et al. (2023) confirms that increased social media use tends to correlate with materialistic tendencies. In order to understand the impact of nature images conveyed by social media influencers on their followers, it is necessary to analyze the nature images prevalent in influencer content. Although there is some research on nature images in documentaries or advertisements, little is known about the role of nature in influencer content. Hence, a qualitative content analysis was conducted to find out how social media influencers portray nature and their relationship to it in their posts?

The sample of influencers included the twelve most popular German social media influencers, quoted by gender. All posts (images and videos or reels) published between December 2022 and November 2023 with a explicit or implicit reference to nature were included into the sample (n = 280 posts).

Findings indicate that nature only appears in tandem with human presence, with the influencers positioned as central figures within the scene. The portrayal of nature predominantly aligns with positive attributes, i.e. depicting it as something fresh, pure, and unpolluted. Common elements used to craft these images include settings like the sea, beaches, sunsets, snowscapes, and mountains. Additionally, nature is dominantly portrayed in a domesticated context, e.g. through pets or gardens. Influencers depict nature in a hedonistic light, using it as a picturesque backdrop for their physical appearance or extravagant attire. They also present it as a setting for experiential enjoyment such as boat tours, dolphin watching, or wellness experiences. Consequently, nature images often serve the purpose of self-expression and pleasure-seeking, conveying the idea that a life within nature embodies a happy, healthy and enjoyable lifestyle. Another noteworthy observation is that many nature-related posts are captured during travel, providing first insights into the environmental behavior that influencers communicate. Despite the prevailing admiration for nature and the emphasis on its positive attributes, the sampled posts do not explicitly address climate change, the vulnerability of nature, or humanity's impact on the environment. In the presentation, detailed results, further findings, and implications regarding the impact on the followers' understanding of nature and environment will be discussed.

SCI06 Perspectives on nature and sustainability

PP 0487 "A landscape of fascinating beauty..." – How emotionalization of voice-over narration in nature documentaries influences aesthetic experience and persuasive effects

Fabian Mayer¹, Holger Schramm¹

¹ Julius-Maximilians-Universität of Würzburg, Department of Media and Business Communication, Würzburg, Germany

Television nature documentaries enjoy great popularity due to their aesthetic shots of flora and fauna with dramatic narratives (Bousé, 1998). Particularly the characteristic off-screen narration can be attributed importance (Jones et al., 2019), oscillating between entertainment and information transfer (Soppe & Pershina, 2020). But should content of narration and way of speech be rather factual or emotional and how does this influence the reception process?

Experience of nature has always been strongly associated with aesthetics (Ulrich, 1983). Aesthetic experience has a cognitive and an affective component (Mennighaus et al., 2019), whereby the latter, following Schindler et al. (2017), can be seen as consisting of prototypical-aesthetic, pleasant and epistemic emotions. An emotionalized content of narration should reinforce visual aesthetics and thereby lead to a stronger cognitive and affective aesthetic experience, which is expected to be reinforced by a matching emotionalized way of speaking (Bänziger et al., 2014). Following Diessner et al. (2018) we further integrated the personality trait "appreciation of beauty" as a moderator here. A strong emotional aesthetic experience should lead to a more positive relationship with nature (Ng, 2023). This in turn should lead to a more positive attitude towards environmental protection (Tam et al., 2013), whereby this relationship is expected to be moderated by environmental knowledge (Ienna et al., 2022). A positive

attitude towards environmental protection is expected to lead to higher pro-environmental behavior (Arendt & Matthes, 2016).

A laboratory study was conducted using a 2(content of narration factual vs. emotional)-x-2(way of speech factual vs. emotional)-between-subjects-design. The sample contained $N = 150$ persons ($N_{\text{female}} = 118$, $M_{\text{Age}} = 23.40$, $SD_{\text{Age}} = 7.04$). As stimulus we used a nature documentary on the Patagonia region (28:42minutes). Soundtrack was newly created, whereby nature sounds and background music were identical in all conditions. Off-narration was recorded by a professional speaker for all four versions. Manipulation of content of narration ($t(148) = -1.807$, $p < .05$) and way of speech ($t(148) = -1.683$, $p < .05$) was successful. All measures had a reliability of Cronbach's $\alpha > .70$.

Results of a customized-process-model (Hayes, 2018) show a direct positive influence of an emotionalized content of narration on the cognitive aesthetic evaluation of the seen nature ($b = .86$, $p < .05$). This in turn is positively related to prototypical aesthetic ($b = .51$, $p < .05$), pleasant ($b = .49$, $p < .05$) and epistemic ($b = .57$, $p < .05$) emotions. Way of speaking and appreciation of beauty have no significant influence. Both prototypical-aesthetic ($b = .31$, $p < .05$) and pleasant ($b = .33$, $p < .05$) emotions are furthermore positively linked to the relationship with nature, which improves the attitude towards environmental protection in interaction with high environmental knowledge ($b = .02$, $p < .05$). However, a positive attitude towards environmental protection does not lead to stronger pro-environmental behavior ($b = .46$, $p = .08$).

Nature documentaries seem to be able to increase the cognitive and emotional aesthetic experience of nature conveyed by documentaries through an emotionalized content of narration, which pays out in terms of positive persuasive effects regarding environmental protection. Contrary to expectations, the way of speaking does not appear to have any influence. The presentation will discuss this in detail and point out further implications for research into and production of nature documentaries.

SCI06 Perspectives on nature and sustainability

PP 0488 The discursive construction of nature in biodiversity and climate change debates

Mette Marie Roslyng¹

¹ Aalborg University, Department of Communication, Copenhagen S, Denmark

"The green energy transition is too often stifled by green concerns for nature and biodiversity and bureaucratic inertia". In an interview in the Danish newspaper *Politiken* 8th October 2023, the Danish Foreign Minister, Lars Løkke Rasmussen, makes his position clear in relation to an environment struggle over energy and green transition, referred to internally in the government as "the green dilemma". On the one side, land areas are set aside for windmill farms in the name of the green energy transition; on the other, large scale green energy constructions may cause noise pollution and threaten biodiversity. Environmental NGO's, in contrast, criticise the government for its lack of ambition in the green transition. This paper explores how political actors draw on conspicuous and diverse constructions of nature in the articulation of positions in environmental discourse about biodiversity, green transition, and climate change. Environmental politics has been studied as a hegemonic expression of ecological modernisation, emphasising how the nature is discursively constructed in a way that emphasises technological solutions to environmental challenges (Hajer 1996; Moll & Sonnenfeld 2000). Adopting a discourse analytical approach to the public debates on green transition allows us to study the Danish government's articulation of the 'green dilemma' (and the critiques thereof) as an environmental discourse, that is inherently antagonistic (Laclau 1990) as well as political (Mouffe 2000). This leads to the following research question: How do political actors articulate an opposition between concerns over climate change and biodiversity thus constructing particular notions of nature in environmental discourse?

The analysis draws on data in the form of 1) transcripts from the Danish Prime minister's opening speech addressing the 'green dilemma' and the parliamentary debates that followed this speech and 2) the subsequent critical media debate within the three main Danish broadsheet newspapers (*Politiken*, *Berlingske*, *Jyllandsposten*) showing the concerns voiced by parties, NGOs, media and other political actors about the Danish climate change policies and goals for CO2 emission reductions. Based on the analysis, the paper argues that the Danish government's articulation of a political conflict as a green dilemma between biodiversity and climate change redirects the focus away from the antagonistic nature of environmental discourse. This leads to a rearticulation of the classical environmental conflict regarding economic versus ecological concerns into a struggle between different green positions. Paradoxically, this rearticulation of environmental discourse draws on constructions of nature that favour green transition's potential for investment and export opportunities rather than nature conservation and environmental justice.

SCI06 Perspectives on nature and sustainability

PP 0489 Sustainable fashion in the infosphere: An analysis in the light of the technological paradigm

Pedro Dourado¹, Vasco Ribeiro¹

¹ Faculdade de Letras da Universidade do Porto, Centro de Investigação Transdisciplinar Cultura- Espaço e Memória, Porto, Portugal

Fashion plays a crucial part in the construction of identity and belonging, as well as in the confidence of individuals in expressing their personality [13]. Nonetheless, fashion overconsumption has been identified as a contributor to global warming and climate change [12], harming both natural and human resources – from obsolescence in production [9] to the solidification of throwaway culture [18]. Despite increased awareness of the environmental damage caused by existing consumption patterns [11], education and information for sustainable fashion remain insufficient [1][19].

Understanding a problem requires considering how the World is organized and how we interact with it [14]. This theoretical study reveals the evolution of sustainable fashion in the setting of the Infosphere, in continuous counterpoint with one of the key macro-paradigms of information and communication on digital platforms: the technological one. Starting with Manuel Castells' concept of the network society as a new model of social organization, the critical role of information in today's research on sustainability and fashion is examined. The concept of paradigm is presented by Edgar Morin as a kind of great matrix of thought, a scenario described by Thomas Kuhn [10] as the reconstruction of a specific area of knowledge based on new foundations, which change the beliefs, values, tools, and techniques shared by a community.

The network society [3] is based on the emergence of the Internet and widespread access to Information and Communication Technologies, with informationalism serving as the material foundation of twenty-first-century societies and the increase in human capacity to process and communicate information [6]. The Internet's value has expanded in the fashion sector as well, proving to be an essential source of knowledge, surpassing the financial value related to e-commerce [16]. The interaction of consumers generates a massive amount of information about production, products, and consumption [7], which is especially relevant when we consider Castells' reconfiguration of space and time: a space of flows that transcends any geographical limit, and a timeless time [4].

The effects of the online allow consumers to access the world of fashion in a faster, deeper [8] and unmediated way [5] – the Internet's ubiquity surpasses conventional gatekeepers such as the press [15]. There is now a leveling of actors and institutions [5], which leads to value co-creation processes between production and consumption [16]. Indeed, as a result of consumer pressure, the Internet has proven to be an important tool for organizing and mobilizing for the establishment of sustainable fashion [2], by raising awareness of alternative lifestyles and building political strength to ensure that they are implemented [5].

This theoretical study allow us to understand how digital communication functions in response to unprecedented environmental issues. In the case of sustainable fashion, taking action is critical due to the urgency of the climate crisis. Otherwise, we will enter a path where the dissemination of "green" begins to be disregarded, and keywords such as sustainable development become nothing more than empty concepts [20].

PP 0490 Examining the nexus of science, science communication, and activism: Young scientists' perspectives in Switzerland

Sabrina Heike Kessler¹, Max Rabinovich¹

¹ University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

In our knowledge-based society, scientists are directly exposed to the political struggles of our time, such as climate change and COVID-19. Many expect science to be "neutral" and provide "facts," while others advocate for science-supported activism or even activist scientists. This study aims to understand the evaluations and expectations of young scientists themselves regarding their own activism in their disciplines, such as participation in social movements or civil disobedience, and how these actions intersect with their professional responsibilities and knowledge transfer. The literature has extensively discussed how activist scientists should be (Conde, 2015; Isopp, 2015; Krueger, 2021; Muir, 2020; Pielke, 2007). We ask: Where do young scientists in Switzerland see the boundaries between science and activism? How activist are young scientists in Switzerland in the face of numerous current challenges? What opportunities and risks do they see in activist actions? How do they assess the importance of activist action, and can disciplinary differences be identified?

Method

In 2023, we qualitatively surveyed 33 young scientists from the Swiss Young Academy, representing 28 disciplines (Mage = 35; 67% female; Natural Sciences (45%); Social Sciences (27%); Humanities (27%)). The questionnaire included 17 open-ended questions asked by a trained interviewer (average duration: 33 minutes).

Results

The majority of respondents had been activists in some form according to their definition. They saw benefits such as "strengthening societal awareness for certain topics," "relevance for their own discipline," and "supporting concrete positive changes (e.g., policies)," as well as personal benefits: "The benefit lies more in being able to change something through one's work, and that is a kind of intrinsic motivation." However, numerous risks were also addressed, such as fear of online or physical threats and negative consequences for their careers: "A big fear for me is that you then lose your credibility and that you are no longer taken seriously." Disciplinary differences between the Natural Sciences and the Social or Humanities regarding activism were evident. More respondents from the Natural Sciences indicated that it is not very important for scientists in their discipline to be activist, and reactions in their discipline differ. On the question of whether science and activism can or should be separated, opinions were balanced as nearly half of the respondents doubt that science and activism can and should be separated; some accept a theoretical/analytical difference between science and activism, but this is not their normative/practical position: "I don't think they can be separated... I believe that good science is nourished by activism and good activism is nourished by good science." The majority reject the idea of entirely objective science. However, most mentioned that science must be transparent by clearly communicating assumptions, starting points, etc. For some respondents, the ideal of objectivity clearly exists, which one can aspire towards: "It's not science if it doesn't try to be objective," vs. "This whole objective science is anyway an illusion."

Discussion

This study critically examines the boundaries between science (communication) and activism among young scientists in Switzerland, a topic increasingly discussed but not comprehensively explored from a transdisciplinary perspective.

SCI07 Political polarization, climate change, and the media

PP 0598 The right-wing legacy media in the UK and their campaign in 2023 against the Net Zero policy: A case study of the systematic deployment of inaccurate and misleading information

[James Painter](#)¹

¹ Reuters Institute- Oxford University, Politics and International Relations, Oxford, United Kingdom

Context

After a period of relative unanimity from 2019–2021 over the importance of taking action to curb greenhouse gas emissions, in 2023 parts of the media gave considerably more space to questioning aspects of government policy including the ban on fracking, Low Transport Networks, and most importantly, the net-zero GHG target for 2050 (including calls for a referendum). Opposition to the net-zero target increased notably after the Conservative Party's victory in a by-election on 22 July 2023, and culminated in the Prime Minister, Rishi Sunak, rowing back on the government's green commitments in September 2023.

The study draws on existing scholarship designed to identify forms of climate obstructionism, particularly casting doubt on climate policy solutions, but also more traditional doubting of climate science or the climate movement (Lamb et al., 2020; the nature of climate policy skepticism in the UK media (Painter et al., 2023); the identification of different forms of mis-/disinformation in general; and in the specific case of climate change, false/inaccurate and misleading information. (Treen et al., 2020).

Scope

We focus on a four-month period of media coverage from 20 July 2023 to 19 November 2023, and include a range of UK legacy print newspapers including left-leaning and right-leaning, tabloid and broadsheet), both print and online.

Method

Detailed manual content analysis using Exeter University's c3ds department's new Media Monitoring programme to locate relevant articles including news reports, opinion pieces, and editorials.

RQs 1. What are the dominant discourses found in our sample about the achievability of the Net Zero target?

2. i) Are there patterns of false or inaccurate information about the target or the policies designed to achieve it? ii) Are there patterns of misleading information about the target or the policies designed to achieve it?
3. Are there important differences in the coverage between the eight media outlets?

4. In general, is there evidence from our sample that the UK media or parts of it are, on a regular basis, publishing inaccurate, misleading or distorted information about the Net Zero policy.

Results

Initial sampling shows how some right-leaning media, and particularly the Telegraph, Mail and Sun notably increased their opposition to the net zero policy, and were a key factor in influencing the government in watering down its climate commitments. There is also preliminary evidence that these papers regularly deployed inaccurate, misleading or partial information to make their case, and were reliant on agenda-driven commentators. It is a stand-out case study of how right-wing media, and their political allies in the climate obstructionist lobby groups, can effectively oppose the enactment of ambitious climate legislation.

SCI07 Political polarization, climate change, and the media

PP 0599 Political anatomy of an environmental controversy: Mapping Twitter reactions to climate protests in Italy

Massimo Airoidi¹, Laura Bruschi¹

¹ University of Milan, Department of Social and Political Sciences, Milano, Italy

Disruptive climate protests ordinarily ignite digital controversies, which can be mapped out to understand whether such actions are effective at mobilising segments of the public toward environmental issues, and why. Since late 2018, groups like Extinction Rebellion and Fridays for Future inaugurated a new wave of grassroots activism, followed by platformized and highly polarised social media debates. In Italy, civil disobedience group Ultima Generazione's climate protests have been making the news, as in the case of January 2nd 2023, when a group of activists defaced with orange paint Palazzo Madama, seat of the Italian Senate in Rome.

The present paper makes use of computational methods to investigate Twitter users' reactions to this specific environmental action gone viral, with the goal of reconstructing the discursive patterns and deeper political anatomy of the controversy. In the days immediately after Ultima Generazione activists spray painted the façade of the building, we retrieved 43,768 unique tweets in Italian mentioning keywords linked to the protest, as well as metadata about the Twitter accounts followed by the authors of the tweets. By analyzing this large corpus through a combination of text mining (topic modeling), visual network analysis and qualitative content analysis, we show that a) while Ultima Generazione's nonviolent action succeeded at giving visibility to climate-related topics, the majority of posts in our dataset focused on the legitimacy and modalities of the protest; b) the Twitter reception of the protest is very mixed, with a slight majority of positive reactions; c) users who followed Twitter accounts of politicians, media outlets and journalists close to right and centre-right positions in the Italian political field tended to negatively judge the protest, and vice-versa.

With this paper we aim to make at once a methodological and a theoretical contribution. On the one hand, we show how digital and computational methods can be successfully mobilised to shed light on the social and ideological roots of ephemeral controversies on social media platforms. On the other, we stress the role of platform publics' political background in the polarised reception of environmental activism, highlighting how this can affect how the communication strategies of nonviolent climate activists are discursively framed and evaluated online.

SCI07 Political polarization, climate change, and the media

PP 0600 The (de)legitimization of climate change protests in German newspapers of record

Sabrina Morenz¹, Moritz Bürger¹

¹ University of Passau, Chair of Science Communication, Passau, Germany

Not only climate change itself causes social disorder, but also, to a substantially smaller extent, the activist movements calling for political action to tackle the issue – especially if they resort to tactics of civil disobedience to gain attention. The present study addresses the question of how such forms of protest are perceived by the public. The German activist movement *Letzte Generation* ('Last Generation') and its portrayal in established media serve as a case study.

Theoretically, the study is primarily based on the concept of subjective legitimacy as a social scientific perspective on the perception of certain actors and power relations as legitimate and the resulting influence on people's attitudes and behavior (Beetham, 2013). More specifically, we aim to answer the following research question:

How are the Last Generation's climate change protests (de)legitimized in German newspapers of record?

To measure the concept of (de)legitimization, we drew on the idea of legitimation statements as statements consisting of four elements: speaker, object of legitimation, evaluation and argument (cf. Kleinen-von Königslöw et al., 2019). Speakers could vary depending on the source cited in the media, the object was always the Last Generation, the evaluation could be either legitimizing or delegitimizing and possible legitimation arguments, i.e. criteria to justify the evaluation, were derived from the existing literature as well as from the material for investigation.

To answer the research question, we conducted a quantitative manual content analysis. We drew a sample of 300 articles about the Last Generation published in *Süddeutsche Zeitung (SZ)* and *Frankfurter Allgemeine Zeitung (FAZ)* between the movement's foundation on August 30, 2021 and June 28, 2023 (N = 699). An intracoder reliability test with 10 articles yielded satisfactory results (Krippendorff's Alpha/Gwet's AC: .75-1).

Our results show that SZ and FAZ primarily reported on the forms of protest (main topic in 45% of the articles under study) and actions directed against the protesters (19%), while the protesters' arguments and motives as well as their demands only played a minor role (2% each). With regard to legitimation statements (n = 766), both newspapers allowed the Last Generation to speak for itself to a similar extent (19% of the statements published in the SZ, 20% of the statements published in the FAZ) and predominantly evaluated the movement to be illegitimate (56% and 66% of the statements respectively). However, the conservative FAZ delegitimized the group significantly more often than the liberal SZ ($\chi^2(1) = 8.3, p = .004$). The predominantly negative evaluation appears to be related to the coverage's overall focus. E.g., 65% of the statements that dealt with the forms of protest delegitimized the Last Generation, while statements about their arguments and motives as well as their demands were mostly positive (79% and 57%). To legitimize the protesters, the newspapers mostly argued that the protests were rational (29% of all statements), non-violent (20%), or effective (11%). Conversely, arguments of criminalization (31%), lack of effectiveness (11%), and being a threat to the common good (10%) were most often used to delegitimize them.

SCI07 Political polarization, climate change, and the media

PP 0601 A systematic literature review of social media, climate change and political polarization

Marc Esteve Del Valle¹

¹ University of Groningen, Media Studies and Journalism, Groningen, Netherlands

With regard to climate change, political polarization has arisen in parallel to people's increasing use of social media. This increased use has induced many scholars to investigate whether, how, and to what extent social media contributes to a polarized environmental discourse (Ludovico et al., 2020; Röcher et al., 2020; Williams et al., 2015).

Polarized discussions about the environment have been shown to have several negative effects, including undermining public confidence in human-caused climate change, increasing political inaction (Bruell, 2014), and delaying or impeding mitigation efforts (Cook et al., 2018). Addressing the impact social media has on climate change-related discussions is thus fundamental to the realization of climate-neutral societies and prevention of social unrest.

The first step to addressing this schism is better understanding the characteristics of climate change-related political polarization on social media. Despite the urgency of the climate situation, research into the causes and effects of polarized public views in this area remains limited. Moreover, there has to date not been a comprehensive account of the disparate scientific work that has been done on climate change-related polarization on social media. This systematic literature review represents such an endeavor.

Specifically, this systematic literature review presents the findings of a content analysis of 27 peer-reviewed scientific articles investigating the relationship between social media, political polarization, and climate change. It provides a thorough overview of the trends and dissonances across these studies in terms of their areas of focus, methods, and results.

The review yields contradictory findings with regard to the degree of polarization in climate change-related conversations on social media: 13 publications find some instances of polarization, 6 report none, and 8 remain inconclusive. Despite these divergent results, the review points to clear relationships between the existence of polarized climate change-related conversations in the studies' findings and their foci, type of data employed, and forms of polarization approached. Specifically, polarized climate change-related discussions on social media clearly overshadow studies that explore communicative interactions, utilize digital trace data, and address affective polarization. In contrast, in publications investigating the effects of exposure to climate change-related information on social media, particularly those relying on self-reported data to examine ideological polarization, the predominant trend is either the absence of polarization or inconclusive results.

SCI08 Public trust and mistrust in science II

PP 0603 When science won't guide you, who else will? The relationship between (dis-)trust in scientific guidance and exposure to alternative online media

Fabian Zimmermann¹, Christine Petersen¹, Matthias Kohring¹

¹ University of Mannheim, Department of Media and Communication Studies, Mannheim, Germany

This paper addresses the question whether and how exposure to alternative online media is associated with public (dis-)trust in science. Specifically, we introduce and examine the concept of *guidance trust*, which refers to the role of science as a public guide or advisor for decision-making. This implies providing and communicating relevant orientational knowledge about social issues, pointing out possible choices, and recommending certain decisions (e.g., Pielke, 2007). Hence, guidance trust in science builds on the expectation that scientific propositions and recommendations will be *practically relevant and applicable to inform reasonable decisions*. This dimension of trust in science relates to but goes beyond its epistemic aspect, which focuses on the *validity* of scientific evidence (e.g., Hendriks et al., 2016).

Especially in uncertain times of global challenges for society such as the COVID-19 pandemic or the climate crisis, the public is in need of reliable orientation to make the right decisions. However, some parts of the population have withdrawn their trust in scientific experts. Distrustful people do not only disbelieve scientific facts but also doubt science to be a useful guide for decision-making. The digital media environment serves them as a counter-hegemonic public sphere offering alternative guidance. Especially the self-proclaimed alternative news media position themselves as fundamental opposition to the established epistemic authorities. Alternative media outlets use digital communication channels (especially Telegram) to spread scientific misinformation and to advocate policies that contradict scientific reasoning (e.g., Walther & McCoy, 2021). Therefore, people lacking trust in scientific guidance should be especially prone to this alternative media coverage.

We will present evidence on this matter drawing on an online survey, which is representative for the German population regarding age, gender, education, and residency (N = 1.200). First, we introduce and validate reliable scales to measure epistemic and guidance trust in science, which we developed based on an elaborate qualitative pilot study. By conducting exploratory and confirmatory factor analysis on a split sample (N₁ = 600; N₂ = 600), we show epistemic and guidance trust to be correlated but discriminant factors. Furthermore, we demonstrate the explanatory power of guidance trust regarding alternative online media use over and above epistemic trust in science and other confounders. Apparently, the less people trust science to guide decision-making successfully, the more they use alternative online media. This especially holds true for individuals with a high need for orientation towards scientific topics. Hence, trust in scientific guidance is crucial to prevent people from being misled by alternative online media, which often undermine scientific advice and could lead to decisions that are detrimental to social order and democracy.

SCI08 Public trust and mistrust in science II

PP 0604 Scientific (dis)information and ingenuous trust in science: Engagement and reception of scientific (dis)information in Italian high schools

Alessandro Ricotti¹, Simone Tosoni¹

¹ Università Cattolica del Sacro Cuore di Milano, Dipartimento di Scienze della comunicazione e dello spettacolo, Milan, Italy

The proposed intervention focuses on the high school classroom as a social group in order to investigate its role in mediating access, reception, and circulation of scientific (dis)information. It is based on a two-year-long mixed-method research on twelve high school classrooms selected from six schools proposing different curricula (humanistic, scientific or professionalizing). In each of them, we conducted qualitative interviews with students, teachers and parents; focus groups with students and parents; two rounds of qualitative media diaries; virtual ethnography and commented social media reel scrolling sessions; and data donation.

Especially when compared with the family, the classroom as a social group has by and large emerged as a weak mediator for the access and reception of scientific (dis)information: a role that is almost entirely fulfilled by the

guidance provided by teachers within their educational programs. Beyond that, scientific information is rarely shared or discussed among classmates, except for information delivered through infotainment formats on social media, or strictly related to common concerns for everyday life (in particular regarding health and nutrition). By far more relevant are smaller groups of friends, within and across the classroom, who share the same interests or passions, like astrophysics.

Notwithstanding this role of the classroom, our observations suggested how students share the same criteria to distinguish between scientific information and disinformation – generally based on stylistic features on the message and on the refusal of scientific populist or conspirative frames – and above all a similar – and somehow ingenuously unrealistic – idea of science, based on an unerring capacity of the scientific method to ascertain definitive truths, grating unanimous consensus in the scientific community.

This ingenuous trust in science can represent a vulnerability when probed by personal or social crises (like a disease or the pandemic). As a part of the project, we have developed an experimental formative module to promote a more realistic understanding of science, based on the main acquisitions of the Social Studies of Science, taking care, however, not to undermine its trustworthiness.

SCI08 Public trust and mistrust in science II

PP 0605 Science-society intermediaries 'in the line of fire': An interview study on hostility and institutional support in science communication

[Sophia Charlotte Volk](#)¹, Niels G. Mede¹

¹ University of Zurich, Department of Communication and Media Research, Zurich, Switzerland

Recent years have seen an increase in public hostility against science, ranging from hate speech and threats to attacks on scientists (Nölleke et al., 2023), who may suffer severe negative consequences (Valiveronen & Saikkonen, 2021). This has also challenged science communication, as hostility against scientists is often mediated via public or private communication channels such as social media (Nogrady, 2021). Anecdotal evidence suggests that professional science communicators – particularly, university communicators – who serve as “intermediaries” at the science-society interface (Schuijjer et al., 2022) are also prone to becoming targets of attacks. Building on the concepts of boundary work (Gieryn, 1983) and boundary spanning (Schwetje et al., 2021) and multivocal crisis communication and rhetorical arena theory (Frandsen & Johansen, 2020), we conceptualize university communicators as actors who play a boundary spanning and intermediating role between the public and universities, and between attackers and targets of hostility, respectively. In this role they provide communicative advice and support to those affected by hostility, even if they are not personally targeted.

Since there are no studies on this issue, we conducted a qualitative interview study with university communicators. We explored how they experience or observe hostility (RQ1) and how they deal with it or support those affected (RQ2). In summer 2023, we conducted in-depth interviews with 16 university communicators from 10 countries, who were recruited via a screening survey shared through social media and/or professional networks, using a semi-structured interview guide with a vignette illustrating different types of hostility. The interviews (Ø 59 min.) were analyzed with structured qualitative content analysis that employed deductive and inductive coding.

Results show that hostility against university communicators is not widespread (RQ1). It rarely targets them personally, but rather “the university or the faculty or a research group or individual researchers” (NL1). Nevertheless, communicators ‘work in the line of fire’, as university members approach them for advice and support. Although communicators are therefore often ‘only’ observers of hostility and supporters of others, they experience “this also as a burden” (AU1) and may suffer from exhaustion and frustration.

The interviews further show that institutional support measures for targets of hostility are being built (RQ2), but vary widely across universities and countries. Common prevention strategies include media trainings for researchers and coaching for public communication. Communicators typically provide individual counseling to those affected and help them respond to hostile communication, often backed up by legal advice to “be on the safe side legally” (GE1). However, there are only few post-hoc measures, e.g. to facilitate exchange between those affected. Moreover, university communicators may experience loyalty conflicts between their responsibility – qua position – to safeguard the reputation of the university and their sense of responsibility to protect the well-being of the researchers.

This study provides novel insights into the intermediary role of science communicators and support measures for dealing with hostility. The findings highlight the influence of organizational contexts (Schäfer & Fähnrich, 2020) in protecting individual researchers and may inform the development of countermeasures against hostility in science communication.

SCI08 Public trust and mistrust in science II

PP 0606 Intermediaries in the limelight: How exposure to trust cues in content about science affects public trust in science

Justin T. Schröder¹, [Lars Guenther](#)¹, Anne Reif², Janise Brück¹, Monika Taddicken³, Weingart Peter⁴, Evelyn Jonas³

¹ LMU Munich, Department of Media and Communication IfKW, Munich, Germany

² University of Hamburg, Journalism and Communication Studies, Hamburg, Germany

³ TU Braunschweig, Institute for Communication Science, Braunschweig, Germany

⁴ Bielefeld University, Institute for Interdisciplinary Studies of Science, Bielefeld, Germany

Research on *public trust in science* is paramount as a potential decline of trust in science is discussed. This decline has often been linked to digital media environments, which serve as *intermediaries of trust* by providing cues for why to trust science. In the context of public trust in science, five trust groups have already been identified by AUTHORS that differ in terms of trust in science – but also in their media use: (1) “Fully Trusting”, (2) “Highly Trusting”, (3) “Moderately Trusting”, (4) “Rather Untrusting”, and (5) “Untrusting”. Considering the media use of these groups and their trust in science, this study examines *how the exposure of trust cues in content about science affects public trust in science across trust groups*.

Answering this research question requires a mixed-method design. In this linkage study, we combine German panel survey data in two waves ($n = 1,030$; t1: March/April, 2022, t2: March/April, 2023) with a content analysis of the sources most frequently used by German audiences to get informed about science, collected in seven constructed weeks between t1 and t2 (i.e., journalistic, further non-journalistic social and online (e.g., blogs) as well as fringe/populist media; $n = 906$). For this, a standardized codebook including 35 trust cues based on inductive, qualitative groundwork by AUTHORS was used. With data from both analyses, we created linkage variables: the multiplication of source-specific media use (average of media use frequencies between t1 and t2, weighted by no. moderate and high use) and trust cues (average number of trust cues per source, divided by the average number of trust cues across all sources). Hence, higher values of “trust cue exposure variables” (i.e., one per source, 13 in total) indicate more exposure to trust cues.

The five groups reached the following frequencies: “Fully Trusting” ($n = 163$; 16%), “Highly Trusting” ($n = 230$; 22%), “Moderately Trusting” ($n = 250$; 24%), “Rather Untrusting” ($n = 207$; 20%), and “Untrusting” ($n = 180$; 18%). Trust in science at t1 was the strongest predictor for trust in science at t2, for the whole sample and across all groups. Exposure to trust cues across different media affected trust in science differently across these groups: Trust cue exposure in science blogs affected “Highly Trusting” and “Moderately Trusting” negatively. However, trust cue exposure in science magazines had a positive effect for “Moderately Trusting” and “Rather Untrusting”. Exposure to trust cues in populist/fringe media negatively affected trust in science for “Untrusting”; social networking sites like Facebook, in turn, had a positive effect on this group.

At the conference, results will be discussed in more detail and will be tested against further concepts, such as knowledge about science, reservations and promises towards science, science populism, authoritarian perceptions, and conspiracy beliefs. Thus, we try to sort out social (dis)order in communication to some extent. The findings so far reveal that exposure to trust cues in certain media predicts public trust in science and variations across trust groups indicate a nuanced nature of trust-assessing processes in digital media environments.

SCI08 Public trust and mistrust in science II

PP 0607 Strategies of contestation of official science in the Italian Stop-5G movement: From Scientific to Syncretic Patchwork Storytelling

[Simone Tosoni](#)¹

¹ Università Cattolica di Milano, Scienze della Comunicazione, Milano, Italy

The proposed paper delves into the Italian Stop5G movement, aiming to explore the discursive practices – media related and not – it employs to construct, stabilize and in some occasions radically transform a body of shared knowledge refused by the majority of the scientific community – in particular, regarding the effects of non-ionizing electromagnetic radiations. For this end it adopts a perspective inspired by the Social Worlds Framework (Clarke & Star 2007) – that conceives social worlds and their discourses as co-constructed – and by an ecological understanding of media (Anderson 2016) – that conceives them as a vast interconnected environment where discourses interact in different ways: sometimes competing, sometimes adapting one to the other, and sometimes again merging in new ones.

Through on one year of online and offline ethnographic observation (between 2019 and 2020), interviewees to citizens and activists, and focus groups with different samples of population, it was possible to identify four phases characterizing the social world of the Stop5G movement, its discursive practices, and its shared knowledge:

1. The phase of public appeals (2017–2018), featuring scientists contesting officially accepted knowledge on electromagnetic fields;

2. The activist phase (2018–2020), with an increasing number of citizens organized in local groups participating in the social world and the arena, and adopting discursive strategy closely mirroring the ones from the previous phase;
3. An intermediate phase at the beginning of the pandemic crisis (February–April 2020), where discursive practices in the social world began to undergo significant transformations, particularly in addressing the nature of the virus and the associated illness;
4. The pandemic phase (until the end of 2020, when observation came to an end), when discourses in the social world, with some significant exceptions, took a populist or conspiratorial turn.

As it will be shown, for the Stop 5G movement these phases marked a turn from a 'scientific' to a 'syncretic' patchwork storytelling approach in the discursive practices of knowledge production and of contestation of official science. In short, the former relied on the selection of sources strictly deemed as scientific (i.e. peer reviewed papers published in scientific journals) all confirming the harmful nature of 5G waves; the latter assembled materials from a vast array of different sources, including science, new age spiritualism, cultural critic and conspiracism. At the same time, through these phases the 5G movement radically transformed its organizational forms and the ensemble of mediated and not mediated spaces employed for its communicative practices.

The talk intends therefore to contribute to the understanding of the tight intertwinement between the structuration of a social world and of its arena, its discursive practices – media related and not – and the shared knowledge produced by these same practices.

SCI09 Media representations of climate change

PP 0692 Shifting semantics: How climate change keywords have changed over three decades

Mikkel Fugl Eskjær¹, Florian Meier¹

¹ AAU Copenhagen, Communication and Psychology, Copenhagen, Denmark

The terms greenhouse effect (GE), global warming (GW), and climate change (CC) are often used interchangeably. They commonly refer to the same phenomenon, described by UNFCCC as: "a change of climate which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere" (UN 1992). Each term, however, is associated with different aspects of this reality. GE refers to the causes of climate change, GW concerns the effects of changes to the global atmosphere, and CC describes the general instability of the climate (Gardiner 2004).

While the three terms carry their own sets of connotations, their meaning in public communication have rarely been studied. Because of their interchangeability the terms have mostly been considered synonymous, treated as shorthand for anthropogenic climate change, or served as (unquestioned) keywords in data retrieval (Hase et al. 2021). Most studies consequently fail to grasp the historical patterns, semantic differences, and communicative implications that lie behind the shifting popularity of the three keywords.

This study looks at how the three terms have evolved over 30+ years of public climate change reporting. We investigate the Danish press from 1990–2021. Our sample consists of all articles ($n = 63,743$) on climate change in national dailies ($n = 6$) and national public service corporations ($n = 2$). We use machine learning and computational methods (Grimmer, Roberts, and Stewart 2022) to map and analyze changing patterns in how public communication talk about anthropogenic climate change through the lens of greenhouse effect, global warming and climate change. The overarching research question is:

RQ: How has the prevalence and semantics of Greenhouse Effect, Global Warming, and Climate Change developed in public communication on climate change.

Our data shows a clear pattern in annual frequencies of each keyword. Whereas the 1990s were dominated by GE, the term has all but disappeared by the late 2000s being replaced by GW. In the 2010s CC becomes the dominant term. It suggests that the 2000s was a transitory decade, with more terminological diversity in public discourses on climate change.

To further explore semantic variations, we have used word vector analysis. By dividing the sampling period into three consecutive phases, we have identified the 20 most frequent words associated with each keyword per decade. It shows that each keyword is associated with different scientific and social discourses. GE is mostly linked to scientific terms like carbon dioxide or thermal radiation. GW follows a different trajectory. Whereas it is a relatively technical notion in the 1990s it becomes increasingly associated with (social) effects of climate change in the 2010s. Variation is further measured by a so-called Jaccard Index, which captures degrees of dis/similarity. It confirms that GW is the most uneven keyword with a high degree of internal variation.

Of the three keywords, CC is the most diverse dominated by words that emphasize the severity of the climate crisis. This finding has been confirmed by a subsequent sentiment analysis, which shows that CC is associated with more negative words compared to both GE and GW.

SCI09 Media representations of climate change

PP 0693 Sustainable peaks: Communicating sustainable development narratives in mountain destinations

[Elisenda Aguilera-Cora](#)¹

¹ Universitat Pompeu Fabra, Communication, Barcelona, Spain

Mountains are present in 139 countries across all continents. They cover 24% of the Earth's surface and are home to 1.1 billion people. Ranked as the second most popular destination in the world, mountains hold widespread appeal. Within the broader scope of place branding, destination branding assumes a crucial role. In this context, destination branding becomes a key element in shaping the identity and attractiveness of mountain destinations, whereas place branding is instrumental in promoting economic, social, and environmental sustainability.

Existing literature on mountain destinations and sustainable development has primarily emphasized environmental sustainability, conservation, tourism, and local stakeholder perceptions, as well as community involvement. Despite these contributions, research at this intersection is still limited.

This study contributes to filling this gap by exploring the management and communication strategies of mountain destinations. Specifically, it addresses the communication of challenges within these fragile environments. A scoping review of literature on mountain destinations and sustainable development published between 2013 and 2023 in Web of Science and Scopus is carried out, involving the analysis of 45 articles.

The results show mountain tourism is predominantly portrayed as a sport-related activity, neglecting its cultural dimension while underscoring climate change as the main threat for these regions. Moreover, explicit references to the Sustainable Development Goals (SDG) are limited, despite being a globally accepted framework, with only one study mentioning SDG 15 "Life on land".

Results call for research-informed approaches that engage local stakeholders, as well as close international collaboration to address climate change challenges and develop effective sustainable development narratives. Communication efforts in mountain destinations should prioritize informing visitors about the dynamic landscape and vulnerability of these areas, while residents need education on the adverse environmental impacts of mountain tourism and the potential effects of environmental disasters. Additionally, communication efforts should target both visitors and accommodation providers, offering education on eco-labels, certification, and accreditation.

From a communication perspective, strategies should integrate environmental concerns by emphasizing the importance of nature conservation and community wellbeing. However, despite theoretical understanding, there is a gap in practical sustainability implementation. The growing environmental awareness of local communities suggests their participation in planning processes can contribute to strategies that mitigate landscape impacts and preserve the peacefulness of mountains.

This study consolidates key implications from previous research, highlighting the crucial necessity to educate and raise awareness about nature, environmental issues, and preservation among diverse stakeholders. It also advocates for increased discussions on the SDGs at this intersection.

SCI09 Media representations of climate change

PP 0694 Media coverage of the food systems-climate change link at the 2023 COP28 meeting in Dubai

[Silje Kristiansen](#)¹, James Painter²

¹ University of Bergen, CET - Centre for Climate & Energy Transformation - Department of Information Science and Media Studies, Bergen, Norway

² University of Oxford, Reuters Institute, Oxford, United Kingdom

Climate communication research rarely examines the presence of the climate change-food systems-diet nexus in the media, despite the fact that about a quarter of all Greenhouse Gas emissions come from food production. Even if all emissions from fossil fuels were stopped immediately, emissions from the global food system would make

it impossible to limit warming to 1.5°C and difficult even to realize the 2°C target (Clark et al., 2020). Thus, major changes in how food is produced and consumed are needed if we want to meet the goals of the Paris Agreement. For the first time in the history of the UN climate negotiations held every year at the COPs (Conference of Parties), at COP28 in Dubai, 30 November to 12 December 2023, the role of food systems and animal agriculture in the climate system was addressed. Early in the conference, more than 130 countries signed up for a declaration on food, including most of the world's largest agricultural economies (USA, Australia, and Brazil), known as the UAE Declaration on Sustainable Agriculture, Resilient Food Systems and Climate Action (Rannard, 2023; World Resources Institute, 2023). However, negotiations between countries on adapting the global food and agriculture system to climate change imperatives were halted during the COP, and shunted off to the next inter-sessional UN meeting in Bonn in June 2024.

It is not known what role the dozens of representatives of large agricultural companies, and their lobbyists, present played in the negotiations (Sherrington, 2023; Sherrington et al., 2023). However, research has mapped the extensive influence they exert at the COP via multiple routes, including belonging to country delegations. The discourses they deploy, including presenting meat as sustainable nutrition, have also been described in newspaper reports.

We aim to use a key metric to assess the influence of these companies, by exploring their impact in the mainstream legacy media in key countries – the USA, the UK, Australia, and Norway, during the COP28. In each country, we focus on the five most popular news online sites according to the Reuters Institute for the Study of Journalism (Newman et al., 2023). Search terms used: COP28 AND food OR COP28 AND agriculture. We address three key research questions:

1. How much coverage do the media assign to the 'food systems' question compared to other drivers of GHG emissions?
2. What are the key discourses deployed by the agricultural companies which the media pick up on?
3. How much is this sector quoted compared to other sectors such as NGOs, small farmers, and governments?

The quantitative content analysis analyses media coverage from during the COP28 meeting and until December 31, 2023.

The codebook has been developed based on previous codebooks used in Kristiansen et al., 2020, as well as based on close reading of a small sample of the media coverage from COP28 to ensure current topics and developments are captured.

Preliminary sampling suggests that for the first time at a COP the media covered extensively the links between climate change and food systems, including a range of discourses and sectors quoted.

SCI09 Media representations of climate change

PP 0695 Framing climate futures: A cross-examination of ethos, action-oriented appeals, and activism in popular climate books

Daniel Wuebben¹

¹ Universidad Pontificia Comillas, Institute for Research in Technology/Humanities and Social Sciences, Madrid, Spain

This study examines the application of climate communication frames to two non-fiction climate books: *Solving the Climate Crisis: Frontline Reports from the Race to Save the Earth* by John Berger (2023) and *What If We Get It Right? Visions of Climate Futures* by Ayana Elizabeth Johnson (2024). A new typology of frames recently developed (Wuebben et al., 2024), comprises nine frames derived from prior research on climate framing, including Matthew Nisbet's work on "Communicating Climate Change: Why Frames Matter for Public Engagement" (2009) and a more recent systematic review by Guenther et al. (2023).

Two specific frames from Guenther et al.'s typology have been adapted to better capture the distinctive approaches taken by individual authors of climate books. Specifically, these modified frames emphasize the construction of ethos, the incorporation of ethical and personal appeals, the use of qualitative and quantitative evidence, and the advocacy for timely climate action, also known as kairos. Ethos and kairos are particularly significant in the context of public-facing, scientifically informed arguments that propose solutions to the climate crisis or urge readers to contribute to actions that can lead society beyond the crisis frame.

Both Berger and Johnson effectively convey the urgency of climate change by integrating stark scientific facts into their narratives. They highlight the necessity for transformative social, technological, and economic changes in order to mitigate ecological and societal collapse. By employing these frames and compelling storytelling techniques, the authors engage readers in a call to action and underscore the importance of addressing the climate crisis.

Berger's book, *Solving the Climate Crisis: Frontline Reports from the Race to Save the Earth*, provides firsthand accounts from individuals on the frontlines of climate action. Through personal stories and experiences, Berger establishes ethos and fosters empathy, making a strong case for urgent climate action. He combines these narratives with scientific evidence to present a comprehensive picture of the crisis and the potential solutions.

In "What If We Get It Right? Visions of Climate Futures," Johnson explores a range of possible future scenarios and presents a compelling vision of what could be achieved through collective action. She weaves together personal narratives, scientific data, and ethical arguments to build a persuasive case for immediate and transformative change. By doing so, Johnson taps into the kairos frame, urging readers to act now and seize the opportunity to create a better future.

Overall, this study demonstrates that these two non-fiction climate books effectively utilize the climate communication frames of ethos and kairos to convey the urgency of the climate crisis and advocate for meaningful action. By employing these frames, the authors engage readers in a compelling narrative that combines scientific evidence, personal stories, and ethical appeals, ultimately inspiring individuals to take steps towards addressing the climate crisis and envisioning a sustainable future.

SCI09 Media representations of climate change

PP 0696 A world of climate change: Constructing the issue space of climate change on Twitter during COP26 and COP27

Daniela Stoltenberg¹, Ellen Linnert², Barbara Pfetsch¹

¹ Freie Universität Berlin, Institute for Media and Communication Studies, Berlin, Germany

² University of Amsterdam, Graduate School of Communication, Amsterdam, Netherlands

Climate change constitutes a key "planetary issue", requiring the response of a global public sphere (Castells, 2008, p. 82). Yet, climate change is also characterized by unequal geographical distributions of its victims and perpetrators and by different local manifestations. Similarly, systematic literature reviews show that climate communication research (e.g., Agin & Karlsson, 2021) disproportionately focuses on places in the Global North and on the national scale.

Studies with a global perspective on climate communication are rare. Furthermore, the role of focusing events, such as the annual Conference of the Parties (COP) summits, in bringing together a global public sphere is insufficiently understood. COP summits are intriguing for inquiring into the "issue space" (Stoltenberg, 2021) of climate change as they are hosted in changing locations, chosen for geographic diversity (United Nations, n.d.).

We investigate the shifting socio-spatial order of public discourses around climate change and ask: What is the issue space of digital climate change communication around the annual COP summit? In particular, which places and scales are discussed? Are there differences in the issue spaces of a summit held in the Global North and the Global South?

We analyze the Twitter discourse around COP26 and COP27, which took place in Glasgow, UK (2021), and Sharm el-Sheikh, Egypt (2022) respectively. The data comprise 1.8 million tweets covering a 17-day time span around each event. Using computational methods, we investigate patterns within the Twitter discourse to identify trends and differences between the two selected global events.

Specifically, this study employs state-of-the-art language models to identify geo-spatial references and scaling patterns in tweets. We develop a computational approach combining tools such as prompt-tuned GPT models and geoparsing APIs to grasp the geo-spatial order of the discourse. Using transformer-LLM based topic models, we further assess the spatial dimensions and constraints of sub-issues and actors.

This study expands knowledge on geographical orders in digital communication about global events on climate change. Its findings contribute to an understanding of inequalities of public attention to local climate change struggles and the role of different places and scales. Additionally, we present and evaluate novel computational approaches to detect and analyze discursive references to spatial entities in online speech.

SCI10 Furthering a sustainable agenda

PP 0805 Surfing fragmentation: The uses of web scraping to advance sustainability agendas

[Matteo Tarantino](#)¹

¹ Università Cattolica del Sacro Cuore di Milano, Communication and Performing Sciences, Milano, Italy

In an era marked by information superabundance and fragmentation, environmental communication faces both unprecedented challenges and transformative opportunities. This presentation explores how different social actors, particularly non-governmental organizations (NGOs), harness web scraping techniques to pursue sustainability agendas amidst the deluge of dispersed environmental data. Through two compelling case studies, we delve into the promises, costs, and potential risks associated with scraping air quality and water quality data, shedding light on the intricate interplay between technology, communication, and environmental advocacy.

Moving from a perspective combining software studies and environmental communication, this presentation will examine role of web scraping in aggregating dispersed environmental data to enhance the effectiveness of sustainability communication and illustrate the promises and challenges associated through two case studies: one regarding air quality and the other regarding water quality data. We will discuss the implications of information superabundance and fragmentation for environmental communication strategies and highlight the ethical considerations, costs, and risks faced by NGOs engaging in web scraping for sustainability initiatives.

The presentation draws on a case-study approach, combining interviews with NGO representatives, qualitative analysis of communication strategies and quantitative assessment of web scraping outcomes. The analysis includes an exploration of the data aggregation process, communication strategies employed, and the ensuing impacts on public awareness and engagement.

The first case study scrutinizes an Italian citizen association's endeavor to scrape dispersed air quality data from various online sources, including their own network. The presentation will detail the technological processes involved, challenges faced, and the outcomes in terms of informed public discourse and policy advocacy. Additionally, it will delve into the ethical considerations and potential risks associated with scraping sensitive environmental data. The second case study focuses on the failure of another Italian citizen initiative to aggregate water quality data through web scraping. The presentation will showcase the successes and limitations of this approach, shedding light on how the organization navigates fragmented information landscapes to catalyze meaningful action. Similar to the air quality case study, ethical considerations and risks will be discussed.

Web scraping proves instrumental in aggregating dispersed environmental data, providing NGOs with a comprehensive understanding of air and water quality issues. The presentation explores how web scraping enables NGOs to craft more targeted and impactful communication strategies, fostering public awareness and engagement. Despite the promises, the presentation emphasizes the costs, challenges and potential risks associated with web scraping, including ethical considerations, data accuracy issues, and legal implications.

SCI10 Furthering a sustainable agenda

PP 0806 Five Citizen Segments in the Dutch Energy Transition: Cross-segment variation in knowledge, media-use, participation, trust and support

[Jeroen Jonkman](#)¹, [Christian Burgers](#)¹, [Christel Van Eck](#)¹, [Anke Wonneberger](#)¹

¹ University of Amsterdam, Communication Science, Amsterdam, Netherlands

Today, many countries initiate large-scale transformations of their energy systems aimed at dramatically cutting greenhouse gasses (GHGs) emissions, in order to mitigate the most disastrous impacts of climate change in the coming decades. At the same time, polarized public discussions and mediated controversies around the energy transition have been gaining traction around the world. Previous research indicates that the success of strategic communication about climate-change consequences crucially depends on the ability to discern between citizens' climate concerns, personal values, norms, and beliefs. Yet, so far, climate change audience segmentation research has not focused specifically on the energy transition. This study addresses that timely gap in the literature. The focus of this study is on the following research question: To what extent can climate change-based segmentation be used to predict variation in outcome variables relevant to the energy transition – such as factors related to efficacy beliefs regarding the energy transition, emotions, participation, communication, individual energy behaviors and support for energy sources? We conducted a survey among Dutch adult citizens (N = 2010) and performed a segmentation analysis through latent class analysis (LCA). The analysis was based on twelve items measuring climate change concerns and beliefs, environmental personal norms, climate change salience, efficacy beliefs regarding the energy transition, and biospheric value orientations. Model-fit statistics (BICs and AICs) combined with in-depth qualitative evaluations of the LCA results indicated five citizen segments, which hierarchically range from feeling most (segment 1) to least (segment 5) concerned, involved, and responsible with regard to climate change. In addition, segments one and two, and segments three and four share many commonalities regarding

their climate-related beliefs and attitudes. Thus, we labelled segments one and two as people "alarmed" by climate change, segments three and four as people "concerned" by climate change, and segment five as people feeling "indifferent" towards climate change. Yet, this hierarchical pattern deviates when looking at respondents' optimism regarding the energy transition. Respondents in segments two, four, and five are more pessimistic about successfully implementing the energy transition, whereas respondents in segments one and three are more optimistic about the success of the energy transition. Thus, we co-labelled segments one and three "optimists" and segments two, four, and five as "pessimists". The results of this study furthermore demonstrate that segments successfully predict variance in variables relevant to various themes associated with the energy transition. The segmentation variable proves to have predictive value above and beyond variables commonly used in communication campaigns, civic involvement programs, and policy communication with citizens—such as age, identified gender, education level, institutional trust, and political orientation. We draw specific attention to the finding that segments differ in terms of efficacy beliefs (i.e., optimism and pessimism) regarding climate change mitigation. In our data, we find indications, albeit limited, that this dimension can influence efficacy beliefs in the energy transition among citizens. The outcomes of the study are relevant for strategic communicators working in the energy transition.

SCI10 Furthering a sustainable agenda

PP 0807 Battle of the e-cowarriors: Differential effects of environmental appeals by SMIs and organizations on youth's pro-environmental attitudes and behavior intentions

Heleen Dekoninck¹, Desiree Schmuck²

¹ KU Leuven, School for Mass Communication Research, Leuven, Belgium

² University of Vienna, Department of Communication, Department of Communication, Austria

The pro-environmental battle is traditionally waged by institutional eco-warriors such as environmental nonprofit organizations (ENPOs). Yet, with the rise of social media, ENPOs are joined by a growing force of non-institutional social media influencers (SMIs), referring to regular people who gained fame with their successful online self-presentation (Khamis et al., 2017). Drawing from the Theory of Planned Behavior, environmental social media posts by (non-)institutional sources may sustain pro-environmental attitudes and behavior (intentions) (e.g., Kim & Han, 2020; Dekoninck & Schmuck, 2022). Therefore, we systematically compare, for the first time, the effects of pro-environmental appeals by ENPOs and SMIs on youth's attitudes and behavior intentions. Due to SMIs' reputation as relatable role models who establish perceptions of trust among young followers (Schouten et al., 2020), we also examine perceived similarity, wishful identification, trustworthiness and attainability (Morgenroth et al., 2015) as novel underlying mechanisms for these effects. More specifically, we expect these mechanisms to explain the sources' differential persuasive power.

Method

This pre-registered between-subjects experiment among Belgian youth aged 16 to 25 ($N = 269$) consisted of three conditions (i.e., SMIs, ENPOs, control) to which participants were randomly assigned. Our treatment groups consisted of two real Instagram profiles (i.e., SMIs or ENPOs) showing existing environmental content about litter picking and sustainability. For our control group, we displayed the profiles of a museum and city, which were equally popular to the SMIs and ENPOs. All conditions revealed successful manipulation and randomization checks before data analysis in R using path analyses. This study was IRB-approved.

Results and Discussion

Findings revealed that exposure to environmental appeals overall induced stronger pro-environmental attitudes ($b = 0.19$, $SE = 0.09$, $p = .041$) than no exposure to environmental appeals (i.e., the control condition). ENPOs were perceived as more trustworthy than SMIs ($\beta = 1.17$, $SE = 0.10$, $p = .001$), which was related with higher pro-environmental attitudes ($\beta = 0.54$, $SE = 0.05$, $p = .001$) and behavior intentions ($\beta = 0.43$, $SE = 0.06$, $p = .001$). Both SMIs ($\beta = 0.38$, $SE = 0.13$, $p = .005$) and ENPOs ($\beta = 0.31$, $SE = 0.13$, $p = .021$) stimulated perceptions of attainability, which in turn positively affected youth's pro-environmental attitudes ($\beta = 0.26$, $SE = 0.05$, $p = .001$) and behavior intentions ($\beta = 0.30$, $SE = 0.05$, $p = .001$). SMIs exerted persuasive effects via wishful identification and perceived similarity—yet only among women and those with higher environmental concern. When all source perceptions were controlled, residual effects of exposure to SMIs on youth's pro-environmental attitudes and behavior intentions emerged, when compared to the control condition (attitudes: $\beta = 0.78$, $SE = 0.11$, $p = .001$; behavior intentions: $\beta = 0.49$, $SE = 0.12$, $p = .001$) and ENPOs (attitudes: $\beta = 0.79$, $SE = 0.12$, $p = .001$; behavior intentions: $\beta = 0.53$, $SE = 0.13$, $p = .001$). Overall, the findings show that both SMIs and ENPOs are effective environmental communicators, but the specific mechanisms vary and are not yet fully understood.

SCI10 Furthering a sustainable agenda

PP 0808 Managing role pluralism: Researchers as actors in environmental and climate communication

Pamela Nölleke-Przybylski¹

¹ University of Münster, Department of Communication, Münster, Germany

The "triple planetary crisis" (Passarelli et al., 2021) is (also) a communication crisis. The great communicative challenge of this crisis lies in its character as a conglomerate of so-called wicked problems (Head, 2022; Incropera, 2015; Rittel & Webber, 1973), which, despite much scientific evidence, cannot be reduced to clear cause-effect relationships. Instead, the problems are in many ways interwoven and interdependent. Consequently, solutions can never be perfect and comprehensive, but at best better or worse. Since imperfect and therefore potentially flawed solutions always have ethical implications, wicked problems have a moral dimension (Chan, 2023). Furthermore, in the debate on wicked climate and environmental problems, preferences for the solutions discussed tend to be politicised. Consequently, those involved in communicating wicked problems inevitably have to deal with the fact that their communication is politically and morally judged.

Environmental and climate researchers are both pulled and pushed into this complex web of environmental and climate communication debates. They are pulled by expectations: citizens, the media, and politicians expect science to communicate scientific knowledge in the form of application-relevant scientific expertise to contribute to the development of solutions (Peters, 2021). They ascribe certain roles and obligations to science. At the same time, scientists are pushed by a sense of responsibility and a perceived obligation to communicate. Researchers fundamentally believe in the importance of scientific knowledge for society, but are divided on the legitimacy of climate advocacy (Boykoff & Oonk, 2020) and are sometimes overwhelmed by the challenge of balancing their professional role as researchers and their private role as fellow citizens concerned about the future of the planet (van Eck, 2023).

This qualitative interview study explores this role pluralism, which arises from the interplay between different external role expectations and a multi-layered self-image. It reconstructs how researchers position themselves in the field of environmental and climate communication. Drawing on the analysis of 20 semi-structured interviews with senior environmental and climate researchers, the study provides answers to the following question: How do environmental and climate researchers deal with the diverse external role expectations and their role self-perceptions resulting from the public salience of their research topics? Given the nature of the wicked problems discussed in this field and the associated moral, political, and social ambiguity of right and wrong, it is particularly challenging for researchers to identify and justify their role. The study assesses the role of researchers as actors in environmental and climate communication in terms of external expectations, actual and intended communication behaviour, as well as their perceptions of responsibility for communication. The interviews with scientists in Austria, Germany and Switzerland, conducted in late 2023 and early 2024, place particular emphasis on researchers' views of their position at the interface between science and policy. Researchers from the social sciences and humanities as well as from the STEM disciplines are included in the analysis. The results are therefore also discussed regarding the influence of disciplinary parameters on coping with role pluralism.

SCI10 Furthering a sustainable agenda

PP 0809 How do luxury fashion brands integrate sustainability in their social media communication? An exploration of tweet data analysis

Anqi Yu¹, Veroline Cauberghe¹, Shubin Yu²

¹ Ghent University, Department of Communication Sciences, Ghent, Belgium

² BI Norwegian Business School, Department of Communication and Culture, Oslo, Norway

Fashion industry, the second largest polluter worldwide (EcoWatch, 2015), has generated detrimental impacts on our environment and society (Fletcher 2013; Chow and Li, 2017). Luxury fashion industry is accused of its slow reactions to sustainability (Jain, 2019; Di Benedetto, 2017), reliance on non-renewable materials and exploitation of labor force. This industry faces considerable challenges regarding environmental and social issues and must embrace more sustainable practices to mitigate negative impacts generated by its supply chain (Bundgaard and Huulgaard, 2019; Arrigo, 2018).

Since that sustainability and luxury fashion are often perceived as two contradictory concepts (Kong et al., 2016), and that sustainability messages decrease the evaluation of luxury brands when connected with self-enhancement that motivates one to positively view oneself and seek social superiority (Torelli et al., 2012; Cannon and Rucker, 2022), the luxury fashion industry encounters a significant challenge in communicating their sustainable practices without compromising brand values. Yet, it is imperative to understand how to achieve this effectively.

In this study, we seek to explore how luxury fashion brands communicate their sustainability initiatives on social media and to identify which sustainability message framing strategy used by luxury fashion brands maximizes user

interactions. We collected 259,200 English tweets posted by the world's top 100 luxury fashion brands from Jan. 2014 to Feb. 2023, with user interactions quantified in counts of retweet, like and reply. A subset of 1,347 sustainability-related tweets was extracted from the dataset.

A t-test was performed to investigate the user interaction difference between sustainability-related tweets and non-sustainability-related tweets. The results showed that users tended to retweet ($p < .001$) and like ($p < .05$) more non-sustainability-related tweets than sustainability-related ones, except for reply ($p = .17$).

Furthermore, we examined the framing of sustainability-related tweets focusing on several dimensions encompassing sentiment scores, the 17 Sustainable Development Goals formulated by the United Nations, sustainable offerings (pro-environmental/pro-social) and market offerings (product/service/strategy). To label the messages, we adopted an automated content analysis method using large language models (i.e., GPT 4). The results of ANOVAs indicated that 1) users were more likely to retweet ($p < .001$), reply to ($p < .001$) and like ($p < .001$) messages of life below water and climate action; 2) users tended to reply more to positive messages ($p < .01$); 3) users were more inclined to retweet and like tweets related to industry, innovation and infrastructure ($p < .05$). However, this increased engagement did not extend to tweets about responsible consumption and production. Notably, this pattern of user behavior was observed specifically when the tweets were about products, and not when they discussed services or strategies.

The findings of our study indicate that when luxury fashion brands communicate about sustainability, it tends to result in diminished social media engagement. Nonetheless, these brands could potentially enhance their social media interaction by strategically tailoring their message framing. This could involve concentrating on specific aspects of sustainability, thereby aligning their communication more effectively with the nature of luxury brands.

SCI11 Visualizations of climate change and the environment

PP 0907 Eco terrorists, climate criminals, culture rebels – Visual news representations of climate civil disobedience in Italy, Germany, and the UK

Delia Dumitrica¹, Giuliana Sorce²

¹ Erasmus University, Media & Communication, Rotterdam, Netherlands

² Eberhard Karls Universität Tübingen, Institut für Medienwissenschaft, Tübingen, Germany

Thousands of vehicles stopped on the road, historical monuments tarnished. Reports of climate protests have become a staple in daily news across Europe, and lately, civil disobedience groups account for most of the headlines. In this presentation, we offer a cross-country comparison of the visual news representation of climate civil disobedience in Italy, Germany and the UK. While the scholarship of the so-called "protest paradigm" has captured the framing mechanisms dominant in news coverage of protest, the role of news visuals remains understudied (Dumitrica & Schwinges, 2022), while most of the recent scholarship on news representation of youth climate activism employs text-based approaches (e.g., Bergmann & Ossewaarde, 2020).

Our project zooms in on the visual news representation of three highly mediatized collectives: Just Stop Oil! (UK), Letzte Generation (Germany), and Ultima Generazione (Italy). All three are part of the transnational "A22 Network," a collective that connects international climate activism projects and civil disobedience activists. The network's declaration argues that humanity's end has neared and thus, all actions have become legitimate. Our sampling month (May 2023) was declared by A22 as a "month of global action," with all three collectives under study staging public disruptions of everyday life that have been extensively covered by news media in all three countries.

We examined a total of $N = 182$ news articles across news outlets with diverse ideological orientations (left, center, right): *The Guardian*, *The Times* and *The Telegraph* (UK); *La Repubblica*, *Corriere della Sera*, *Il Giornale* (Italy); and *Süddeutsche Zeitung*, *Die Zeit*, *Frankfurter Allgemeine Zeitung* (Germany). For each article, we recorded the headline, the photograph(s) and the corresponding caption(s). Our analysis employs an inductive-deductive codebook, in line with the principles of qualitative content analysis (e.g., Schreier, 2013) paying attention to how activists are represented visually and how journalists frame the civil disobedience acts in their descriptions.

Our preliminary findings suggest that visual representations of civil disobedience news are consistent with ideological orientations across the sample: left-wing oriented newspapers emphasize police violence on activists, while right-wing oriented newspapers deride activists and underscore the inconvenience for the regular citizens. While the picture captions are largely descriptive ("activists block a street in Berlin"), the headlines suggest sensationalized framing, employing nouns such as "paralyze," "stunt," "illegal," "criminal," to describe protest events. Overall, we observe a tendency of more conservative reporting, even in more liberal news outlets in all three nations, particularly in the UK and Italy.

PP 0908 Communicating climate change on TikTok: Adopting visual storytelling to promote public engagement across nations

Xiaoyue Yan¹, Jing Zeng²

¹ University of Zurich, Department of Communication and Media research, Zurich, Switzerland

² Utrecht University, Department of Media and Culture Studies, Utrecht, Netherlands

Introduction & Research Questions

Climate change is one of the main issues facing humanity and is relevant to everyone's life. However, due to its invisibility and complexity, communicating climate change to the public is not easy (Moser, 2010). Prior research shows that visual representation of climate change can play a critical role in increasing public awareness and motivating behavioral change (O'Neill & Smith, 2014). However, scholars also warn that prevalent visuals in climate communication, e.g., melting glaciers and speaking politicians, tend to be abstract and psychologically distant (Wang et al., 2018). Such images can be problematic and perpetuate the idea that climate change is a distant problem (Manzo, 2010).

The current scholarly discourse surrounding visual representations of climate change underscores the need for further academic investigation. This study contributes to the debate by examining how climate change is presented on TikTok, one of the fastest-growing social media in recent years. Social media have played a crucial role in bringing climate change psychologically closer to people (Anderson, 2017). With its unique affordance and popularity amongst the youth, TikTok is emerging as a prominent platform for climate-related activism and education (AUTHORS, 2021). Several high-profile climate-themed campaigns have been initiated by the platform and its creator communities (AUTHORS, 2022).

While existing research of climate-related videos on TikTok is dominated by English-speaking content, the current study takes a cross-cultural comparative perspective, covering seven countries: Indonesia, Japan, Pakistan, the Philippines, Thailand, the United Kingdom (UK), and the United States (US). We asked:

RQ1. What types of visual storytelling are dominant in each country?

RQ2. What types of visual storytelling attract more engagement for each country?

Data & Method

This study collects $N = 7,564$ climate change-related TikTok videos through 16 hashtags^[1] from the aforementioned seven countries. The countries represent diverse degrees of vulnerability and responsibility for climate change (Eckstein et al., 2020; UNFCCC, 1997). Visual storytelling is operationalized as the visual style of the videos and the communicative functions of its corresponding video description and captions, which are captured through the Google Vision API and a BERTopic model, respectively. Video likes, shares, comments, and play counts are used as indicators of engagement.

Results & Implications

We found 4 types of visual styles: person-dominated, nature-dominated, text-dominated, and a mixture of the above styles. And 7 types of communicative functions: calling for action, explaining the causes, warning about the impacts, offering solutions, raising awareness of wider environmental issues, commenting on climate-related politics, and campaign hijacking. When it comes to nation-level patterns, for instance, in Japan and Thailand, videos containing nature-related visuals and explaining the causes and solutions of climate change are more dominant and stimulate more engagement; in the US and UK, the most popular videos often portray individual TikTokers calling for action and even protests.

This study enhances our understanding of climate communication on TikTok and showcases principles of effective TikTok visual storytelling in the context of climate change for different nations.

SCI11 Visualizations of climate change and the environment

PP 0909 Visual framing of climate change on Instagram

Matthias Mack¹, Christian Schemer¹

¹ University of Mainz, Communication, Mainz, Germany

At present, global climate change is portrayed as one of the most significant challenges confronting society. The communication of climate change and the media's coverage of global warming play a pivotal role in shaping people's awareness, emotions, and opinions on the issue. Consequently, a considerable amount of empirical research has focused on analyzing the coverage and framing of climate change in news media (Feldman et al., 2017). Nevertheless, comprehensive gaps in research still need to be addressed:

Firstly, since the majority of studies analyze text, significant knowledge gaps remain in the visual representation of climate change. Research on visual effects has demonstrated the relevance of visual content: Compared to text, images have a higher potential to attract attention, evoke stronger emotional reactions, and leave a more lasting imprint on memory (Geise 2014). The studies on visual effects of climate change imagery differentiate between the following visual frames: solutions (e.g. wind energy), impacts (e.g. flood), causes (e.g. plant), politicians and cliché (e.g. ice bear). The majority of findings reveal that images of politicians and clichés have no or counterproductive effects such as frustration (Metag et al., 2016). Images of solutions elicit positive emotions and self-efficacy, whereas images of impacts and causes create negative emotions, hopelessness, and reduced self-efficacy (Feldman & Hart, 2018).

Secondly, most of the studies focus on print media, while social media are neglected, especially visual platforms such as Instagram (Guenther et al., 2023). Instagram ranks among the most frequently used social media platforms today and an increasing number of users turn to the visual platform for climate-related information (Molder et al., 2022)

The following research questions address the outlined research gaps: Which visual frames dominate in climate-related posts on Instagram? How does the frequency and dominance of visual frames change over time?

To answer these questions, several Instagram accounts of German news media outlets were scraped with the python package Selenium. This resulted in 144.499 posts dating from 2013 to 2023. Relevant posts were selected by filtering the post text and hashtags for climate-related keywords. This resulted in a sample of 9299 climate-related posts. To analyze the visual content of these posts, the currently best performing zero-shot image tagging model (Recognize Anything Model) was used to extract objects shown in an image (Zhang et al., 2023). The result is a list of keywords for each image. Subsequently, the topic modeling technique BERTopic was applied to the keywords describing each image. If possible, the identified topics were summarized to clusters that represent visual climate frames.

Results show that impacts of climate change (23%) are the most used visual frame followed by causes (13%). Solutions or remedies appear less than in 5% of the images but show a consistent upward trend over time. Cliché images decrease over time from 9% in 2017 to 2% in 2023. Images depicting protests are driven by 2019 (referring to the activities of "Fridays for Future") and 2023 (protests of "Letzte Generation"). Over time, the diversity of frames increases, resulting in a decreasing dominance of the impacts frame.

SCI11 Visualizations of climate change and the environment

PP 0910 Economic power and Gen Z activism: The visual motif of the work of art in the media representation of environmental crisis

Ana-Aitana Fernández-Moreno¹, Brunella Tedesco-Barlocco²

¹ International University of Catalonia, Communication, Barcelona, Spain

² Pompeu Fabra University, Communication, Barcelona, Spain

In the past years, one of the most recurring media images of the climate crisis has been the attack on works of art by Just Stop Oil activists. These images stray from more conventional representations, as they are not set in natural nor industrial landscapes, the most frequent stages for depicting environmental emergencies. Although these protests –with paint thrown at the protective methacrylate of paintings by young activists– have not entailed any de facto harm to the works of art, they have resulted in a media portrayal of the activists as puerile and capricious villains. Have these protests triggered a shift in media discourse, suggesting a displacement of power and liability from corporations and industrial players to civil power (Gen Z activists)?

Traditionally, the visual representation of economic power as linked to climate change has focused on the industrial landscape (industrial chimneys, nuclear cooling towers) and the ecological consequences of its activities (oil spills), ratifying the responsibility of corporate and political players. As the climate crisis accelerates and its consequences become more tangible, the endangered landscape, flora and fauna have turned into protagonists of visual motifs

(Balló, 2000; Balló, Bergala, 2016; Salvadó, Balló, 2023) related to ecological disasters. The image of activism, furthermore, has been reconfigured by the focus on the youthfulness of activists, with the bodies and faces of Generation Z as an essential driving force.

Within climate activism, the Just Stop Oil protests have garnered media attention for their iconoclastic cultural and economic attack rather than their symbolic nature. In this sense, it is important to highlight the role of the art work as a representation of economic power: as John Berger states in *Ways of Seeing* (1972), their commodification through auction, exhibition in museums or protection in safe deposit boxes has endowed works of art of "a new kind of impressiveness. Not because of what it shows (...) [but] because of its market value". Thus, this paper analyzes how climate change reshapes the way economic power is represented in the media through the visual motif of the work of art. To achieve this, we examine photographs of these attacks published in news outlets and contrast them with more conventional representations of that motif -from images of million dollar auctions such as Da Vinci's "Salvator Mundi" to the destruction of a Frida Kahlo illustration, then turned into an NFT-

Regarded as iconoclastic acts, these protests therefore "engage with the materiality of the object, but also, and most importantly, with the power and value hidden within and beyond the object, which are almost always tantalizingly out of reach" (Stapleton and Viselli, 2019). Disregarding the productive nature of iconoclasm highlighted by Stapleton and Viselli (2019), this apparent settling of scores of citizen power against economic power is seen as a profanation of the sacred space of the museum (Berger, 1972), and results in the criminalisation of the protests under the slogan of the cultural heritage, while the actual destruction of art for conversion into NFT, with an invisible environmental impact, is applauded.

SCI11 Visualizations of climate change and the environment

PP 0911 A climate of change? Unveiling the impact of multimodal climate change coverage on public perception and policy support

[Katharina Maubach](#)¹, [Stephanie Geise](#)¹

¹ University of Bremen, ZeMKI, Bremen, Germany

Climate change has emerged as one of the crucial challenges of the 21st century. Despite the long-standing emphasis on the importance of visual information in climate change communication by strategic actors such as Greenpeace (Doyle, 2007), surprisingly little research has explored the impact of multimodal and visual news on climate change beliefs and climate-friendly actions, even though the news are considered one of the most important sources of information for citizens (Metag, 2016). Moreover, while various studies have examined visual and multimodal frames in climate change news coverage (Wozniak et al., 2015), research on audience reception of this coverage remains the exception (Neverla & Taddicken, 2012; Bolsen et al., 2019).

Aiming to improve our understanding of the interplay between visual and textual frames in climate change communication, we conducted an one-factorial experimental study. A sample of 332 individuals, quoted by age, gender, education, and political interest, was exposed to either a monomodal or multimodal article. The monomodal climate change article consisted of a headline, a date, the author name, and a written article that included three textual frame components (issue, conflict, human emphasis frame). The multimodal article version added a press photograph (serving as visual human emphasis frame) accompanied by a brief caption.

Building on previous visual and multimodal research (Brantner et al., 2011; Geise et al., 2021; Powell et al., 2015), we hypothesized that the multimodal news article would be more likely to influence recipients' issue beliefs regarding the relevance of the issue (H1a) and their perceptions of an imminent threat (H1b). We also predicted that the visual image embedded in the multimodal news article would elicit more pronounced emotional responses, particularly in terms of fear (H2a) and compassion (H2b). And finally, we expected that a press photograph in a multimodal news article would lead to higher support for political interventions (H3).

Our results partially supported these hypotheses. Within the multimodal article, the embedded visual had a marginal effect on the recipient's relevance ratings (H1a: M-mono: 4.23; M-multi: 4.27; $p = 0.7$) and a slightly reversed effect on threat perceptions (H1b: M-mono: 4.58; M-multi: 4.50; $p = 0.4$). However, as expected, multimodal news reception elicited significantly more fear (M-mono: 2.53 vs. M-multi: 2.82; $t(329) = -2.56$; $p = .02$) and compassion (M-mono: 3.20 vs. M-multi: 3.82; $t(329) = -4.87$; $p < .001$) than the text alone. While the multimodal frame did not have a direct effect on political interventions regarding climate change (H3), we identified an indirect effect of the multimodal frame on policy support. As our mediation model shows, and consistent with framing research (Lecheler et al., 2015), emotions (specifically compassion) mediated policy support (indirect = .10, SE = .04, 95%CI [0.04, 0.18]). Put differently, individuals exposed to the multimodal climate change article not only felt a deeper sense of compassion (and fear), but were also more inclined to rally behind policies promoting a climate-friendly approach.

In our presentation, we discuss these findings in the context of previous research on multimodal framing, news reception, and climate change communication, highlighting potential implications for strategic and political actors, and extending our exploration beyond potential effects on individuals.

PN 146 Exposing meat advertising in the face of the environmental crisis

Tanja Kamin¹, [Sinja Gerdina](#)²

¹ University of Ljubljana, Faculty of Social Sciences, Ljubljana, Slovenia

² University of Ljubljana, Communication studies department, Ljubljana, Slovenia

Among the efforts to tackle the challenges of climate change and environmental degradation, changes in resource-intensive food systems have the greatest potential (IPCC, 2019; Willett et al., 2019). Evidence shows that a simple shift from a meat-based to a plant-based diet could help mitigate the climate crisis by reducing emissions per person by 20–35% (Hallström et al., 2015), while also contributing to better human health. However, low awareness of the negative environmental (and health) impacts of meat consumption (Garnett et al., 2015; Sanchez-Sabate & Sabaté, 2019) and intensive advertising of meat and animal products (Delliston, 2021; Haffner & Culliford, 2023) perpetuate meat consumption as a normal, standard and even desirable dietary pattern and hinder its necessary reduction. In the context of the failure of the food system, it is reasonable to ask what role food, and meat advertising in particular, plays in this. Research shows that meat advertising increases the demand for meat and meat consumption at the individual level (Boetel and Liu, 2003; Dong et al., 2007; Boyland et al., 2016), and some studies suggest that mere exposure to advertised meat images increases meat cravings in meat eaters and reduces the intention to consume less meat, for example once a week (Elinthorpe et al., 2022). Therefore, societies that are committed to making changes to tackle the climate crisis and improve the health of their citizens should seriously consider the way they communicate about meat consumption. We believe that agencies such as governments should take the lead here and be held accountable for their communications that could hinder necessary changes in finding solutions to our failing food systems. In this paper, we will discuss an advertising campaign co-financed by the Slovenian government with the slogan "Our super meat". Using a multimodal discourse analysis (Ledin & Machin, 2018) of television adverts, we aim to show how these texts contribute to the perpetuation of a meat-based diet as a social norm by targeting salient dietary concerns, which research suggests are the main motivators that lead people to reduce meat consumption. According to Fox & Ward (2008) and Sanchez-Sabate & Sabaté (2019), these are animal welfare, health and environmental concerns. We want to show why such advertising messages supported by state institutions are highly problematic, especially when we analyse them against the background that Slovenia is part of the European Green Deal, which aims to mitigate the climate crisis by reducing global greenhouse gasses by at least 55% by 2030 compared to 1990 levels (European Commission, 2023).

SCI12 Food communication in falling food systems

PN 147 Communicating cultured meat: an analysis of scientific and technological discourses

[Andreja Vezovnik](#)¹

¹ University of Ljubljana, Chair of Media Studies, Ljubljana, Slovenia

Cultured meat, an innovative food product grown from animal stem cells through tissue engineering, is a promising solution to the challenges posed by conventional meat production and its environmental impact. Since the Food and Agriculture Organization of the United Nations (FAO) published the report *Livestock's long shadow* in 2006, the environmental problems caused by conventional meat production have become an important issue for governments, supranational organizations, industry and consumers. Around the same time, the industry began developing high-tech meat alternatives from various sources, mostly from plant-based ingredients (legumes, algae), but also from animal stem cells. This paper looks at the historical development of cultured meat and examines the promotional discourses of the main cultured meat producers, such as Eat Just, Mosa Meat and Upside Foods. The aim of the paper is to analyze the websites and social media channels of the main companies in this field in order to examine the prevailing discourses and communication strategies in the promotion of cultured meat as a valuable and environmentally friendly alternative to conventionally produced meat. Through a transhistorical lens and using the method of multimodal critical discourse analysis, the paper reveals the intertwining of scientific and technological narratives embedded in the promotion of cultured meat. The article shows how scientific discourses and arguments based on scientific knowledge and technological advances conceptualize cultured meat in terms of naturalness, health and cleanliness. By contextualizing contemporary marketing strategies within the historical framework of late 19th and early 20th century food advertising, the paper illuminates the meanings and ideologies underlying both past and present food marketing efforts previously associated with scientific and technological discourses and fields of knowledge, and offers valuable insights into the evolution of these discourses over time. The paper concludes with an examination of the role of science and technology in cultured meat marketing communications in the context of late capitalist envisionment of solutions to the environmental challenges posed by the Western food system.

SCI12 Food communication in falling food systems

PN 148 Sustainable Food in Times of Crisis: a Multimodal Critical Discourse Analysis of Consumer Campaigns

[Helen Andersson](#)¹

¹ Örebro University, School of Humanities Education and Social Sciences, Örebro, Sweden

Swedish food production faces a changed situation and new challenges. Pandemics, social unrest, war in the immediate area and climate change have not only motivated Swedish politicians to (re)emphasize crisis preparedness and the will to defend, but also, entailed challenges for Swedish food production and food consumption. Added values such as sustainability, animal welfare and health, which have been explicitly brought forward in the marketing and packaging design of Swedish food (Andersson, 2019, 2020), have been shown not to have the same value for Swedish consumers when inflation rises and prices increase. In the choice between cheaper imported food and the more expensive domestic one, the former has increasingly been in demand. In this presentation I will discuss communicative activities linked to two consumer campaigns launched in 2022 and 2023. #Säkramaten [#Securethefood], by Swedish Meat, and From Sweden. For Sweden [From Sweden. For Sweden] by The Federation of Swedish Farmers, LRF. The main aim of the paper is to discuss the construction, representation and reproduction of domestic food production and food consumption, as expressed in the campaigns. What representations are constructed and how? Which discourses, ideas and values are realized and reproduced, and how? The data consists of social media content (Instagram, and Facebook) and the content on campaign websites. The study draws on principles of Multimodal Critical Discourse Analysis (Machin & Mayr, 2012), and van Leeuwen's notion of recontextualization of social practices (van Leeuwen, 2008). More specifically, the analysis investigates how values and ideas linked to sustainability, health, and crisis preparedness are realized multimodally through choice of design, texts, and images. Of particular interest is the commercial contribution to "the creation, contestation and maintenance of national identity" (Ranta & Ichijo, 2022). The presentation will show a marketing discourse that engages with the world situation of ongoing war, pandemics, and climate change to steer sales. Discourses related to environmental and social sustainability, health, animal welfare, resilience, and crisis preparedness, are drawn upon and given a nationalist frame. By doing so, the campaigns promote and express ideas of who and what the nation is and needs, and what are the national interests. Keywords: food campaign, food supply, sustainability, national identity, marketing Andersson, H. (2019). Recontextualizing Swedish nationalism for commercial purposes: a multimodal analysis of a milk marketing event. *Critical Discourse Studies*, 16(5), 583–603. <https://doi.org/10.1080/17405904.2019.1637761> Andersson, H. SCI12 Food communication in falling food systems

PP 1144 Targets and tantrums: How farming media frame climate action

[Hannah Byrne O'Morain](#)¹, [David Robbins](#)¹

¹ Dublin City University, Communications, Dublin, Ireland

The global climate system continues to be disrupted by human economic activity. In turn, proposed changes to ameliorate these climate disruptions have themselves often proved to be socially and politically disruptive. For instance, there has been an increase in societal debate and conflict concerning emissions-reduction policies relating to the agriculture sector in Europe. Opposition to policy proposals such as reductions in the amount of permitted nitrate fertiliser, the EU's Nature Restoration Law, and other land use change and animal herd management initiatives has increased among farming organisations and farmers, and has led to the formation of farmer-focused political parties. It is important, therefore, to understand how farming communities and other actors and stakeholders societal debates concerning agriculture construct, conceive of, and approach climate change mitigation measures. Specialist farming publications are an important – yet often neglected – forum in which these debates take place. Ireland is an interesting case study, as its agriculture sector contributes almost 40% of its emissions (compared to 10% in the US, and 13% in the EU as a whole). The agriculture sector in Ireland, therefore, is a leading contributor of greenhouse gas emissions, and faces significant challenges in meeting reduction targets. The communication of climate-related information to farmers will be important in encouraging the farming community to adopt more sustainable farming practices. This study examines how a key information source – the specialist farming media in Ireland – frames the issue of climate change. It does so by analysing coverage of the release of the Irish government's 2021 Climate Action Plan, across a six-week period in three publications: the *Irish Farmers Journal*, the *Farming Independent*, and *AgriLand*. It investigates media framings, the use of sources, and the influence of a powerful lobbying organisation, the Irish Farmers' Association (IFA). We find that the Irish farming media largely

favour policy and political frames. However, a farming supplement published by the country's most popular print title adopted a more combative approach, and deployed a conflict frame with greater frequency than the other publications. Government politicians and farming organisations are the most frequently quoted sources, giving these groups the most opportunity to shape the debate. This study adds to the limited research focused on climate change coverage in specialist farming publications.

SCI12 Food communication in falling food systems

PP 1145 Moo-ving beyond dairy: The impact of animal welfare-, environmental- and health-focused video appeals and message valence on dairy consumption

[Daniëlle Bleize](#)¹, Michelle van Pinxteren¹

¹ Behavioural Science Institute- Radboud University, Communication and Media, Nijmegen, Netherlands

The production of meat and dairy and its consumption are associated with negative consequences for animal welfare, the environment, and individual health of people who consume animal-based foods. Previous research has tested the potential of documentary films to increase awareness about these detrimental consequences and to reduce meat consumption (e.g., Buttlar et al., 2021; Herchenroeder et al., 2023; Pabian et al., 2020). Herchenroeder et al. (2023) conducted a pioneering experimental study that compared the effects of animal welfare-, environmental-, and health-focused video appeals on consumers' intentions to cut down meat consumption. Their findings revealed that an environmental video appeal leads to increased explicit intentions to reduce meat consumption, unlike the other video appeals. Consequently, environmental appeals may, thus, be most effective for increasing intentions to alter future meat intake.

While reducing intentions to consume meat is an important step toward adopting a consumption pattern that is more favorable for animal welfare, the environment and health concerns, reducing dairy consumption is equally imperative. Substituting both meat and dairy consumption with plant-based alternatives not only eliminates the inhumane treatment of animals, but also reduced environmental impact including a decrease in global greenhouse gas emissions from animal husbandry. Moreover, such dietary changes offer health benefits, reducing the risk of type 2 diabetes, heart disease, and cancer. Therefore, this study will investigate how consumption of animal-based dairy can be discouraged by exposing people to different video appeals.

The study will partially replicate Herchenroeder et al.'s (2023) design and will use a 3 (video appeal: animal welfare, environmental, health-focused) x 2 (message valence: positive, negative) factorial between-subjects design. Message valence helps to persuade people to change their behavior, but its effectiveness is context-dependent. Some evidence suggests that messages with positive valence are more effective in the context of reducing meat consumption, and such positively frames messages may also appeal better to consumers' self-efficacy. Further, including message valence may help explain previously inconsistent results regarding the effects of different types of video appeals.

An online experiment will be conducted, where participants are randomly exposed to one of six versions of a videoclip that addresses the effects of dairy consumption on either animal welfare, the environment, or health, framed either positively or negatively. Intentions to reduce dairy consumption will be measured in a questionnaire conducted after the experimental manipulation. The experiment will be conducted in March 2024 after which the data will be analyzed. At the ECREA conference (September 2024) full results will be presented.

SCI13 Scientists communicating

PP 1086 Hype in science communication: Exploring the perspectives and practices of scientists

[María T. Soto-Sanfiel](#)¹, [Chin-Wen Chong](#)¹, [José I. Latorre](#)²

¹ National University of Singapore, Communications and New Media, Singapore, Singapore

² National University of Singapore, Centre for Quantum Technologies, Singapore, Singapore

In science communication, hype is defined as the use of promotional, hyperbolic, and dramatic language to glamorize, embellish, or exaggerate aspects of science, research, or scientists (Millar et al., 2020; Jones, 2017). It involves simplifying and sensationalizing science to shape future visions and gain support, often leading to optimistic or pessimistic expectations influenced by promotional activities (Roberson, 2020). Some authors view hype as a form of scientific deception characterized by misleading or unjustified communication (Wilson, 2019; Intemann, 2022).

Authors have raised concerns about the adverse consequences of hype in scientific communication. For instance, Auch (2018) and Powers (2012) argue that creating and promoting expectations through 'hype' may erode public trust in scientific work, potentially leading to the spread of biased beliefs or political agendas. On the contrary, Roberson (2019, 2020) considers 'hype' to be an effective communication tool that drives engagement in the domains of science and technology, promoting progress and advancing discussions on feasibility and potential.

This study explores scientists' perceptions and use of scientific hype in media, offering insights into how they introduce and present their breakthroughs and their concerns about public engagement (Caufield, 2018; Tiffany et al., 2022).

We conducted online focus groups (FGs, 4–6 participants each). The study included 24 Quantum Physicists working in ANONYMIZED INTERNATIONAL RESEARCH CENTRE. Recruitment utilized a snowballing technique. Quantum physics is experiencing significant hype, with overstated claims about quantum computing's potential (Ezraty, 2022).

The results of an inductive thematic analysis (TA) highlight that scientists actively acknowledge their pivotal role in generating science hype, aligning with previous research findings (Sumner et al., 2014). They skilfully tailor science communication to suit different audiences, objectives, and visibility strategies within academic and organizational contexts.

Furthermore, the research uncovers a wide range of emotions associated with the concept of hype and its multifaceted practices in science communication, an aspect not extensively explored by previous research. Participants express a complex mix of emotions, primarily stemming from the belief that scientists resort to hype as a means to secure funding. This emotional tapestry includes sentiments of concern, frustration, and skepticism. It's worth noting that frustration is especially evident among those who see hype as a byproduct of broader organizational issues within the academic funding system. They voice dissatisfaction with the pressure to adapt and embellish their narratives to secure financial support, and desolation is notably associated with the demand to sell their research and essentially become sales agents, reflecting the profit-driven aspect of contemporary science.

Interestingly, another significant aspect that emerges from the findings is the presence of cognitive dissonance (Festinger, 1957) among scientists. They acknowledge the prevalence of hype and its negative impact on the integrity of science, yet they also actively engage in and, to some extent, justify the use of hype to secure funding or maintain visibility. While they recognize the problems associated with hype, such as the distortion of scientific findings or the propagation of misinformation, they rationalize their own use of hype by framing it as a necessary adaptation to the academic and communicative landscape.

SCI13 Scientists communicating

PP 1087 Robust and generalizable or complex, costly, and cumbersome? Learnings from a reproduction, a direct, and a conceptual replication

Mario Haim¹, Philipp Knöpfle¹, Johannes Breuer^{2,3}

¹ Ludwig-Maximilian University, Department of Media and Communication, Munich, Germany

² GESIS – Leibniz Institute for the Social Sciences, Computational Social Science, Cologne, Germany

³ Center for Advanced Internet Studies CAIS, Research Data & Methods, Bochum, Germany

The social and behavioral sciences have recently reported low levels of replicability (e.g., Camerer et al., 2018) and reproducibility (e.g., Artner et al., 2021). Potential impact on scientific reputation has thereby been pointed out (Howell, 2020), just as a more constructive framing has, showing that, for example, the German public interprets the lack of replicability *vis-à-vis* increasing replication efforts largely "as an indication of science's self-correcting nature" (Mede et al., 2021, p. 98). Generally speaking, replicability describes reaching similar conclusions using the same (direct replication) or similar (conceptual replication) methods but new data. By comparison, reproducibility describes arriving at the same results using the same data and methods. To promote reproducibility and replicability, open science practices such as shared data and study materials have been highlighted as necessary preconditions (Dienlin et al., 2020). In communication science, however, content-analytic studies show that open science practices are largely uncommon (Haim & Jungblut, 2023; Markowitz et al., 2021). While this is likely to hinder reproductions and replications, it has been extensively discussed that communication science may be a special case that (a) cannot easily share all of its data for legal and ethical reasons (Freiling et al., 2021; van Atteveldt et al., 2020) and (b) may require conceptual replications as much as direct replications due to the rapid evolution and diversity of its central research objects (Keating & Totzkay, 2019). Nevertheless, replication studies are an important effort for assessing the robustness of existing findings and assessing their generalizability. To illustrate this and the challenges researchers may face in the process, we conducted and protocolled a reproduction, a direct, and a conceptual replication of a study. The study used is an online survey experiment investigating the credibility of manually manipulated online images (Shen et al., 2019). Selecting this case was the result of a prior content analysis of published studies in communication science from 2009 to 2022 with respect to their characteristics that potentially promote or hinder replicability (Authors, under review). Notably, while data and materials were not published with the original study, the original authors shared the data with us via email. In addition to reproducing the results, we directly replicated the study, following the original sampling strategy of US citizens via Amazon MTurk and providing participants with the original manually manipulated images as stimuli. For the conceptual replication, we recruited a German sample via the non-probabilistic online "SoSci Panel" (Leiner, 2016). Taking into account recent developments in the area of generative AI, we updated the conceptual replication study to the new cultural context and by using an AI tool

for creating new fake images. Findings from our reproduction and both replications show large coherence with the original study, with minor interpretative discrepancies mainly due to sample differences. Our approach also shows that it is cumbersome, complex, and costly to run reproductions and replications, both directly and conceptually. In order to ensure robustness and generalizability of the field's findings, this calls for changes in the reward system to more thoroughly honor such endeavors.

PP 1088 Uncertain futures: Communicating scientific modelling in the public space

[Signe Filler](#)¹, Berend Barkela¹, Michaela Maier¹, Stephan Winter¹, Christian von Sikorski¹

¹ University of Kaiserslautern-Landau, Institute for Communication Psychology and Media Education, Landau in der Pfalz, Germany

The public debate on how to deal with future developments such as climate change, economic growth or pandemic developments can be challenging. In order to anticipate these developments, the scientific literature provides a large number of projections based on mathematical, dynamic models. These are often complex and their results must be treated with care in view of the scientific uncertainty. In the public debate, various actors and stakeholders interpret and frame these uncertain projections according to their individual perceptions, experiences and interests.

This paper reviews the current state of research in this problem area and identifies research gaps. A framework is presented that provides an overview of the entities involved in the public discourse and is used here to map the existing literature. Accordingly, the *Source* is the producer of the scientific projection model (e.g. scientists) or a stakeholder who introduces their own interpretation of it into the public discourse (e.g. politicians who refer to scientific reports). *Content Creators* (e.g. journalists) produce *Media Content* and make it available to the public. *Decision Makers* are the recipients who make individual or political decisions on the basis of the projection (e.g. citizens, policymakers). Each of these roles can be taken on by different actors, who can also change them (e.g. Sources and Decision Makers can become Content Creator in social media).

A literature search in the Web of Science yielded 4518 papers, which were reduced to 493 by screening the title and abstract. For more detailed inclusion criteria and further analysis a codebook was developed. All papers that examined the public communication or reception of mathematical models on socially relevant topics were included. It was assessed to what extent which actors (e.g. politician, NGOs, citizens) were examined in which role (Source, Content Creator or Decision Maker) and whether the communication of scientific uncertainty was considered. The research method, the modelling topic and the scientific discipline of the publication were also recorded. The analysis was carried out by four trained coders with overall good to very good reliability.

A preliminary analysis of $n = 106$ included papers revealed that majority of the literature is qualitative research (empirical or narrative reviews). Political actors and agencies are examined particularly frequently in the role of both Source and Decision Maker, followed by scientists as Sources and stakeholders from economy and the public as Decision Makers. Communication and the understanding of uncertainties were almost always taken into account. The existing empirical quantitative research focuses mainly on how laypersons deal with projection models and their uncertainties in fictitious scenarios. Most studies focus on environmental projection models (climate, weather and hydrology) and disaster forecasting.

The analysis also revealed that research on Content Creators, especially journalists, as well as analyses of online and offline media content are rare. Furthermore, quantitative studies with a more diverse focus in terms of the actors studied and thematic priorities are a good approach for further research, whereby findings from the broad, qualitative research should be taken into account.

SCI13 Scientists communicating

PP 1089 Misrepresentation of scientific uncertainty. Automated analysis of (un)certainty in science communication across disciplines and platforms

[Jana Laura Egelhofer](#)¹, Petro Tolochko²

¹ LMU Munich, Department of Media and Communication, Munich, Germany

² University of Vienna, Department of Communication, Vienna, Austria

Uncertainty is inherent to the self-correcting nature of science, and scientific findings are always limited by scientists' decisions regarding sampling and statistical analyses (e.g., Oreskes, 2015). However, the uncertainty of scientific information is often misrepresented in news coverage (e.g., Dumas-Mallet et al., 2018; Sumner et al., 2016). While media logic plays a crucial role in this misrepresentation of scientific information, there are also indications that the misrepresentation of uncertainty already occurs in scientific articles (Haber et al., 2018) or related press releases (Sumner et al., 2016). The failure to effectively communicate uncertainty in science can leave people misinformed, potentially leading them to overestimate the effectiveness of new discoveries or misunderstand the scientific process, which can ultimately diminish public trust in science. Thus far, there is only little empirical evidence on the

prevalence of uncertainty in science and science communication. Specifically, there is no systematic analysis of how the communication of scientific (un)certainty differs across a) different scientific disciplines and b) platforms of science communication (i.e., academic studies, press releases, news coverage).

To fill this gap, we develop an automated method of measuring the concept of "uncertainty" in texts. Using a context-specific text embedding model and a synthetically augmented database of uncertainty categories, we operationalize scientific uncertainty based on the average distance of the scientific publication to either of the poles of the training data (high vs. low uncertainty). We will then use this method to analyze the prevalence of (un)certainty in a large sample (N = 45,734) of interdisciplinary scientific articles (published in 35 Nature journals), their related press releases, and news coverage. Data collection has been finalized; human validation will be completed by July 2024.

PP 1110 Media framing of heatwaves in Pakistan: The link to climate change and public health

[Rabia Qusien](#)¹

¹ Dublin City University, School of Communications, Dublin, Ireland

Extreme weather events like heat waves are getting increasingly severe, frequent, and prolonged across the world due to climate change. The impacts of extreme weather events are severe in low-income countries because of low mitigation and adaptation capacity. However, literature on the communication of extreme weather events is dominated by the Anglophone media. The level of media coverage and framing strategies used to report these issues are important to understand because how these issues are debated in the media can influence public engagement with these issues and policy response. Pakistan is one of the climate-vulnerable countries in the Global South, witnessing extreme weather events more often. However, the level and nature of media coverage of extreme weather events in Pakistan is understudied. Therefore, this research investigates media coverage of extreme weather events in Pakistan by analysing two distinct heatwave incidents that hit the country in 2015 and 2018. The events had a huge impact, such as the heatwave in 2015, which resulted in more than 1300 casualties in Karachi, Pakistan. Two months of coverage of each selected event from six leading Urdu and English newspapers are analysed. The quantitative content analysis provides evidence that the magnitude of an event determines the level of its media coverage. Additionally, despite the country's vulnerability to climate change challenges, the media failed to establish the link between anthropogenic climate change and repeated incidents of heat waves. On rare occurrences when media linked heatwaves to climate change, the connection remained generic and lacked any reference to event attribution science. Furthermore, the qualitative framing analysis shows that the media foregrounded six frames in its coverage: attribution of responsibility, public health, disaster, disaster response, morality and ethics, and human interest. The media reported heat waves as a potential health risk, which may help educate the public about the health implications of extreme weather events and climate change in general.

SCI14 Weather, water, and coasts

PP 1111 Role of moral obligation and self-Efficacy to promote acceptance for alternative water sources: Implications for effective communication

[Estefanya Charlotte Vazquez-Casaubon](#)¹, [Veroline Cauberghe](#)¹, [Thijs Bouman](#)²

¹ Ghent University, Communication sciences, Ghent, Belgium

² University of Groningen, Environmental Psychology, Groningen, Netherlands

In response to escalating global water scarcity, this study explores the psychological determinants that shape individuals' acceptance of alternative water sources (i.e., rainwater & recycled greywater, instead of current tap

water that is sourced primarily from freshwater reservoirs) for different water usages. Understanding these dynamics is crucial to design communication strategies that promote and introduce innovative approaches for sustainable water practices. An online survey ($n = 2623$) assessed whether perceptions regarding (future) water scarcity likelihood, perceived vulnerability, self-efficacy to adopt alternative sources of water, moral obligation, water-saving behaviours, and sociodemographics as predicted the acceptance of different of water source (current tap water, rainwater, and/or recycled grey water) for direct (cooking and drinking), semi-direct (shower, sink, bath & dishwasher), indirect (washing machine & cleaning inside), and distant (toilet, watering plants & cleaning outside) usages.

Ordinal logistic regressions revealed influential factors in water acceptance patterns. Tap water was – by far – most accepted for direct water use, but became increasingly less accepted the more indirect the usage was, in particular for those who feel a strong moral obligation (for the case of semi-direct, indirect and distant activities), feel more self-efficacious (for of direct, semi-direct and indirect activities) and to some extent the future likelihood of water scarcity. Education and age also revealed to have an influence increasing acceptance for tap water usage based on the degree of distance to the water.

The odds of accepting rainwater as a water source was higher for those individuals with a strong moral obligation. In addition, for semi-direct use odds also increased for those who perceive water to be more scarce in the future. Besides the previous factors, for indirect and distant use the odds also increased for individuals that feel more self-efficacious and that reported frequent past conservation behaviours. Age revealed to decreased the odds of accepting rainwater for the four categories.

For direct recycled greywater, the odds of accepting it as a source were increased by feeling more self-efficacious. Additionally, for the case of semi-direct and indirect use, the odds increased for individuals with higher moral obligation; while surprisingly, those who reported to conserve water in their past revealed lower odds of accepting recycled water for these categories. For distant use, beyond the prior, the odds also increased for those who perceive water to be more scarce in the future and perceive to be affected personally by water scarcity and have a higher education.

The findings emphasize pivotal policy and societal implications for sustainable water management. Recognizing the impact of moral obligation and self-efficacy provides a foundation for crafting targeted messages that align with individual motivations. Such communication strategies can be instrumental in promoting the widespread adoption of rainwater harvesting and greywater recycling practices. Societally, emphasizing these psychological drivers could catalyse a cultural shift towards valuing water conservation, leading to more resilient communities in the face of escalating water scarcity challenges. Policymakers should thus consider integrating psychological insights into sustainable water management strategies to convey both individual behaviours and broader societal norms effectively.

SCI14 Weather, water, and coasts

PP 1112 Cultivating coastal consensus: Exploring the impact of intrinsic and instrumental message framing about the sea on project acceptance, and examining the moderating role of openness to change

[Catho Vermeulen](#)¹, [Veroline Cauberghe](#)¹, [Thijs Bouman](#)², [Sara Vandamme](#)³

¹ Ghent University, Department of Communication Studies, Ghent, Belgium

² University of Groningen, Department of Psychology, Groningen, Netherlands

³ Ghent University, Department of Animal Sciences and Aquatic Ecology, Ghent, Belgium

Climate change and increased human activities near and at sea, call for a sustainable transition of our coastal regions. However, this transition encounters resistance from the population due to its perceived impact on the region and its inhabitants. Increasingly, social scientists are being called upon in this maritime context, to identify effective communication strategies to promote acceptance of a sustainable transition in coastal areas. While value-based framing is often implied, there is limited to no research on the impact of message framing of values in a maritime context. The current study examined the use of more specific values, termed 'marine value orientations', to develop two different communication frames. The instrumental framing of the sea described the sea as a resource for humanity, in contrary with the intrinsic framing, where the sea as valuable in itself, was emphasized. Both framings included the same risk message about the challenges and dangers the coast is facing due to climate change, and the importance of adapting now. A control frame was added to the design which did not include any value representation of the sea, only the risk message and the importance of adapting to these dangers were presented.

The quasi-experimental study was conducted in a nature reserve where visitors could scan the QR-code and were randomly assigned by Qualtrics to one of the three framing conditions, followed by some questions about their acceptance for divers nature-focused projects (e.g., implementing policies to limit coastal economic development, returning public space to nature to enhance biodiversity). After checking the reliability of the scales, an ANOVA was performed. No main effect was found for the framing on the acceptance of the nature-focused projects ($F(2, 116) = 1.928, p = 0.150$). To gain a deeper understanding in which framings work best for which types of people,

we conducted a moderated mediation model for the acceptance of nature-focused projects, with people's overall openness to change as a moderator and their risk perception as a possible mediator.

Our results indicate that framing effects significantly vary based on individuals' openness to change. For those with a high openness to change, the intrinsic framing of the sea (vs instrumental) leads to significantly more acceptance of nature-focused projects, partially mediated by a higher risk perception. For individuals with low levels of openness to change, the instrumental frame (vs intrinsic) leads to more acceptance of these nature-focused projects, without a significant mediation through risk perception. Given that this group exhibit more resistance to the transition (given the lower openness to change), additional research is needed to identify the variables contributing to the heightened appeal of the instrumental frame for accepting nature-focused projects. Consequently, communication frames must be carefully constructed, as this study shows that the same message can provoke opposite reactions among distinct groups.

PP 1113 Listen to the River Song: Sonic ecologies and sustainability communication

Miaotong Yuan¹, Yihua Ao¹

¹ Communication University of China, School of Music and Recording Arts, Beijing, China

The history of the Grand Canal in China started from 486 BC, with a total length of 1797 kilometers, connecting the north and south regions of China. This artificial water system has witnessed the rise of cities and towns along the river line. During the modernization process, the old canal has been damaged and polluted. From the 1980s, local government began to regulate the canal and work on the ecological landscape restoration.

This project was originated in 2022, carried out by members from School of Music and Recording Arts, Communication University of China and Beijing Radio Station. The core research question raised in this study is how to build up the conceptual model of the local residents' audible relationship with the hydrological ecosystem of the Grand Canal? To answer this question, we took methods from media archeology (Fuller 2005, Gitelman 2006, Kirschenbaum 2008), using sound walk and multimode environment documentary to reflect a sonic ecology. At the preparation stage, through archive study, two lists were sorted out. List A: biodiversity of the Canal (Beijing Section); List B: 12 historical heritage sites along the Canal. By making short documentaries, we interviewed groups of local residents from the 12 heritage node locations (semi-structured, with age groups), in aim of finding out the soundscape ontology of each location in different times. To this end, a public service advertisement was broadcasted by Beijing Radio Station. In Stage II we applied a technology enhanced sound walking as a methodology for the constructive process of art participation in sustainable communication. The Beijing section of the Grand Canal is about 82 kilometers, going through six districts of Beijing city, including 12 cultural heritage sites (we visited in Stage I). Our sound walking team has divided a day into 12 2-hour time periods, in each time period, we start to walk along the river from a heritage node, use motion cameras to record our visions, surround microphones to pick up what we hear. At the 12 stops, we document urban soundscape or wild recording depend on the condition of different nodes. Finally obtaining comprehensive audible data sets of the natural environment, public participation and the reference group. Accurate positioning between walking groups is carried out through GPS mapping.

As deep mediated methods have enriched the human cognitive space in many ways. The historical and cultural data of ecological soundscape has conveyed a wealth of information in sustainable communication. By analyzing the recordings of the audible nature and audible public participation along the Beijing Section of the Grand Canal, we will build a media model of the *River Song*, which is expected to be intergraded into media and installation art. Soundwalk recordings in the project are used to make YouTube videos, blog entries, sound pieces for radio and other kinds of broadcast, and as sources for a gestural installation piece. Participants' experiences are also discussed directly in conversations following each walk, and this discussion informs the sound work, video and blog entries.

SCI14 Weather, water, and coasts

PP 1114 Deconstructing "sustainability" in communication research – A critical systematic review of a fuzzy concept

Thomas Steinmaurer¹, Suay Melisa Özkula¹, Corinna Peil¹

¹ University of Salzburg, Communication Studies, Salzburg, Austria

Sustainability communications have been subject to increasing scholarly interest, particularly in response to global climate crises and environmental movements seeking more accountability. Given the growing research in the field, a range of reviews have documented research gaps at the nexus of environmentalism and media/communications (Evans Cornford & Eun Park, 2018; Baran & Stoltenberg, 2023; and the collected works of Mike Schäfer). Even so, "sustainability" is itself comparatively little researched. Where it is the subject of research, sustainability discourse often relates to research trends and ideologically anchoring (e.g., belief in anthropogenic climate change, or not). The purpose of this review is therefore to (1) identify the broad range of sustainability discourses and map these over time (mapping); (2) to deconstruct the term "sustainability" (discourse analysis); (3) to refine extant understandings

of sustainability (conceptualisation): (4) to identify gaps and/or under-representation in research within communication research.

Since "sustainability" is in itself a fuzzy term that may be used in manifold ways for various semantic purposes, this systematic review was used explicitly for identifying articles that subscribed to sustainability as a wider *discourse* – whether in relation to environmental issues or indicators of economic, social, political, or technological longevity. Published, peer-reviewed articles within the cognate discipline of communication research were collected from the Web of Science database, with cross-checks on Scopus and Google Scholar. The initial sample comprised 350 articles, of which 146 articles were selected for further analysis on the basis that they applied sustainability as a specific discourse. These were coded on potential definitions and conceptualisations of sustainability, along with the objects of study for which sustainability is used as a theoretical frame.

Initial results indicate that sustainability discourses in communication research largely focus on climate change and environmental communications in media contents, representations, and imaginaries as shared and articulated on social media platforms. In comparison, little research exists on environmental sustainability discourses that move beyond media contents and representations, such as, for example, environmental sustainability as an infrastructural or material concern (e.g. server farms; the carbon footprints of digital technologies and data centres). While those discourses partially take place in interdisciplinary fora (e.g. in journals such as *Sustainability* and *WIREs Climate Change*), they feature little within communication research and often with little definitional and conceptual clarity. As such, extant research is subject to conceptual fuzziness and largely focuses on specific understandings of sustainability in relation to environmental issues (= a narrow understanding). We therefore suggest that more research is needed on sustainability beyond its environmental impact, including social, economic, and political aspects, towards underscoring its critical importance for advancing the field.

TVS01 European (hi-)stories & crises on screen

PP 0491 Representation of crisis: Transatlantic as transnational and transhistorical drama

[Susanne Eichner](#)¹

¹ Film University Babelsberg, Media Studies, Potsdam, Germany

During the last decade a number of research projects and publications have engaged with matters of transnationalism in television (e.g. Bengesser, Esser and Steemers 2022; Lordache, Raats and Afilipoaie 2022; Waade et al. 2020; author 2020). Applying a transnational perspective to TV at the level of production, circulation, and reception is beneficial, since it allows to consider the realities of today's complex media markets operating globally and in geo-linguistic realms within a world that is on the other hand organized by national borders. Transnationalization as approach raises attention to the fact that increasingly social, political, and economic forces are not bound by national borders but operate on supranational, transregional, and translocal scales and scopes (Levitt and Khagram, 2007). With transnationalism as an analytic angle, it was, for instance, possible to trace the global appeal of specific local products (such as Danish TV series). On the textual level, the transnational either resulted from particular historical circumstances (e.g. when *Dallas* had its global success, it was due to the scarcity of TV available) or a particular shift in market developments (e.g. the global attention towards Danish series was due to Britain functioned as a shop window for *Forbrydelsen/The Killing* (2007–2012) raising awareness for the products globally (see author 2020).

When considering the level of textuality many recent examples of transnational TV drama are, in fact, produced by global streaming platforms and distributors such as Netflix or Amazon Prime. The "transnational grammar" that Mareike Jenner (2018) points out refers to genre, value context, aesthetics and language as key tools that are used in a specific way across texts in Netflix's own productions. The Netflix-specific use of these tools thus establishes itself as a grammar that claims transnational understanding (2018; 2021). A recent study supervised by the author (2022) confirmed that the "transnational grammar" of Netflix Teenage drama series is not oriented towards transnational cultures but confirms to a particular Netflix convention, the "Netflix Universe".

Against this background this paper explores existing structures and alternative examples of a "transnational textuality" and takes *Transatlantic* (Netflix, 2023) as case study. It argues that *Transatlantic* is a transnational format that successfully and artfully develops a grammar of the transnational by using a concrete historical event in Marseille during the Nazi occupation; it also develops a language of the *trans-historical*, by evoking visual and narrative parallels between stateless people and refugees now and then. Thus, the transnational appeal plays out on the "middle ground", between the strategy of local specificities (see Danish TV drama) and universalism (see Netflix Teenage drama series), demonstrating how topics, stories, characters, and the concrete audio-visual staging appeals across borders.

To elaborate the argument the paper draws on a past study by the author on the transnational grammar of Netflix Teenage drama series, applies a close analysis of the limited series *Transatlantic* and includes expert voices (e.g. an interview with creator, head writer and producer Anna Winger).

TVS01 European (hi-)stories & crises on screen

PP 0492 "...today, the world is not automatically the better one." 30 years of Western democracy and East German readings of the historical TV serial "Charité"

[Maria Loeblich](#)¹, [Elisa Pollack](#)²

¹ Institute for Media and Communication Studies, FU Berlin, Berlin, Germany

² Institute for Media and Communication Studies, Freie Universität Berlin, Berlin, Germany

More than 30 years after the end of socialism there is a fierce debate in Germany about the socialist past of East Germany. Some observers assume that the diminishing appeal of the liberal Western order, particularly in East Germany, might be the reason for this renewed debate. Following on this assumption, we wonder whether East German engagement with a TV serial about the socialist past may provide insights into the identification with the current social order. We build on the knowledge that historical TV serials connect their audiences to the present by framing the past in a particular way, promoting current ideas of society and belonging. They influence subjective memories and may challenge, produce or reinforce identification.

We take the example of the German audience success *Charité* and study how East Germans, by reading the third season of this public service broadcasting serial, engage with the two social orders they experienced: with socialism and with capitalism. How do they read the (TV construction of the) socialist past against the background of their experience of the last 30 years? A period in which a media discourse dominated, which largely devaluated East Germany and contributed to cleavages within German society. *Charité* deals with the history of a famous Berlin hospital from Empire until German Democratic Republic (GDR). The third season is set in the GDR at the time of the building of the Berlin Wall in 1961. It was broadcasted in 2021.

The theoretical framework combines discourse theory (Foucault), the Encoding-Decoding-Model (Hall) and the concept of habitus (Bourdieu). Empirically, we draw on eight focus groups with 27 East Germans. Our aims were firstly to include participants born until 1973. The reason for this decision was to limit our sample to people who experienced socialism and reunification at least as young adults. Secondly, we aimed at variation, and for this purpose recruited according to age, gender, educational level and place of residence.

Our findings show that, no matter what the GDR and post-unification biography, participants used the GDR construction in *Charité* to refer to current social conditions. References ranged from the financing of the health system and the official rejection of Russian vaccine against Covid19 over the remigration of East Germans to the war in the Ukraine. We found different readings of the serial. Its characters and plots served as anchors of (retrospective) identification with or rejection of the socialist past. The readings of the serial reveal subjective experiences as well as official discourses. Readings formed the background against which the identification with or the criticism of the current German social order unfolded. The different ways in which *Charité* was used to relate oneself to the past and the current society are set in the context of biographies and the dominant media discourse about East Germany.

Our study contributes to the research about popular media influencing post-socialist identities and about the extent they help to "deal with the cleavage between the socialist past and the capitalist present" (Carpentier Reifová et al. 2013, p. 203).

TVS01 European (hi-)stories & crises on screen

PP 0493 TV transnational (re)ordering of historical disorder: Material awakening as transcultural TV history and memory, a case study of Chernobyl

[Janet McCabe](#)¹

¹ Birkbeck- University of London, Creative Arts- Culture and Communication, LONDON, United Kingdom

TV transnational (re)ordering of historical disorder considers what it is to write history and recall collective memories within the context of a transnational TV co-production, with the first collaboration between HBO and Sky Television: *Chernobyl* (2019). HBO has long been known for giving visibility to histories at the margin, giving representation to those often without 'official' representation, but also to events before the more significant ones are written. But what does it mean to produce a transcultural discourse of history, especially one so contested as the nuclear power disaster at Chernobyl in 1986, within a transnational co-producing TV context?

Chernobyl (2019) tells a fictionalised version, almost as witness, as collective memory based on what HBO tell us is 'an untold true story'. This paper asks what it means to constitute within a transnational co-producing TV context a mediated transcultural memory of an historical event, to order it through a television materiality, especially one as contested as the accident at the Chernobyl nuclear power facility in Ukraine, at that time part of Soviet Union. In bringing to light this question, I am especially curious about the role of 'transcultural memory' (Crowshaw 2014; see also Bond and Rapson 2014) in consecrating a new TV transnational partnership between Sky in association with HBO Miniseries. My purpose is to explore what Astrid Erll calls 'mnemonic processes unfolding across and beyond cultures' (2014: 14). Highlighting the way in which a transcultural memory travels and transcends borders I adopt this perspective to stress how idioms of witness testimony shaping a televisual materiality representing this past cataclysmic event contributes to legitimising a contemporary high-end TV miniseries designed for a specific television circuit with high cultural ambitions.

Drawing on theories of memory studies and the sociology of culture, I ask what is it to produce a transcultural history of this unparalleled disaster flowing through a transnational co-production 30 years after the fact: which history, whose memories? But ultimately, as this paper will explore, how are mediated transcultural histories order messy ones through a thick description of television materiality.

TVS01 European (hi-)stories & crises on screen

PP 0494 Transcending the blurred boundaries of Chernobyl

[Renira Rampazzo Gambarato](#)¹, [Johannes Heuman](#)²

¹ Jönköping University, School of Education and Communication, Jönköping, Sweden

² Södertörn University, Historical and Contemporary Studies, Stockholm, Sweden

Focusing on the 2019 HBO mini-series *Chernobyl*, this study discusses the potential ethical implications of the fictionalization of historical events represented across multiple media platforms to examine the potential impact fictionalization has on what is culturally remembered and what is forgotten. Theoretically, the paper is based on the conceptualization of cultural memory (Assmann 2011; Erll 2011) and the Peircean conceptualization of ethics (Shepperson 2009) applied to a transmedia context (Gambarato and Nani 2016) to discuss potential ethical implications for and impacts on what is remembered and what is forgotten regarding the 1986 Chernobyl nuclear disaster (Gambarato, Heuman and Lindberg 2022). Methodologically, the paper is structured as a case

study underpinned by the multidimensional analytical model developed by Erll (2010), adopted to elucidate how the cultural memory of the mini-series *Chernobyl* is mediated amid its ethical implications shaped by the blurred boundaries between fact and fiction spread across multiple media platforms. This analytical model involves the *intra*-medial aspects of how memory is expressed within the representation itself, the *inter*-medial relations that designate the interplay with other representations of the same historical event, and the *pluri*-medial contexts in which memory-making representations are received and exert influence, encompassing reception and discussions in diverse media spheres. The research findings indicate that a deeper understanding of historical fiction as a genre has the potential to alleviate the ethical implications of the series, thus enriching the audience interaction and guiding public discussions toward new perspectives. The inherent tension within the genre not only gives rise to ethical considerations for the audience as they navigate the gray area between fact and fiction but also accentuates the compelling nature of *Chernobyl* as a representation that ingrains memories of the nuclear disaster into the public sphere.

TVS01 European (hi-)stories & crises on screen

PP 0495 Becoming a 'Netflix nation': Extroversion, exportability and visibility through a case study of *Maestro in Blue* (MEGA TV/Netflix, 2022-)

Georgia Aitaki¹

¹ Karlstad University, Department of Geography- Media and Communication GMK, Karlstad, Sweden

Christopher (Christoforos) Papakaliatis is one of Greece's most recognizable and successful television authors and *Maestro in Blue*, his latest series, managed to turn Greece into a full 'Netflix nation' (Lobato, 2019). Supported by the National Centre of Audiovisual Media and Communication (EKOME) and originally broadcast by private television channel MEGA TV, *Maestro in Blue* became – on 19 December 2022 – the first Greek drama show to launch into global subscription video-on-demand streaming platform Netflix, with the latter having already acquired the rights for the second season at the time of writing. This was experienced as good news, a national accomplishment, as well as a potential turning point for Greek television industries and their representability in the global streaming universe.

This paper is located at the intersection of critical industry and textual studies, incorporating analytical angles that cover the business, aesthetics, and politics of screen storytelling and, thus, contributing to extant research that centralizes the 'disruptive' impact of SVODs on production cultures and practices, as well as modes of storytelling. Shot on the Ionian islands of Paxos, Antipaxos and Corfu, using the locations strategically in a way that combines Papakaliatis' signature glossy aesthetic style, traces of Mediterranean noir and 'weird' wave, and established (cinematic) representations of Greek island idyll, *Maestro in Blue* is addressed in this paper as part of Netflix's glocalization practices (Iordache et al. 2022; 2023) and as an example of 'television that travels' (Waade et al. 2020).

By combining a textual reading of the first season of the drama series with a presentation of its production context and an overview of its popular/critical reception, this paper engages with the question around the significance of a small television culture gaining international attention, focusing on three concrete analytical dimensions:

- (a) exportability, addressed through a close examination of the visual and storytelling strategies potentially contributing to the appeal of the series to international audiences, including the importance of locations to narrative, iconography and cultural specificity;
- (b) extroversion, addressed through an analysis of the creative synergies and production strategies orchestrated in order to resonate with a global commercial logic and (international) distribution, as well as to potentially activate additional market-oriented investments tied to cultural industries and other generators of income and employment, such as tourism;

(c) visibility, addressed through a reflective discussion regarding the impact that representability in global streaming catalogues may have on small television cultures and industries, as well as television studies in broader terms.

Using *Maestro in Blue* as a case study, the present paper provides an empirically grounded analysis of small television industries' engagement with developments in international media production and transnational television theory (Jenner, 2023; Lotz & Lobato, 2023). What is more, it discusses the drama series in question as a potential game changer for Greek television (studies), thus contributing to a broader discussion about the pleasures and gains of international appeal.

TVS02 Video-on-demand strategies

PP 0583 The rise and fall of Viaplay's Dutch Fiction Slate: A failure study

Sandra Becker¹, Daphne Rena Idiz²

¹ Utrecht University, Media and Culture Studies, Utrecht, Netherlands

² University of Amsterdam, Amsterdam School for Cultural Analysis, Amsterdam, Netherlands

The disruption of social life during the COVID-19 pandemic led to an increase in VOD streaming boosting the SVoD market – for both global and local players (Bengesser 2022). The hype of SVoD and its investment in local content production to attract subscribers was followed by a drastic scaling back of transnational drama productions by global streamers like Netflix and (HBO) MAX in Europe and a switch to cost-effective reality TV formats due to most streaming services making yearly losses (Krauss 2023, Mikos 2024).

This paper highlights this development based on a case study of the Swedish multinational streaming service Viaplay, which extended its service to the Netherlands following the pandemic in March 2022. Fitting with the conference theme of 'Communication & social (dis)order', we focus on Viaplay's cancelled Dutch fiction slate as an outcome of market disruptions in global, and particularly European, streaming and original content production.

Between April 2022 and March 2023, Viaplay enthusiastically announced its first scripted Dutch Originals produced under the supervision of Kennard Bos: real-life-based drama *Roombeek* (EndemolShine Scripted), true crime drama *De Jacht op Jasper S.* created by Willem Bosch (Pupkin), dark comedy *Something Stupid* (Leviante Film) written by bestselling novelist Saskia Noort, crime drama *De Schuldige* (Ginger Fiction) written by Liesbeth Strik, and untitled Christmas comedy directed by Michael Middelkoop (HALAL). In summer 2023, Viaplay, however, cancelled all five of its planned Dutch productions due to the deterioration in earnings detected by the company's new CEO Jørgen Madsen Lindemann and his team.

Based on a production failure study (Redvall 2023), the paper contextualises the case of Viaplay in current SVoD market trends in Europe. Our methods include analysis of European industry reports (Film i Väst Analysis, Nostradamus Reports); trade press articles; and information from Viaplay's website, press releases, and communications with stakeholders.

As streamers have become increasingly disciplined with their commissioning practices in a shrinking TV drama market (Koljonen 2023, 24–29), we use the rise and fall of Viaplay's Dutch fiction slate as a case study to signal trends and raise concerns around the future of multinational SVoD productions in Europe. In addition to our key findings, we present a methodological toolkit for failure studies, which offer valuable insights that cannot be gained from research into successful productions.

TVS02 Video-on-demand strategies

PP 0584 Is Netflix making local television more diverse? Conversations with creatives and content commissioners from Belgium

[Axelle Asmar](#)¹, [Tim Raats](#)¹, [Leo Van Audenhove](#)¹

¹ Imec-SMIT-Vrije Universiteit Brussel, Scdm, Brussel, Belgium

Following the publication of its first diversity report, Netflix has positioned itself as a driver of inclusion and representation within the global entertainment industry, pledging to create more pathways for talents from underrepresented communities, and to showcase more diverse stories from around the world (Sarandos, 2021). Recent research (Asmar et al. 2023) shows that, in an attempt to position itself as a transnational broadcaster, the emphasis on cultural diversity (i.e. gender, race, etc.) is for Netflix a crucial strategy of distinction. At the local level, this diversity strategy is, on one hand, deployed by the streamer to presents itself to (local) audiences as the voice of a new generation committed to more inclusive stories; on the other hand, this strategy is used by Netflix to attract (local) talents worldwide by promoting the service as a key partner for the visibility and representation of local creatives.

Yet, while the disruptive impacts of Netflix on local television industries, as well as the strategic responses of national players have been extensively studied within television studies, the focus of existing research remains centered on economic and policy approaches. However, few – if any – existing scholarship examine how local television industries attempt respond and adapt to Netflix's diversity strategy. Therefore, taking Flanders (Belgium) as case study, this contribution explores a) how Netflix localizes its diversity strategy, and b) how national players negotiate seemingly conflicting understandings of diversity and representation, torn between showcasing national specificity and striving for universalism.

Hence, this contribution is based on in-depth interviews with creatives (i.e. writers, directors, etc.) and content commissioners (i.e. public/commercial broadcasters) from Flanders. The preliminary results show firstly that Netflix's diversity strategy and the inclusive practices the streamer appears to be setting in its local productions and content, seem to be putting pressure on local legacy media; we find that local creatives, especially young creatives, while being disgruntled by the streamer's aggressive tactics, are also critical of the perceived conservatism of national players, especially with regards to the on/off screen representation and inclusion of sexual and racial diversity. Secondly, the preliminary results highlight how diversity, especially for content commissioners, becomes a key tool to attract young audiences yet is very often carefully circumscribed to the most 'marketable' aspects of cultural differences, which raises questions as to the potential consequences such use of diversity could have for the local television industry.

TVS02 Video-on-demand strategies

PP 0585 Different Diversities: A comparison of policies and practices at three European public service VoD services

[Cathrin Bengesser](#)¹, [Jannick Kirk Sørensen](#)²

¹ Aarhus University, Media and Journalism Studies, Aarhus, Denmark

² Aalborg University Copenhagen, Dept. of Electronic Systems, Copenhagen, Denmark

While commercial globally operating SVODs have discovered identity-based diversity as a branding strategy (Asmar et al. 2023) and way to project a benevolent image, the concept of diversity has a much longer history and a broader meaning in public service media (PSM) tied to the foundational ideal of universality that obliges PSM to speak to all members of a, usually nationally delimited, society and to offer them a diverse array of programmes and viewpoints. More identity-based ideas of diversity have entered public service remits and practice in a cultural "diversity turn" since the 1990s (Horsti 2014) as well as entering regulators' efforts in benchmarking and monitoring diversity. Our question is thus: How are these two understandings of 'diversity' expressed 1) in legal and policy requirements to the PSM, 2) in strategy papers and public service audits issued by PSM or their regulators and 3) in the presentation and exposure of content in the VoD interfaces?

We examine these questions through quantitative and qualitative studies of three PSM organisations and their VoD services: BBC iPlayer (UK), DRTV (DK) and the different VoDs in the ARD Mediathek (DE). We analyse the presentation and exposure of 'diversity' (in its different understandings) in VoD content via longitudinal datasets that document the VoD landing pages daily – starting February 2022 – and record the position of every programme title at the VoDs' front pages, as well as deck titles. We analyse for each of the three countries policy- and legal documents such as The Royal Charter (UK), the public service contract (DK) and Medienstaatsvertrag (DE). We analyse how strategy documents and auditing reports issued by the PSM organisations or their regulators have talked about diversity in relation to their VoDs in the period covering these two years. The combination of these methods and comparison of the three broadcasters from different countries allows us to showcase how differently diversity can be conceptualised and operationalised in VoD practice.

This paper is a report on different publishing strategies for 'diversity content' in PSM VoD interfaces, a discussion of the potentially conflicting relation between the foundational politically oriented diversity ideals at the heart of PSMs' contribution to societal coherence, and the more recent, individualised understanding of diversity as defining one's identity, one's relation to society and one's ability to exercise one's rights (Beck & Beck-Gernsheim, 2002).

TVS02 Video-on-demand strategies

PP 0586 Teaching and doing television studies with the video-essay: Pragmatics and potentials

Anne Marit Waade¹, Alan O'Leary¹

¹ Aarhus University, Media Studies and Journalism, Aarhus N, Denmark

This paper takes as its starting point three questions about the video-essay as a radical approach to scholarly challenges in higher education:

1. How can video-essays reframe the relationship between teachers and students in television studies and create collaborative, playful teaching models that strengthen the students' engagement and scholarly reflection?
2. How can video-essays be included in the curricula, teaching- and exam formats in television and media studies?
3. How can we understand the relationship between screen media as a field of study – and screen media/video itself as a way of engaging in, reflecting, and publishing on screen media?

In higher education, we experience that students are struggling with reading, understanding, and engaging in traditional academic texts and theories as part of their study. For some, this is caused by the fact that students read the texts on screens (Spjældnæs & Karlsen 2022). Furthermore, we experience that students brought up with screen media (television, film, computer, mobile phones) as a significant part of their everyday life, have well-developed knowledge and skills regarding the audio-visual as genre, style, story, technology, production, and significant experience of sharing videos online and on social platforms. How can we as teachers at universities take advantage of this and facilitate learning that considers these new conditions and possibilities?

Video-essays have become a go-to form of information and commentary on platforms like YouTube. Meanwhile, in the academy, video-essay-making is recognised as a powerful medium of research and means of scholarly communication and publication in a 'post-literate' digital world (Cox Stanton & de Fren 2020; O'Leary 2021; [in] *Transition* 2014-), and as an essential means of teaching and of developing epistemic competence, i.e., the ability to identify reliable sources and rhetorics of knowledge and to discern and critique techniques of disinformation (Kackman et al. 2018; Grant, Keathley & Mittell 2019; McCabe & McStravick 2019). It is likely that video-essay-making will become a core academic skill akin to writing, and that the ability to make 'creative-critical' contributions in audio-visual form will become an important vector of engaged citizenship.

In this paper we will focus on the video-essay as a significant element in teaching students at universities. Our analysis will include classes of students working with video-essays at University of Oslo (Media and communication) and University of Aarhus (Media Studies and Journalism). The study will be conducted during the Spring of 2024, and the paper will present the main take aways, as well as reflecting on the above-mentioned questions. We will also discuss ways of training teachers at universities to encourage them to use video-essays as part of the curricula, teaching- and exam formats in television and screen studies.

TVS02 Video-on-demand strategies

PP 0587 Netflix uncovered: Insights from data donations

Karin Van Es¹, Dennis Nguyen¹

¹ Utrecht University, Media and Culture Studies, Utrecht, Netherlands

Netflix is claimed to have disrupted the traditional media industry. Its success is largely attributed to its capacity for extensive data collection and analysis, coupled with the effectiveness of its recommendation system. As a subscription-based platform, Netflix has had no interest in sharing viewing data with external parties. This reluctance has been characterized as a strict anti-transparency policy (Wayne 2021). Facing public pressure, and introducing an

ad-supported tier. Netflix has slowly started to increase transparency. However, as Lotz (2023) notes, "Netflix is only sharing information it wants to share."

Such empirical data, however, is crucial for researchers analyzing streaming services. Several scholars (Lotz 2021; McKensie, Crosby, and Shin 2023; Scarlata 2022) have used Netflix's limited data to try and analyze usage patterns. Castro et al. (2021) went another way and developed a browser extension to examine binge-watching by 13 participants over ten days. The lack of comprehensive data is problematic because it leads to reliance on Netflix's own narratives about matters such as binge-watching, content popularity (and diversity), taste clusters and their recommender system. These narratives help to perpetuate myths that limit our understanding of streaming platforms, raising questions about their disruptive impact (van Es 2023).

A new approach to data gathering has emerged. Under the General Data Protection Regulation (GDPR) of the European Union, individuals are granted the right to obtain a copy of their personal data held by data processors. Netflix subscribers in the EU can easily request their viewership data through a download button. These data come in CSV files that contain relevant information including viewing account details, clickstream, viewing activity, devices, profiles, and playback related events. In our Data Donations project, we invited Netflix subscribers to contribute this data for research, along with completing a survey about their streaming preferences and perceptions of the recommender system. By analyzing Netflix interaction data and surveys from about 200 Netflix subscribers, this study offers a critical assessment of Netflix's claims regarding binge-watching, popularity, diversity, and algorithm effectiveness, while also highlighting potential limitations and inaccuracies in Netflix's released data and metrics.

TVS03 Television's role in societies – Past and present

PP 0677 Television in the service of social planning: Creating preschool television in 1970s Finland

Mari Pajala¹

¹ University of Turku, Department of Media Studies, Turku, Finland

This paper explores television's role in social change in a historical perspective, focusing on television's "era of scarcity" (Ellis, *Seeing Things*) in Finland. Television was tied in with social planning in the era of modernization, urbanization and the development of the welfare state. To explore the hopes placed in television's potential to manage social change I examine public service broadcaster Yleisradio's (YLE) preschool programme *Noppa* (1973–1981). I analyze *Noppa's* production background, focusing on connections between television and governmental and non-governmental organizations and other actors. Methodologically, the paper is based on media historical inquiry using archival sources. YLE's archives for *Noppa* include research, scripts, production plans, press articles, promotional material, etc. In addition, I've studied contemporary publications relating to *Noppa*.

Noppa was developed in response to a major social reform, the introduction of the comprehensive school system which promised the same education for all children regardless of social background. At the same time, kindergartens were developed to enable women's participation in the workforce. *Noppa* was to provide preschool education for children who did not attend kindergarten, to ensure they learned skills required at the new comprehensive school.

Noppa's ethos grew from the programming policy of the Children and Youth department of YLE TV1, which emphasized television's responsibility to alleviate social inequalities and democratize access to culture. *Noppa* was also inspired by international models of preschool television, in particular *Sesame Street* (1969–). YLE collaborated actively with other Nordic public service broadcasters but it declined to participate in plans to create a Nordic

Sesame Street, developing *Noppa* instead. *Noppa*'s creators emphasized its difference from international models: whereas *Sesame Street* focused on literacy, *Noppa* covered a broad range of social and cultural issues.

Noppa's production drew on a wide network of institutional and individual partners. A key member of *Noppa*'s production team was Pirkko Liikanen, a Professor of Psychology at the University of Jyväskylä, who provided the theoretical foundations for *Noppa*'s educational approach and published a lot of research on the programme. The production team also included Liikanen's twin sister, who worked at the UN Association of Finland, providing *Noppa* with a direct link with Unesco's policy of internationalizing education; as a result, *Noppa* included regular segments about Third World children. To ensure that *Noppa* would be properly used for preschool education, YLE collaborated with the state department of social affairs (Sosiaalihuolto) to disseminate a guide magazine for nannies (often lacking professional training), to teach them how to use *Noppa* to create educational activities for children. Later, YLE collaborated with the Central Union for Child Welfare for the same end. Thus, *Noppa* participated in efforts to develop preschool education in collaboration with many other social actors.

Noppa illustrates the hopes placed in television's potential to further democracy and social equality during the creation of the modern Nordic welfare state. Now that the welfare state model is in many ways threatened, it invites us to reflect on the potential of public service television in the present.

TVS03 Television's role in societies – Past and present

PP 0678 "No, there will never be a dictatorship again in Argentina": Remembering the dictatorship (1976–1983) and empowering the child citizen in Argentinian animation

[Vladimir Cotal San Martin](#)¹, [Georgia Aitaki](#)¹

¹ Karlstads University, Department of Geography- Media and Communication GMK, Karlstad, Sweden

During the 1960s and the '70s, several military coups took place in South America. These dictatorships unleashed violent and brutal state terrorism across all spheres of private and public life. The disappearance, torture and assassination of thousands left a deep mark in these societies and created collective traumas that are still being negotiated across generations. Today, post-dictatorial children are dependent on different media to understand, cope with and learn from this recent past, including popular culture forms, such as animated series.

This paper focus on the role of television animated series in negotiating dictatorial pasts and collective traumas in a social context of growing negationism and disinformation in the region. Specifically, it provides a close reading of an episode of the Argentinian children's animated series *La Asombrosa Excursión de Zamba* (Zamba's Amazing Excursion) broadcasted on the public channels Canal Encuentro/PakaPaka (2010–), titled 'En la Casa Rosada' (At the Pink House), which focuses on the suspension of democracy and the takeover of political power by the military dictatorship (1976–1983). It approach the series as a site of struggle over collective (post)memory, with a particular focus on how the child-subject is represented and (politically) positioned in the narrative.

By applying a textual reading focusing on aspects of narrative structure, characters, and style (including settings, editing, sound) and by critically examining the relationship between animation, post-memory and children's citizenship, we argue that this particular episode not only convey memories across generations that challenge dominant 'silence' and/or (official) political narratives, it also contributes to the educational and emotional understanding of historical trauma among today's post-dictatorial Argentinian children. Moreover, we claim that the episode contributes positively to their understanding of democratic values, government structures and civic responsibilities, encouraging the cultivation of an active critically informed and socially responsible (child) citizen.

Keywords: Television, Animation, Post-dictatorship, Post-memory, Collective Memory, Children Citizenship, Civic Children

TVS03 Television's role in societies – Past and present

PP 0679 Videograms of an anti-revolution: In defense of an inclusive engagement with the TV archives of the Romanian Revolution

[Victor Morozov](#)¹

¹ Trinity College Dublin, Film Studies, Dublin, Ireland

It is by now widely acknowledged among scholars that television as a medium played a pivotal role in the unfolding of the Romanian Revolution of 1989 (Petrovsky, Tichindeleanu, *Romanian Revolution Televised*, 2018). This assertion is commonly understood to highlight the significance of the Romanian Revolution as a historical event that was broadcast in real-time, thus marking the inauguration of a new era in the history of media. It also implies the gradual change of status of the Romanian Television as an institution during those intense days, from a catalyst of popular discontent to becoming the main agent of large-scale manipulation.

However, this paper posits that such arguments predominantly rely on an imperfect and incomplete engagement with, as well as a truncated analysis of, the available archival corpus of televisual footage amassed during the days

of the revolution. It argues that a vast majority of theoretical and practical contributions to this topic, spanning from Jean Baudrillard's essay on the mass graves of Timisoara and the more general proliferation of simulacra to the seminal found footage film *Videograms of a Revolution* (1992) by Harun Farocki and Andrei Ujica, have culminated in the creation of what film critic Serge Daney referred to as "trademark images" (*images de marque*) – convenient clichés which block the acquisition of critical knowledge, while helping to create an immediately intelligible image of the event. It comes as no surprise, then, that the Romanian Revolution has garnered so much attention, since it conformed to a clear-cut revolutionary, even catastrophist imagery: severe blood spills, theatre of war cityscape, mass killings, and so on.

By tracing a recent personal involvement with the existing archival material through a selection of case studies (ranging from well-known documentary films to previously uncharted footage) that contradict/prolong previous interpretations, this presentation advocates for an extension of the mass of images deserving consideration when addressing the subject of the Romanian Revolution. Furthermore, it aims to show that a comprehensive examination of this body of TV rushes could generate updated perspectives on this particular matter, capable of effectively challenging ossified interpretations which have pervaded both academic and popular discourse for decades. Ultimately, this underscores the need for a reassessment of overlooked televisual depictions of the revolution. It posits the days of December 1989 as an unparalleled period of liberation for Romanian Television—transpiring between an era characterized by tightly regulated, state-controlled broadcasts and the imminent shift towards a commercially driven, marketing-oriented landscape.

TVS03 Television's role in societies – Past and present

PP 0680 How to justify the invasion of another country with the help of TV: Tips from Russian propaganda

Olena Churanova¹

¹ National University 'Kyiv Mohyla Academy', Faculty of social sciences and social technologies, Kyiv, Ukraine

Russia's full-scale invasion of Ukraine in February 2022 was accompanied by large-scale information operations. For this purpose, all possible communication channels were used: from television to social media, including mass texting on mobile phones.

Information has become a powerful tool in this war and continues to play its role. At the same time, the waging of war in Ukraine, the occupation of its territories, and the shelling of cities are accompanied by the support of the Russian population, which has remained virtually unchanged for 2 years of full-scale war. This also indicates that propaganda in local media is important and influential, and forms exactly the necessary picture of the world that the Russian authorities need. Given that television is the main channel for receiving information among Russians, it is important to monitor and analyze the narratives that are spread there to understand better information threats, as well as to understand how the authorities can use television even to explain why it is worth starting a war.

That is why this study will analyze what narratives Russian propaganda formed on national TV on the eve of the invasion of Ukraine in January and February 2022, and what methods and techniques it used to do so. Using the content analysis method, the news of the 3 most popular TV channels in Russia, namely prime-time news, will be analyzed.

This research will show how Russia prepares its population for war by using television and disinformation methods alongside, which narratives Russia uses to form an image of an enemy that must be destroyed, and how it explains the need for war. Such studies can be compared in the future with similar information operations used in Nazi Germany, Fascist Italy, and other countries that were involved in wars on the side of the aggressor to understand this algorithm and try to develop methods of counteraction.

TVS03 Television's role in societies – Past and present

PP 0681 Still relevant but not as much? The role of television in the media consumption of young people in Portugal

Mariana Scalabrin Müller¹, Margarida Maneta¹, Maria José Brites¹, Teresa Sofia Castro¹

¹ Lusófona University, Centre for Research in Applied Communication- Culture- and New Technologies CICANT, Porto, Portugal

Young people of the digital generation consume news and information in their logic (Swart, 2021; Swart, 2023). Multiplatform consumption and personal preferences highlighted by algorithms prevail. In this context, what role does a traditional medium like television still play?

In a financed project on young people, news and digital citizenship, we gathered data on the role of television in the informational routine of young people (15–24) living in Portugal from an online survey (N = 1300) and semi-structured interviews (N = 42) applied between January and September 2023.

This research is structured around a mixed research design. The interviews were carried out via Zoom using card-sorting exercises with a think-aloud protocol (Schrøder, 2012; Peters et al., 2022) and focused on the consumption and socialisation of news in the context of a digitalised society.

The survey showed a broader perspective, indicating that television ranks fourth (85.5%; n = 1088) in terms of media that young people dedicate time to every day (between half an hour and over five hours). At the top of the ranking are social media (97.9%; n = 1253), smartphones (97.7%; n = 1248), and laptops (86.2%; n = 1078). In the fifth position is television/streaming (77.9%; n = 961).

The particular purpose of this presentation is to map the role of television in the informational routine of young people (15–24). We deepened the analysis using qualitative data. The young people interviewed (N = 42) are divided into three main profiles: 1) those who say they don't watch television, but mention details of TV shows, news coverage, and TV presenters; 2) those who say they don't have a television set at home or only use it to watch streaming services; 3) those who watch television when socializing, whether in family or other contexts.

Among the justifications for not watching television are the difficulty of fitting it into the routine, a preference for on-demand services, and a lack of interest in the presented content, which is considered repetitive. Some interviewees also associate the habit of watching television with previous generations, particularly parents and grandparents. Those who watch it during socialization moments emphasize that this habit is longstanding and promotes dialogue.

Despite television not being the primary means of accessing information for young people in Portugal, the results indicate that it remains relevant. Interviewees from the three different profiles stated that they watch excerpts of television news reports posted on social media. Exceptional events, such as the pandemic and wars, also led them to turn to television. On the other hand, there is a perceived loss of relevance. A portion of young people do not have a television set at home and do not express a need for it. Additionally, some interviewees question the coverage of television channels and assert that they all address "more of the same" (negative sense). Although data show that young people trust traditional media, they also assume they primarily use digital media. This may raise questions about the relevance of information quality and its social impact.

TVS04 Serial dramas and the gender(s): A transnational approach to detect the influence of media narratives on european youngadults' awareness about gender-related issues

PN 117 Young adults and gender issues in serial dramas: the case of Italy

Valentina Re¹, Elena D'Amelio²

¹ Link Campus University, Department of Human Sciences, Rome, Italy

² University of San Marino, Department of Human Sciences, San Marino, San Marino

This paper focuses on three contemporary serial dramas aimed at young adults: two Italian productions, namely *Mare Fuori* (Rai, 2020–) and *Prisma* (Prime Video, 2022–), and *Sex Education*, a British production for Netflix. The three serial dramas have been chosen as case studies based on various criteria. These include focus groups conducted in Italy with high school students, in-depth interviews with audiovisual professionals, and the objective of providing an accurate, albeit partial, snapshot of the Italian media system and its diverse production and consumption practices. *Mare fuori* is a crime drama produced by the Italian public broadcaster and set in a juvenile prison in Naples. *Prisma* is a coming of age tv drama co-produced by the global service Prime Video with Cross Productions, the production company behind *SKAM Italia* (TIMvision 2018–19, Netflix 2020–). Finally, *Sex Education* (Netflix, 2019–23), besides shedding light on young Italian viewers' widespread habit of watching Anglo-American products, was revealed by the Italian focus groups with students as one of the most discussed serial dramas directly tackling gender issues. All three cases were approached with a mix of methods. For the two Italian dramas, insights from professionals directly involved in the production or distribution processes were merged with data gathered through production studies. For *Sex Education*, desktop production studies focused on how the serial drama circulated and was promoted in the Italian context. In particular, our analysis centres on specific issues in terms of gender equality and representation of gender roles in the three selected case studies: in *Mare fuori*, we analyse the problematic construction of alpha-male, toxic masculinity within a patriarchal criminal subculture; in *Prisma*, the coming of age of a character through the nuances of exploring one's own complex, non-binary gender identity and how to communicate it to others; in *Sex Education*, the aftermath of a sexual attack and the experience of unwanted sexual attentions that the majority of women share at one point in their lives.

TVS04 Serial dramas and the gender(s): A transnational approach to detect the influence of media narratives on european youngadults' awareness about gender-related issues

PN 118 From toxic masculinity to gender empowerment: Media literacy and gender issues in danish high schools

Louise Brix Jacobsen¹, Kim Toft Hansen¹

¹ Aalborg University, Department of Culture and Learning, Aalborg, Denmark

Data from five focus group interviews with Danish high school students conducted in Denmark suggests three cases that potentially work well in a teaching situation with specific attention towards motivating debates about gender equality and media literacy. 1) The US series *Euphoria* (HBO, 2019–21) is a well-known series among Danish high

school students, and it is applauded for its 'naturalised' narrative about transgender identities, among other things. Other series meet disapproval for a 'forced' or caricatured representation of gender issues. The series represents the presence of larger US platforms on the Danish market, while it presents a narrative way to tackle and discuss and examine the complexities of toxic masculinity. 2) The Danish series Rita (TV 2/Netflix, 2012–20) surfaced unmotivated by the interviewer in four out of five interviews and appears as a much-watched series by many Danish high school students. The series epitomises local and commercial public service entering co-production agreements with larger streaming services such as Netflix, while motivating discussions about gender and sexuality as well as gender-blended character traits. 3) The Danish series Zusa (YouTube 2022–23) works as an overall incorporation of the Danish creator Jonas Risvig, a notorious voice among Danish young adults. This specific series represents a recognizable sociocultural environment for young adults, while it – as a series specifically distributed through YouTube – also points towards new, independent production and circulation of serial drama content through social media. Especially guided by naturalised dialogue and close collaboration with young adults during production, the series also presents central moments of gender empowerment, but predominantly is portrays naturalised gender environments in young adult drama. In this paper, we present insights into Danish high school students' comprehension of gender issues through the lens of serial drama and series consumption. We highlight three series usable for teaching media literacy and gender issues through TV aesthetics and character studies. Finally, it points towards how such insights into TV series aesthetics and media practices may satisfy existing needs among Danish teachers in high schools.

TVS04 Serial dramas and the gender(s): A transnational approach to detect the influence of media narratives on european youngadults' awareness about gender-related issues

PN 119 Evaluating the place of gender in Irish serial drama production, representation and reception

Sarah Arnold¹, [Lizzy Fox](#)¹

¹ Maynooth University, Department of Media Studies, Maynooth, Ireland

This paper represents findings from our research undertaken on Irish serial drama productions, representation and reception with a particular focus on gender representation, gender identities and gender stereotypes and how they are viewed by young people. While the GEMINI project is concerned with European approaches to gender equality by engaging young people in serial drama analysis in educational contexts, there are localized nuances that frame and shape the interrelation between production, representation and reception. Firstly, we discuss how the Irish audiovisual industry more generally has engaged with policy aimed at improving gender representation in production through various audiovisual agencies' funding schemes, which are important supporters of serial drama production. We demonstrate how these schemes have put gender center stage in audiovisual production. We also detail how the small size of Ireland has necessitated more transnational productions and globally appealing content which, in turn, has influenced the type of gender representations we find in Irish and transnational serial drama. Secondly, we examine the types of gender representations in Irish serial drama and read them through the lens of Ireland's increasing social liberalism which has resulted in better quality and quantity of gender representations outside of the traditional hierarchical gender structure that dominated Irish society for most of the past few centuries. However, our research on Irish local and transnational serial drama productions demonstrates that there is a persistence of some gender stereotyping, particularly of young people who are often represented in heteronormative ways. Thirdly and finally, we relate these findings to those of our focus groups with young people. In our focus groups we found that young people varied considerably in the extent to which they engaged with, were cognizant of, or resistant to gender equality and discussion of gender issues. These young people were, nonetheless, able to recognize gender stereotyping and provoke discussion of gender representation in serial dramas. In particular, they saw Irish serial drama as representing the parent generation's view of gender and, so, they looked instead to foreign-made serial drama to find more relevant and meaningful gender representations. We consider the implications of these findings in our effort to promote gender equality through use of serial drama in the Irish educational context.

TVS04 Serial dramas and the gender(s): A transnational approach to detect the influence of media narratives on european youngadults' awareness about gender-related issues

PN 120 The enculturation function of platform algorithms: how Romanian teenagers discover gender equality

[Raluca Radu](#)¹, [Mihai Coman](#)¹, [Anamaria Sasu](#)¹, [Nicoleta Talpes](#)¹

¹ University of Bucharest, Department of Journalism, Bucharest, Romania

In the Gender Equality Index 2022, Romania is the last but one EU country. The index is a composite of several criteria measuring the differences between women and men regarding access to work and fair payment, financial resources and economic situation or access and behaviour related to health. Another set of data, on sexual crimes, shows an even gloomier difference between the status of men and women and an utter disregard for the wellbeing of girls. The 2023 Eurostat data on live births by mother's age and citizenship indicate that nearly half of

all teenage mothers in EU are coming Romania. Romania is, also, one of the main sources of human trafficking in Europe, with more than seven out of 10 victims trafficked for sexual activities. The recruiting methods, for girls and boys alike, range from the human trafficking done by a member of the family or an acquaintance, that offers the perspective of a better life and of work, to a lover boy, that promises emotional and financial support. Sexual crimes against young girls and human trafficking for forced labour and for illegal sexual activities are supported by social perceptions of the role and the place of women and children in the Romanian society and the role of the state in protecting the weak. Yet, things are changing. Three focus groups with Romanian teenagers from different high schools in Bucharest and twelve in-depth interviews with high school teachers from Romania demonstrate that mentalities are changing and younger generations are more inclined to acknowledge, understand and even defend fundamental human rights, including in gender equality issues. In general, teenagers have little or no possibility to talk about gender equality issues in family, at school or in their community. Some of them admit to avoiding gender equality discussions, because it is a controversial subject, both with adults and with some of their peers. Nevertheless, all are aware of the main themes, from women's representation in politics to LGBTQ+ rights of private, fulfilling lives. The main information source is social media and serial dramas on streaming platforms. What teenagers consume is based on algorithms recommendations. The results are mixed, depending on personal background and direct knowledge of persons belonging to a sexual minority. Focus groups and interview data, gathered in the GEMINI project, show that algorithms alone can not be trusted to nurture an inclusive society. Online content can support old stereotypes or create new ones. Parasocial opinion leaders, from social media, movies and serial dramas, can have a wonderful or, on the contrary, a terribly dangerous influence on young adults. For an inclusive society, we need coherent public policies that address actual problems regarding gender equality and a coherent educational offer for all high school students, no matter their personal background or the location of the school – as the GEMINI project sustains.

TVS04 Serial dramas and the gender(s): A transnational approach to detect the influence of media narratives on European young adults' awareness about gender-related issues

PN 121 Measuring serial dramas' influence on EU young adults. A transnational approach toward gender issues

Marica Spalletta¹, Nicola Ferrigni¹, Paola De Rosa¹

¹ Link Campus University, Department of Human Sciences, Rome, Italy

In the wide European scenario, EU Member States stand out for different approaches toward gender-related issues, and they tend to show strong disparities in gender equality and women's empowerment, thus highlighting the threat of a Europe "at different speeds". According to EIGE'S Gender Equality Index, the ranking of leading Countries was dominated in 2023 by the Nordic ones – with Sweden and Denmark in the top three – while Romania and Hungary occupy the bottom two places. This different approach towards gender equality in EU Countries, also resulting from the latest Global Gender Gap Index and Women, Peace, and Security Index, reflects a consolidated historical and sociocultural trend. Nordic countries turn out to be leaders on gender equality in Europe. On the opposite side, Eastern Countries keep showing most pronounced inequalities in the domain of power, especially related to women's unemployment and under-representation in decision-making positions. If compared to the average Gender Equality Index score for the EU-27 (70.2 points out of 100), the EU Mediterranean Member States show the more diversified distribution of their gender equality scores – thus highlighting different progress degrees in the domains of knowledge, power, money, and health imbalances as well as gender-based violence. The Anglo-Saxon area stands above the EU's score, showing high rates in the domain of health and economic decision-making. Based on these premises, the paper aims at understanding to what extent and how gender-related narratives provided by serial dramas differently influence European young adults coming from different countries (Denmark, Ireland, Italy, Romania) representative of the above-mentioned four areas (Northern, Anglo-Saxon, Mediterranean and Eastern). From a methodological point of view, the paper presents the results of a multilanguage quantitative CAWI survey, addressed to European high school students, which carried out a mixed method approach aiming at measuring and understanding high school students' interest, perceived relevance, awareness, and attitudes towards gender-related issues within the wide scenario of an intersectional approach; their perception about the relationship between serial dramas and gender-related issues, focusing on key topics like relationships, stereotypes, and identity within these narratives referring both to "local" and "not local" productions; the perceived influence of serial dramas on gender-related issues, examining how these narratives contribute to shaping their own world; the interplay between gender-related issues, serial dramas and educational training in European young adults' perceptions. The research's main findings confirm that serial dramas consist of meaningful discursive practices decoded by each individual/social group according to their own meaning structures (frameworks of knowledge, structures of production, and technical infrastructures). Therefore, their power of influence is strongly mediated by sociocultural backgrounds, which result in a selected exposure to the message they share and, as a consequence, in the attitudes and behaviors young adults perform towards gender-related issues.

TVS05 Production processes across genres & platforms

PP 0896 Producing content in Turkish TV industry: Connections, clusters and patterns

[Ayşegül Kesirli Unur](#)¹

¹ Istanbul Bilgi University, Department of Film and Television, Istanbul, Turkey

Turkish TV industry has become a major player in the global television market following the worldwide success of Turkish TV series since the mid-2000s (Yanardağoğlu and Turhallı 2020). These TV series which are branded and categorized as 'dizi' (Öztürkmen 2022) have distinctive narrative and stylistic attributes that are based on a mixture of genre formulas, established tropes, and character types. When Netflix is launched in Turkey in 2016 the successful formula of making a Turkish TV series which does not only work in the local context but also travels well on a global scale has already been formed. Following the appearance of global and local video-on-demand platforms, a new wave of Turkish TV series is launched and reshaped this formula.

Compared to the Turkish TV series that are broadcast on mainstream TV channels on primetime with a duration of 150 minutes per episode, these new generation 'digital series' (Vitrinel&Ildır 2021) are designed by appropriating global standards with much shorter episodes and seasons. Soon they started to be defined as an alternative to the Turkish TV series on mainstream television channels (Ildır&Çelik 2021) and perceived as 'quality television' in the local context (Arslan&Tetik 2021). However, the studies analyzing these contents from audience and industry perspectives show that despite the opportunities offered by online streaming platforms to tell unconventional stories and experiment with visual styles, internalized limitations of the mainstream television in Turkey such as the censorship laws, rating anxieties, channel policies and economics still have a big influence in their production (Yörükoğlu&Akçalı 2020).

Based on these remarks, it can be asserted that although Turkish TV series on streaming platforms are bound to different dynamics of circulation, reception and technology compared to their local counterparts on mainstream television channels they still operate on a common ground in terms of production. This paper is mainly concerned with this interdependence which can be seen more apparently in the case of Netflix which "positioned itself more in relation to the traditional TV in Turkey, by using globally recognized stars and collaborating with production companies known for their work in local television" (Vitrinel&Ildır 2021, 8). In an attempt to make research on this interdependence, the study starts off by collecting the data of the above the line crew members such as the producers, showrunners, directors, and scriptwriters who create Netflix Turkish originals and expands this data by examining the other works of the same individuals that are done for the mainstream television channels. By using social network analysis as a method (Weber 2018), the study qualitatively interprets the data in order to identify the central figures in Turkish television industry who play major roles in connecting streaming platforms and mainstream television, recognize clustering themes, trends and stylistic patterns in Turkish television contents on Netflix and mainstream television channels and reveal the connections between 'digital' and 'mainstream' Turkish TV series which are discursively positioned in opposition in the local context. Hereby, the study aspires to take an initial step to understand the ecosystem of Turkish television industry.

PP 0897 The disruption of live programs on online video platforms: The case of Spanish "Operación Triunfo" (OT2023) and its second resurrection thanks to Prime Video, YouTube and TikTok

[Juan Francisco Gutierrez Lozano](#)¹, [Francisco Javier Ruiz del Olmo](#)², [Antonio Cuartero](#)³, [Eduardo Ramos Rodriguez](#)³

¹ University of Malaga, Department of Journalism – Communication Faculty Media Studies, Malaga, Spain

² University of Malaga, Department of Audiovisual Communication – Faculty of Communication – Media Studies, Malaga, Spain

³ University of Malaga, Department of Journalism – Faculty of Communication – Media Studies, Malaga, Spain

The adaptation of long-established television formats, not only fiction series, but especially reality or talent-shows created on traditional television at the beginning of this century, is one of the most recent trends in the offer of global TV platforms. Although there have been many reluctance to live content, and some initial experiences have not been very fruitful, in the Spanish case the recent example of a format known worldwide as "Operación Triunfo 2023" ("Star Academy" in other countries) could offer clues and warnings about the advantages and risks of these adoptions of classic linear television formats on new payment platforms.

In this paper we would like to focus both in the background and, above all, the second resurrection of this format. Born in 2001 on the Spanish public state television (TVE), it accumulated 11 seasons until last year, all of them broadcast on free-to-air channels. After a first decade (2001–2011) broadcast first on public state television and then on the private channel Telecinco, in 2017 the format experienced a first resurrection thanks to its recovery on TVE, but this time with a decided commitment to its expansion on social networks as Twitter, now X, and a 24-hour uninterrupted online content channel on YouTube. The success among the new generations was dazzling, recalling the great initial achievements and introducing new musical styles and, especially, new ways of behaviour of Spanish youth. In 2023, the space's production company (Gestmusic, belonging to Endemol Shine Iberia of the

Banijay Group) agreed with Amazon's Prime Video to recover the format, for the first time to broadcast weekly galas live on its platform, while maintaining the 24h channel on YouTube and betting for a new and abundant presence on TikTok. The premiere took place on November 20, 2023, with an expected end date of February 19, 2024. Its programs are broadcast, according to the production company, to 30 countries around the world.

Although there is no known data on the success of the new season, it is evident that its contents occupy the top positions in the Spanish social conversation on Twitter/X, for example. This paper will also analyze both the strategy designed for this "second resurrection" of the format and, on the other hand, present the first results of an audience research on these Spanish youth audiences and their judgments, among others, about these new practices of live consumption on platforms until now reserved for fiction or on-demand content. This audience research is part of the work of the National Research Project "Repertoires and media practices in adolescence and youth: reception and use of online audiovisual platforms" (AV-ADJUVEN, 2023–2027), financed by the Ministry of Science, Innovation and Universities of the Government of Spain.

TVS05 Production processes across genres & platforms

PP 0898 Television "mediariat" and its fallacy: How cast members in reality programmes position themselves in the production process

Irena Reifová¹, Jan Zápotocký²

¹ Charles University, Faculty of Social Sciences, Praha, Czech Republic

² Independent scholar, independent scholar, Prague, Czech Republic

This paper explores how Czech amateur participants in reality television (RTV) programmes interpret their position within production relations. The research is theoretically informed by the notion of value as understood in Critical Marxist theory and the study of extraction of surplus value through capitalization of unpaid work in RTV production. The principal aim of the research is to circumscribe the narratives produced by the cast members to expound on their provision of their labour for free.

We coined the concept of "mediariat" – a portmanteau of media and proletariat – to underpin that the cast members are exploited by the television industry as they contribute their physical and mental powers into the production of shows, while their efforts are not considered to be work and they are deprived of proper wages (Wood and Kay, 2017). The theoretical focus of our research expands on "the turn to labor" (Hesmondhalgh 2017) in the cultural branch of media production studies (Mayer et al. 2009). We have utilized the perspective of "immaterial labor" (Negri and Hardt 2004) to explain the basis of exploitation in the television industry, which applies not only to professional cultural workers but also to amateurs. The substance of amateurs' immaterial labour on RTV is in the complete embroilment of their psychic sensibilities and social life in production of the media content (Grindstaff, 2010, 2014; Hearn, 2008, 2010, 2014). They work primordially with producing and receiving strained emotions, activating bodily affects, and showcasing positive or, more likely, negative relationships – all this in the form of the commodifiable spectacle captured by camera.

The qualitative analysis of semi-structured interviews demonstrated that RTV participants subjectively interpret their engagement not as labor. This perspective uniquely downplays the exploitative elements of the RTV production model in their conceptual framework. The accounts given by our participants to justify their presence on RTV were diverse, yet they all shared an understanding of the production realities of RTV. From a political-economic perspective, these realities might seem exploitative, but to the participants, they appeared either acceptable or even agreeable. We have assembled four clusters based on the gratifications sought by participants, explaining different interpretive strategies behind respondents' willingness to accept their exploitation. Precarised workers – in the Czech context, often socio-economically challenged individuals burdened with debts – engage in RTV to alleviate their financial difficulties. Missionaries participate in RTV, feeling they have a significant mission to accomplish. Attention seekers, viewing themselves as budding celebrities, hope to later capitalize on their unpaid labor by enhancing their personal brands. Adventure seekers are drawn to the allure and behind-the-scenes aspect of the television industry. The tendency among our respondents to conceptualize their involvement in terms of labor force, value creation, and its appropriation is notably low. This phenomenon is attributed to the pervasive influence of neoliberalism, particularly unchallenged in the post-socialist Czech Republic. Such a neoliberal context effectively suppresses workers' and unionists' identities, promoting instead the model of the entrepreneurial individual.

TVS05 Production processes across genres & platforms

PP 0899 Keeping it together: Thinkshop insights on German public service broadcasting and social cohesion

Irene Broer¹

¹ Leibniz Institute for Media Research – Hans Bredow Institute, Social Sciences, Hamburg, Germany

Recent corruption scandals surrounding Germany's public broadcasters have sparked national debates about the system's merits and costs, and the need for reform. This presentation discusses societal perceptions on the mission

and future of German public broadcasting, particularly in relation to its statutory mandate to contribute to social cohesion.

Despite its frequent use in academic, political, and public discourse, there remains no consensus on the definition of the 'quasi-concept' of social cohesion (Bernard 1999). Nevertheless, it can be understood as an aspirational form of 'collective togetherness' (Schiefer & Van der Noll, 2016), grounded in factors like mutual trust, identification, and a shared commitment to the common good. Social cohesion is at least partially fostered through media, enabling integrative exchanges beyond individual spheres (Weiß & Jandura 2017, Hasebrink et al. 2020), while realities such as cultural diversity, economic inequality, political polarization, and rapid technological developments are thought challenge it.

The authors will present the outcomes of six 'Thinkshops' conducted with diverse participants, including junior and senior citizens, civil society organizations, media practitioners, public broadcasting regulators, and media scholars. These workshops, held between 2021 and 2023, aimed to promote critical reflection, discussion, and collaborative idea generation concerning the role of German public service media (PSM) in fostering social cohesion. Using methodologies from Design Thinking and Participatory Action Research, participants were engaged in defining the concept of social cohesion, articulating their expectations of PSM, and identifying constraints and aids at their interface. Additionally, the sessions involved the development of future scenarios and strategies to foster the resilience of German PSM.

The Thinkshops provided a deeper understanding of well-known tension fields within PSM, particularly the challenge of balancing collectively shared interests and values with the inherent diversity in a heterogeneous society. Perspectives that emerged through inductive exploration include desires for increased transparency in financing and decision-making, improved representation of cultural diversity, advocacy for constructive journalism, and an envisioned moderating role of PSM in public debates on digital channels. In line with arguments put forth by others (e.g., Bonini 2017; Gerlach & Eilders 2021; Reimer, Albert & Loosen 2023), the potential for German PSMs to fulfill their mission of contributing to social cohesion appears to extend beyond programming. Instead, it lies in diverse expressions of the media-audience relationship, particularly concerning participation, accessibility, representativeness, and responsiveness. However, these aspects are not without challenges (Vanhaeght & Donders 2021) and require careful consideration.

TVS05 Production processes across genres & platforms

PP 0900 Audience Centricity in digital and linear TV Production: A comparative study of legacy broadcasters

[Sylvia Albert-Vogl](#)¹

¹ University of the Arts, College of Communication, London, United Kingdom

This research elucidates empirical insights into audience construction within linear and digital television production at established broadcasting entities. Amidst a diversifying television market, the paradigms of media production, commissioning, and distribution have evolved, with audience behaviour being increasingly mediated throughout the industry. This study investigates broadcasters in the United Kingdom and Germany, offering a critical examination of the shifts and influences these entities encounter due to burgeoning data availability, such as television ratings, social media metrics, and web analytics.

Drawing upon media production studies (Caldwell 2008, Deuze, 2019), theories of power dynamics, and data studies (Doyle, 2018), this research explores the nexus between production processes and audience data within daily operational routines and decision-making frameworks. It scrutinises the interaction, growth, and quantification of viewing experiences as commodified media engagement (Dahlgren and Hill, 2023). The methodology employed encompasses 22 semi-structured interviews conducted within the United Kingdom and Germany, involving a cohort of professionals comprising producers, commissioners, and media consultants.

The findings highlight a divergent approach towards data utilisation. Practitioners in digital domains exhibit a propensity for embracing diverse data streams gleaned from online and social media platforms, contrasting with their counterparts in linear settings who predominantly rely on traditional television ratings. Digital producers demonstrate a nuanced appreciation of audience information, integrating it comprehensively into their everyday practices. This research uncovers a disparity between digital and traditional content production modalities, with television production exclusively experiencing pressures, power struggles, and adverse influences during decision-making phases.

Addressing these emerging dynamics, the study concentrates on the operationalisation of metrics within broadcasting organisations. By collating, analysing, and evaluating examples from various broadcasters, it becomes evident that data plays a pivotal role in decision-making in both linear and digital production. However, in the digital sphere, audience construction commences earlier in the development phase and is seamlessly integrated into the format development process. Conversely, in linear contexts, ratings remain the primary influence, relegating alternative data sources to a peripheral role.

VIS01 Visual cultures of and in conflict and crisis

PP 0566 AI-documenting war: A mixed method analysis of Adobe AI-generated images of the Israel-Hamas war

Chiara Spaggiari¹, Laura Gemini¹, Stefano Brilli¹

¹ University of Urbino Carlo Bo – Università di Urbino Carlo Bo, Department of Communication Sciences- Humanities and International Studies – Dipartimento di Scienze della Comunicazione- Studi Umanistici e Internazionali DISCUI, Urbino, Italy

The relationship between computer-generated photorealistic images and photographic ones has become more complex since the summer of 2022 after the popularization of AI generative visual media (Arielli, Manovich 2023). The constant development and improvement of these systems is reconfiguring how the sense of authenticity of images as representations of reality is constructed (Esposito 2022).

The perceptual ambiguity between the synthetic and the photographic images is particularly important for photojournalism (Lehmuskallio et al. 2018).

While the generic aesthetics of stock images are now widely used in the media and journalism industries as the vehicle of news and information (Aiello, Parry 2023) the debate about the changes in visual aesthetics and their documentary possibilities remains. These discourses occur within the controversy between direct and manipulated photography in documentary fields and concern the loss of indexicality and referentiality of the photographic record, about the rise of generative visual media based on predictive, computational data processing.

In this regard, we consider the paradigmatic case of the sale of ai-generated stock images of the Israeli-Palestinian war by Adobe Stock. After the outbreak of war in Gaza on 7th October 2023, the online marketplace Adobe Stock began collecting user submissions of ai-generated images, which paying customers can download and publish in online media. The case developed when the circulation of these images by online news media did not contextualize their ai-generated production.

This proposal does not intend to emphasize the political purpose these images had in the debate on the Israeli-Palestinian war, but rather to investigate the role that user-generated images with AI tools can play in the image industry, within stock images sites, in which the profession of photojournalist is in second place. The focus is on the role that ai-generated images and their generic aesthetics play in shaping the imaginary inherent to the representativeness of events.

As the case study proposed is layered on its implications, it is necessary to analyze different types of media sources. First, we do the content analysis of the online newspaper articles that covered the case of the sale of ai-generated images by Adobe regarding the Gaza war, framing discourses on agents, roles and viral images. Then, following the model of analysis proposed by Gillian Rose in *Visual Methodologies* (2016), we examine the three spaces that define the meaning of images. Considering the site of the images itself, we conduct a visual content analysis of the viral ai-generated images, dealing with the composition and its visual meaning. Regarding the site of production, we highlight the ai-generated characteristics of the images, metadata, tags, labeling and captions for categorization on Adobe Stock. Examining the site of audiences, we use the Google Reverse Images tool to track the dissemination of viral images in the online media and frame the integration into the texts, through which they circulate.

VIS01 Visual cultures of and in conflict and crisis

PP 0567 Playful visions: Visual AI aesthetics in synthetic warfare

Sandra Kero¹, Christian Schwarzenegger², Manuel Menke³

¹ CAIS Centre of Advanced Internet Studies, CAIS Centre of Advanced Internet Studies, Bochum, Germany

² University of Bremen, ZeMKI Centre for Media- Communication & Information Research, Bremen, Germany

³ University of Copenhagen, Department of Communication, Copenhagen, Denmark

The social discourse about the transformative potential of AI, its challenges, benefits and risks is in full swing. The recent hype about generative AI and its tremendous potential for profound transformations in culture and society has reinstated dystopian and utopian techno-visions for the impact of new communication and media technologies. A prominent and recurrent trope regarding visions brought about by technological innovations is the area of dis- and misinformation.

AI-generated synthetic images are already being utilized in various media, social, and political contexts, including intentional deception, without the generative origin being apparent or disclosed to users. Generative Imageries hold immense potential to fundamentally alter the production, use, reception, and handling of images. Yet, there has been little exploration of how our understanding of imagery changes as images are increasingly generated.

In this paper, we explore the utilization of synthetic content not for the primary dissemination of false information but for the effective spread of (latent) visual hate speech, ideology, and propaganda. We investigate whether there is an attempt at narrative persuasion through the artistic presentation of a story, examining the immersive impact of AI-generated visual contents. Additionally, we question whether an AI aesthetics is succeeding in the visual

communication strategy of the political activist groups and in particular the extreme right, moving from memetic warfare to what could be termed as synthetic warfare. This analysis contributes to understanding the evolving landscape of AI in political communication and its potential implications for public discourse and societal resilience.

Against this backdrop, we argue that the crux of the matter lies not in citizens' ability to discern AI-generated images and manipulations, but rather in the emergence of a distinctive AI aesthetics as a potent mode of political commentary and a legitimate channel for shaping political visions. This paradigm shift goes beyond the quest for truth, delving into the realm of imagination, where potential futures and alternative realities come to life. Through an analysis of content posted on X (formerly Twitter) and Instagram, we develop a typology of prevalent image categories in AI-generated visual campaigns, identifying prevailing aesthetic consistencies and features.

Our methodology extends beyond mere categorization, encompassing a qualitative content analysis of comments associated with these images. This dual analysis aims to reveal how the AI-generated nature of these images is navigated, interpreted, and embraced as a novel aesthetic expression or, conversely, dismissed as unreal, artificial, fake, or manipulative. The conspicuous AI-generated nature of these images contributes to a dual effect: on one hand, their manipulative potential is perceived as less threatening. Simultaneously, this transparency allows for the normalization and dissemination of motives, narratives, and staging methods. We conclude that this calculated ambivalence, generally inherent in images, is further heightened in the case of AI-generated images and aesthetics. This examination not only enhances our comprehension of the evolving landscape of AI aesthetics in political visual communication but also sheds light on broader implications for public perception, discourse, and the construction of political narratives in the era of synthetic media.

PP 0568 Using images to fight social disorder: A joint analysis of the productions and discourses of Ukrainian data journalists during the Russian invasion of Ukraine

[Valentyna Dymytrova](#)¹

¹ Université Lyon 3, Information and Communication, Lyon, France

This paper examines the uses of images as a source of knowledge and a means to produce knowledge by Ukrainian data journalists during the Russian invasion of Ukraine.

We approach images as instruments of vision and visualisation (Latour, 1987), which maintain a dynamic, active and even problematic relationship with the world of reference, and which are reinvented according to the devices, media and practices (Manovich, 2001). Often considered as amplifying informational disorder in times of social media, visual productions are still also appreciated for their creative potential.

From the start of the war, Ukrainian journalists ensured the continuity of information by constructing a narrative of the war, featuring new actors, envisaging the outcomes and reconstructing "the symbolic fabric of sociability" (Lamizet, 2011), specific to each crisis. This narrative is constructed with a diversity of images, both traditionally produced by data journalists (dataviz, cartography) as well as remediated images produced by a wide range of humans and non-humans. We would like to examine the sensitive issues of the relationship between public space, data, media and images, by looking at ways of knowing through images, i.e. the methodological, documentary and epistemological status of images in the approaches to images by Ukrainian data journalists in wartime.

Our fieldwork includes:

- 1/ a semio-pragmatic analysis of a corpus of productions by Ukrainian data journalists from the Texty.org.ua, published during the first year of the war.
- 2/ semi-structured interviews with Ukrainian data journalists (n = 5, April 2023).

In terms of methodology, we opted for the systematic identification and analysis of elements relating to the editorial work of visual formatting and data narration. The analyses focus more specifically on the constructed universes, enunciation, aesthetics, enunciative gestures and interactivity and the accompanying discourse.

Among the main results we want to discuss:

- A diversification of the discursive registers of data journalism to go beyond the "analysis of statistical data" dimension and integrate human subjectivity and emotion
- When remediated images are integrated into multimedia formats, they respond to a storytelling logic: an explanatory scheme with humans and non-humans, organised around the central axis of "aggression – resistance" and with superimposed temporal layers to create links between the present and the past.
- In our corpus, images ensure the various mediations: documentary, heritag, memory, legal, educational and critical.

The visual productions relating to war link local and national scales, as they combine both close-up views of the war and its atrocities, using 'shock' images (Barthes, 1957) and synoptic views that seek to stand back and think about the war as a whole, making heuristic use of images (Drucker, 2020). In both cases, such images of war open

up new views and new visibilities and help to signify worlds of data. Far from offering direct access to reality, war images offer a representation that is "inevitably prismatic" (Gervereau 2006), constructed from different, overlapping points of view. These images are always extremely fragile reflections, highly dependent on the way in which they have been obtained, interpreted and integrated into info-communication devices, both in their technical and discursive components.

VIS01 Visual cultures of and in conflict and crisis

PP 0569 Visualizing cultural memory: Analyzing gender dynamics in the aftermath of the 2023 Turkey–Syria earthquake through visual narratives

Nermin Alkan¹, Canan Dural Tasoujji²

¹ Mersin University Faculty of Communication, Public Relations and Advertising, Yenişehir/ Mersin, Turkey

² Mersin University Faculty of Communication, Journalism, Yenişehir/ Mersin, Turkey

Cultural memory encompasses the collective remembrance of a society regarding its past events, experiences, and values. Natural disasters, such as earthquakes, profoundly impact the lives, cultural dynamics, and collective memories of societies. Similarly, the association of these interactions with gender is especially crucial, particularly in the context of women's experiences. The entrenched masculine authority in societal order uses gender to relegate women to a secondary position, particularly during crisis periods when the imperative to uphold daily routines becomes pronounced, thereby exacerbating these inequalities. Traditional gender norms and power structures are sustained by societal systems, contributing to the marginalization of women, especially in challenging times. This can lead to a reinforcement of traditional gender roles, wherein women are expected to assume caregiving responsibilities and support roles. Despite the anticipation that earthquake response strategies and societal reconstruction plans should be gender-sensitive to diminish inequalities and bolster resilience, narratives surrounding women during disaster periods persist in perpetuating traditional gender roles, and expectations continue to operate more prominently. This research delves into the complex interplay among cultural memory, gender dynamics, and disaster narratives against the backdrop of the 2023 Turkey–Syria earthquake. With a specific focus on the photograph archive of Anadolu Agency, a prominent state news channel in Turkey, the study examines the representation of women's experiences in the aftermath of such a disaster. The data for this research were derived from a total of 421 photographs obtained by scanning images related to the 2023 Turkey–Syria earthquake in the photo archive of Anadolu Agency. The dataset spans a one-year period starting from February 6, which marks the beginning of the 2023 Turkey–Syria earthquake. Through a combination of thematic and visual analysis, this study examines the portrayal of women in visual narratives of the earthquake provided by the news agency, evaluating its impact on shaping cultural memory concerning women in the challenging context of a crisis. The research argues that by disseminating these images, Anadolu Agency actively engages in shaping societal and cultural perceptions regarding the roles, responsibilities, and agency of women during times of crisis, thus contributing significantly to the construction and preservation of cultural memory concerning gender dynamics in challenging circumstances. In essence, the agency's actions are seen as influential in shaping how people remember and perceive the roles of women in times of crisis within the broader cultural context. This research contributes to the existing literature by providing insights into the dynamic relationship between media representations, gender roles, and the formation of cultural memory. By understanding how women are framed visually in the aftermath of disasters, we gain a deeper understanding of the societal narratives that influence perceptions, attitudes, and policies surrounding women's experiences in times of crisis.

Keywords: Cultural memory, 2023 Turkey–Syria earthquake, Anadolu Agency, Gender dynamics, Visual narratives

VIS01 Visual cultures of and in conflict and crisis

PP 0570 Expanded corpses: Visual representations of the first Ukrainian war deaths in mass media

Glòria Salvadó Corretger¹, Polina Gorbaneva², Santiago Fillol¹, Fran Benavente¹

¹ Pompeu Fabra University, Department of Communication, Barcelona, Spain

² Pompeu Fabra University, Department of Humanities, Barcelona, Spain

In this paper we propose to address the visual treatment of the first corpses of the Ukrainian war, focusing on the episode of the "Bucha massacre", a media controversy centered around the image of the corpse. At the beginning of April 2022, several media published the first images revealing "what happened there". The controversy erupted when the pro-Russian media accused the Western media of generating fake news (they questioned the authenticity of the corpses and argued that what was shown was a staging).

The Ukrainian war is one of the most mediatized to date and the Bucha episode represents a paradigmatic example of it. By observing the images that both sides wield in the public sphere, this paper seeks to raise a state of question of the indeterminacy of the image as a document or evidence today.

Our starting hypothesis is that, in the Bucha massacre, the visual representation of the first corpses of the war achieves unprecedented virtualization in history: their recreation and representation by means of new visual tools and the AI transforms them into an ever-moldable and vectorizable matter.

Our theoretical framework formulates a genealogy of the politics of the image, by contrasting the perception of the "false image" in the 80's and 90's (Baudrillard, 1988,1991) with the "post-truth" regime and the "deep fake" of our contemporaneity (Sadin, 2020). We turn to Ford and Hoskins (2022) and Chamayou (2016) to see this post-truth regime in the fabrication and the reception of war images, following also Paul Virilio in his work on the logistics of perception in war and cinema (Virilio, 1984).

One of the most prominent documents purporting to debunk the pro-Russian versions is a documentary produced by NYT, which reconstructs the prior, during and after the events, in a sort of "virtual model" (Weizman, 2021), using images from security cameras, Ukrainian army drones and smartphone recordings made by eyewitnesses. This document, which is postulated as legal evidence of war crimes, constitutes for us an example of the role that "exactitude" (Sadin, 2020) and "hyperdefinition" (Szendy, 2021) play in the new regime of truth.

This research aims to open a way to rethink, from the proposed theoretical focus and a methodology centered in iconography and visual cultural studies, a history of the representation of corpses in war conflicts, from the Iraq war to the present day, taking the Ukrainian war as a privileged case study.

VIS02 Social media and digital visual cultures

PP 0672 Emerging visual narratives on the environmental crisis on Instagram

[Gemma San Cornelio Esquerdo](#)¹, [Elisenda Ardèvol](#)², [Sandra Martorell](#)³

¹ Universitat Oberta de Catalunya, Information and Communication Sciences, Barcelona, Spain

² Universitat Oberta de Catalunya, Arts and Humanities Studies, Barcelona, Spain

³ Polytechnic University of Valencia, Audiovisual Communication- Art History and Documentation, Valencia, Spain

Amid the current climate crisis, communication plays a pivotal role in fostering new perspectives and encouraging positive citizen action. Through social media, conscientious individuals engage in environmental communication activism, reshaping the prevailing visual narratives on the climate crisis. Identified as both activists and environmental influencers (San Cornelio et al. 2021), these individuals challenge established media narratives, presenting alternative viewpoints through their posts and stories on Instagram.

This paper aims to elaborate an incipient characterization of the emerging elements of these visual narratives in social media as potentially able to engage citizens to take action in their ordinary lives. Our research draws on a qualitative methodological approach, based on: (1) a digital ethnography (Pink et al. 2016, Ardèvol and Gómez, 2012) carried out on 60 Instagram accounts devoted to the dissemination of environmental concerns and contents; (2) a visual narrative analysis (Daiute and Lightfoot, 2004) of 281 selected posts of the previous accounts (3) 14 in-depth interviews conducted with digital activists.

As a result, we have identified the main traits of these emerging visual narratives: the use of positive visuals and content; first-person accounts highlighting the small actions and achievements (propositive narratives) that can be carried out in our daily lives; and/or the use of memes, humor, and other elements of popular culture. These characteristics distinguish our participants contents from the established environmental visuals produced by either legacy media or environmental organizations. We have discerned a combination of communicative strategies that are closer to those of influencers (Leaver et al. 2020), although not all of the participants in our study identify themselves with this label. They believe that their approach will have a positive impact on the community of followers, making the efforts attainable for everyone and trying to reach spaces or people that the established narratives by legacy media and experts do not reach.

VIS02 Social media and digital visual cultures

PP 0673 "I wish I could clean my life the way this man cleans this rug". Embodied Spectatorship and the aesthetics of pleasure in 'oddly satisfying' content

[Louise Yung Nielsen](#)¹

¹ Roskilde University, Department of Communication and Arts, Roskilde, Denmark

The short-form video format of social media favors content that quickly elicits a pleasurable viewing experience (Liu et al., 2021); thus, the production and display of pleasurable visual imagery is highly encouraged. This study investigates how a specific type of content, known as oddly satisfying content, caters to the spectating body. I will explore the aesthetics of pleasure: audio-visual aesthetics, media technologies, and platform logics. Furthermore, I discuss how viewers engage in embodied spectatorship (Nielsen & Bork-Petersen, 2022; Balevičiūtė, 2015; Ryberg, 2015). Through these efforts, I hope to address the new visualities created in the context of social media consumption and explore emerging forms of spectatorship.

The 'oddly satisfying' content refers to a genre of digital content that elicits a unique and unexpected sense of pleasure, gratification, or relief in viewers through visual, auditory, or tactile stimuli. Platforms such as Instagram (reels), TikTok, and YouTube (Shorts) display oddly satisfying content. Obviously related to ASMR, this genre often features videos or images that showcase repetitive, rhythmic, or precisely executed actions, resulting in satisfying and harmonious outcomes. Examples of oddly satisfying content may include videos of items fitting perfectly into spaces, intricate patterns being created, kinetic sand cutting, paint being mixed in a mesmerizing manner, the encounter of different textures such as oozing slime being mixed with sparkling pearls, or the meticulous completion of a task with satisfactory precision, or even rug cleaning and lawn mowing.

In my analysis of 'oddly satisfying' content, my aim is to explore these instances as meticulously crafted engagements with materials designed to evoke pleasure. I intend to delve into the interaction between the content and its audience by examining how viewers experience these visually satisfying images. To comprehend spectators' responses, I will closely examine the comments section, focusing on the pleasurable, sensory, and emotional reactions triggered by these encounters. The theoretical framework for this study draws inspiration from aesthetic visual theory in film studies, specifically emphasizing the concepts of the gaze (e.g. Mulvey, 1975), the haptic (e.g. Marks, 2002), and sensoric imagery (Fausing, and insights from studies related to the depiction of pleasure, akin to those explored in porn studies (e.g. Paasonen, 2011).

Engaging in the study of oddly satisfying content presents an opportunity to contribute with insights into the evolving landscape of entertainment consumption. This study aims to unveil novel ways in which users interact with digital content, emphasizing embodied experience over other forms of engagement. It explores the development from traditional modes of entertainment consumption to a more bodily and sensory-driven form of engagement. This study recognizes that oddly satisfying content taps into a multisensory experience, involving visual, auditory, and tactile elements that bypass traditional forms of entertainment.

VIS02 Social media and digital visual cultures

PP 0674 Exploring visual and ephemeral news content on social media: Finnish news organisations' Instagram Stories

[Margareta Salonen](#)¹, [Jonathan Hendrickx](#)², [Veera Ehrlén](#)¹

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

² University of Vienna, Department of Communication, Vienna, Austria

The current digital news environment contains increasingly visual and short-lived ephemeral content that news media produce for their social media accounts (Author, 2023; Pesce, 2016). Ephemerality refers to content that can be either consumed in seconds or minutes (Grainge, 2011) or content that can be viewed for a certain amount of time or for a specific amount of time (Anderson, 2015). While journalism research has lately started to accumulate, (e.g., Hendrickx 2023; Hermida, 2020; Salonen & Laaksonen, 2023) only a handful of studies have examined specifically the ephemeral nature of news content, such as Instagram Stories and TikTok videos (e.g. Vázquez-Herrero et al. 2019, 2020). Instagram specifically has gained traction among publishers to reach (young) audiences (Newman et al., 2023), which warrants more examination.

Therefore, this study examines the journalistic use of Instagram Stories with a specific focus on ephemerality and visuality of news content on Finnish news organisations' Instagram accounts. Instagram Stories are images or short videos that last for 24 hours on a given account. The study explores two accounts. One is Yle Kioski (@ylekioski), a social media native news account of the Finnish public broadcaster Yle with over 70k followers. The other is HS Nyt (@hs_nyt), owned by the Finnish national daily newspaper Helsingin Sanomat with nearly 85k followers. These amounts are significant as the two accounts are among the biggest Finnish news media's Instagram accounts.

Digital news content and the visual elements of news can be portrayed by utilising a multimodal approach (e.g. Hiippala, 2017). Multimodality comprises different combinations of modes through which meanings are created.

Social media can be seen to comprise different kinds of textual and visual modes or elements (Author, 2021), such as hashtags and news headlines (textual mode) and still images and videos (visual mode). Consequently, they offer multiple opportunities to study digital news and its elements.

Based on these premises, this study asks:

RQ1: Which news topics are present in the ephemeral news content on Yle Kioski and HS Nyt's Instagram Stories?

RQ2: Which modes can be identified in the ephemeral news content, i.e. Instagram Stories, on the Yle Kioski and HS Nyt Instagram accounts?

RQ3: What purposes do the modes serve and specifically, what is the role of visuality in them?

The dataset consists of one month of Instagram Stories published by both news media. It will be gathered in early 2024 and consequently analysed using qualitative content analysis (Silverman, 2011). Prior research by the first author on Yle Kioski's Instagram Stories in 2023 found more hard news than soft news present. As this differs from other studies (e.g. Salonen & Laaksonen, 2023; Hendrickx, 2021), it is important and interesting to see how the data looks in 2024 in conjunction with the Finnish newspaper's (HS Nyt) Instagram data. In addition, this study contributes theoretically by exploring Instagram Stories from a multimodal perspective and by developing a framework for analysing ephemeral and multimodal social media content.

VIS02 Social media and digital visual cultures

PP 0675 Conveying uniqueness through visual homogenization: The aesthetics of neo-craft work on Instagram

Gaia Casagrande¹, Giulia Giorgi¹, Alessandro Gandini¹

¹ University of Milano La Statale, Department of Social and Political Sciences, Milano, Italy

The aim of this paper is to investigate how the aesthetics of 'neo-craft' work on Instagram are constructed by means of visual practices that attune to the platform logics and vernaculars.

According to Manovich (2019: 3), we live in an 'aesthetic' society, where "the production of beautiful images is central to our economic and social functioning". Instagram, more than other social media, contributed to the aestheticization of everyday moments through a sheer variety of features for image/video editing, including filters and effects. Some of Instagram's distinctive aesthetics, like the minimalist or the retro-nostalgic style, gained huge popularity among users, content creators, small and large companies advertising their products on the platform.

Our focus is on 'neo-craft' work, a form of post-industrial work consisting in the 'artisanalisation' of different manual, traditionally working-class, low-status jobs, that are 'resignified' through an embroidery of material and discursive elements (Gandini and Gerosa, 2023). Epitomised by craft beer brewing, neo-craft work combines the materiality of craft production with a process of discursive production characterised by forms of 'marginal distinction', based on authenticity and 'particularisation'. Social media platforms, especially Instagram, are pivotal to actualise this process of discursive resignification and, just like content creators, neo-craft workers must follow the platforms' logics to convey a brand-image as authentic as possible. For these reasons, we believe neo-craft work represents an ideal object of study as an emblematic case of the "aestheticization of society".

Our research consisted in a qualitative visual analysis (Aiello and Parry, 2020) of 346 Instagram accounts of neo-craft activities based in the EU aimed at finding recurrent patterns in how these businesses present themselves and their work on Instagram. Attention was devoted to how neo-craft work's core values of authenticity and particularisation are visually conveyed, while considering the influence of Instagram minimalist and retro-nostalgic style in shaping an 'aesthetics of neo-craft work'.

Although uniqueness is supposedly a central value to neo-craft work, a high degree of aesthetic homogenization characterises these activities, regardless of their geographic location and business type. The Instagram profiles surveyed look similar to one another, with the same set of colours and tropes. Images of laboratories, studios or venues are presented with a common visual style and a visible recurrence of symbolic components that seem to speak the same visual language. The presentation of the product employs specific shapes and colours that recall a minimalist style; the logos and fonts used by artisans are similar to one another, recalling vintage elements, specific places, and an overarching postindustrial allure. After outlining the characteristics of the neo-craft aesthetics, we critically reflect on the implications that this homogenising power brings, as craft businesses must at once differentiate from their competitors and be perceived as part of the same cultural scene.

VIS02 Social media and digital visual cultures

PP 0676 Picturing pain, science and the body: Social media aesthetics of hereditary cancer

Stefania Vicari¹, [Hannah Ditchfield](#)¹, Yu-Ning Chuang¹

¹ The University of Sheffield, Sociological Studies, Sheffield, United Kingdom

Existing research has foregrounded the role of first-person visuals in offering potential to express illness through narrative, voice and biography, which can both provide an entry point into personal "worlds of illness" and challenge societal norms and practices (Radley and Bell, 2007). This research has however only marginally addressed the role played by social media as digital platforms shaped by both "techno-commercial" strategies and user practices (van Dijck et al., 2018). In other words, we do not know how social media visuals, as discourse originating in profit-driven technological contexts, play with reinforcing or hindering dominant and subversive practices of illness and medicine and related "disease regimes" (Klawiter 2004). In this paper, we argue that the situated encounter of platform corporate strategies and user practices has important implications for the production, selection, curation, and distribution of contemporary "imaginings" of illness.

In this paper we present an investigation of top visuals relevant to BRCA-related hereditary cancer syndromes posted by Instagram or Twitter public accounts or on Facebook pages or public groups over the course of twelve months (01 May 2022–30 April 2023). We focused on public visuals because these are likely to be seen by both intended and unintended audiences, with their publicity being similar to that of traditional legacy media. We filtered "photo" posts for Facebook and Twitter and "image" posts for Instagram. Finally, using 4CAT, we downloaded the corresponding visuals: 360 images (10 top visuals * 12 months * 3 platforms). Combining quanti-quali techniques (Vicari and Kirby, 2023) and visual digital methods (Colombo et al., 2023), we traced both platform-based visual practices and overall patterns in the broader mainstream social media ecosystem.

Very preliminary findings point at clear differences in the way visuals of hereditary cancer gain traction and picture the condition on each platform. On Instagram, influencer work becomes most evident, in particular through the use of selfies and inspirational messages. As evidenced in previous research (e.g., Rademacher, 2018) here, those likely to post selfies appear to be "those able to credibly inhabit celebrity subjectivity". In practice, there still seems to be little space on the platform for non-normative visuals featuring people of various races, sizes, genders, ages, and shapes. Facebook visuals share some characteristics with the Instagram ones, especially when it comes to exposing and documenting the body (e.g., see instances of before/after breast reconstruction photos) or advertising women's fashion. Influencer work is however absent here, with selfies and close-ups becoming visual exemplars rather than fragments of a personal and sustained journey to be followed over time. Twitter clearly stands apart from both Facebook and Instagram, with visuals being predominantly screenshots of scientific papers, infographics or conference pictures tending towards a professionalised and seemingly more datified imagination of illness as disease. These findings suggest reflections on the way mundane social media practices enhance the emergence of platform-based (i.e., 'vernacular') aesthetic and interpretive norms to understand health, illness and disease.

VIS03 Visual trust practices on social media

PN 112 Social media doctors and visual trust: Balancing epistemic authority and parasocial relations

[Jenni Niemelä Nyrhinen](#)¹, Asko Lehmuskallio¹

¹ University of Tampere, Faculty of Information Technology and Communication Sciences Communication Sciences, Tampere, Finland

Research objective Today social media is an alternative source of health information, especially for adolescents and young adults. However, social media is also identified as a considerable and potential source of health misinformation that is confronted with suspicion. This paper will focus on how doctors, as traditionally trusted health sources, navigate within visual social media (e.g., Instagram, TikTok, YouTube) a tension between a medical gaze, relying on traditions and techniques learned in medical education and practice, and that of a mediated social media gaze, leaning towards relaxed and informal social interactions. More specifically, the paper provides a taxonomy of ways in which social media doctors create trust with and through visual digital content in order to influence decisions related to health and wellbeing. Methodology This research, as part of a larger international and multimethodological research project on trust and visibility in the context of health and wellbeing, will focus specifically on analysing the tension between the medical gaze and the social media gaze. Empirically, our work relies on digital ethnography, content analysis, and interviews conducted in Finland. In our analysis, we approach the data openly with a focus on the visual and with the aim of identifying relevant visual ways in which social media doctors create trust. Importantly, trust is considered as a volatile dimension of social interaction that needs to be regularly recreated by forms of interaction that seem reliable. Findings Our preliminary findings indicate a range of visual ways that aim at and are used to create trust by social media doctors. The medical gaze, as a historically well-established mode of epistemic authority – visible in white coats, medical paraphernalia, specialist language, and diagrammatic forms of visualising medical content – is complemented by a felt need to be social media savvy, adding informal,

relaxed, and unconventional modes of social interaction to the repertoire of trust-building. The doctors active in social media are balancing ways of conveying trust through forms of epistemic authority and a carnivalisation of classical hierarchies, aiming to form parasocial relations with audiences they might never meet face-to-face. This balancing act ties in with the formation of professional identity and the coexistence of scientism and humanism in medicine. The doctors stress their education and professional status through visualisations referring to science (e.g., the use of professional equipment, medical illustrations, and visually recognisable links to academic articles). At the same time, parasocial relationships are formed with followers by enforcing inter-subjectivity and a feeling of affective closeness through strategic visual forms (e.g., use of selfies and intense eye contact, surprising humour, sharing images of concrete whereabouts, showing private spaces). The findings presented herein will be complemented and deepened in forthcoming interviews with social media doctors, to be held and analysed before the panel. Continuing the analysis, we will specifically pay attention to intentionalities and motives behind the visual ways of creating trust in order to better understand the tension between the medical gaze and the social media gaze.

VIS03 Visual trust practices on social media

PN 113 Performing visual trust: not too polished, not too scrubby

[Jaana Davidjants](#)¹

¹ Tallinn University, Baltic Film Media and Arts School, Tallinn, Estonia

This presentation is based on interviews conducted with Estonian students (30) and content creators (10) as part of the research project "Trust and Visuality – Everyday digital practices" (TRAVIS). The presentation asks how people practice visual digital trust in their socially mediated everyday life, particularly in multimodal communication pertaining to everyday health and wellbeing. In the presentation, we pose two questions. Our first question focuses on the site of production – we ask how trust is performed visually. Our second question focuses on the site of the audience – we ask how visual trust (as enacted and performed in social media content) is perceived by social media users. This presentation conceptualizes trust as a practice, and visual content and practices as always situational, contextual, and as pending on interpretative competencies and communities. Visual digital trust, thus, is also practiced – it hinges on a set of doings, sayings, and feelings that rely on relationships, ideologies, perceptions, and affect. Finally, we rely on the recent conceptualizations of authenticity, in particular, in influencer studies. We propose three types of negotiation undertaken by social media users and content creators in their visual digital trust practices. All three were articulated via vernacular perceptions and presumptions of authenticity – of images, of the environment or space depicted and of the appearance of the creators within visual content. 1. The image: Regarding the image, interviewees attributed trustworthiness to specific colors, angles, and visual elements. Trust was also linked to a certain level of professionalism; however, there was a tension in the negotiation of professionalism as linked to authenticity and through that, trustworthiness. Trusted images were characterized as "professional" but not overly so, with continuous friction between professionalism as justifying attention and professionalism that was deemed "too manicured" and thus inauthentic. 2. The space / environment depicted: As our empirical study focused on everyday health, the content depicted spaces where creators exercised, meditated, cooked, or offered advice by speaking to the camera. Elements like colors, lighting, the overall "vibe" of these spaces were carefully considered. On TikTok, images showcasing creators in highly aestheticized settings, which we call "calibrated mundanity" (drawing from Abidin's "calibrated amateurism"), emerged as a tactic of enacting authenticity in the sense of normatively acceptable self-presentation. This in turn created trustworthiness. 3. Creator appearance: Finally, trust linked to the creator's appearance and body shape, which was seen as legitimizing the rhetorical and informational content of posts (does the creator look like someone who should be giving me fitness advice; is their body similar to mine or unattainable). The creator appearance-related preferences were tacitly class and status-related regarding clothing/style, posture, makeup, and general grooming, which, similarly to the previous point, relied on the acceptable and normative as seemingly authentic and thus trustworthy.

VIS03 Visual trust practices on social media

PN 114 Patients, professionals, and influencers: Navigating visual constructions of health expertise

[Marius Liedtke](#)¹

¹ University of Salzburg, Department of Communications, Salzburg, Austria

The research project "Trust And Visuality: Everyday digital practices (TRAVIS)" focuses specifically on the role of the visual in building trustworthy relations within social media communication and investigates how and why people trust some visuals over others in the context of health and well-being content. The question of trust in the realm of health is intimately connected to perceptions of expertise and authority. Normatively, scientific and medical expertise is expected to fulfill the societal function as the premier source of health advice. However, assessing its validity has never been quite easy for laypeople, and usually other factors, like the authoritative social position of the advice-giver, are equally if not more important to the practice of trusting. With people increasingly looking for health information on social media, they are confronted with a multiplicity of actors claiming expertise on various

grounds and constructing authority in multiple, often novel ways. Based on data we collected by using aggregated auto-ethnography and in-depth interviews, users experience a variety of content creators during their social media practices and are relevant to them in terms of health content: health professionals, like doctors and nurses, but also science journalists, affected people speaking from lived experience or lifestyle influencers, to name only a few. Assuming the position of the authoritative advice-givers, these content creators construct their expertise in multiple ways and design their visual content accordingly. We also see that these ideal-type groups often cannot be separated as distinctly as one would think, but often share characteristics and aesthetics and adopt practices from each other. Health professionals and journalists utilize entertainment genres usually reserved for influencers and adopt their distributive strategies. Fitness influencers refer to scientific sources to prove the effectiveness of their workout plan. Affected people use their advocacy videos to advertise courses and seminars. Already successful beauty influencers utilize their own mental health issues to tap into new markets, and so on. This contribution is interested in these multiple (audio-)visual constructions of expertise and answers the questions: How do users navigate this variety of content, actors, and claims to authority? What are the categories that they classify creators by and what attributes are they ascribing to them? What kind of expertise are they looking for? What kind of presentation does or does not appeal to them? And of course, who do users ultimately trust and why?

VIS03 Visual trust practices on social media

PN 115 Studying the messiness of visual social media practices. An aggregated auto-ethnographies approach

² Utrecht University, Media and Performance Studies, Utrecht, Netherlands

Visuality is central in people's experiences of social media and to people's enactment of sociality, but incredibly complex and messy to research. This messiness complicates units of analysis and concepts established in classic visual studies: authorship and ownership are difficult to pin down – original content is often remixed with appropriations of third-party material, reshared, endorsed or reframed, which does not only impact the location of the field or object of one's analysis, but how one might conceptualize methods. As visual media move through times, space, and contexts, their meaning can obviously change, as interpretation is always situational, but also what they refer to might not always be entirely clear: representation of someone or something can be iconic and indexical, but only be accessible as such for specific interpretive communities. Moreover, to overcome a simplistic, causal understanding of media effects, one needs to focus on how people relate to images in different ways. This is why our own and colleagues' earlier work has argued that to study social media visibility, one needs to take seriously what people are doing, saying, and feeling in, on, and with visual content – e.g. their practices, focusing specifically on social media social practices and social media visual practices. Not every research design is well suited for that. Moreover, to make sense of social media visibility, then, we need to find ways of both aggregating and integrating conceptual frameworks used in different fields – classic visual studies concepts regarding negotiated interpretations, indexicality, representation, and intertextuality continue to be relevant, but intersect with notions of platform vernaculars, socio-technical affordances, attention economies, and algorithmic imaginaries. We propose a large-scale ethnographic approach called aggregated auto-ethnography for making sense of socially mediated visual vernaculars, practices, norms, and the messy flows they are enacted and experienced in. The approach starts from guided auto-ethnographies, which empower participants to explore their own experiences and build thick descriptions. Participants are trained in documenting their own visual and digital practices, collect digital visual material, and record their perspectives and reflections. This form of data collection generates particularly rich data, as it is able to capture visual materials as well as their perception, and the perspectives and reflections of the participants. The paper will focus on the practical realisation of the method in the European project 'TRAVIS: Trust and Visuality – Everyday digital practices'. Based on examples from our data, we will illustrate how aggregated auto-ethnographies provide incredibly rich insights, which enable the kind of granularity and nuance otherwise difficult to attain in researching visual practices.

VIS03 Visual trust practices on social media

PN 116 Contested body images on social media

[Maria Schreiber](#)¹

¹ University of Salzburg, Department of Communication, Salzburg, Austria

While the impact of body images on individual wellbeing and social norms is one of the classic topics of media and communication research, the entanglement of these images with different platform infrastructures and logics has not yet been under much scrutiny. Building on the context and data of the European research project 'TRAVIS: Trust and Visuality – Everyday digital practices', our paper will focus on different ways of how students (18–25 years old) relate to body images in the context of health and fitness practices on heavily visual platforms like YouTube and Instagram. To reconstruct their practices and imaginaries, we build on aggregated auto-ethnographies. This

approach is an innovative method designed by Annette Markham (2012) and developed in collaboration with Katrin Tiidenberg (Tiidenberg et al. 2017) wherein students are taught to become the auto-ethnographers of their own social media experience and they (voluntarily and with consent) share the materials they generate with the researchers. This participatory pedagogical method is unequivocally empowering for the participants and incredibly rich and thick for the researchers. Building on these auto-ethnographic accounts, we focused on the students' use and perception of body images. In this paper, we are specifically interested in observations where users describe or frame body images as not trustworthy, manipulated, inauthentic etc. We will outline how users derive the authenticity and trustworthiness of images through different strategies and literacies, e.g. looking for visual markers of manipulation and filters (like weirdly shaped extremities or flawless skin) or consulting the comment section for other users' critiques and judgements. We will map these trust practices across our data and discuss their relations with specific platforms, but also gendered dynamics and creator cultures. Moreover, findings from our pilot study show that users are irritated or even annoyed by content creators who exhibit normatively beautiful bodies and then bandwagon on 'body positivity' trends. These visual brand disruptions tend to decrease trust and fail parasocial relationships.

VIS05 Understanding visual truths in the contemporary media landscape

PN 142 Classifying, making, and presenting "visual truths": observations from newsrooms

Jenni Mäenpää¹, Liudmila Voronova², Patrik Åker³

¹ Tampere University, Communication Sciences, Tampere, Finland

² Södertörn University, Journalism, Stockholm, Sweden

³ Södertörn University, Media and Communication Studies, Stockholm, Sweden

This paper highlights some preliminary observations about how visuals are used in Swedish, Finnish and Russian journalism (the latter – in exile newsrooms), in order to make truth claims about the world. The aim of the study is to understand how visual professionals at news organisations classify, make, and present photographs as part of the broader context of visual journalism. By focusing on the three contexts (two similar, one very different) within the Baltic Sea region, we aim to contextualize the visual production processes and trace the relations between the surrounding context and the professionals' interpretations of visual truth. The war in Ukraine has intensified the struggles for what is to be understood as (visual) truth, and, when it comes to Russian independent journalism, has also signified a shift in journalistic values: Objectivity ideal that formerly had been seen as a building stone of independent journalism has been reviewed and reconceptualized. This opens for an important comparison between how (visual) truth and objectivity are linked and inter-related by visual media professionals located in democratic European countries, but using different types of platforms to reach out to their users, and belonging to different types of media organisations and media systems. Visual professionals include photographers, photo editors, photo department managers, layout editors, and others involved in negotiating visual truths in the newsroom. The intention is to focus on the interaction between and among the visual professionals and the rest of the newsroom and their technological environment, and explore how their work is shaped by different news media platforms and their own experiences. Of interest is also what, and how, the visual professionals know about their users and how that influences their visual practices. While the main focus is on photographs, they are understood in relation to other visuals, texts, and also visual design. The study approaches visual producers as interpretative communities. The focus on visual professionals' interpretations of visual truth and the degree of reflexivity in finding ways of presenting visuals is an underdeveloped area in studies about media. The study focuses on three distinct but interrelated aspects: 1) "Classifying visual truths" highlights the negotiations around categorisation of photographs, 2) "Making visual truths" focuses on the collectively negotiated interpretive repertoires around making visuals, and 3) "Presenting visual truths" focuses on if, and how, the technological, journalistic and cultural context forces visual professionals to reflect upon forms of presenting visual material so it can be used as a trustworthy and usable resource for their users. Methodologically, the study takes departure from participant observations at 1–2 newsrooms in each of the contexts that are accompanied by qualitative interviews with the identified key actors within these newsrooms.

VIS05 Understanding visual truths in the contemporary media landscape

PN 143 The media forensic production of visual evidence at the International Criminal Court

Kari Andén-Papadopoulos¹

¹ The Institute for Future Studies, The Institute for Future Studies, Stockholm, Sweden

This paper considers the recent turn towards media forensic practices and use of open-source imagery and video footage as evidence in international criminal investigations and prosecutions, with a specific focus on recent cases before the International Criminal Court. Based on an ethnographic study, which includes 15 semi-structured interviews with key actors in this legal field of practice it explores how the ICC is harnessing new image technologies and advancements in computing power to both reassess and reassert the status of video as usable evidence in human rights litigations. Since 2016, open-source information derived from the internet, especially eyewitness video

footage, has increasingly been relied upon as lead information or direct evidence in international and domestic courts. At the ICC, which has been posed as the leading forum for testing and advancing the use of open-source materials and methods for human rights legal practice, the Al-Mahdi (2016) and Al-Werfalli (2017) trials reflect a paradigmatic shift towards cases in which the crimes themselves have been caught on camera and where social media-derived eyewitness imagery may be admitted as direct evidence at trial. As the wish to and urgency of using digital eyewitness images as evidence in international criminal trials grows, courts and investigative mechanisms must develop contemporary criteria for weighing the admissibility, reliability, and probative value of this material. This paper looks at ways in which digital open-source imagery and new media forensic technologies and techniques are being incorporated into and transforming the work practices of the ICC and how, in the process, the status of video as evidence of the real is reasserted – even as it is synthetically produced and reconfigured by the redeployment of video into larger assemblages of non-linear, extensive image-data complexes. If digital imaging technologies has brought on a crisis of photographic referentiality, we must also consider how they open possibilities for creating new kinds of documentary evidence and for laying newly vested claims to the truth of visual media – and what the significance of this is for the pursuit of legal accountability and the broader battle over truth in what is often termed a “post-truth” era.

VIS05 Understanding visual truths in the contemporary media landscape

PN 144 Real or rendered? Ethical implications of using AI-imagery in journalism

[Rebecca Bengtsson Lundin](#)¹

¹ Umeå University, the Department of Culture and Media Studies, Umeå, Sweden

In news contexts, photographs are used to visualise news reporting and thus, they represent, and serve as witness to events taking place in the world, carry symbolic meaning, are products of technologies mediated by human action, exist in an economy of images, and can be afforded agency on their own. Furthermore, photographs have long played an authenticating role in news, likely due to their perceived ability to capture the ‘real’. Given journalism’s significant influence on shaping people’s social imaginaries, what news media pay attention to and how they do so, is important for how people perceive reality. Technologies play a pivotal role in reproducing and recirculating news images, holding considerable material, symbolic, social and cultural implications. Towards the end of 2022 and in the first months of 2023, platforms enabling AI-images became widely available and became everyday tools for creating realistic images based on written prompts. Despite the prevailing belief in the neutrality and impartiality of AI technology in public discourse, studies have found that the dataset from which these platforms derive data have been found to contain racist, misogynist and otherwise harmful stereotypes. AI is understood as not only a technology, but as a (potential novel) media form that depends on technology, social and cultural developments as well as various practices. As AI-technology facilitates the production of photo-like imagery that can pass for photographs, this paper specifically explores the potential and risks associated with the use (and republishing) of AI-imagery in journalism in relation to journalism ethics, visual truth, and the ability of images to shape social imaginaries. One overarching research question is addressed: What type of AI-imagery is used in news media and in what contexts is it published? Here, I examine where, when, how, by whom and for what purpose specific AI-imagery is used in the news and further explore what ethical implications this potentially have for journalistic credibility. The study includes material from 10 Swedish newspapers: DN, Aftonbladet, Expressen, Svenska Dagbladet, D1, Göteborgs-Posten, Sydsvenskan, HD, UNT and Östgöta Correspondenten. The data includes AI-imagery created by journalists as well as imagery produced by external actors and reproduced in news stories. Through an in-depth visual analysis I map how AI-imagery is conceptualised, attributed and circulated in these news outlets. Additionally, the study includes interviews with visual journalists. With the digitalisation of news and the evolving media landscape over the past two decades, new challenges, including fake news and deepfakes and more recently, the use of AI-generated texts and images, have emerged. While the use of AI-produced texts in the news (e.g., for sports results) has been studied for some time, less focus has been given to journalistic use of imagery produced by AI tools (i.e., Midjourney, DALL-E). Through this paper, I aim to contribute to a renewed discussion on the role, significance, and ethical implications of AI-imagery in relation to journalism and visual truths.

VIS05 Understanding visual truths in the contemporary media landscape

PN 145 Realism, authorship, and value in contemporary news & documentary photography

[Marco Solaroli](#)¹

¹ University of Bologna, Department of the Arts, Bologna, Italy

Since its inception, photography has revealed constitutive tensions and generated intellectual debates dealing with the various positions existing within a hypothetical theoretical continuum whose extreme poles are represented by the notions of “realism” and “expressionism” – that is, photography as a mechanical, objective, detached and scientific form of reproduction vs. a form of aesthetic expression and subjective interpretation of reality. In the journalistic field, such a double nature of photography has complexly defined both the profession and the scholarly work. On

the one hand, the journalistic field is founded on the socially constructed professional value of news objectivity, in which the largely perceived-as-factual dimension of photography clearly plays a fitting role. On the other hand, as a constitutively multi-dimensional and polysemous cultural object, and heterogeneous social practice, photography embeds also an expressive, emotional, creatively and subjectively articulated side, thus referring to cultural questions of crafting skills, style, taste, symbolic distinction and even artistic ambition – all of which can complicate and exceed the tasks that photography is assumed to fulfill within the journalistic field, providing at the same time room for innovation in the professional practice. Since the early 2000s, together with the disruptive impact of digital technology and the loss of salaried jobs with the restriction of the editorial market, such a tension has constituted a fertile ground in which to analyze the changing nature of contemporary photojournalism and documentary photography. This paper presents the results of a research project on the process of social construction and institutional recognition of the status of author in the international professional field of journalistic and documentary photography in the first two decades of the twenty-first century. The paper offers a critical historical reconstruction of major ways in which the notion of photographic realism has been framed in the professional discourse and practice. It focuses on a number of examples of highly established news photographers who have creatively and strategically adapted to a rapidly shifting technological and professional scenario by renewing traditional practices of production and representational forms, and by articulating recognizably distinctive aesthetics with subjective implications. In particular, it analyzes the institutional role played by the World Press Photo awards in consecrating practices and forms of visual authorship, and in framing visual subjectivity and expressive realism as organizing principles and discursive resources increasingly contributing to shape the practice of production and the hierarchy of symbolic value of photojournalism. On this basis, the papers aims to shed light on shifting practices and styles that negotiate the dichotomous tensions opposing objectivity and subjectivity, as well as on emerging repertoires of professional values that enrich visual news objectivity and newsworthiness with trustworthiness and affect. In methodological terms, the paper draws upon qualitative analysis of two research archives (2001–2021): the first one of photojournalistic representations of major global events on various international newsmagazines; the second one of all the photographs winning World Press Photo awards. The archival analysis is integrated by in-depth interviews with international photojournalists, photo editors, and jury members of press photo awards.

VIS06 Representations of bodies and spaces

PP 1077 'Pussy power not coal power!': Female participation and visual forms of activism in the school strikes for climate protests

Michelle Catanzaro¹, Judith Bessant²

¹ Western Sydney University, Design – in school of Humanities and Communication Arts, Sydney, Australia

² RMIT, Global – Urban & Social Studies, Victoria, Australia

Since 2018 millions of students around the world have taken to the streets calling for urgent action on global warming. Australian young people have initiated and led movements like the School Strike 4 Climate with an estimated 500,000 school students participating in protest around the country (Hilder & Collin, 2022). Significantly girls and young women have a dominant presence at these strikes, with a large number leading the movement, assuming centre stage as speakers and organisers (Bessant, 2022).

This presentation begins by observing how girls and young women are highly visible in the contemporary climate movement. For many young women, the protests are a unique space for their political voice, including messages delivered through signs and placards carrying diverse images, words, slogan and metaphor. Signs and placards are deliberately made to be read by a public audience, including peers, politicians, and policy makers. We note that a prominent feature in the placards (which the girls and young women make and take to the protests) is their use of historic, iconic feminist imagery and language. This article documents the renewed use of these 'vintage' feminist symbols and texts that include eg 'earth as mother, goddess, Gaia, the world war 2 'we can do it' poster, women's liberation and suffragettes icons, and more recent 'pussy riot' and body autonomy references.

Drawing on our own extensive portfolio of photographs of the signs made by girls and young women which they use to communicate feminist politics at the Australian School Strikes for Climate movement we ask two questions: How have vintage feminist icons been variously retro fitted, revised and remixed in contemporary settings to communicate political messages about climate change?

What does this signify, if anything, about contemporary feminist politics?

Bessant, J. (2022). Young Women, Gender, and the Future of Political Participation.

VIS06 Representations of bodies and spaces

PP 1078 "Realities" of Dating: Visual representation of romantic love in Korean dating reality shows

[Kwangho Lee](#)¹, [Jinah Lee](#)²

¹ Keio University, Faculty of Letters, Tokyo, Japan

² Keio University, Institute for Journalism- Media and Communication Studies, Tokyo, Japan

The surge in unmarried and non-married populations, coupled with a record-low birth rate in South Korea, has been predominantly attributed to economic factors, including dwindling formal employment opportunities, youth poverty, and escalating childcare costs, as well as broader social conditions such as heightened competition and expanding inequality. However, scant attention has been given to the potential role of evolving attitudes toward love, marriage, childbirth, child-rearing, and divorce in contributing to or exacerbating these societal challenges. Focusing on the attitudes of young individuals, particularly those in their teens to 30s, towards love and marriage, this study endeavors to discern the interplay between these attitudes and prevailing social issues. Of particular interest is the impact of dating reality shows, which enjoy significant popularity, on shaping the perceptions of romantic love among the youth. To establish a connection between the viewing of dating reality shows and the perception of romantic love, this research initiates its analysis by delving into the portrayal of romantic reality within these shows. Employing the analytical frameworks of semiotics, sociolinguistics, and cultural studies, we scrutinize the visual expressions, narratives, and production techniques of a highly-rated dating reality show, namely, "Heart Signal 4," broadcast on Channel A in 2023. Our findings underscore the show's emphasis on love games played by physically attractive and fashionable individuals, while overlooking the practical challenges associated with dating. The show constructs a visually appealing dating space, comprising a luxurious house, trendy restaurants, scenic spots, and amusement parks, reinforcing the romantic illusion of dating with an aesthetic standard that aligns with fashionable visual expressions. The presented romantic love ideology on the show promotes an upper middle-class norm characterized by love detached from marital expectations, partner selection driven solely by individual preferences, and a focus on infatuation as the sole determinant of relationship authenticity. Further research is needed to determine how such representations of romantic reality affect viewers. However, if the portrayed ideals of dating, which are only "illusions" for many young people in Korean society, are presented as if they are achievable "realities", viewers may persist in pursuing partners until these illusions materialize. This pursuit, when faced with the inevitable disparity between fantasy and reality, may lead to frustration, abandonment, and confusion within the realm of unattainable love. Considering the diversity in representations of romantic reality across different shows, future research should extend its analysis to include a broader spectrum of dating reality shows. Additionally, understanding the viewership patterns and preferences for specific program types will be crucial in comprehending the nuanced impact of these shows on young people's perceptions of romantic love in South Korea. Furthermore, given the transnational consumption of dating reality shows through platforms like Netflix, it becomes imperative to consider the far-reaching implications of these shows beyond the confines of their country of production, extending their influence into diverse cultural contexts.

VIS06 Representations of bodies and spaces

PP 1079 Imagining urban spaces: How Google Images and visual generative AI represent the city of the future

[Cornelia Brantner](#)¹, [Joan Ramon Rodriguez-Amat](#)², [Joanne Kuai](#)¹

¹ Karlstad University, Department of Geography - Media and Communication, Karlstad, Sweden

² Sheffield Hallam University, Department of Culture and Media, Sheffield, United Kingdom

Cities are not only the places we live in; they are also spaces we imagine. Analyzing cities as projections, as "socio-technical imaginaries" (Jasonoff & Kim, 2015), has evolved from ideologically charged material representations driven by revolutionary ideals (Stibbe, 2023) to digitally mediated spaces challenging geographers' city conceptions, urging recognition of urban posthuman agency's diversity (Rose, 2017); and building complex and contested representations of communicative spaces (Anonymized). Factoring into the mesh of encountered representations of the city, artificial intelligence (AI) in its visual generative forms has evolved to become still another voice in the projections of the cities of the future. Prior studies on city representations have indicated that search engines, notably the quasi-monopolist Google Images, tend to simplify, commercialize, and homogenize city views, prioritizing one-dimensional perspectives over showcasing the social and cultural diversity of cities and urban spaces (Anonymized). Therefore, it is pertinent to continue with this line of inquiry by exploring how the Google Images search engine and visual generative AI (e.g., Midjourney, DALL-E) contribute to and interact in shaping the representation of cities' future and discern the specific perspectives they tend to favor. This project delves into the implications of visual representations of city futures provided by the Google Images search engine and various visual generative AI tools for selected cities and the city of the future in general. The methodology adopts a mixed-methods approach, combining digital-computational tools with interpretive iconographic-iconological techniques. This perspective aims to capture the projections of the future of the cities, analyze and compare the

resulting images, and identify the actors, perspectives, and social, political, and ecological representations shaping these visions. The findings presented revolve around a dual inquiry: 1) an investigation into the roles and implications of the Google algorithm and visual generative AI in ranking and prioritizing certain visions over others, and 2) an exploration of the available representations of urban spaces projected into the future, including their features and aspects related to communicative spaces research.

VIS06 Representations of bodies and spaces

PP 1080 Ambiguities of the prayer gesture in the public sphere. A cultural exploration of meanings, uses, and intentions in Western visuality

Mercedes Burgos-Martínez¹

¹ Universitat Jaume I. History- Geography and Art Department, Castellón de la Plana, Spain

In 2016 Pope Francis, known as @Franciscus on Instagram, asked its virtual followers to pray for him. This sacred demand was enforced by a picture of Francis in prayer attitude. Two years before, the Canadian rapper Drake had launched his album *If You're Reading This It's Too Late* (OVO Sound/Cash Money Records/Young Money Entertainment/Universal Records, 2015). The illustration of the cover was the naïve writing of the title, and at the bottom two hands in prayer attitude with a number 6. Drake's illustration of the folded hands copies the drawing by Albrecht Dürer in 1508 (*Praying Hands*, The Albertina Museum, Vienna). If we analyse the gesture in both examples, it has different meanings. While Franciscus is making a plea for his role as Vicar of Christ, Drake has changed the rhetorical intentions of *Praying hands* to mean "sorry". This ambiguity of meaning is characteristic of our transcultural world, which translates into the use of the same gesture in Asia, with the Indian *Añjali Mudrā* or the Japanese *Itadakimasu*, and in Western Europe with the gesture of prayer. We can find the simplest example of this complex linguistic use of gestures as a non-verbal form of communication in the folded hands emoji. Which, according to its original definition, means "please or thank you or praying hands" (Bai et al., 2019: 7).

Gestures play a key role in Western Visuality. Art historians such as Moshe Barasch studied the language of gestures in Giotto's production. He defined some conventional gestures as symbolic acts that emerge in certain historical periods, and are often specific to one culture, and therefore unintelligible to another (Barash, 1999: 12). This idea was exposed by other scholars, such as Erwin Panofsky, Aby Warburg, Ernst Gombrich and Gerhart Ladner. All of them were influenced by each other and followed the iconological approach to visual culture.

This paper aims to study the ambiguity of meanings -or the (dis)order- of the gesture of prayer in Western visuality and their ideological uses. Inasmuch as its sacred use related to Christianity has been stripped of its original meanings and hybridised with Asian influences. This (dis)order is exploited in the public sphere, and the need to analyse seemingly banal images of politicians, athletes, or celebrities transmitted through newspapers or propaganda is necessary for a correct understanding of contemporary visuality. Hence, we are going to base our analysis on Panofsky's term *pseudomorphosis*, which we understand as the reuse of forms and gestures with a resignification of their meanings and connotations (1964), and the method of Warburg's *Mnemosyne* (1929) based on the survival and transformation of certain symbols and themes throughout history, emphasizing the interconnectedness of cultures and the persistence of visual elements.

VIS06 Representations of bodies and spaces

PP 1081 The empty city during the COVID-19 pandemic as an 'hyperobjectual' becoming of the visual motif: An inquiry into saturated aesthetics

Juan M. Pardo¹

¹ Universitat Pompeu Fabra, Department of Communication, Barcelona, Spain

During the first compasses of the pandemic, an image often imagined but rarely seen was omnipresent: that of the empty city. The intense fascination of media with this iconographic irruption evoked the photogenic qualities that the urban space apparently lacking human activity has. It was an image sought by photojournalists that recalled the unearthliness of early photography, metaphysical painting, surrealism, science-fiction literature or apocalyptic cinema, serial television and video games. This artistic lineage allows to typify it as a Visual Motif (Balló & Salvadó, 2023). The empty city retains its aura of enigma, but it also suffers a mutation in its transposition to the public sphere by the haunting of an Hyperobject: COVID-19, a zoonotic occurrence caused by the climate crisis and, ultimately, global capitalism (De Vogli, 2023).

Due to hyperobjects' space-time magnitude being so vast relative to humanity, their existence is deeply uncanny: they can only be felt locally and intimately, as they adhere their presence to smaller entities; their phased totality remains inaccessible, generating a profound sense of unreality; and yet, they are (Morton, 2013). There is a direct link between their attributes and how the empty city has historically been represented (Yablon, 2020): both are marked by the nightmarish. If pre-pandemic images portrayed subconscious fears through urban absence, rendering newly visible an otherworldly non-appearance (Jaffé, 1995), pandemic images were inspired by the art of the past to mediate an actually altered reality, whose spectral weirdness was inscribed on the ultimately measurable reverberations of the Anthropocene. By concentrating the presence and effects of COVID-19 into the empty city's depiction, the latter developed a unitary, saturated aesthetics (Marion, 2002) whose imagery is both catastrophic and dreamy. In this way, the visual motif may turn 'hyperobjectual' phenomena iconic.

Since space, as a socially generated and historically situated product that allows for a symbolic embodiment of everyday life (Lefebvre, 2013), is often created through image-making (Lynch, 1960), then the visual motif may serve as an effective cognitive map to navigate the urban: a mediation of late capitalism, whose diseased emptiness reflects a displacement towards the ruinous (Pohl, 2022). If each society produces its own space, the empty city is an eloquent expression of the pandemic age' aesthetic field. But a paradox lingers: the confined metropolis was not uninhabited at all, it only appeared to be so. There was no extinction event, as consumerism prevailed. Population stratified in those forced to remain outside risking infection and those quarantined, while the urban was transferred to a Fourth Space (Hardegger, 2022), colonizing home via digital interfaces in which work and leisure intermingled. This withdrawal from the tangible uncovered a dynamic of exteriority and interiority in COVID-19 imagery.

This communication aims at describing the pandemic drift of the empty city visual motif, analyzing its journey from surrealist-apocalyptic metaphysics to 'hyperobjectual' immanence, and at showing how, through representation, it might be able to render visible the invisible: the end of the world, brought about by global capitalism through the climate crisis that originated COVID-19.

AEM01 Worlds shaped by affect, emotion and media: Everyday life, news, and conflict

PP 0134 Boredom, young people and everyday media practice in digital life

[Martin Danielsson](#)¹

¹ Halmstad University, School of Health and Welfare, Halmstad, Sweden

This paper explores and exemplifies the complex interplay between boredom and media practice in the everyday life of young people in Sweden. Being bored is a fundamental aspect of youth culture and experience, as well as a common theme in the narratives and imageries of youth popular culture. Yet the issue of boredom remains inexplicably underexplored in both youth cultural studies and media and audience research. Though boredom has long been acknowledged as an integral part of the lived realities of young people (Corrigan, 1979; Willis, 1977), including their everyday media practices (Hjort & Richardson, 2009; Livingstone, 2002), boredom is rarely the main analytic focus, and it generally tends to be taken for granted rather than explored in-depth. At the same time, the last couple of years has seen the emergence of a new multidisciplinary research field called "boredom studies" (Gardiner & Haladyn 2017), dealing explicitly with the many facets of boredom, but apart from Paasonen's (2021) ambitious treatment of the relationship between media and boredom there has so far been little exchange between boredom scholars and media scholars.

Theorizing boredom as a socially constructed emotion (Thoits, 1989) emanating from perceived lack of meaningfulness (Barbalet, 1999), this paper puts the boredom in young people's lives at the center of analytic attention and explores the ways in which their media practices both relieve and reinforce emotional experiences of boredom in digital life. Taking inspiration from media ethnography and drawing on original empirical material from in-depth qualitative interviews with four Swedish university students (18–20 years old), the paper sets out to revive boredom as an issue in the study of youth culture and everyday media practice. By showing how emotional experiences of boredom are always embedded and shaped in everyday life contexts and situations, intersected with other emotions such as loneliness, and actively regulated through a variety of both media and non-media practices, it also makes a much-needed empirical contribution to the growing body of mainly theoretical literature on the relationship between boredom and digital media (Hand, 2017; Kendall, 2018; Paasonen, 2021).

AEM01 Worlds shaped by affect, emotion and media: Everyday life, news, and conflict

PP 0135 (Un)doing intimacy. Emotions and the technological infrastructure of patchwork families

[Miroslaw Filiciak](#)¹

¹ SWPS University, Department of Cultural and Media Studies, Warsaw, Poland

For years, we have been observing the phenomenon of the progressive emotionalisation of the Internet, that is, the development of services that not only enter the most intimate spaces of our lives, but also feed on the affectations of users, making them a source of revenue for service providers. Much of the research in this space, however, is devoted either to politically motivated conflicts between people who are strangers to each other or connected by weak ties – as these disputes then play out online – or to building new intimate relationships, for example using dating apps. I want to lean into a topic where love and aversion come together, with much of the communication taking place through various media channels.

My submission is the result of an ethnographic research project on the use of smartphones in a large Polish city, more specifically a case study focused on women from patchwork families with shared childcare, involving meetings with 30 people. It is a space with a large role for technology, which is essential for the logistical coordination of

the functioning of a dispersed family, but also an emotionally dense space. Children, family, old and new partners communicate with each other at a distance, because most of the time they do not share a physical space. Their communication is loaded with different emotions, including grief, resentment and new hopes. However, my interviewees are not only operating at a distance, they are also operating on a timeline: they are grappling with pre-break-up 'memories' archived on social media and performing the opposite process to displaying intimacy – actively forgetting and actually not only doing (new) intimacies, while planning their future, but also undoing (old) intimacy. The platform for all these activities and tensions is smartphones, its apps, continuous Internet connectivity and geolocation services, which allow – and sometimes even force – users to modify their behaviours and develop a range of new ones.

After the pilot interviews, men were excluded from the sample: it turned out that in a patriarchal society their level of logistical and emotional work is much lower, and some of them do not reflect at all on the fact that someone is doing these activities, that things do not happen by themselves.

The presentation will explore the emotional dynamics in the study group and their relationship to the infrastructure of intimacy understood as the applications used for patchwork contact. I will also share my thoughts on the challenges of conducting research in an area that is so difficult from an emotional perspective.

AEM01 Worlds shaped by affect, emotion and media: Everyday life, news, and conflict

PP 0136 Emotional communities in the journalistic age: Establishment of feeling rules by and within the field of journalism

Dominik Hokamp¹, Melanie Haberl¹, Folker Hanusch¹, Lenka Waschková Císařová²

¹ University of Vienna, Department of Communication, Vienna, Austria

² Masaryk University, Department of Media Studies and Journalism, Brno, Czech Republic

Journalism's relationship with emotion is an uneasy one: While research has shown how emotion structures news-making processes and journalistic narratives (Wahl-Jorgensen, 2020), perceptions of "neutrality, objectivity and detachment" (Kotissova, 2020, p. 1713) are still prevalent within the profession. Journalists are thus entangled between normative expectations and their own emotional experiences (Lünenborg & Medeiros, 2021). Most research on those "feeling rules" (Hochschild 1979) focuses on journalists' emotional management. Our study however investigates how feeling rules are constituted and (re-)negotiated by the journalistic field in the first place, and how they establish sub-groups, contradictions, and boundaries within the field.

Feeling rules can be established from within a group but also can be imposed upon a group – the latter Reddy (2001) names an "emotional regime". Here, however, we focus on the bottom-up constitution of feeling rules that Rosenwein (2006) defines as an "emotional community" – dynamic groups of people who share similar emotional values, norms, and expressions. *Emotional communities* are constructed but also made identifiable by repeated patterns of 'emotion words' (Plamper, 2010) or other emotional expressions (Verheyen, 2010). Within each *emotional community* exists a specific emotional repertoire guiding how individuals experience and express their emotions (Scheer, 2012). Journalists may be part of conflicting *emotional communities* having to manage contradictions between established emotional norms and actual emotional practices. They might also create something that we call 'imagined emotional community': By attributing feeling rules to others, they anticipate the emotional practices of e.g. audience communities and adapt their own feeling rules accordingly. Focusing on the in-group negotiation process of feeling rules advances a deeper understanding of the role emotions play in everyday journalistic work life.

Data will be based on two waves of reconstructive, semi-structured interviews with 20 journalists each from Austria and the Czech Republic in the first half of 2024. Using a comparative and longitudinal approach allows us to capture the temporal and spatial aspects of emotional practice. By applying Rosenwein's concept of *emotional communities*, we can better conceptualize their contradicting nature within the journalistic profession, but also the implications of conflicting feeling rules for journalists themselves. Feeling rules are inherently shaped by normative expectations of other (imagined) *emotional communities*, and our study helps to better understand their influence on journalistic production. Shifting the focus from how journalists perceive professional feeling rules to how they constitute and (re-)negotiate them will offer novel insights into their everyday emotional practices.

AEM01 Worlds shaped by affect, emotion and media: Everyday life, news, and conflict

PP 0137 Local conflict journalists making news: Audience responses to the coverage of Motaz Hilal Azaiza and Wael Al-Dahdouh in the Gaza Conflict

[Josephine Lehaff](#)¹

¹ University of Groningen, Media and Journalism Studies, Groningen, Netherlands

In the wake of the Israel-Gaza conflict, Gazan journalists have stepped to the fore, making headlines in the very stories on which they have been reporting. The importance of local Gazan journalists has been all the more significant given the restrictions on entry to Gaza for foreign correspondents. Two journalists in particular, Motaz Hilal Azaiza and Wael Al-Dahdouh, have become emblematic figures of Gazan journalism, in part for their on-the-ground reporting from the Gaza Strip as it has been under bombardment, in part for the consistency of this work in an area where the threat to journalists has been particularly heightened, and in part for the massive personal losses they have suffered during their labor. Motaz Hilal Azaiza, "The Eye of Gaza", is a 24-year-old photojournalist for the UNRWA. Wael Al-Dahdouh, "The Mountain", is bureau chief for Al-Jazeera in Gaza City. Whereas proximity to danger is a condition of conflict journalism, the death toll among journalists in Gaza has been the highest since the International Federation of Journalists (IFJ) began recording conflict deaths of journalists, and the personal losses suffered by both journalists have made the imminent danger to their persons all the more apparent. Their personal losses have also meant that these journalists are being viewed in a particular light by their audiences. In this light, the outsourcing of emotion to affected parties, typical of the strategic ritual of emotionality practiced by journalists and expected by audiences, has been made not only wholly unnecessary, but virtually impossible. Audiences abroad have been privy to the personal grief of both men alongside their reports, raising an important question about the quality of their reception: how do audiences respond to journalism when journalists become the story? Analyzing comments on Twitter/X and Instagram, in this paper I set out to illuminate the responses of international audiences to the reportages and testimonies of Gazan journalists Motaz Hilal Azaiza and Wael Al-Dahdouh during the Israel-Gaza conflict. Theoretically, the paper draws on strategic rituals of emotionality (Wahl-Jorgensen, 2013) and emotional regimes (Pantti & Wahl-Jorgensen, 2011) as these pertain to the journalistic audiences who receive and react to the reports of these Gazan journalists.

PP 0138 Emotive means and disinformation: Analyzing linguistic emotionalization strategies on Twitter in the context of the Reichstag Occupation and Capitol Storming

[Eva-Marie Neugebauer](#)¹

¹ University of Tübingen, Institute of Media Studies, Tübingen, Germany

The occupation of the Reichstag steps in Germany in August 2020 and the storming of the US Capitol in January 2021 have underscored the escalating threat posed by the spread of disinformation through social networks, affecting democracy, the political system, and the public sphere. Members of extremist groups, deeply embedded in disinformation channels, attempted to storm public government buildings. To effectively counteract the spread of disinformation, it is vital to understand the mechanisms of emotional influence in social networks and messaging services. Emotionalization plays a key role in how information is consumed, shared, and perceived in these networks. This study focuses specifically on linguistic emotionalization strategies employed in disinformation messages on Twitter, a platform of considerable influence in digital communication. Notably, Twitter has been instrumental in disseminating disinformation, particularly during the occupation of the Reichstag steps and the storming of the US Capitol. Our analysis is framed within the context of these pivotal events. We introduce an approach, that uniquely combines qualitative content analysis with an emotion-linguistic categorization system, addressing a notable underrepresentation of linguistic analysis in examining emotive means within social networks. We applied a multi-layered qualitative analysis model, featuring four primary categories of linguistic emotionalization: typographic, morphologic, pragmatic, and lexical. This approach also included an examination of emotional valences and variations in emotionalization strategies across different themes, which were previously identified in the data set. Throughout the analysis, we observed emotionalization strategies in all four key categories, across all themes, without any topic-specific variation. However, the authors of disinformation tweets avoided emotive means in pseudoscientific arguments or when imitating journalistic styles. The emotionalization strategies were supplemented by persuasive stylistic devices and specific metaphors, such as war and theatre metaphors. Overall, the data set displayed a predominantly negative emotional climate. Our analysis of emotionalization strategies revealed various stylistic devices used by the authors of disinformation tweets in different forms, showing a wide range of emotive techniques and diverse application and contextualization. Ultimately, we found that the expression of emotions acts as a control element to either highlight or trivialize topics.

AGC01 Dynamic dialogues on digitization in later life

PN 001 Older people, ICTs, (post)pandemic: Digital exclusion, resistance and digital services domestication

Simone Carlo¹, Sara Nanetti², Francesco Diodati³

¹ Università Cattolica del Sacro Cuore, Communication and Performing Arts, Milan, Italy

² Università Cattolica del Sacro Cuore, Sociology, Milan, Italy

³ Università del Sacro Cuore, Communication and Performing Arts, Milan, Italy

The emergency of COVID-19 has deeply impacted the digitization of many activities and has particularly contributed to the introduction of digital solutions in welfare services. This rapid (and often imposed) digitalization process has offered the opportunity to new segments of the population to deepen their knowledge of digital tools while other segments have seen an increase in the difficulty of using digital technologies, which are more and more indispensable for everyday life. Older people, particularly affected by the pandemic, have been key players in digital transformation, as seen in the case of video calls in nursing homes and digital solutions adopted for assistance and care support. In particular, the older people, a part of the population which, especially in Italy, is less digitalised than younger cohorts, have had to deal with the sudden digitalisation of relationships and public services. But although it was thought that the pandemic would be able to spread the use of technologies even among those most resistant to innovation, the first data and the first empirical evidence make this hypothesis blurrier. Some studies have underlined that this digital acceleration risks being a transitory push to the digitalization of older people, not capable of reducing the digital divide but rather deepening it, according to the theory of stratification of digital inequalities. Starting from this context, this contribution presents the first results of a longitudinal qualitative study that investigated transformations in daily habits and digital tool usage among a panel of over 65 residents in Italian towns that were among the first affected by the pandemic. The Longitudinal Study on Older People's Quality of Life during the COVID-19 pandemic (ILQA-19) is a longitudinal qualitative study conducted on a purposive sample of 40 men and women aged between 65 and 80 years, residing in ten towns in the rural area of the province of Lodi (Italy) and belonging to the first COVID-19 'Red Zone' in Europe. In line with Goal 9 of the Agenda 2030, on the availability of an Internet connection for all, this contribution highlights how older people have seen their approach to technology transform in recent years and, in particular, what aspects are of greatest interest to older people in the use of digital technologies and what are the major challenges. In particular, the research focuses on the processes of resistance, rejection, and domestication of the use of digital services by older people and the role that social relations play in negotiating access to public services, increasing 'digital by default'. Finally, the research aims to consider not all forms of disconnection, resistance, negotiation in the use of ICT among the older population as forms of digital exclusion (especially in the post-pandemic context) but rather as 'choices' of older people, in a calculation of costs and benefits, utility, opportunity of use of specific media and services.

AGC01 Dynamic dialogues on digitization in later life

PN 002 Investigating the impact of over-helping and under-helping on older adults' digital skills

Viivi Korpela¹, Laura Pajula¹, Riitta Hänninen¹

¹ University of Jyväskylä, Department of Social Sciences and Philosophy, Jyväskylä, Finland

Although digitalization is increasingly pervasive in modern society, certain marginal and societal groups can still encounter challenges in the digital world. Promoting digital inclusion and digital support aims to address these disparities, enabling equal participation in a digital society for individuals of all backgrounds. Regarding this, the quality of digital support emerges as a critical factor in ensuring fair access to digital technologies in a society that is becoming increasingly digitally connected. In this article, we examine the quality and dynamics of informal learning and digital support from the perspective of older adults' subjective experiences. Specifically, we ask (1) what are the key elements of informal learning in the context of older adults' acquisition of digital skills? Based on the first question, we further examine (2) how do the identified key elements of informal learning influence older adults' subjective learning experiences and independent use of digital technologies? Inductive thematic analysis is based on participant-induced elicitation (PIE) interviews (n = 21) carried out in Finland with older adults (aged 65 and over). Our findings suggest that older adults are a heterogeneous group with individual support needs and diverse prior experiences with digital technologies, strongly influenced by their media literacy skills and exposure to various media and communication environments. Second, we argue that even in cases where digital support is available (by e.g., friends and family), it can fall short without promoting independent use or generating subjective experiences of learning. As digital inclusion cannot be achieved only by improving access or availability of digital technologies, it is important to take a deeper look at the skills and knowledge required to operate in the digital society and to navigate different media and communication landscapes effectively. Lastly, our findings suggest that it is necessary to bring forward how informal digital support provided by warm experts can not only enhance but also hinder digital inclusion and independent aging.

AGC01 Dynamic dialogues on digitization in later life

PN 003 Decoding ageism in the digital inclusion debate: A detailed media and interview study

[Cora van Leeuwen](#)¹, An Jacobs¹

¹ VUB Vrije Universiteit Brussel, imec-SMIT, Brussels, Belgium

As ICT use has become an integral part of everyday life, it has also permeated the ageing experience. Research into the media representation of older adults' relationship with ICT still shows a negative stereotypical view on ageing and technology (Köttl et al., 2022; Rasi, 2022; Ivan & Loos, 2023). The influence of this view on older people has been reflected in research on stereotype threat (Barber, 2017) and the embodiment of stereotypes (Levy, 2009). This research examines how media typification of ageing and technology influence the older individuals' narratives of digital inclusion in Flanders, Belgium. To enable this comparison, the media typification was determined by conducting a qualitative content analysis of Dutch-language newspaper (Dutch and Belgian) articles (N= 281). Selected articles: 1) discussed digital inclusion, and 2) were published in the period 2000 to 2020. The analysis resulted in five types, ranging from positive (Digital Fighter, Digital Debutant) to negative types (Old-thus-incompetent, Reluctantly Digital, and Digitally Self-Excluded). This typification constituted the basis for a qualitative analysis of the digital inclusion narratives used by 76 Flemish older adults (aged 65 to 91). The participants had different ICT engagement levels, which resulted in different uses of the types. The disengaged embraced the negative types to defend their disengagement. Thus, they embodied the classic media stereotype, as reflected in their language and tropes. The ICT engaged utilized the negative types to distinguish between their own ageing experience and that of the disengaged. They focus on explaining the differences between their ageing experiences and that of the negative types. Furthermore, the analysis of the digital inclusion narratives resulted in a sixth type of digital inclusion for older adults: the Digital Veteran. This narrative centers on the long history with different ICTs and the enthusiasm to easily engage with ICTs on a daily basis, a positive typification towards digital inclusion. Overall, the five types generated by the media are part of the narratives used by older people to explain their digital inclusion. However, the necessity to create a new type shows that the media only partially reflects the ICT experiences of older people. Barber, S. J. (2017). An examination of age-based stereotype threat about cognitive decline: Implications for stereotype threat research and theory development. *Perspect Psychology Science*, 12(1), 62-90. Ivan, L., & Loos, E. (2023). The marketing of technology products for older people: Evidence of visual ageism. In *Digital Ageism* (pp. 88-115). Routledge. Köttl, H., Tatzler, V. C., & Ayalon, L. (2022). COVID-19 and Everyday ICT Use: The Discursive Construction of Old Age in German Media. *The Gerontologist*. Levy, B. (2009). Stereotype embodiment: A psychosocial approach to aging. *Current Directions in Psychological Science*, 18(6), 332-336. Rasi, P. (2022). AGC01 Dynamic dialogues on digitization in later life

PN 004 AI and aging: What older people want to know

[Kim Sawchuck](#)¹

¹ Concordia University, Department of Communication Studies, Montreal, Canada

The exploration of Artificial Intelligence (AI) in the context of aging populations has become a focal point in recent collaborations between community-based initiatives and organizations dedicated to older people in Montreal. This paper delves into the multifaceted efforts aimed at disseminating information and fostering discussions on AI's implications for the older adults, showcasing how a reciprocal approach based on the co-development of events can effectively lead to knowledge mobilization. How can the co-design of media education with community organization, on different platforms, in different configurations, lead to life-long critical learning about new technologies, such as AI? This paper will discuss the lessons from three recent initiatives. The first, the creation of a local book club composed of older adults who have taken a unique angle to engage with AI – through the lens of science fiction. This unconventional approach provides a creative and speculative space for members to ponder the potential impacts of AI on aging. Through discussions spurred by futuristic narratives, participants explore the intersections of technology and aging, fostering a nuanced understanding that extends beyond traditional informational sessions. The second co-designed collaboration involves a robust community organization boasting over 300 members. Leveraging the power of online webinars, this group has facilitated lively discussions that reach a wide audience, bridging geographical gaps and providing accessibility to a diverse range of older individuals. These webinars serve as a platform for experts to share insights into the intricacies of AI and its relevance to the aging community. The interactive nature of the sessions encourages active participation, ensuring that the discussions remain engaging and tailored to the specific concerns and interests of the attendees. The third example involves a community resource center that invites experts to participate in sessions to delve into emergent issues surrounding AI. The center serves as a meeting ground for older individuals seeking a comprehensive understanding of AI's implications. Through facilitated discussions with experts, participants gain valuable insights into the evolving landscape of AI and its

potential ramifications for their lives. This paper meticulously outlines the key issues and challenges initially identified by the organizers, shedding light on the considerations that prompted these community-based initiatives, and why they suggest strategies for their very different communities of older adults. Furthermore, it examines the perspectives shared by experts and the concerns raised by older participants, who co-construct a critical examination of AI that captures the evolving dialogue on the intersection of AI and aging within Montreal's vibrant but very diverse older community. The collaborative efforts showcased herein exemplify the relevance of bringing in the voices of older adults into meaningful conversations about the transformative impact of AI on their (our) lives.

AGC01 Dynamic dialogues on digitization in later life

PN 005 Life transitions and media transitions: How retirement and widowhood shape media usage in later life

Mireia Fernández-Ardèvol¹, Loredana Ivan²

¹ Universitat Oberta de Catalunya / Open University of Catalonia, Faculty of Information and Communication Sciences, Barcelona, Spain

² SNSPA National University of Political Studies and Public Administration, Communication Department, Bucharest, Romania

Life transitions refer to discrete changes embedded in life trajectories that, planned or not, happen throughout life. Accompanied by shifts in social roles (Levinson 1978, 1997), they constitute biographical ruptures, discontinuities or "turning points." Life transitions shape different aspects of life, including media usage (e.g., Bryan et al. 2016). Yet, studies in this area mainly focus on the instrumental role of media in supporting such transitions and, to our knowledge, do not analyze everyday practices and neither employ longitudinal approaches. Besides, most focus on young or middle adulthood and, to a lesser extent, on later life. With a particular focus on retirement and widowhood –two turning points that particularly shape later life – our main research question is: How do life transitions shape media usage in later life? To answer it, we took a dynamic longitudinal perspective, which is essential in studying transitions (George, 1993). We relied on a four waves survey-based panel conducted in Romania between 2016 and 2023 that involved Internet users aged 60 and over at the beginning of the study. The same 254 participants answered the survey in the four waves –approximately every two years. During the studied period, 25% of the participants widowed and 18% retired. Preliminary results show that, in general, life transitions do not shape the regular usage of traditional media and digital media. However, time devoted to these media increases with life transitions but in different ways. Retirement tends to foster an increase in digital media, whereas widowhood relates more to traditional media, either before or after the Covid-19 pandemic. The difference appears to be justified by socio-economic conditions, meaning that a proper understanding of older audiences and their dynamics need particular, focused research. Whereas results should not be assumed statistically representative, this set of data that spans seven years is valuable in analytical terms and is also unique in communication studies involving later life.

CAS01 Gender perspectives on media (re)presentations of sports

PP 0041 Female professionals in Nordic media sports: Agency and expertise in the changing media environment

Veera Ehr len¹, Riikka Turtiainen²

¹ University of Jyv skyl , Department of Language and Communication Studies, Jyv skyl n yliopisto, Finland

² University of Turku, Faculty of Humanities, Pori, Finland

Sports culture has remained for a considerable time a distinct part of our society, dominated by the laws of hegemonic masculinity and heteronormativity (Adams et al., 2010; McKay et al., 2000). The practices that still affect the field today stem from long-held values and attitudes in sports, whereby, for example, women's sporting activities have been seen as inherently inferior to top-level male sports. This is particularly pronounced in team sports, which are perceived as masculine, and is reflected, for example, in inequalities in the income and media visibility of athletes of different genders.

In this study, we examine the extent to which hegemonic structures are still affecting women's roles in Nordic media sports. The theoretical framework of the study is feminist sports studies, which emphasise intersectionality and gender diversity. In this line of research, the transformation of sports culture is not seen as a linear progressive development, but as a fragmented and complex phenomena that seeks to identify the intersections of multiple differences that influence power relations in sports in any given period (Caudwell, 2011; Hargreaves, 2004; Tredway, 2020). Based on these premises we ask: How do female sports professionals in the Nordic countries perceive and express their agency in the changing media environment?

The data for this study consists of thematic interviews with 20 Finnish female journalists and top-level sports coaches conducted in 2023, and recordings of social media content updates by elite team sport athletes from Nordic countries collected during a one month period in 2022. The digital dataset includes a total of 142 feed updates and 418 stories, compiled using both digital ethnography and automatic recording. The interview data was analysed with the means of applied thematic analysis (Guest et al., 2012), and a framing analysis (Entman, 1993) was carried out of the social media material. Finally, the datasets were triangulated to discover whether there were any cross-cutting themes relating to the perceptions and expressions of women's agency in the sports field.

The analysis revealed that female athletes' social media updates were united by their self-portrayal as serious professional athletes. Compulsion to prove oneself was also a theme that inductively and frequently surfaced from our interview data. Hence, the study shows that female athletes, journalists and coaches are repeatedly forced to showcase their expertise and prove their competence in the field, and at the same time restrictive norms are narrowing the roles available for them. Furthermore, along with the opportunities, the study shows that digitalisation has caused more challenges for female professionals since it has increased the ways of trivialisation and harassment. These topics were reflected both in the content produced by the athletes and in the interviews with female coaches and journalists. Digitalisation has thus both empowered female sports professionals and made the media sports environment even more complex for them. Conclusively, we argue that even in one of the most gender-equal parts of the world, othering attitudes and discourses are constructing a sports culture where there are separate rules and practices for different genders.

CAS01 Gender perspectives on media (re)presentations of sports

PP 0042 What tournament press conferences reveal about gendered media bias in professional tennis

Marko Bachl¹, Dalreen Ramos¹, Jo-Ju Kao¹

¹ Freie Universit t Berlin, Institute for Media and Communication Studies, Berlin, Germany

Gender disparities are a pressing issue in professional sports. Compared to their male counterparts, female athletes are subjected to worse conditions, paid less, and receive unequal recognition. Media coverage reflects and is partly responsible for these disparities. Women athletes receive less media attention and are more frequently depicted in roles unrelated to their performance.

In the sporting world, professional tennis ostensibly enjoys a reputation for gender equality. The sport has produced male and female (*) global stars. Major championships, such as the four Grand Slam tournaments, include men and women, offer equal prize money, and share public attention. However, glaring disparities, including unequal prize money, have only been reduced in recent years, and many implicit and explicit biases against women persist today.

This context makes professional tennis particularly interesting for studies of gendered media bias. It is not only one of the most-watched sports globally but also a presumed trailblazer for gender equality in sports. Hence, we investigate (1) sports journalists' biases against female tennis players compared to male players and (2) how these biases have changed over the past three decades, 1992-2023.

We do this through the lens of press conferences held at professional tournaments. They provide regular, highly standardized, and mostly unfiltered encounters between journalists and tennis players. Our analysis focuses on journalists' questions and their interactions with the players, advancing other approaches to gender bias detection in two critical ways. Contrary to survey self-reports, we get a glimpse of journalists' revealed preferences and attitudes. Sports coverage, on the other hand, is the product of many individual and organizational actors. A content analysis of press conference questions reduces ambiguity as journalists are solely responsible for their questions.

Our mixed-methods approach integrates computational text analysis of a large corpus (about 30,000 press conferences, 400,000 questions, 1,400 tennis players) with context-aware qualitative analysis. Preliminary findings suggest subtle but notable differences in the journalists' treatment of male and female tennis players. Surprisingly, female athletes received slightly more questions than their male colleagues. However, both quantitative measures of the questions' content and qualitative analyses of notable exchanges indicate persistent biases against female players: for example, more unprofessional questions pertaining to family, parenthood, on-court behavior, fashion, etc. Additional analyses will track how these biases have changed over time. We discuss our findings against the broader societal tapestry in which athletes and journalists are situated through a nuanced exploration of biases across various social identities.

(*) Following the logic of professional tennis, our writing and analysis make the binary distinction between female and male players and define them through membership in the Women's Tennis Association (WTA) or the Association of Tennis Professionals (ATP). We acknowledge that this is a simplification of gender as a social construct.

CAS01 Gender perspectives on media (re)presentations of sports

PP 0043 Sporting inclusion: An examination of the Czech media's approach to football player's Jakub Jankto coming out and the subsequent public reaction

[Ondrej Trunečka](#)¹, Veronika Macková¹, Kateřina Turková¹, Alice Němcová-Tejkalová¹

¹ Charles University in Prague- Faculty of Social Sciences, Institute of Communication Studies and Journalism, Prague, Czech Republic

Historically, sports have been characterized by heteronormativity, creating an environment designed to prevent the "feminization" of men. This configuration of masculinity in sports perpetuates and reproduces gender and sexuality stereotypes (Ayvazo & Sutherland, 2009). In the sports context, there has been a growing recognition and acceptance of LGBTQ+ individuals in recent years (Watt & Elliot, 2019).

This study deals with the coming out of Czech male footballer Jakub Jankto. He revealed his sexuality in February 2023 as the first player in the Czech professional competitions. His decision to talk about it publicly remains a significant exception also on the highest global level, especially during his active career (Justine Fashanu was first in 1990, but with tragic end; most recently Josh Cavallo in 2021, or Jake Daniels in 2022). Jakub Jankto played that time in Sparta Prague; now, he is a midfielder of Cagliari; he also has experiences from Getafe, Sampdoria, Udinese, and Ascoli, and he was a member of the Czech national team too.

The paper analyzes how the Czech environment represented by the media and their audience reacted to his coming out. It examines whether the media representation of this topic follows global trends where sports journalism is moving away from the "toy department" and focusing on non-sporting topics with a social overlap, as Cassidy (2016) proves in the United States in the similar cases of Jason Collins and Michael Sam. The paper also explores the perspectives of sports fans and readers of selected websites and their reactions. The previous research shows that sports fans do describe themselves as tolerant (Walser et al., 2022), but this is not supported by published posts in online discussions, which demonstrate that there are still comments with homophobic, offensive and harmful content (Nabono Martins, 2023).

The sample includes 43 texts published by the leading Czech sports online media (Sport.cz, iSport.cz and iDnes.cz) two weeks after the announcement, which were examined by discursive analysis, and thousands of posts in discussions under articles, which were examined by quantitative content analysis. While the journalistic texts appreciated Jankto's decision and supported him directly in commentaries or through interviews with relevant respondents, the discussions related to these articles contain, besides encouraging posts, more restrained or even critical statuses; some of them were even deleted because they did not respect the standards of the forums.

PP 0044 Championing well-being: An analysis of European sports personalities and the (dis)order of public influence on the youth

Maria Cerga¹

¹ Faculty of Political – Administrative and Communication Sciences at the Babes Bolyai University, German department of Communication – PR and Advertising, Cluj-Napoca, Romania

This article explores how European sports personalities communicate about well-being. Focusing on prominent figures from Denmark, Germany, Spain, Romania, Slovenia, and Italy, the study analyzes the most followed athletes' online presence and its touch with dimensions of well-being. The selected personalities include Caroline Wozniacki (Denmark, Tennis), Toni Kroos (Germany, Football), Sergio Ramos (Spain, Football), Simona Halep (Romania, Tennis), Luka Dončić (Slovenia, Basketball), and Valentino Rossi (Italy, Motorcycling).

The research question is: *In what ways do European sports personalities engage with the concept of well-being in their online communication?* A secondary question is *Are there instances where they contribute to (dis)orderly perceptions among youth followers?* By addressing these, the article aims to shed light on sports personalities, well-being, and potential (dis)orderly influences on the youth.

Each athlete is examined in the context of well-being domains, such as emotional, career, social, financial, and physical. For instance, Caroline Wozniacki's communication, the most followed sportsperson in Denmark, is explored in the context of social well-being, addressing her experiences with injury and divorce. Similarly, Toni Kroos is analyzed for emotional well-being, highlighting the impact of his marriage on his communication. Others like physical well-being, as exemplified by Sergio Ramos, and career, illustrated by Simona Halep, who faced mental health challenges amid a doping scandal. Luka Dončić from Slovenia is scrutinized for his influence on emotional well-being, while Valentino Rossi from Italy is studied for the implications of a tax scandal, reflecting on financial well-being.

The literature review incorporates the Framing Theory, and Source Credibility Theory from an Influencer Marketing perspective, touching with the Health Belief Model. This adds to understanding the dynamics of sports personalities' influence on youth well-being perception. Ethical considerations in the realm of public influence from an Image Transfer point of view are also explored.

The qualitative analysis involves focus groups to analyze the nuances of the athletes' online presence and its impact. Quantitative methods include measuring social media engagement to assess the reach of these sports personalities if they address well-being topics.

The focus groups of students aged between 19 and 24 were organized based on active engagement with social media and their following of the chosen European sports personalities. Identified themes were categorized into topics such as *Positive Influence*, *Negative Influence*, *Ethical dilemmas*, *Authenticity and Trustworthiness*, and others covering the recurrent themes in the participant's responses.

Results highlight a spectrum from unrealistic portrayals to transparency and controversial statements or actions. Positive role modeling, where influential personalities openly discuss struggles and victories, benefits the youth. Conversely, public personas must be cautious of potential negative influences, particularly regarding body image or lifestyle choices.

Implications of the study range from influencer responsibility to media literacy and dialogue. It emphasizes the need for efforts to ensure responsibility and positivity in youth well-being within European communities. The study's significance extends beyond individuals to societal and mediatic domains, considering the substantial image capital sports personalities possess.

PP 0045 Breaking barriers with a football: The activist TikTok narratives of Maymi Asgari

Mogens Olesen¹

¹ University of Copenhagen, Department of Nordic Studies and Linguistics, Copenhagen S, Denmark

Female football culture on TikTok

Since its introduction in 2018, TikTok has emerged as a hugely influential, trend-setting social media platform in an increasing range of contexts. Like most other cultural domain, sport is also increasingly consumed through short, spectacular, highlight-focused formats such as TikTok videos, YouTube shorts and Instagram reels, especially among

younger generations. This phenomenon is a consequence of fundamental processes of digitization within sport, as digital platforms increasingly are being involved in the production and consumption of sport content. These brief formats have emerged as algorithmically curated and personal alternatives to the traditional, communal address of mass-media sports events such as TV transmissions of football matches and "wraparound" (Goldsmith, 2013) pre- and post-event programs.

As an example of how sport is mediated on short form video, this paper explores how TikTok is employed by female footballers and female football fans in self-presentational performances and for sharing female expressions of football culture. While there is extensive literature examining feminist approaches to sport (e.g. Pfister & Pope, 2018), including specific focuses on older social media like blogs (Antunovic & Hardin, 2013) and Instagram (Toffoletti et al., 2021), sports culture on TikTok, including feminist perspectives, is a profoundly under-researched topic. As such, in a larger perspective the paper hopes to contribute with insights into ways short-form video platforms affect the emergence of new expressions of football culture and sports in general.

Using an ethnographic approach (Schellewald, 2021; Stahl & Literat, 2022; Vaterlaus & Winter, 2021) the chapter sketches how women apply the communicative, memetic affordances of TikTok (Zulli & Zulli, 2020) to present themselves as football fans and players. Analytically, a distinction is made between identity strategic expressions containing gendered, and activist messages, and more integrative, communal strategies emphasizing personal, affective, and performative perspectives of football.

CAS02 Mediatization of sport and sports media logic: Theoretical and methodical approaches

PP 0129 News or not? Sports journalism and the climate crisis

Klemens Daniel Hempel¹, [Thomas Horky](#)¹

¹ Macromedia University, Sports Communication, Hamburg, Germany

The increasing effects of the climate crisis demand rapid political and societal action, as it was stressed repeatedly in IPCC and UN reports (UNEP, 2023; IPCC, 2023). Germany, too, is already experiencing the consequences of global heating (BMUV, 2023). As the climate crisis is increasingly affecting all areas of life, media are reacting to that challenge both internationally and in Germany with extended coverage in diverse ways (Brüggemann & Sadikni, 2023; Hase et al., 2021; Tschötschel et al., 2022). However, scholars have thus far rarely analysed the potential changes dealing with the climate crisis might bring specifically to sports journalism (Wilson & Yoon, 2023) – despite sports being one of the well-established editorial departments (Boyle, 2006). Hence, this study creates an insight into how national sports editors and their departments in Germany deal with the topic of climate crisis.

As there is still little research in this area specific to sports journalism, a few theoretical aspects were drawn from the debate around journalism's coverage of the climate crisis generally. These include the potential use of constructive journalism as a reporting pattern (Haagerup, 2017; Urner, 2019), the applicability of traditional news values and factors (Marquardt, 2023; Neverla & Schäfer, 2012; Schäfer, 2019; Schulz, 2011) as well as a possible role conflict for journalists between their professional norm of objectivity and the accusation of activism when reporting on climate issues (Brüggemann et al., 2022; Haeming, 2020; Marquardt, 2023).

Additionally, other theoretical aspects have been derived from sports context, more vaguely referring to reporting on sustainability generally and other socio-political issues connected to sports. These involve potential differences

in the coverage intensity both based on political orientation of media outlets as well as in the context of sport mega-events such as Olympics (Yoon & Wilson, 2019). Also, the aspect of scholars criticising sports editor's roles as the "toy department" (Hardin et al., 2009; Oates & Pauly, 2007; Rowe, 2007) was reflected contrasted by more recent studies suggesting a shift towards journalistic ideals and more socio-political awareness in sports departments (Broussard, 2020; Schmidt, 2018; Weedon et al., 2018).

The study's character is explorative, thus eight semi-structured in-depth interviews with editors from national sports departments in Germany have been conducted. These are analysed with a qualitative approach, using the software MAXQDA. The sample is not representative but will offer trends from practical experts on how sports departments deal with the climate crisis in their reporting.

The interviews have not yet been finally analysed. However, we expect that the results will include the following: a general rise of awareness for climate issues in Germany's sports reporting. Some departments consciously researching climate topics while others focus on external factors like mega-events, cancelled competitions in e.g. winter sports or PR-communication by clubs and associations. Accusations of activism and the implementation of constructive journalism are rare, journalistic role perceptions vary and seem to influence the perceived importance of socio-political context and climate related coverage in sports – these seem to be more relevant in public service media.

CAS02 Mediatization of sport and sports media logic: Theoretical and methodical approaches

PP 0130 Praise for the deceased: Metajournalistic discourse in European (sports) media on the closure of the New York Times sports desk

Daniel Nölleke¹, José Luis Rojas-Torrijos²

¹ German Sport University Cologne, Department of Communication and Media Research, Cologne, Germany

² University of Seville, Department of Journalism II, Seville, Spain

When the *New York Times* announced the closure of its sports desk on July 10th 2023 it added a whole new layer to the already hotly debated disruption of sports journalism (McEnnis, 2022). While established sports media had been threatened for some time by new entrants (McEnnis, 2017; Mirer, 2022; Nölleke & Perreault, 2023), reputable media outlets in particular seemed to pave avenues out of the crisis by reclaiming authority through a revival of traditional journalistic norms and practices (Gentile et al., 2022) as well as offering innovative narratives (Rojas-Torrijos, 2019). In this respect, the *NYTimes* could be considered a role model for sports journalism survival in times of digital disruption – so it came as a surprise when it closed its sports desk and shifted its coverage to *The Athletic* (which was acquired in 2022).

While this incident in itself says a lot about the ongoing changes in sports communication, it also provides a perfect opportunity to examine what societal value is attributed to sports journalism. When other outlets report on the closure of the *NYTimes* sports desk, they provide an institutional conversation (Perreault et al., 2023a) on the history and the current state of the field. Through this metajournalistic discourse they "construct, reiterate and even challenge the boundaries of acceptable journalistic practices" (Carlson, 2016, p. 349). Moreover, metajournalistic discourse offers insights into the role ascribed to (sports) journalism in society (Perreault & Nölleke, 2022). In this regard, previous research has shown the value of obituaries of individual journalists in understanding how the current state of journalism is reflected in the field (Perreault et al., 2023b). Since the closure of the *NYTimes* sports desk has prompted numerous obituary-like articles around the world, we ask:

RQ1: How do European sports media discursively construct the role of sports journalism in digital media landscapes?

RQ2: What understanding of good sports journalistic practice is revealed by the metajournalistic discourse of European sports media?

Examining European media responses is particularly valuable since the *NYTimes* is considered a model of quality journalism worldwide. However, sports and media culture in the US and Europe differ greatly. Thus, it is valuable to see how European media construct their own affectedness by the situation thereby reflecting about their own position in the wider fields of journalism and sports media. We therefore conducted a thematic analysis of 'obituaries' on the passing of the *NYTimes* sports desk published by German and Spanish media. Findings show how (sports) journalists take the opportunity to publicly reflect on the wider contribution of sports journalism to society and lament economic constraints and technological developments that threaten (sports) journalism's role. Using the *NYTimes* as an example the importance of good journalistic practices and ethical reporting is emphasized, in contrast to new entrants who are mainly seen as a threat to what worked in the good old days. We discuss this praise for the deceased in terms of boundary work, since the metajournalistic discourse serves to claim authority and delineate legitimate sports journalism from (illegitimate) insurgents.

CAS02 Mediatization of sport and sports media logic: Theoretical and methodical approaches

PP 0131 MeSort – methodological development and empirical findings: An innovative approach to research communication repertoires and strategies of grassroots sports clubs

Thomas Neumann¹, Philip Sinner², Jörg-Uwe Nieland¹, Christof Seeger³

¹ University Klagenfurt, Department of Media and Communications, Klagenfurt am Wörthersee, Austria

² University of Bremen, Centre for Media- Communication and Information Research ZeMKI/Lab Datafication and Mediatization, Bremen, Germany

³ Hochschule der Medien, Fakultät Druck und Medien, Stuttgart, Germany

Only four years ago, grassroots sports clubs in Germany and Austria clearly underestimated necessity and possibilities of digitization (Wadsack, 2019). In a quantitative survey (Ehnold et al., 2020), 55% of sports clubs stated that digitization was not particularly important to them in 2019. This has fundamentally changed. Covid-19 and accompanying restrictions triggered a profound "digitization push" (Couldry & Hepp, 2023) in grassroots sports that is proving to be enduring.

However, the clubs did not change their communication strategies of their own free will: Serious societal upheavals (Aschauer et al., 2023; Hahn & Langenohl, 2022) and particular challenges posed by the pandemic (Grimm, 2023; Hastall & Scherenberg, 2023) forced them to act to fulfill their obligation to enable exercise (EC, 2007), engage their members (Weiss & Norden, 2015), and foster social cohesion (Nagel et al., 2015). But academia has also responded. Many communication scholars (Sanderson & Brown, 2020; Repenning et al., 2021; Pedersen, 2022; Horky et al., 2022; Schallhorn et al., 2022; Seeger et al., 2023) have examined the changes in "communicative practices" (Hasebrink & Hepp, 2017) and researched how clubs have acted in crisis communication (Manoli, 2016).

It is emphasized that a broad "media ensemble" (Hasebrink & Hepp, 2017) is used and clubs have sustainably expanded their media repertoires. Success of communication strategies depends to a large extent on individual commitment of competent members (Ehnold et al., 2020; Schallhorn et al., 2022). Many club-representatives underline that digital communication channels should be maintained and expanded, especially for informal exchange, administration of the clubs, and external presentation (Sinner et al., 2023; Seeger et al., 2023). Although multilevel-designs (Creswell & Creswell, 2018) and long-term observations have been implemented, desiderates continue to emerge (Sinner et al., 2023), particularly with regard to usage of newer social media channels, strategic combination of offerings, and target-group orientation. In addition, European clubs are once again confronted with new (communicative) challenges that will have an impact on the digitization process: energy costs and the return of the refugee-"crisis".

Therefore, we implemented a qualitative sorting-study (Stephenson, 1953; Davis & Michelle, 2011) among 29 selected clubs in Austria and Germany to both, contribute to mediatization research in sports (Frandsen, 2020) and addressing the research gaps by answering these RQs:

RQ1: *What importance do clubs assign to various digital offerings in their communication repertoires?*

RQ2: *What is the primary purpose assigned to each offering?*

As a methodological innovation, we used the DFG-funded software MeSort (MeSoftware, 2023), that provides "circle sort for researching media repertoires", "different sorting schemes for Q-sort methodology", and "concentric circles for social network analysis". This allows to provide new facets to the "communicative figuration" (Hepp, 2020, 102) of "mediatized grassroots sports" (Sinner et al., 2023). In doing so, we can show how many clubs are increasingly employing modern communication repertoires. They rely on a deliberately chosen main channel. In addition, they also offer target-group-specific content that is distributed via separate channels as needed. However, it is still not possible to identify a coherent overall strategy among the clubs surveyed.

CAS02 Mediatization of sport and sports media logic: Theoretical and methodical approaches

PP 0132 "It represents a pure and unfiltered form of connection and adventure". The role of physical activity in the digital disconnection of emerging adults

Katarzyna Kopecka-Piech¹

¹ Maria Curie-Skłodowska University in Lublin, Institute of Media and Communication Studies, Lublin, Poland

Research on digital disconnection is developing intensively. Similarly, research on the role of digital technologies in physical activity. However, there is little research on the importance of not using technology in physical activity and the importance of physical activity for effective and enjoyable digital disconnection. Emerging adults constitute a population whose daily life is highly mediatized, but in which awareness of the role of digital disconnection for well-being is still limited. Therefore, the following question was posted in the study: What role does physical activity play in digital disconnection experience of emerging adults?

The study fits in with the conference theme, showing how the constant and powerful presence of media technologies in people's lives leads to the disruption and results in limiting digital technology through physical activity.

what is accompanied by restructuring users' daily lives and unlocking the creative and health potential inherent in technology non-usage and being physically active.

The study data collection was based on photo reporting by informants along with their textual interpretation of them. The survey was conducted in two waves, in spring and autumn (March-May and October-December 2023, respectively). Respondents were recruited from among university students of media and communication studies – their participation was free of charge and anonymous as well as consent was voluntary. 25 Polish informants aged 19-25 participated in the research. Each was asked to provide 5 photos depicting, in their opinion, situations of experiencing digital disconnection in their own or others' daily lives. For each illustration, the respondent was asked to provide a description of 150–200 words, answering short questions. Thus, a systematic visuo-textual analysis, inspired by the photo-voice method, was performed on corpus of 125 photos.

Results show that physical activity – including sports activities, functional movement (e.g. commuting, gardening), tourism and recreation – appears as the most common alternative to using digital technology. The respondents described physical activity as characterized by six contrasting features to the digital experience: 1). realism; 2). materialism; 3). multisensoriality; 4). authenticity; 5). meaningfulness, and 6). relationality. Respondents indicated that physical activity allowed them to experience multiple dimensions and components of externality, as well as themselves, i.e. their own inner thoughts and emotions.

Physical activity took different forms, but provided similar effects, which were certain mind and body states and feelings. The digital disconnection experience of the respondents was overwhelmingly positive. An essential element of physical activity was the outdoors, which could not be provided by digital technology; and the possibility of contacting with oneself (resting, relaxing) and/or others (making connections and bonds).

In the context of this year's conference theme, the results indicate how emerging adults "interpret and engage with a mediatized environment" – i.e. how they formulate and perceive counter-responses to the experience of digital over-connection, and the importance of their physical activity in this. Physical activity is a key alternative, but also a transformative force, both in practice of people's daily lives and in the perception of the importance of technology non-usage.

CAS02 Mediatization of sport and sports media logic: Theoretical and methodical approaches

PP 0133 Deep mediatized actors of sports betting in Belgium: When producers and consumers become a data source in a communicative figuration

Philip Sinner¹, Niels Bibert²

¹ University of Bremen, Centre for Media- Communication and Information Research ZeMKI/Lab Datafication and Mediatization, Bremen, Germany

² University of Hasselt, Social Sciences, Hasselt, Belgium

Gambling is a well-established topic within disciplines as psychology (Nicoll, 2019), health (Hayer & Kalke, 2022) and legal (Gebhardt, 2018) sciences, and sociology (Drews & Wuketich, 2019). In contrast, it is only marginally studied by media and communication scholars (see Dottori et al., 2023). This must be critically questioned, as online sports betting is a growing multi-billion-euro market and (mobile) online offers of bookmakers are among the most powerful drivers of mediatization in sports communication. In addition, online sports betting offers many consumers enjoyment and entertainment, but the field also poses major risks for many of those involved: Betting is a driving force behind match-fixing and associated crime. Furthermore, online sports betting offers great potential for addiction, especially for young men, active members of clubs (supposed experts), and supporters of athletes and managers who appear as testimonials in advertising (Turowski et al., 2023).

Against this background, it becomes clear why the rapidly progressing mediatization and digitization of the gambling sector has a major influence on communication and social (dis-) order and, though, demands a media and communication studies perspective to achieve a better understanding of the complex ecosystem in which players, industry, and other manyfold stakeholders interact. In order to capture these diverse actors and their object-related communicative practices, we rely on the communicative figuration approach (Hasebrink & Hepp, 2017) with the frame of relevance defined as *online sports betting as a communicative play network*. In this approach the figuration, defined by Elias (1978) as a network of relationships between interdependent individuals, is expanded to include deep mediatized communicative practices and digitized actors.

As empirical object, we analyze Belgium's sports betting landscape. We examine the field on three complementary levels with three RQs:

- RQ1: How is the Belgian gambling market structured compared to Europe?
- RQ2: Which bookmakers are represented and which contents are offered?
- RQ3: Who are the registered consumers of online betting and how do they act within the offered environment?

To answer our RQs, we first analyzed the available data on the betting market in Europe and the underlying Belgian legal texts (e.g. Gambling Act 1999, regulation by Belgian Gaming Commission). Secondly, we analyzed a quantitative data set (requested in accordance with Art. 14(1) Gambling Act) containing both, all bookmaker registration

data and their media texts, and data on consumer registration and their online behavior. This allows to structure the Belgian market on two levels: We can characterize bookmakers by their brands, license types, and localization, but also by quantity and type of provided content. Besides the provision of betting offers they publish control-enhancing information (e.g., providing stats), risk-reducing promotions (e.g., free bets), and sense-of-urgency offers (e.g., limited deals) messages. Moreover, we can structure the consumers according to their age and gender. We can also show which sports they bet on, and in the environment of which bookmaker. In addition, we can examine when they practice betting over time, and to what extent they do it. The combination of these parameters is unique and only available for Belgium.

EMS01 Ethics of mediated suffering

PP 1009 Conjuring the intolerable future: Victimhood, victimcould, and the political ambivalence of premediated suffering

[Kathryn Claire Higgins¹](#)

¹ Goldsmiths – University of London, Department of Media- Communications and Cultural Studies, London, United Kingdom

This paper uses multi-modal critical discourse analysis (CDA) to examine how mediated spectacles of intolerable futures (and, the hypothetical injuries they contain) are emerging as a prominent, yet deeply ambivalent, technique of political claim-making. It develops a critical commentary on the political uses of what I call mediated “victimcould” (Author, 2022) through a dialogical analysis of three paradigmatic examples: 1) a dystopian campaign video from the Republican party in the United States (titled *What if?*) released in April 2023; 2) a staged-for-media protest performance in London by the climate action group Just Stop Oil in which two activists threw a can of tomato soup on Vincent van Gogh’s famous *Sunflowers* painting in October 2022; and 3) a series of AI-generated images depicting the forceful arrest of Donald Trump, which circulated globally on social media as the former US president faced a looming indictment by federal prosecutors in March 2023.

From heated debates about the future of migration in the UK and Europe, to public ruptures over the (il)legitimacy of mass civilian slaughter in Israel’s so-called “war on Hamas” in Gaza, to the divisive and escalating rhetoric of populist politicians around the world, the landscape of contemporary politics is increasingly legible as a terrain of struggle over competing claims to vulnerability and victimhood. Working with Chouliaraki’s (2021) conceptualization of victimhood as a flexible communicative structure (rather than a stable political identity), the present analysis argues that we need to critically re-attune to the *uneven temporalities* of contemporary claims to victimhood as well as to the specifically *anticipatory* character of vulnerability politics. While victimhood centers injuries in the past and/or present, I argue that the three cases listed in the paragraph above – as paradigmatic examples of *victimcould* – deviate from that model in two important ways: first, by locating the definitional injuries of “the victim” in a future that is unarrived and (officially) unreal; and second, by harnessing different kinds of creative media spectacle – from viral performance to generative AI – to “premeditate” (Grusin, 2004) or “conjure” (Tsing, 2001) that future in the emotional and affective politics of the present.

Rather than seeking to deceive (as in campaigns of disinformation), these acts of creative premeditation invite their viewers to *feel* futures of victimization as if they were already taking place. This, in turn, helps to culturally construct a mandate for securitizing practices designed to prevent those very futures from unfolding. Thus, while vulnerability has emerged as the *lingua franca* of both progressive political movements and the reactionary movements of the far-right (both in Europe and around the globe), my analysis concludes that *victimcould* often serves reactionary ends by a) strategically collapsing *probability* and *possibility* in symbolic politics; and b) failing to hold cultural imaginations of future suffering accountable to the political inequalities of the present.

EMS01 Ethics of mediated suffering

PP 1010 Come and see the suffering: Reception of *Come and See* (1985) on English-speaking YouTube

[Alesha Serada¹](#)

¹ University of Vaasa, School of Marketing and Communication, Vaasa, Finland

Due to over two centuries of Russian and sometimes Polish cultural oppression, there has been very little awareness of Belarusian culture and history in Europe, let alone English-speaking countries. The Soviet Belarusian historical/horror film *Come and See* (Klimov, 1985) makes for one exceptional case that stands out in a very particular niche of cultural criticism on YouTube. In this paper, I study representation of Belarusian national trauma through the prism of *Come and See* as it is reflected in video essays by popular English-speaking YouTube cinema channels. These channels cover either one or both of the following topics: the craft of filmmaking, and horror and shock content.

From the content uploaded by YouTube creators, I select 15 most popular videos for textual and visual analysis. As it appears, the majority of these videos belongs to one of the two popular YouTube genres: a video essay and a reaction video. Additional data for interpreting the audience’s reaction is sourced from viewers’ comments. *Come and See* is based on documented accounts of witnesses of extreme violence during World War II in Belarus, and it reproduces images of war crimes with a respectfully appropriate level of truthfulness. Despite the “high art” status of the film, it appears to satisfy YouTube audiences’ needs in both shared feelings (e.g. shock and horror) and educational content.

The first section of the paper explores how and why extreme sufferings depicted in the film based on real life events have become the material for the rather mundane genre of YouTube reaction videos (as in Sontag, 2013). The second section of the paper investigates representation of Belarus, and its national trauma (see Alexander, 2004), in the content and discussions from the international and primarily English-speaking YouTube communities, who were brought together by the shared experience of watching *Come and See*. In the third section, I open up

the discussion about the role of shared affect in the practice of production and consumption of YouTube videos, as shared 'structures of feeling' (Papacharissi, 2015), and make assumptions on how exactly these feelings can be structured to appeal to international communities on YouTube.

EMS01 Ethics of mediated suffering

PP 1011 Solutions journalism: Understanding its impact on journalists' emotional well-being

Dora Santos Silva¹, Gabriela Ferreira¹

¹ ICNOVA / NOVA FCSH – Faculdade de Ciências Sociais e Humanas da Universidade Nova de Lisboa, Science Communication, Lisboa, Portugal

This research explores the impact of solutions journalism – as an editorial strategy and innovative narrative – on journalists' emotional well-being, working in European solutions-oriented newsrooms.

The traditional impact of journalism as the fourth power or watchdog has been recently challenged by studies that point to information fatigue and news avoidance due to excessive coverage of various topics, creating a news overload, and extreme focus on problems (de Bruin et al., 2021; Schäfer et al., 2022).

Solutions journalism – which Solutions Journalism Network defines as "rigorous and compelling reporting about responses to social problems" (n/d) – emerges as a change in the practice of journalists and the conceptualization of the story, which starts to privilege the solution to the problem instead of focusing only on the problem. The narrative is not intended to be merely "positive" but oriented towards solutions to social issues, duly proven with qualitative and quantitative evidence, to produce insights and scalability. This solution-oriented approach can rebuild lost credibility and increase audience interest in the news since it is evidence-based, and accurate and provides citizens and communities with information on how they can act on and leverage societal change (McIntyre & Lough, 2019).

Regarding the academic agenda, we see a parallel: it has focused on journalists' precarity, in different contexts (Owen, 2019; Pantti & Wahl-Jorgensen, 2021; Becket, 2015), and only recently on their well-being at work. For this research, we use WHO's definition for well-being as it is in 2021's glossary: "a positive state experienced by individuals and societies. Similar to health, it is a resource for daily life and is determined by social, economic and environmental conditions" (2021).

As Pantti & Wahl-Jorgensen (2021) state, journalism is an emotional work, shaped by changes in the industry and specific routines, so there is a need for a better understanding of context-sensitive circumstances that can impact their well-being, including the newsroom editorial strategy.

We start from the hypothesis that, since solutions journalism has a positive impact on the audience, as shown in studies, it can also positively impact journalists' emotional well-being. Three research questions are addressed to explore the impact of solutions journalism on journalists working in European solutions-oriented newsrooms: 1) How do journalists perceive the impact of solutions journalism on their well-being? 2) How does it change their relationship with the purpose of journalism? 3) What kind of rewards and emotions do they feel when producing solutions-oriented stories?

To address these questions we used a mixed-methods approach combining a questionnaire with semi-structured interviews with journalists working in 20 European solutions-oriented newsrooms, representing all platforms.

Preliminary findings from a total of 45 valid questionnaires and 9 completed interviews show that journalists see solutions-oriented stories as a way to fulfil their notion of journalism as a service public profession and establish their legitimacy as essential actors in contexts of mediation, contributing to emotional reward and well-being at work.

EMS01 Ethics of mediated suffering

PP 1012 Mapping youth democracy: The individual and collective emotion/s of political action

Michelle Catanzaro¹, Rob Watts², Judith Bessant³, Philippa Collin⁴

¹ Western Sydney University, Design – in school of Humanities and Communication Arts, Sydney, Australia

² RMIT, Social policy, Victoria, Australia

³ RMIT, Urban & Social Studies, Victoria, Australia

⁴ Western Sydney University, Institute for Culture and Society, Sydney, Australia

Fuelled by increased discontent and disillusionment with formal politics, increasing numbers of children and young people are taking to the streets all over the world, striking to demand a more inclusive democracy and an equitable society. In response, political elites and the legacy media persist in representing young people as either politically disengaged and apathetic or else dismiss evidence of student action suggesting that young people are being

manipulated and managed by devious adults. This paper refutes such claims arguing that many young people are deeply political, but in ways that are less conventional and more "expressive" and "emotional" (Muxel, 2010; Pickard & Bessant, 2018).

To demonstrate this, we present findings from a study of the Australian SchoolStrike4Climate movement ('New Possibilities, Young people and democratic renewal') using a participatory activist research framework. We begin by presenting some preliminary data that explores the multiplicity of emotions expressed in the placards at student-led school strikes (Catanzaro and Collin, 2023). Emotions are depicted on placards using a number of diverse semi-otic devices, including colour, expressive typography, and symbolism. We then address findings from our in-strike interviews with young people, revealing that the emotions they experience whilst they are at the strikes sometimes contrast to the emotions presented on their visual signage. This paper explores these contrasting modes of political emotions, communication, and expression.

To understand this further, we use a participatory emotion heuristic to reveal how young people experience, share, and communicate their experiences of collective action. With the aid of a digital tool, we explore the multitude of emotions felt by young people at various moments within a protest event. This approach allows us to examine affective responses across the duration of a protest action. Lastly, we assess the value of using a digital emotion 'mapping tool' in conjunction with young people's reflections to decipher how this method can support young people to share the ways collective action makes them feel and why.

EMS02 Emotion and distant suffering

PP 1115 Goodnight Ma'am: Contesting legacies in digital mourning of the queen in a global media event

Johanna Sumiala¹, Anu Harju¹, Julia Sonnevend²

¹ University of Helsinki, Media and Communication Studies, Helsinki, Finland

² The New School, The New School for Social Research, New York, USA

On the 8th of September, 2022 the world paused as the BBC announced the death of Queen Elizabeth II. After 70 years on the throne, the longest-reigning British monarch had died aged 96. In no time the Queen's death became a global media event that would eventually culminate in the state funeral broadcasted and followed live worldwide. While many mainstream news and legacy media maintained a classical Coronation style ceremonial mode of reporting (Dayan & Katz 1994; see also Sonnevend 2016), social media became a highly contested arena in its ritualistic response to the Queen's death (Clancy 2023; see also Frandsen et al., 2022). In this paper we analyse the Queen's death and funeral by examining the contested performances of mourning in this global media event (see also Sumiala 2021). The empirical data is gathered by applying digital ethnographic observation of the event unfolding live (cf. Tikka et al., 2022; Valaskivi et al., 2022) in diverse news and social media platforms. These sites include BBC, Daily Mail, X (Twitter) and Instagram. The analysis consists of ethnographic description and close reading of three phases in the media event e.g. News on Death, Lying in State and the Funeral. In conclusion we reflect the live participation as a key performative strategy in contesting the legacy of the Queen's death as a global media event and related mourning and her role as a globally unifying symbol, and discuss how such contestations may not only produce different dramaturgies and narratives in digital mourning, but different events in which the social is brought to life through affective contestations (cf. Chouliaraki 2021; Dövelin et al., 2018) between and among different actors and platforms.

EMS02 Emotion and distant suffering

PP 1116 Emotional contagion and ethical concerns in mediated human suffering: An examination of the Global South and Western audiences

Ekwutosi Nwakpu¹

¹ Edge Hill University, Film and media, Ormskirk- Lancashire, United Kingdom

It has been argued that media coverage of human suffering which by all means a media event, must be brought into a narrative order that presents the human face of suffering or else audiences will not be moved. This is because, event such as terror attacks, natural disasters, war and so on – provide little more than voyeuristic entertainment when televised. To ensure the media audiences understand the pain, helplessness, and vulnerability of those involved in disaster, the narrative order that allows sufferers speak for themselves or tell their experiences on the camera with evidence pointing at suffering. Through mixed method, the study investigates the western (represented by the UK) and global south (represented by Nigeria) audiences' emotion on humanised proximal and distant suffering. Findings showed that humanising suffering through visual and auditory cues in the moment of mediation leads to emotional contagion, which emanates from the mediated victims to an audience, and leading to intra-group affect. Also, among the Western audiences, the more emotional contagion a mediated human suffering triggers, the more they are influenced to take responsibilities in alleviating suffering and the question about ethical consideration of the media. Whereas among global south audiences, the level of emotional contagion does not determine collective action as factors such as structural and systemic issues influence their taking responsibilities and less concern on media ethics. The implication of this study is that it sheds light on how emotional responses to mediated human suffering are influenced by cultural and social factors, allowing for cross-cultural understanding. Ethically, it contributes to the development of an ethical framework and guideline in mediating human suffering that promote empathy and dignity in the portrayal of human suffering, fostering greater global solidarity and understanding.

PP 1117 From uncensored documentation to emotional truth – Ethical approaches to mediated suffering in the work of Finnish war correspondents during the Russian-Ukraine war in 2020's

Suvi Mononen¹, Liia-Maria Raippalinna¹, Pasi Ikonen¹, Turo Uskali², Markus Mykkänen¹, Antero Holmila³

¹ University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä, Finland

² University of Jyväskylä, Department of Language and Communication Studies, Jyväskylä yliopisto, Finland

³ University of Jyväskylä, Department of History and Ethnology, Jyväskylä, Finland

Since the Russian military invasion of Ukraine in 2014, which escalated into a full-scale war in 2022, Ukraine has been a central interest of Western media. While news and images across multiple platforms have spread on an unprecedented scale, the reliability of information has been questioned due to disinformation and propaganda. In this context, eyewitnessing and interviewing local people have been considered crucial for reliable and truthful journalism. Professional journalists and photographers work to produce news stories ethically, taking into consideration the vulnerability of the participants and the audiences.

In this paper, we discuss the ethics of mediated suffering in the context of Finnish journalism on the Russian-Ukraine war, based on in-depth interviews (n = 50) with correspondents and photographers reporting from Ukraine in 2014–2024. The interviews, conducted in 2023–2024, focus on journalists' own experiences of their work in Ukraine. Here, we investigate the ethical approaches and practices that journalists and photographers implement in witnessing and reporting war: How do media professionals perceive and mediate the ethical relationships between sufferers, spectators, and themselves? What are the limitations, responsibilities, aims, and justifications related to representing and mediating suffering?

We build on existing literature on proximity and distance, emotions, and the ethics of care. The affective proximity of the journalist is often seen to threaten the journalistic ideal of objectivity. However, the emotional turn in journalism has highlighted the emotional aspects of journalistic representations and practices of reporting, allowing a wider display of emotions in news stories, and drawing attention to the emotions of the journalists (e.g., Wahl-Jorgensen & Pantti 2021; Stupart 2021). Emotions are a part of ethical journalistic practice (e.g., Durham 2023; Matheson 2015). It has been shown that the ways of representing suffering differ depending on the cultural and geographical distance between the sufferer and spectator, affecting for instance the grievability of victims (e.g., Khaldarova & Pantti 2020; Dokyun Kim 2020).

Based on preliminary findings, we suggest that Finnish journalists and photographers reporting from Ukraine apply various ethical approaches and practices. For instance, some video- and photographers refrain from capturing lifeless bodies, while others seek to document the reality of war in its uncensored form. More traditional forms of war journalism are being accompanied by human-interest stories seeking to mediate the everyday experiences of people living amidst war. The war in Ukraine 'hits close', geopolitically and emotionally. For many Finnish journalists, this proximity is a central motivating factor to work in Ukraine. They aim to capture the emotional reality of their Ukrainian interviewees and evoke empathy in the audience.

Combined with self-reflection, witnessing, and mediating the suffering of another can create a broader understanding regarding emotional reality, which is mirrored in ethical journalistic practices. Research can reflect and make visible the ethical practices and approaches that remain implicit in newsrooms.

The research project has been approved by the Ethics Committee of the local university. (Anonymized)

EMS02 Emotion and distant suffering

PP 1118 Who let the dogs out? Fellas and the Russian invasion of Ukraine

Merja Ellefson¹

¹ Örebro University, School of Humanities- Education and Social Sciences, Örebro, Sweden

This study is based on evocative autoethnography, an "insider" ethnography, which is often, but not exclusively, used to study lived experiences. The aim is to discuss the emotional labor of keyboard warriors during an ongoing war. I'm a North Atlantic Fella Organization (NAFO) member, a leaderless Twitter/X collective supporting Ukraine with donations and countering (pro)-Russian posts, primarily on Twitter/X. My own experiences are combined with tweets and memes illustrating the collective's emotions and discussions.

Being an online activist during a war is more than just hammering the keyboard. It is an emotional, embodied experience. We laugh and cry together. We wish each other happy birthdays and happy fellaversaries (one year as a member). We see copious amounts of disturbing images (drone footage, go-pro video, bloody body parts, destroyed houses etc), and mourn losses related to the collective. We form a parasocial relationship to the military units we support. We follow and communicate with individual soldiers, both foreign and Ukrainian. There are fella fundraisers both in and outside Ukraine, and we support multiple crowdfunding operations.

During the past year, there has been an increasing number of tweets speaking of mental health and the importance of taking breaks and looking after oneself. There have also been discussions about guilt. Fellas feel guilty for being able to take a break while Ukrainians have no escape. Some speak of feeling guilty about being unable to donate as much as they wish. In contrast, there is also a lot of joking, camaraderie, virtual hugs, and casual banter, such as starting the day by wishing others "good morning".

Fellas are shitposters using memes and gifs to harass Russian public diplomacy efforts and pro-Russian propagandists. Shitposting, i.e., ironic engagement, mockery with provocative or vulgar humor, originates in 4chan and is mainly associated with AltRight trolling. Shitposting can, however, be seen as a rhetorical device that can be used for different purposes. For example, Anonymous used it to mock ISIS with memes, replacing jihadists' faces with yellow rubber ducks (Mortensen & Neumayer 2021, McCrow-Young & Mortensen 2021). As fellas see it – it is impossible to reason with sources who parrot absurd claims and are immune to fact-checking. Also, countering absurd claims may be funny for a few weeks. After doing it several hours a day, every day for roughly two years, it ceased to be funny. Mockery and shitposting insults offer an outlet for the inner tensions caused by dealing with a constant firehose of bullshit and zombie hoaxes (false claims impossible to kill by fact-checking and debunking). In brief, the aim is to provide an insider perspective on the complexities of being a shitposter and a keyboard warrior during an ongoing war.

EMS02 Emotion and distant suffering

PP 1119 Emotions and social (dis)order. The disruptive forces of schadenfreude and compassion in media reception

Katrin Döveling¹, Lilian Suter²

¹ University of Applied Sciences Darmstadt, Department of Social Sciences, Darmstadt, Germany

² Zurich University of Applied Sciences, School of Psychology, Zürich, Switzerland

As the call for papers of the "Affect, Emotion and Media" Temporary Working Group highlights, emotions can be functional and dysfunctional forces in today's society. These current times have been and still are, without doubt, burdening and highly emotional, revealing the power of emotions. It seems, especially in today's troubled times, humans need to find relieve from crisis and disorder. It is here, where entertainment experiences come into play. This talk reconsiders entertainment experiences that focus on the suffering of others, often found in so-called reality TV formats, that show misfortunes of others, like "I'm a star – get me out of here", or on social media in the form of so-called fail clips.

In such formats, *schadenfreude*, the "pleasure at the misfortunes of others" (van Dijk & Ouwerkerk, 2014, p. 6), plays a central role. *Schadenfreude*, as a distinct emotion, was considered by Ekman to be one of sixteen pleasurable emotions (2003) and is described as "pleasant to experience" (Graham et al., 2019, p. 207) and therefore potentially viewed as entertaining. Yet, *schadenfreude* is considered a socially undesirable emotion and, when viewing the suffering of another, compassion is considered more morally appropriate. Compassion is perceived as an emotion of regret for the misfortune of others and includes the desire to help (Goetz et al., 2010). Nevertheless, it seems that compassion is disrupted during the reception of such formats with the aim of feeling entertained. The following questions arise:

- Why do people enjoy watching the suffering of others?
- Which disruptive factors play a role when people feel *schadenfreude* or compassion?
- How can answers to the above questions contribute to a better understanding of *schadenfreude* and compassion in globally digitalized disruptive communication, such as hate speech?

This paper tackles these questions and presents a model of *schadenfreude* and compassion in media reception that combines individual and social appraisal processes. We provide evidence for the model in three multi-methodological studies ($N_1 = 424$, $N_2 = 33$, $N_3 = 276$). Snippets of casting show failures and fail clips were used as stimulus material to study the emotions of *schadenfreude* and compassion in media reception. Study 1 investigated several individual appraisals as determining factors of *schadenfreude*. Study 2 and 3 looked at interpersonal communication and social appraisals during the reception situation. Study 3 additionally included whether the reception situation involved known peers or strangers.

The findings disclose factors that foster *schadenfreude* and thus are disrupting compassion. We extend our analysis to today's globalized society and highlight implications of the mechanisms involved in *schadenfreude* and compassion for one global communication phenomenon: hate speech – a conscious and willful public statement intended to denigrate a group of people (Delgado & Stefancic, 1995). Here, *schadenfreude* should be considered as a driving force, with troubling consequences for individuals and society as a whole. As the United Nations (2024) highlight, "we need to better understand the dynamics of hate speech, including the motivations behind its spread". [1]

MLC01 Media literacies and communication competencies

PP 0697 Post-digital literacy: Skills and norms for disconnection

Trine Syvertsen¹, Karin Fast²

¹ Department of Media and Communication, University of Oslo, Oslo, Norway

² Department of Geography- Media and Communication, University of Karlstad, Karlstad, Sweden

Digital literacy and similar concepts are widely used in educational and societal settings (Audrin & Audrin, 2022; UNESCO, 2023). Still, conceptualisations are often criticised for focusing narrowly on individual technical skills (Gran, 2018; Riis, 2017), paralleling a broader critique of the instrumental conception of technology in society (Erstad, 2022; Selwyn, 2022; Aagaard, 2021). Responding to ECREA's invitation to reconsider implications of "the communication dis(order)", this presentation argues that it is timely to discuss what *post-digital literacy* might entail.

The concept of the post-digital recognises that the digital no longer describes distinct processes, but a pervasive sociotechnical system structuring all life's aspects (Cramer, 2015). The post-digital does not imply an uncritical acceptance of the digital, but a set of competencies where reflection on *when and how to disconnect* is as important as online skills (Fast, 2021). In this presentation, we use the term post-digital to recognise that digital technologies enhance communication but also disrupt, exclude, and invade, and that citizens use a multitude of ways to jam, restrict and block digital technologies (Riis, 2017; Syvertsen, 2020; Aagaard, 2021).

Based on two representative surveys from Norway (2018 and 2023), the presentation explores emerging norms for online/offline behaviour in society and discusses tensions over appropriate boundary management. The presentation shows that the understanding that people are *too much online* is shared by a majority in our highly digitised society. Furthermore, emerging norms for (dis)connection are *relational* in the sense that our responsibility towards others influences what is considered appropriate; and norms also vary between *situations, generations, and genders*. Women expect greater problems with the always-on society as they take more responsibility for balancing online/offline life (Beattie, 2020; Ytre-Arne, 2023).

The article challenges individualised conceptions of digital literacy, offers empirical information about emerging norms, and argues that life in post-digital societies requires new skills. Tentatively, we conceptualise post-digital literacy as *the ability to consider societal and individual norms concerning when and how to use digital devices, and understanding how the use of such devices may impact relations, interactions, and situations*.

MLC01 Media literacies and communication competencies

PP 0698 Systematic literature review of algorithmic awareness

Esra Bozkanat¹

¹ Kırklareli University, Sociology Department, Kırklareli, Turkey

Algorithmic platforms like Facebook, Google, and Amazon have become omnipresent in our digital communication habits while algorithmic processes are rapidly advancing in speed and intelligence. As our lives increasingly intertwine with algorithmic machines, comprehending the significance of algorithms becomes progressively crucial. The challenge lies in the fact that a majority of users are oblivious to the ways these platforms operate in their everyday experiences. Therefore, it is crucial to uncover the extent of awareness regarding algorithms.

Various studies have explored algorithm awareness or algorithm literacy. Nevertheless, due to each study assessing algorithm awareness within a different sample, there is a deficiency in comprehensive research that provides a holistic understanding. This study conducts a systematic literature review to analyze existing studies on algorithm awareness in the literature. Therefore, the aim of the current study is to map academic research on algorithmic awareness.

This systematic review offers a comprehensive database encompassing pertinent literature from various disciplines that pertains to algorithmic awareness. In doing so, the variables included in the systematic reviews are divided into three categories. The first category is Journal elements. This variable furnishes details regarding the journal's indexation, ranking, inclusion in the Web of Science (WoS) database, citation number, and the field of study. The second variables refer to the method applied, the research methodology used, and the size of the sample used in each study. The third variable encompasses elements related to the content and structure of the phenomenon under investigation: What discoveries have research on algorithms yielded?

During the initial search using the terms "algorithm awareness" a total of 17,753 articles were identified. Search engines indiscriminately list studies containing the term "algorithm." To pinpoint the studies at the core of this investigation, we conducted repeated searches using the following keywords: algorithmic literacy, algorithm literacy, algorithm awareness, algorithmic awareness, algorithm responsiveness, algorithmic skills. After narrowing down to the most pertinent ones within the research scope, the final count is 32. The PRISMA flow is used for the research, which includes deduplication, screening, and data extraction totals. An online systematic review software, Rayyan QCRI, was used to assist the two-part screening process.

The findings indicate that researchers in the field of algorithms aim to assess users' awareness levels of algorithms for different digital platforms (Facebook, Netflix, Instagram), recognize the significance of algorithms in terms of privacy, and conceptualize algorithm awareness as algorithm literacy, algorithmic skill, and algorithm responsiveness. The study uncovers variations in algorithm awareness levels across platforms, assesses algorithms with regard to personal privacy, and provides significant implications into diverse conceptualizations of algorithm awareness.

MLC01 Media literacies and communication competencies

PP 0699 Transforming media literacy and digital skills: Integrating ai into higher education curricula

[Benjamin Bigl](#)¹, [Volker Gehrau](#)¹, [Desirée Hammer](#)¹, [Jakob Jünger](#)¹

¹ University of Muenster, Communication, Münster, Germany

The advent of Artificial Intelligence (AI) in recent years has significantly transformed the landscape not only of media and digital technologies. In the context of media literacy, AI tools are reshaping how information is created, distributed, and consumed. The emergence of algorithm-driven content, deepfakes, and AI-generated media necessitates a new framework for media literacy and contribute to this year's conference theme.

Today, more than 90% of occupations in Europe require basic digital skills, as well as basic literacy and numeracy. The use of digital technologies extends to all sectors of the economy, from trade and transportation to agriculture. Nevertheless, around 42% of the European population lacks basic digital skills, including 37% of the workforce (European Commission, 2023). The European Commission argues that 80 percent of all adults in the EU should have basic digital skills by the end of the decade. Therefore, the integration of AI into university curricula is crucial both for personal media literacy and for preparing students to successfully navigate this rapidly evolving digital environment. This study's research questions aim to find out which knowledge and skills are necessary to use AI system in the university context from the perspective of the students and staff members.

Various theoretical approaches and competence models are available for modeling the digital transformation in the field of media education. Potters' (2004) model focuses on building an individual's cognitive skills whereas Hobbs' (2011) five core competence model views media literacy as an expansion of traditional literacy. In recent years, Livingstone's (2004) model underlines the importance of contextualizing media literacy within broader societal and cultural dynamics. The study at hand is based on the European Union's Digital Competence Framework for Citizen (DigComp) (Vuorikari, Kluzer & Punie, 2022).

To answer the research questions, an online survey was conducted in December 2023 at the University of Muenster (Germany). The sample consisted of 1613 students and 1034 staff members. Most respondents agreed to the statement that the university should provide learning opportunities for AI systems. Further information was given in two open ended questions which have not yet been finally analyzed. One question concerned requirements the university should meet. Offering trainings for AI usage was often mentioned. Later in the survey, the respondents were asked for knowledge and skills they need to use AI in the university context. A first glance, the answers showed important issues: (a) knowledge about logic and functionality of different AI systems, (b) guidelines about data security and data protection, (c) questions of identification and labeling of AI generated information, (d) usage of AI techniques for teaching, (e) necessary changes in exams as well as (f) specific skills related to prompting. The open-ended answers are very informative and fill about 100 printed pages. Until summer 2024, the answers will be

coded and added to the dataset. The data will be analyzed for frequency and cooccurrence of demanded skills, differences between students and staff members as well as differences between subjects and faculties.

MLC01 Media literacies and communication competencies

PP 0700 Influencers in domestic labor: The skills behind platform work in cleaning, care, and accommodation services

Martina Piña¹, María-José Establés², Mar Guerrero-Pico¹

¹ Universitat Pompeu Fabra, Communication, Barcelona, Spain

² University of Castilla – La Mancha, Communication, Cuenca, Spain

Platforms are not merely digital infrastructure that intermediates between different users. Platforms impact infrastructures, economic processes, and governmental frameworks in different spheres of life, shifting cultural practices (Poell et al., 2019), through a process of "platformization" (Helmond, 2015). In the case of a historically informal and invisibilized type of job, domestic services, platforms have been a door to formalize relationships, in some cases the platform gaining visibility (Ticona and Mateescu, 2018; Van Doorn, 2017). However, the pursuit of visibility (Bishop, 2012) can be considered a disciplinary mechanism where the algorithm determines what is desirable and popular, where users need to modify their behavior to comply with the perceived requirements (Bucher, 2012).

In this article, we delve into two main issues. On one hand, how influencer cultures have originated new practices, what Bishop (2023) calls 'influencer creep', specifically regarding self-branding, optimisation, and authenticity. On the other hand, we analyse the competences domestic workers develop to build and maintain their visibility on platforms. By "playing the visibility game" (Cotter, 2019), there is a process of surveillance, discipline, and control (Bucher, 2012); yet, a process of interpretation and testing the platform's functioning, affordances, and architecture (Petre et al., 2019; Sutherland et al., 2020).

We conducted a qualitative content analysis of 36 profiles in six platforms of cleaning, care, and temporary accommodation, to understand the design and requirements of these platforms concerning workers' practices. In addition, we interviewed 10 workers to gain insights into their daily online and offline routines and their perceptions regarding the use of work platforms and content creation for labor-related purposes.

The content analysis showed a common design of the six platforms (despite their service differences), with a series of parameterized features to expose performance metrics, combined with features that promote content creation, such as the writing of profile descriptions, catchphrases, and posting pictures related to their image, the services, or their previous experience. Within the interviews, we identified a complex set of competences, predominantly related to social management (with practices such as convincing customers via private messages, giving presents to customers, or managing negative comments on their profiles), content creation (e.g. taking and posting "authentic" pictures to set customers' expectations) and resource management (e.g. knowing the response time requirements and the functioning of the rating systems).

Therefore, this study contributes to the previous literature on learning in online environments with competences such as content production, individual and social management, and risk management (Scolari et al., 2018), and associated with the gig economy, such as algorithmic and gig literacies (Glotfelter, 2019; Koenig, 2020; Sutherland et al., 2020). Thus, domestic work in platforms is not only about delivering a service and building connections and trust in a shared physical space (Raval & Dourish 2016) but also managing their visibility similarly to what influencers do in social media (Bishop, 2023; Duffy & Hund, 2019).

Keywords: platform work; domestic work; competences; literacy; influencer

MLC01 Media literacies and communication competencies

PP 0701 Frontline knowledge: Digital media literacy of older adults in Ukraine

Olga Pasitselska¹

¹ The University of Groningen, Centre for Media and Journalism Studies, Groningen, Netherlands

In modern conflict zones digital literacy becomes crucial, as conflicts themselves become increasingly digitized and hyperconnected (Merrin, 2018). While a dangerous environment raises the need for orientation, propaganda and fakes discourage people's sense-making efforts (Pasitselska, 2022). Older adults, who often experience digital and social exclusion due to lack of digital literacy (Holgerson et al., 2019), are especially vulnerable to mis- and disinformation. While research, focusing mostly on Northern Europe, has studied digital media practices of older adults (Rasi et al., 2020), there is very little knowledge on digital media use and resilience of older adults in conflict zones (de Vries-Kedem & Rabho, 2021). Drawing on 8 focus groups with Ukrainian older adults across the country, this paper explores specific challenges and compensation strategies of older adults during the digital war. The study involves both Internet users and non-users, to understand the barriers of Internet access, as well as more advanced practices of social media and messenger app use. An inductive-qualitative analysis identifies three main factors that shape digital practices and dictate literacy needs of the Ukrainian older adults: self-(in)efficacy, social ties, and material infrastructure. The study demonstrates that perceived self-(in)efficacy defines the depth of engagement

with media sources and critically affects attitudes towards privacy and data protection online. It highlights the crucial role of family members in setting up the digital infrastructure of the older users, and in prescribing their media diet. Furthermore, the study reveals that diversity of available media sources and digital devices enables more extensive fact-checking practices. In light of these findings, the study suggests to promote information control and psychological resilience when intervening with media literacy training, while also emphasizing the importance of continuous technical and monetary support for older adults. This research contributes to further understanding of media literacy needs of older adults, and lays the foundation for developing digital literacy study programs for older adults in conflict zones.

CEE01 Disruptions and solutions in communication systems of Central and Eastern Europe

PP 0148 Narrative Twist: A study of Facebook groups for Russian speakers in Finland

[Ilkham Khalimzoda](#)¹

¹ University of Jyväskylä, Language and Communication Studies, Jyväskylä, Finland

Russian speakers in Finland exhibited a notable preference for and engagement with non-Russian news media sources and bi-cultural (not isolative) orientation in Finland (Khalimzoda and Siitonen, 2022). However, the eruption of the Ukrainian conflict has triggered a surge in (counter) disinformation (Babacan & Tam, 2022), transforming social media into a volatile arena of competing war opinions, often characterized by divisive twist and tone of the group moderator(s). This phenomenon is particularly pronounced in the two largest Facebook groups for Russian speakers in Finland, boasting over tens of thousand followers.

Understanding the intricacies of how this phenomenon affects Finland's Russian-speaking community and how they navigate under the informational pressure of their country of origin and destination is of paramount importance (Davydova-Minguet et al., 2019). Against this backdrop, this study delves into the transformation of these groups into arenas of competing war opinions and (counter) disinformation, with specific attention to discussions surrounding Western sanctions against Russia, Finland's economic challenges, and broader political discourse on Russia-West. Of particular interest is the role of group moderators, who often adopt provocative commentary journalism styles to influence the tone of otherwise neutral news reports. The study aims to analyze whether such twisting and tone-setting practices are systematic and thus strategic, potentially qualifying as disinformation, or if they occur infrequently. Drawing on the concepts of disinformation (Iretton & Posetti, 2018) and narrative twist (Phelan, 2008), a content analysis of the groups will be conducted to examine the presence and the nature of narrative twists, exploring whether they contribute to the dissemination of disinformation within these online communities.

Anticipated findings encompass a nuanced understanding of how Russian speakers in Finland navigate the surge in (counter) disinformation and participate in discussions surrounding Western sanctions, Finland's economic challenges, and broader political discourse. Moreover, this research aims to identify potential solutions and strategies for mitigating the divisive effects of disinformation and online tensions within these communities. By shedding light on these dynamics, the study contributes to enhancing media literacy and promoting constructive dialogue in a multicultural society even in times of geopolitical instability.

CEE01 Disruptions and solutions in communication systems of Central and Eastern Europe

PP 0149 Popularity, commitment, and virality. Assessment of the strategic communication of COVID-19 immunization in Romania and Moldova

[Camelia Cmeciu](#)¹, Anca Anton¹

¹ University of Bucharest, Faculty of Journalism and Communication Studies, Bucharest, Romania

Vaccination was seen as a solution to the disorder that COVID-19 pandemic has brought worldwide. Therefore, message strategies used to increase (COVID-19) vaccination among population should be of great concern among (inter)national authorities especially within the context of vaccination criticism, misinformation and medical populism (Lasco, 2020). Studies (Kata, 2010; Dubé et al., 2015; Ward & Budarick, 2021; Su et al., 2022) have showed that health professionals should consider both fact-based scientific strategies, on the one hand, and emotional strategies through personal stories and humor, on the other hand.

The purpose of this study

In this study we focus on a comparative assessment of the COVID-19 vaccination communication strategies employed by two governments in Eastern Europe during the pandemic, namely Romania and Moldova.

Methodology

We used CrowdTangle to extract all the Facebook Romanian and Moldovan governmental posts (N = 4066, Facebook is the most used social media platform in the two countries). ExtractComments will be used to extract the comments to the posts with the highest engagement rate. Employing Loft et al.'s (2020) content strategies categories, Gilpin et al.'s (2010) model of socially mediated authenticity and Bonsón & Ratkai (2013)'s metrics of engagement assessment, we will adopt a top-down and bottom-up perspective. The top-down approach will focus on the identification of (1) the message strategies the Romanian and Moldovan authorities used in the vaccination communication campaign; (2) the message strategies with the highest engagement rate; and (3) the relationships between message strategies and popularity, commitment, and virality. Regression analysis will be carried out.

Since "perceived authenticity" (Gilpin et al., 2010) emphasizes the importance of interaction and since multiple voices and potential counter-discourses are present in online users' narratives (Breeze, 2021), the bottom-up

approach will focus on the identification of Romanian and Moldovan users' stances on (COVID-19) vaccination based on post-comment interaction. Topic modeling (WordStat) will be employed to assess the comments.

While current research identified probable causes for the high level of vaccine hesitancy in Eastern Europe (Mihelj et al., 2022), we consider that this twofold approach to governmental strategic communication may constitute an important insight on understanding the online vaccine skepticism in Romania and Moldova.

CEE01 Disruptions and solutions in communication systems of Central and Eastern Europe

PP 0150 Offering solutions instead of nurturing conflict? Czech solutions journalists' perception of the role of the media economy in the acceptance of the solutions journalism approach

[Lenka Vochočová](#)¹, Jana Rosenfeldová¹

¹ Charles University- Faculty of Social Sciences, Department of Media Studies, Prague, Czech Republic

Recent crisis times in which one crisis (the war in Ukraine) seems to follow another (the COVID-19 pandemic) represent a challenge to all societal segments, including the media and journalistic professionals. In the context of the Czech Republic, a post-transformation country with a relatively small media market and recent economic struggles, this paper discusses the possible impact of global crises on the journalistic profession, mainly its routines and general approaches.

We are theoretically informed by studies stressing the heightened need to build on solutions journalism principles during crisis times, both in news gathering and news writing, thus significantly changing the role journalism plays in society. It is essential, the proponents of solutions journalism argue, to enable communication between the different sides affected by the crisis, as well as to try to offer resolutions to the conflicting situations. Scholars call for an engaged, active approach to reporting and a focus on dialogue and discussion about the problem resolution, rather than sticking to the conventional news style embracing detachment, independence, polemics, and differences. Such transparent and solution-oriented informing is connected with a positive psychological impact on audiences in recent studies. It is also associated with possible economic benefits for the medium, mainly the chance to overcome the problem of audiences's disengagement. However, research results are inconclusive.

We conducted in-depth, qualitative interviews with 12 Czech solutions journalists or journalists awarded for solutions articles to identify how they perceive the position of and support for solutions journalism in the profession and its relation to crisis events and global crises. Sample diversity was ensured by interviewing professionals representing a mix of gender identities, professional experience (age), different working positions, and different media outlets, both mainstream and specialised, nationwide and regional. Data were analysed employing coding procedures of Grounded Theory.

Our results reveal that even those journalists who employ solutions principles only as part of their otherwise more conventional reporting stress the importance and positive impact of solutions approach, mainly in relation to crisis coverage. However, they consider the position of solutions journalism as marginal/ised and endangered, mainly because positive stories are usually not successful in terms of audience reactions (the click economy). Thus, whereas they believe that solutions journalism may attract specific audiences tired of negativity in the media, they strongly reflect the media economy when thinking about the approach. They reveal that solutions journalism represents a rather strange element in the Czech media sphere, pushed "from above", mainly by non-profits' trainings aimed at cultivating journalism and the media sphere in the Czech Republic. They appreciate this influence and believe that journalistic awards for solutions journalism are helping significantly in the acceptance of the approach in the newsrooms. The prestige these awards represent may serve as a competing decision-making factor among editors who are considering their support of solutions journalism.

CEE01 Disruptions and solutions in communication systems of Central and Eastern Europe

PP 0151 Echoes of the Cold War – Post-socialism and social criticism in contemporary Eastern European popular media

[Veronika Hermann](#)¹

¹ Eötvös Loránd University, Department of Media and Communication, Budapest, Hungary

There has been an emerging scholarly interest in post-Cold War Eastern Europe: the revival of Cold War themes and genres in popular culture, the debates on the 1989 transitions and the rise of postmodern populist political leaders put the region back into the limelight. The portrayal of the political, social and cultural aspects of the state socialist period has been constantly changing since the transition. Representation is not only generic and aesthetic, but also politically determined. The most significant stages in this process in recent years have been the illiberal cultural policy and the complete politicization of national film production in Hungary where they expect political loyalty in return for financial support. This practice is in contrast with productions of global media companies that famously formulate social criticism towards contemporary authoritarian tendencies in the region.

I intent to show the entanglements of illiberal states and neoliberal platform imperialism and the relationship between transnational aesthetic formats, regional political ideologies, and post-socialist cultural hierarchies by analyzing media texts such as Czech series *The Sleepers* (Bez vědomí, HBO, 2019), Hungarian *The Informant* (A besúgó, HBO Max, 2022), and Romanian *Spy/Master* (Max, 2023).

These series are merging classic spy culture of the Cold War era with networks of capitalist surveillance technologies and highlight patterns in which Cold War aesthetic and generic themes have reproduced themselves in contemporary culture. I examine bonds of power and representation in pre-figurative spectacles of state socialist regimes, personal and political legacies, aesthetic and social codes, and strategies of cultural colonization. Relying on comparative narrative- and textual analysis, this lecture argues that contemporary Eastern European serial products are utilizing a transnational, Westernized image of (post-)socialism to address tendencies of contemporary political authoritarianism and populism. All of these television products represent a hybrid generic repertoire and they are concerned with the region's troubled past, using state socialist regimes as allegories of alarming issues such as white nationalism, right-wing populism, surveillance and social control. These notions serve as analytical terms in the presentation.

PP 0051 Exploitation and empowerment: Challenges and opportunities to women at the AI era

[Miaotong Yuan](#)¹

¹ Communication University of China, School of Music and Recording Arts, Beijing, China

The era of artificial intelligence provides women with a new ecosystem for survival and development. At the same time, we should aware that, exploitation and empowerment coexist in this process. On a global scale, women are 25% less likely than men to understand how to use digital technology, and also less likely than men to understand how to use computers for programming and apply for information and communication technology patents. UNESCO points out that the development, use, and deployment of AI systems may replicate and amplify existing gender biases, and generate new biases. Lack of diversity in data, programming teams, or methods can lead to biased artificial intelligence tools producing discriminatory results.

At present, the threats and challenges posed by AI to women mainly manifest in the following aspects. Firstly, there is algorithmic discrimination, include mirror isomorphism, real coupling interaction and associative crossover. The bias caused by flawed datasets and datasets is significant for women. In the era of artificial intelligence, as a new type of social right, algorithms and big data may indeed bring widespread and systematic gender discrimination risks to women's digital survival. The risk of gender discrimination in algorithms exists at all stages of the algorithm's entire lifecycle. Compared to traditional discriminatory behavior, algorithmic discrimination has hidden, systematic, and repetitive characteristics, resulting in amplified gender discrimination and structural targeting of women's disadvantaged positions, which have important consequences that affect the daily lives of citizens.

Although human society is transitioning towards digitalisation and deep use of AI, women's basic rights, including the right to education, political rights, and even the right to health, are relatively lagging behind. Therefore, it is necessary to promote women's digital empowerment. At the individual and community levels, through policy analysis and case studies, this article will combine resources, actions, and achievements to seek feasible paths for promoting women's empowerment in the AI era.

PP 0052 Academia as a safe and comfortable space for exclusionary, institutionalized subjectivities

[Marta Roqueta-Fernández](#)¹

¹ Universitat Oberta de Catalunya, GenTIC- Researching Gender in the Network Society, Internet Interdisciplinary Institute- IN3, Barcelona, Spain

This research proposes considering academia as a safe and comfortable space for those who reproduce cis-hetero-sexist, racist, classist and/or ableist subjectivities. The aim of this approach is to understand how academia, as an ideological state apparatus (Althusser, 1974), is both an institution invested in the perpetuation of the exclusionary ideologies that shape the liberal, democratic state; as well as a site organized by them.

First, it explains why academia can be considered a safe and comfortable space for those reproducing institutionalized, exclusionary ideologies. It does so by drawing on the theory of *corporeal geographies* of Barjola (2018), the concept of *dependent individuality* of Hernando (2015), as well as on Ahmed's queer phenomenology (2006). Through the work of Arranz (2015), Brah (2004) and Ortner (2005), it argues that academia perpetuates exclusionary ideologies and is ruled by them thanks to the reproduction of exclusionary subjectivities that inform how scholars produce knowledge and relate with others at universities.

This is illustrated by two examples. The first reflects on how sexual harassment is mostly dealt through the lens of restoring the prestige of the university by ensuring the safety and comfort of the cisgender male aggressor, considered as embodying and signifying that institution. The second analyzes the backlash towards the *Decolonize the curriculum* initiative spearheaded by the students of London's School of Oriental and African Studies to argue that exclusionary subjectivities, perceived as universal thanks to their institutionalization, shape common understandings of critical thought and freedom of speech to privilege the reproduction of those situated knowledges (Haraway, 1988) that best suit the needs of institutionalized ideologies.

This proposal, thus, rejects mainstream discourses that see issues like the promotion of freedom of speech and critical thought as incompatible with the transformation of universities into safe and comfortable spaces for everybody. It does so by unveiling how institutionalized, exclusionary ideologies shape academic understandings of freedom of speech, critical thought, knowledge-production methods and inclusivity policies. All of them aimed at preserving the safety and comfort of those who reproduce exclusionary subjectivities, while legitimating the violence and discomfort endured by those who contest them.

PP 0053 Motherhood in journalism: The impact of precarization on parenting strategies of women journalists

[Hana Řičicová](#)¹, Karolína Hájková¹

¹ Charles University Prague, Department of Media Studies, Prague, Czech Republic

In the demanding profession of journalism, navigating family planning is a significant challenge. This issue becomes more pronounced for women journalists in precarious employment situations without a formal employment contract. In their case, risks associated with precarious employment are heightened due to reduced maternity and parental benefits, along with the absence of a guaranteed job return following parental or maternity leave. This paper examines the job insecurity faced by women journalists, with the research objective centred on understanding how precarity impacts their parenting strategies within the field.

There are many studies focusing on precarity (Hesmondhalgh & Baker, 2013; Standing, 2011), changes in journalistic work (Deuze, 2007; Muehlberger, 2007), and women in journalism (Byerly, 2011; De Vuyst & Raeymaeckers, 2017; Ross, 2014) but a thorough understanding of the intersection between journalistic profession and women's parenting strategies in the context of precarity is lacking. This represents a notable gap in media industry research, as the job insecurity faced by women journalists exemplifies a key structural disadvantage within the journalistic labor market. It is increasingly women who are seeking precarized or part-time work, because they see a more accessible combination of work and care (Fudge & Owens, 2006).

It builds on 14 in-depth interviews with women journalists from diverse media outlets, exploring their perceptions, and strategies they employ to address the intersection of precarity, careers in journalism and parenting. By centering our research on Czech women journalists, we address an additional gap, as existing studies on journalists and precarity predominantly concentrate on Western countries. Central and Eastern Europe – with its unique history of state-sponsored women's emancipation projects and rapid transformation and liberalization after 1989 – constitutes a critical socio-political context for our study. Czechia, one of the countries of the region, exemplifies distinct post-socialist characteristics, including restrained gender equality and a notable embrace of neoliberal trends.

Our research reveals that women journalists are largely self-reliant, lacking systemic support. In the absence of a supportive family background or a partner capable of taking parental leave, these journalists face significant challenges in planning for parenthood. They often depend on positive relationships with their superiors and individualized approaches. However, this reliance hinders the establishment of systematic work-life balance measures within editorial offices and the broader journalism field.
