List of Figures

2.1 *Simplified sketch of the principle of operation of an OTHR-SW system.* 6
2.2 *Need of a CR process to determine the real signal path in OTHR-SW applications.* 7

3.1 *Various HF waves propagation-mode in the Atmosphere.* 10
3.2 *Sketch of the different radar coverage provided by a Sky-Wave and a Ground-Wave OTHR systems and by a $\mu-$wave coastal radar.* 11
3.3 "Chain Home" *HF radar network: sketch of the coverage area and picture of some tx and rx antennas.* 12
3.4 *Antenna systems of the abandoned soviet OTHR-SW system* "Duga-2" *that was part of the* "Chernobyl-2" *radio/radar facility.* 13
3.5 *Antenna's Array of one of the USAF OTH-B radar system located in Moscow, Maine.* 15
3.6 *JORN: displacement of OTHR-SW and ionospheric sensors and radar-coverage map.* 16
3.7 Antenna Systems for the HFSWR: SECAR (A and B) and WERA (C and D). . . 19
3.8 *Achievable range distance comparison between OTHR-GW and microwave coastal radars.* 20
3.9 *The French OTHR-SW "NOSTRADAMUS".* Clockwise from up-left: a picture of the previous airport with the Y-shaped antenna array on top; the antenna array configuration with central elements employed alternately in Tx and Rx; a sketch of the single radiating element of the antenna with the switch between Tx/Rx; a picture of the antenna elements called "Diablos". 22
3.10 *Scheme of the geometri of a bistatic OTHR Sky-Wave.* 23
3.11 *Antenna configuration for the transmitting (left) and the receiving (right) arrays of a bistatic US Navy OTHR-SW.* 24
3.12 *Block diagram of an OTHR-SW system in a pseudo-monostatic configuration.* . 25
3.13 *Scan of the surveillance area by the OTHR-SW system.* 27
3.14 *Bi-conical monopole antenna and radiation diagram in the elevation plane for $f = [2, 7, 30]$ MHz.* 29
3.15 Example of the evaluation of minimum (red) and maximum (blue) frequencies in function of the ground-range distance and the take-off angle. 32

3.16 *Noise in the HF band.* The x axis shows the frequency [MHz] (in a logarithmic scale), while the y axis reports the mean value of the noise figure F_{am} expressed in dB/(Thermal noise at $T_0 = 288$ K). The continuous lines represent the *Anthropic Noise*, the dashed lines correspond to the *Atmospheric Noise* and the dotted line shows the *Cosmic Noise* [21]. 34
3.17 Typical example of *Earth backscattered Doppler Spectrum* [46]. 37
3.18 *Study of sea surface currents with an HF radar system.* **(A)** sketch of the principle of an HF OTHR-GW system. **(B)** First order component of the Sea Spectrum in two different cases: no radial component of surface current (top) and presence of a surface current in the direction moving toward the radar (bottom). 39
3.19 *Normalized Doppler Spectrum of Sea Surface Backscattering at a frequency of 9.4 MHz*: The carrier is centred in 0 Hz, while ± 1 corresponds to a Doppler shift of ± 0.313 Hz. The frequency resolution is 0.01 Hz. [30, 46, 52, 18, 48]. . . . 40
3.20 *Normalized Doppler Spectrum of Sea Surface Backscattering for two different azimuthal directions*: The upper curve is relative to a "stormy" sea region, while the lower curve is relative to a region with a reduced sea activity. [30] 41
3.21 Top: Scattering mechanism and its dependency upon the ground slope and the signal incidence angle. Bottom: an example of Digital terrain Elevation Model (DEM). 42
3.22 *Differences in the employment of a binary or multivalued mask of the HF backscattering coefficient.* 44
3.23 *Normalized Backscattering Profile* of a metallic sphere of radius r. 45
3.24 An example of "stealth" targets. The stealth technique is developed against $\mu-$wave radars and it is ineffective against HF radar systems. 48
3.25 Sketch of the geometry of target's illumination by the radar. 48

4.1 *Electron Density Profile (right) and scheme of the layered structure (left) of the Ionosphere.* 50
4.2 *Interaction of the HF signals with the Ionosphere in respect of parameters β (take-off angle) and f (signal's frequency).* 52
4.3 *Time scale of the most common Ionospheric Disturbances.* 54
4.4 Scheme of the "Multi Quasi-Parabolic Ionospheric Model" (MQPIM) [26]. . . . 57
4.5 *Geometric losses of HF signals in function of range distance for the two frequencies that limit HF band.* 60
4.6 *Scheme of multiple paths of the HF signals in OTHR-SW applications.* 61
4.7 *Possible propagation modes in a simulated OTHR-SW scenario.* 62
4.8 *Multi-mode propagation paths generated with a raytracing software.* 63

5.1 *Counterclockwise from the top: Global Ionospheric Radio Observatory (GIRO) Map; An example of digital Ionogram; The Lowell Ionosonde and its antenna in the four-elements configuration.* 66
5.2 *OTHR-SW scenario in case of employment of HF transponder.* 68

5.3 Map of HF beacon stations around the World and picture of the *VK6RBP* HF beacon located near Perth, Australia. 69
5.4 *Coordinate Registration with target of opportunity.* 70
5.5 *Sketch of two OTHR-SW with partially-superimposed surveillance areas.* 72
5.6 *Simplified scheme of the Forward-Based Receiver Augmentation (FBRA) for OTHR-SW systems.* 73

6.1 Simplified scheme of the geometry assumed for the radar beam (side-view on the top of the figure) and the radar footprint (top-view on the figure's bottom). I indicates the down-range length of the footprint, while A represents its approximated surface. 77
6.2 Example of the application of three possible methods for the definition of the surface clutter mask. 78
6.3 *Sketch of the side-view of the simulated OTHR-SW's scenario with description of geometric parameters. Note that the scheme is not on scale in order to simplify the visualization of the geometric parameters. Consider that the average radius of Earth is about 20 times the height of the maximum of the ionospheric e^- density.* 79
6.4 *An example of SLBM for an azimuthal direction that gives four sea/land transitions.* 80
6.5 *Trapezoidal function: T_P is the rise time and T_L the central duration.* 84
6.6 Sketch of the expected signal power of the echo after the transmission of a single pulse in two different hypothesis for σ_c. 86
6.7 *Mean error* and *Error's Standard Deviation* in the estimate of the Sea/land transition position for $T = 0.1$ ms (left side) and $T = 0.05$ ms (right side). 88
6.8 *Mean Positioning Error* vs *Clutter-to-Noise Ratio* (CNR) for $T = 0.1$ ms (left side) and $T = 0.05$ ms (right side). 88

7.1 *Scheme of the OTHR-SW simulated scenario with repartition in three main model blocks and presentation of the geometric parameters.* 92
7.2 *Main hypotheses initially formulated to implement a model of the OTHR-SW scenario.* 93
7.3 *Simplified sketch of the OTHR-SW geometry.* 95
7.4 *Another scheme of the simulated OTHR-SW scenario with emphasis on the radar footprint model and on the projection of the pulse to the ground.* 95
7.5 *Three of the main assumptions to model the ionospheric propagation channel.* . 97
7.6 Evaluation of the normalized backscattering coefficient σ_0 for a general surface element ΔS. 98
7.7 East-Mediterranean area with an OTHR-SW footprint sample including a sea/land transition. Simulation parameters are listed in the text. 100
7.8 Flow diagram of the simulation process. 101
7.9 Visual scheme of the process employed to simulated the received OTHR-SW echo. 102
7.10 Zoom of the OTHR-SW footprint sample presented in Fig. 7.7, and segmentation of the geographic area in squared surface elements ΔS. The algorithm evaluates the backscattering coefficient for each single patch. 103

7.11 Two consecutive instantaneous clutter realization simulated for a squared (half sea, half land) surface partitioned into 2500 squared patches. 104
7.12 Temporal characteristic (250 samples) of clutter (amplitude and phase are plotted with a continuous line and dots, respectively) relative to one of the sea-patch elements composing the proposed simulation scenario. Simulation duration: 10 ms; sample period: 0.04 ms. 105
7.13 *Snapshot of a Simulation Result:* on the left side the main radar parameters are presented with emphasis on: sea and land backscattering coefficients (σ_m, σ_t); actual and estimated ionospheric reflection height (h_{eq}, h_{est}); Clutter-to-Noise Ratio (CNR). On the right side the plot of amplitude vs range. 106

8.1 Top view of the surveillance area and zoom of the expected radar footprint (after the evaluation of the clutter contribution) for the simulation proposed in section 8.5. 111
8.2 Electron Density Profile extracted from the IRI database for the simulation proposed in section 8.5. 112
8.3 Simulated Clutter Model for the application of the SLTI method to a Ionospheric Probing test. 114
8.4 Chosen electron density profile and relative simulated echo (top); Set of electron density profiles extracted from IRI and relative rough returns. 115
8.5 The 21 extracted electron density profiles and the relative curves of the equivalent ionospheric reflection height (H_{eq}) in function of the elevation angle evaluated by the raytracing algorithm. 116

A.1 Radar Coverage theoretically provided by the OTH-B HF system. 124

B.1 Surveillance area in the hypothesis of two OTHR-SW systems placed in Sardinia and in the center of Italy, both with 90° azimuthal amplitude and a range of 600 to 3000 km. 131
B.2 *Concentric Circles Tx Array.* Clockwise from the left: top view of the 50 elements Rx array (the double rectangle has the surface of a soccer field: 110 by 90 meters); 3d view of a single radiating element; 3d view of a portion of the Tx antenna. . 132
B.3 Radiation Diagram for the *"dragonfly"* configuration illustrated by the previous picture. 133
B.4 *Concentric Circles Tx Array.* Clockwise from the left: top view of the 50 elements Rx array (the double rectangle has the surface of a soccer field: 110 by 90 meters); 3d view of a single radiating element; 3d view of a portion of the Tx antenna. . 134
B.5 *Reversed-cone antenna*: 3d view and side view with geometric parameters. . . . 134
B.6 Effective Radiated Field (top) and relative regions of influence for the two study cases presented in table B.1. 137
