## Introduction

## Chapter 1: Hydroxylated pipecolic acids in nature and in bioactive compounds

L-Pipecolic acids (Figure 1) are cyclic, naturally occurring nonproteinogenic $\alpha$-amino acids which have been isolated from plants, fungi, microorganisms and human physiological fluids ${ }^{1}$. The simplest of them, ( $\mathbf{1}$, Figure 1 ) is the major product of the degradation of lysine in human brain $^{2 \mathrm{a}}$ and it accumulates in the body fluids causing pipecolic acidemia in subjects suffering from Zellweger syndrome, neonatal adrenoleukodystrophy, and infantile Refsum disease ${ }^{2 b, c}$.
L-pipecolic acid $\mathbf{1}$ is a component of a wide range of pharmacologically active compounds, such as for example, the immunosuppressive agents rapamycin ${ }^{1 \mathrm{c}, 3}$ (Figure 2) and FK506 ${ }^{1 \mathrm{c}, 4}$ (Figure 2) the antitumor antibiotic sandramycin ${ }^{5}$ (Figure 2) and the local anesthetic analogue ropivacaine ${ }^{6}$ (Figure 2). Monohydroxy-substituted derivatives 2-7 (Figure 1a) are natural compounds which could be considered expanded hydroxyproline and serine analogues; they play an important role in medicinal chemistry as molecular scaffolds for the preparation of conformationally restricted peptides and pharmaceutically active substances or because they are essential structural components of naturally occurring compounds possessing noteworthy biological activity ${ }^{1 \text { 1a-b }}$.
So, 3-hydroxypipecolic acid 2 (Figure 1a) is embedded in the natural antitumor antibiotic tetrazomine ${ }^{7}$ (Figure 2) and 4-hydroxypipecolic acid 4 (Figure 1a) is incorporated in the structures of the HIV-protease inhibitor palinavir ${ }^{8}$ (Figure 3) and some antagonists of the cholecistokine hormone ${ }^{9}$ (Figure 3). 4-Hydroxypipecolic acid 4 has also been used for the preparation of one of the most potent and selective $N$-methyl-D-aspartic acid (NMDA) receptor antagonists, CGS20281 ${ }^{10}$ (Figure 3) and LY272541 ${ }^{10}$ (Figure 3).
Naturally occurring 4-hydroxypipecolic acid derivatives form the largest subgroup of substituted pipecolic acids and include the cyclodepsipeptide antibiotic virginiamycin S1 ${ }^{11}$ (Figure 3), isolated from Streptomyces virginiae, serotonine receptor antagonist damipipecoline ${ }^{12}$ (Figure 3) recently isolated from Axinella damicornis sponge, ovalin (Figure 3) from leguminose Milletia ovolifolia seeds ${ }^{13}$, tumor necrosys factor $\alpha$-converting enzyme inhibitor ${ }^{14}$ (Figure 3) and a sulphate compound possessing NMDA receptor agonistic activity ${ }^{15}$ (Figure 3) from legume Peltophorum africanum. Pseudoconhydrine (Figure 3) is an example of natural compound embedding a reduced 5-hydroxypipecolic acid skeleton ${ }^{16}$.

Pipecolic acids bearing two or three hydroxyl groups (8-12, Figure 1) are much less widespread in nature and were isolated from just a few sources. 4,5-Dihydroxypipecolic acid $\mathbf{8}$ was extracted from the leaves of Derris elliptica ${ }^{17 \mathrm{a}}$, isomer $\mathbf{1 1}$ from D. elliptica ${ }^{17 a}$ and Calliandra haematocephala ${ }^{17 b}$, where it has a role in the specific resistance of plants to fungi ${ }^{18}$, and compound 9 from the leaves of Calliandra angustifolia and the sap of C. confusa ${ }^{19}$.

Cis,cis compound 10 has been detected by GC-MS in extracts from Tetraberlinia polyfilla together with $\mathbf{9}$ and isolated from the leaves of $C$. pittieri ${ }^{20}$. Similarly, compound $\mathbf{1 2}$ is the only trihydroxypipecolic acid known from natural sources as it has been isolated from the seeds of Baphia racemosa ${ }^{21}$.

## Chapter 2: Previous syntheses of mono-hydroxypipecolic acids

Because of their medicinal applications it is not surprising that there has been much interest in developing synthetic strategies to attain enantiopure 3-, 4-, and 5-hydroxypipecolic acids.

### 2.1 Synthesis from amino acids

The most common source for the starting materials for the asymmetric synthesis of pipecolic acid derivatives are linear proteinogenic $\alpha$-amino acids. General strategies involve the functionalization of the side chain followed by cyclization reaction with the $\alpha$-amino group.

L-pipecolic acid and 3-hydroxypipecolic acid have been prepared from hydroxyproline and serine derivatives, using a ring closing metathesis as the key step ${ }^{22 a, b}$. The strategy involves the formation of an alkene side chain from an hydroxy group. Allylation of the $\alpha$-amine followed by RCM reaction gives the pipecolic acid rings. For example, serine derivative $\mathbf{1 3}$ (Scheme 1) was converted in two steps into alcohol 14.

## Scheme 1

Schema 1: Reagents and conditions: (a) $\mathrm{DMSO},(\mathrm{COCl})_{2}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; (b) vinyl magnesium bromide, THF, $62 \%$ over two steps; (c) MOMCl, DIPEA, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 82 \%$; (d), NaH , allyl bromide, DMF, $90 \%$; (e) Grubbs I catalyst, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 84 \%$

This was subject to Swern oxidation and the resulting aldehyde was treated with vinylmagnesium bromide to give an inseparable mixture of syn- and anti- allylic alcohols $\mathbf{1 5}$ in a 87:13 ratio, respectively. Protection of the secondary alcohol as methoxymethyl (MOM) ether
and allylation of the tert-butyloxycarbonyl (Boc)-derived amine gave the ring closing metathesis ( RCM ) precursor 16, which at this stage could be separated from the minor anti-diastereoisomer. Reaction of diene 16 with Grubb's first generation catalyst gave dihydroxypiperidine 17 in 84\% yield. Hydrogenation, oxidation of the resulting primary alcohol, followed by deprotection allowed the preparation of $(2 S, 3 R)$-3-hydroxypipecolic acid $\mathbf{2}$ in good overall yield.

A one-pot imine reduction and conjugate addition has been used for the preparation of 6substituted 2,6-trans-4-hydroxy-L-pipecolic acid ${ }^{23}$. Reaction of aspartic acid derivative $\mathbf{1 8}$ (Scheme 2) with the anion of dimethyl methylphosphonate gave corresponding ester 19 in $84 \%$ yield. This was used in a Horner-Wadsworth-Emmons reaction with various alkyl and aryl substituted aldehydes to give a series of E enones 20. A four-steps, one pot reaction process involving removal of the trityl protecting group, formation of the imine 21 followed by chemoselective reduction and conjugate addition gave 4-oxo-L-pipecolic acid 22 in modest yield. Reduction of $\mathbf{2 2}$ and deprotection of the amine and carboxylic acid functional groups under standard conditions gave novel 6-substituted 4-hydroxy-pipecolic acid $\mathbf{2 3}$ in acceptable overall yield.

## Scheme 2

Scheme 2: Reagents and conditions: (a) (MeO) ${ }_{2} \mathrm{P}(\mathrm{O}) \mathrm{Me}$, $\mathrm{n}-\mathrm{BuLi}, \mathrm{THF}, 84 \%$; (b) RCHO, $\mathrm{K}_{2} \mathrm{CO}_{3}$, $\mathrm{MeCN}, 57-96 \%$; (c) TFA, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ then $\mathrm{PhCHO}, \mathrm{Et}_{3} \mathrm{~N}, 4 \AA \mathrm{MS} ;(\mathrm{d}), \mathrm{NaBH}_{3} \mathrm{CN}, 29-53 \%$ over four steps

An highly efficient and common strategy for preparing functionalized pipecolic acid ring system involved the use of inter- and intramolecular reaction of amides with various carbonyl species. For example, Blaauw and co-workers applied this strategy with good results for the synthesis of ( $2 S, 2 R$ )-5-hydroxypipecolic acid 7 and 6 -substituted derivatives ${ }^{24}$ (Scheme 3).

## Scheme 3

Scheme 3: Reagents and conditions: (a) TsOH, DMF, toluene, $98 \%$; (b) $\mathrm{Oxone}^{\circledR}, \mathrm{NaHCO}_{3}, \mathrm{MeOH}, 98 \%$; (c) $\mathrm{H}_{2}$, $\mathrm{Pd} / \mathrm{C}$; (d) $6 \mathrm{M} \mathrm{HCl}, 93 \%$ over two steps; (e) $\mathrm{Ac}_{2} \mathrm{O}, \mathrm{Et}_{3} \mathrm{~N}$, DMAP, $99 \%$; (f) TMS-R, Lewis acid, MeCN; (g) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}$, 82-92\% over two steps

Upon treatment with $p$-toluensulphonic acid in refluxing toluene of acetal 24 (Scheme 3) a smooth cyclization-elimination reaction occurred, providing enamine 25 in $98 \%$ yield. Epoxidation of $\mathbf{2 5}$ in presence of methanol, the key step of the synthesis, resulted to give the $N, O$-aminal 26 in $98 \%$ yield and with $94: 4$ diastereoselectivity in favour of the $2 S, 5 R$ configurated product. Subsequent hydrogenation and hydrolysis of the methyl ester gave ( $2 S, 5 R$ )-5-hydroxypipecolic acid 7 in high overall yield. $N, O$-aminal 26 proved to be a good precursor for the preparation of 6 -substituted derivatives using N -acyliminium chemistry. After protection of the 5 -hydroxy group, the N -acyliminium ion was formed by treatment with
$\mathrm{Sn}(\mathrm{OTf})_{2}$ as a Lewis acid. In situ reaction with a series of silyl nucleophiles gave the 2,6-cissubstituted products 28 as single diastereoisomers in high yields. The formation of the $6 S$ configured products is due to nucleophilic attack to the N -acyliminium ion in a pseudoaxial fashion.

Ene-type reactions performed under acidic or Lewis acid conditions have been employed for the stereoselective synthesis of 4-hydroxypipecolic acids.

For example, aldehyde 29 (Scheme 4), synthesized in six steps from $L$-homoserine 30, was subjected to a carbonyl-ene reaction in the presence of methylaluminum dichloride ${ }^{25}$. At room temperature this gave the cis,cis product which spontaneously lactonised to bicyclic pipecolic acid $\mathbf{3 1}$ in 79\% yield.

## Scheme 4

Scheme 4: Reagents and conditions: (a) $\mathrm{MeAlCl}_{2}, 79 \%$

Another strategy, in contrast to previous examples that used the cyclization of linear amino acids to form the pipecolic acid ring, involve ring expansion of cyclic amino acids ${ }^{26}$ (Scheme 5).

## Scheme 5

32

Scheme 5: Reagents and conditions: (a) ethyl diazoacetate, $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}, \mathrm{Et}_{2} \mathrm{O}, 90 \%$; (b) $\mathrm{NaCl}, \mathrm{H}_{2} \mathrm{O}$ (cat.), DMSO, $75 \%$

Hydroxy proline derivative $\mathbf{3 2}$ underwent a ring expansion reaction with ethyl diazoacetate in the presence of boron trifluoride-diethyl ether. The reaction gave a mixture of the two regioisomers 33 and 34, which after decarboxylation reaction afforded the 5-oxo and 4-oxo derivatives 35 and 36, which could be separated via $\mathrm{FCC} . \mathrm{NaBH}_{4}$ resulted as the better reducing agent to give C-4 and C-5 hydroxyl cis and trans derivatives with the highest yield and diastereoselectivity.

### 2.2 Synthesis from carbohydrates

Carbohydrates have been used in combination with key ring forming reactions for the preparation of hydroxylated pipecolic acid derivatives, in similar fashion to amino acids.
The chirality of the pyranoside or furanoside motif is generally used to introduce new stereogenic centres before the key cyclization step, or used directly as a component of the pipecolic acid ring.
Carbohydrates have been converted into chiral dienes and utilized in RCM reactions ${ }^{27 \mathrm{a}, \mathrm{b}, \mathrm{c}}$. As an example, Chattopadhyay reported a stereodivergent route to both enantiomers of $N$-tosylprotected L-pipecolic acids ${ }^{27 \mathrm{a}}$ in which they use aldehyde 37, prepared from D-mannytol ${ }^{27 \mathrm{c}}$ as key building block (Scheme 6).

## Scheme 6

Scheme 6: Reagents and conditions: (a) allylamine, $4 \AA \mathrm{MS}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 91 \%$; (b) allylzinc bromide, THF 66\%; (c) $\mathrm{TsCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 91 \%$; (d) Grubbs I catalyst, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 89 \%$; (e) $6 \mathrm{M} \mathrm{HCl}, 91 \%$ (f) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, \mathrm{EtOAc}, 100 \%$; (g) $\mathrm{NaIO}_{4}, \mathrm{RuCl}_{3}$ (cat.), $\mathrm{CCl}_{4}, \mathrm{MeCN}, \mathrm{H}_{2} \mathrm{O}, 73 \%$

Aldehyde $\mathbf{3 7}$ was allowed to react with allylamine under anhydrous conditions to give imine $\mathbf{3 8}$ which was treated with allylzinc bromide producing the addition products $\mathbf{3 9}$ and $\mathbf{4 0}$, with $\mathbf{4 0}$ as the major product ( $19 \%-47 \%$ ). The selectivity of the addition could be inverted using allylmagnesium bromide as nucleofile. Tosyl protection of product $\mathbf{4 0}$ was followed by RCM reaction with a first generation Grubb's catalyst which gave cyclic alkene 41 in good overall yield. Deprotection of the cyclohexylidene moiety in 41 led to the diol 42, followed by hydrogenation and oxidative cleavage of the diol unit, to give $N$-tosyl-L-pipecolic acid ( $\mathrm{N}-\mathrm{Ts}$ )-ent-1. Starting from alkene 41, the synthesis of 4,5-dihydroxylated compound was also described in the same report (see later for description of this route).

### 2.3 Chiral auxiliary based approaches

The main strategy in chiral auxiliary based approaches involves the use of a chiral amine source which eventually becomes the amine group of the pipecolic acid ring. For example, nitrone 1,3dipolar cycloaddition was used for the synthesis of pipecolic acid derivatives ${ }^{28}$.

## Scheme 7

Scheme 7: Reagents and conditions: (a) $\mathrm{Et}_{3} \mathrm{~N}, 4 \AA \mathrm{MS}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 68 \%$ (b) DIC, $\mathrm{HOBt}, \mathrm{Et}_{2} \mathrm{NPr}_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 52 \%$ (c) 1buthenol, $4643 \%, 4743 \%$ (d) $\mathrm{MsCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ (e) $\mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}$, MeOH (f) 6 N HCl , ent- $5100 \%$ crude, $554 \%$

The condensation of chiral amine (1R)-1-phenylethylhydroxylamine 43 (Scheme 7) with glyoxylic acid 44, followed by coupling with enantiopure amino acid produced nitrone 45, which is entirely present in $(\mathrm{Z})$ configuration. This selectivity is due to the strong hydrogen bond that stabilizes the nitrone. Treatment of $\mathbf{4 5}$ with 1-butenol led to 1,3-dipolar cycloaddition reaction, giving a 1:1 mixture of the isoxazolidines 46 and 47, which were readly separated by chromatography on silica gel. Mesylation of isoxazolidines 46 and 47 led to the formation of epoxylated intermediates 48 a and 48 that spontaneously open in derivative 49 a and 49, which were respectively converted into trans-4-hydroxypipecolic acids 5a and 5. Using a similar reaction sequence, starting from cyclic enantiopure nitrone, the synthesis of cis-4hydroxypipecolic acid was also described ${ }^{28}$.

### 2.4 Chiral synthons approaches

Chiral synthons were used for the synthesis of hydroxylated pipecolic acid derivatives.
Just as an example, for the synthesis of cis and trans 4-hydroxylated pipecolic acid $\mathbf{4}$ and ent-5, (3S)-4-ciano-3-hydroxybutanoate 50 (Scheme 8 ) from the chiral pool (ee $96 \%$ ), was chosen as a starting material ${ }^{29}$. The configuration of the -OH group in the final molecule is maintained from the starting material ${ }^{29 b}$.
The hydroxyl-group in $\mathbf{5 0}$ was protected as $t \mathrm{Bu}$ using a novel procedure ${ }^{30}$, which required the experimental conditions known to lead to the esterification of carboxylic acids, i.e. performing the reaction in tert-butyl acetate in the presence of a catalytic amount of $\mathrm{HClO}_{4}$. So, by stirring a solution of the alcohol 50 in tert-butyl acetate at $25^{\circ} \mathrm{C}$ for 24 hours in the presence of acatalytic amount of perchloric acid, protected compound $\mathbf{5 1}$ was obtained in 94\% yield after FCC. Compound $\mathbf{5 1}$ was involved in a Pt-catalyzed hydrogenation that gave lactam $\mathbf{5 2}$ in quantitative yield. Following protection of nitrogen as $\mathrm{N}-\mathrm{CO}_{2} \mathrm{Me}$ (53) the corresponding vinyl phosphate was prepared by treatment of $\mathbf{5 3}$ with KHMDS followed by addition of diphenyl chlorophosphate. Palladium-catalyzed methoxy-carbonylation of the phosphate in anhydrous DMF at 1 atm CO (balloon) finally gave the key ester intermediate $\mathbf{5 4}$ in $81 \%$ yield after chromatography.

The cis pipecolic derivative 55 was obtained by Pd-catalyzed hydrogenation of 54. In that conditions, 55 was obtained in a $20: 1$ ratio whit the trans derivative ${ }^{31}$. Finally, exhaustive hydrolysis of $\mathbf{5 5}$ gave cis $\mathbf{4}$ in $\mathbf{6 6 \%}$ overall yield from $\mathbf{5 0}$.
For the synthesis of trans isomer, the unsaturated ester $\mathbf{5 4}$ was reduced with Super Hydride ( $\mathrm{LiEt}_{3} \mathrm{BH}$ ). The reaction led to a $4: 1$ mixture of the desired trans and cis isomers, respectively. The two isomers were separated after deprotection of the -OH group and treatment of the
resulting alcohol mixture with PTSA in toluene at $100^{\circ} \mathrm{C}$. In that condition, only the cis isomer lactonized (57), so the remaining trans $\mathbf{5 8}$ was isolated and finally converted in the desired ent-5.

## Scheme 8

Scheme 8: Reagents and conditions: (a) t-BuOAc, $\mathrm{HClO}_{4}, 94 \%$ (b) $\mathrm{H}_{2}, \mathrm{PtO}_{2}, \mathrm{MeOH}, 100 \%$ (c) $n$ - $\mathrm{BuLi}, \mathrm{MeOCOCl}$, THF, $88 \%$ (d) KHMDS, $(\mathrm{PhO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{Cl}, \mathrm{THF}, 99 \%$ (e) $\mathrm{Pd}(\mathrm{OAC})_{2}, \mathrm{Ph}_{3} \mathrm{P}, \mathrm{CO}, \mathrm{MeOH}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DMF}, 81 \%(\mathrm{f}) \mathrm{H}_{2}, 10 \%$ $\mathrm{Pd} / \mathrm{C}, \mathrm{NaHCO}_{3}, \mathrm{MeOH}, 100 \%$ (g) $2 \mathrm{~N} \mathrm{HCl}, 100 \%$ (h) $\mathrm{LiEt}_{3} \mathrm{BH}, \mathrm{THF}$, trans $/$ cis $4: 1,93 \%$ (i) $\mathrm{PTSA} \cdot \mathrm{H}_{2} \mathrm{O}, \mathrm{MeCN}$, 100\% (l) PTSA, toluene, 58 63\% (g) 2N HCl, 100\%

### 2.5 Catalytic Asymmetric Methods

Asymmetric cathalysis was involved in several processes for the synthesis of pipecolic acid derivatives.

Just as an example, for the synthesis of 4-hydroxypipecolic and 3-hydroxypipecolic Alegret used an epoxy-alcohol as source of chirality ${ }^{32}$, a substrate obtained in good yield and $93 \%$ ee by asymmetric Sharpless epoxylation of diene alcohol 59 (Scheme 9) with (+)-diethyltartrate. The regioselective (10:1) C-3 ring opening of $\mathbf{6 0}$ by allylamine, followed by N -Boc protection gave diol 61 in anti-configuration. Ring closing metathesis of 61 lead to diol $\mathbf{6 2}$, which was oxidized in a two-steps process to N -Boc protected baikjanin 63. Iodolactamization in standard conditions lead to $\mathbf{6 4}$ in $98 \%$ yield. Iodide elimination to give $\mathbf{6 5}$ followed by lacton hydrolysis lead to desired (N-Boc)-4.

## Scheme 9

Scheme 9: Reagents and conditions: (a) t-Bu hydroperoxide, D-(-)-DIPT (cat) $\mathrm{Ti}\left(\mathrm{O}^{i} \mathrm{Pr}_{4}\right.$ (cat), $4 \AA \mathrm{MS}$ (b) allylamine, $\mathrm{LiClO}_{4}, 83 \%$ (c) $\mathrm{Boc}_{2} \mathrm{O}, \mathrm{MeOH}, 60 \%$ over two steps (d) Grubbs I catalyst, $\mathrm{CH}_{2} \mathrm{Cl}_{2}, 70 \%$ (e) $\mathrm{NaIO}_{4}$, THF/ $\mathrm{H}_{2} \mathrm{O}$ (f) $\mathrm{NaClO}_{2}, t \mathrm{BuOH} / \mathrm{THF}, 62-75 \%$ over two steps (g) $\mathrm{I}_{2}, \mathrm{KI}, \mathrm{NaHCO}_{3}, \mathrm{H}_{2} \mathrm{O}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 98 \%$ (h) $\mathrm{Bu}_{3} \mathrm{SnH}$, AIBN (cat), $\mathrm{C}_{8} \mathrm{H}_{8}, 76 \%$ (i) NaOH , dioxane $/ \mathrm{H}_{2} \mathrm{O} 70 \%$

### 2.6 Enzymatic kinetic resolution

Many hydrolytic enzymes have been used for the kinetic resolution of a variety of intermediates in the synthesis of enantio-enriched pipecolic acids, though the main class of enzymes used are lipases. For example, Takahata ${ }^{33}$ report the enzymatic kinetic resolution of racemic trans substrate $( \pm)-67$ (Scheme 10) obtained in two steps from allylglicine derivatives 66.

## Scheme 10

Scheme 10: Reagents and conditions: (a) lipase, vinyl acetate, $i-\mathrm{Pr}_{2} \mathrm{O}, 47 \%$ for $\mathbf{6 8}, 47 \%$ for 67 (b) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, \mathrm{EtOAc}$ 99\% (c) $5 \mathrm{M} \mathrm{HCl}, 84 \%$

The ( $2 S, 3 S$ )-67 isomer was converted in acetate derivative $\mathbf{6 8}$ using Bulkoldheria cepacia lipase, immobilized on ceramic particles. Under the best conditions this process gave the acetate in $97 \%$ ee and the remaining alcohol with $99 \%$ ee.

## Chapter 3: Previous syntheses of 4,5-dihydroxylated pipecolic acids

Perhaps due to their scarcity in nature, only a limited number of total syntheses of dihydroxypipecolic acids have been described.

In 1976 Marlier report the synthesis of isomers $\mathbf{8 , 9}, \mathbf{1 0}$ and $\mathbf{1 1}$. Mixture of compounds $\mathbf{1 0}$ and $\mathbf{1 1}$ were obtained in by Marlier ${ }^{17 \mathrm{a}}$ and later by Bleecker ${ }^{19}$ through stereoselective cis dihydroxylation of the natural compound L-baikiain with $\mathrm{OsO}_{4}$ in a $t \mathrm{BuOH}-\mathrm{H}_{2} \mathrm{O}_{2}$. A tedious chromatographic separation procedure (included 8-day long eluition) and re-crystallization from $\mathrm{Et}_{2} \mathrm{OH}-\mathrm{H}_{2} \mathrm{O}$ was required to separate and purify the two free acids, with an overall yield of $14 \%$ and $5 \%$ for $\mathbf{1 0}$ and 11, respectively ${ }^{17 \text { a }}$. To obtain the trans isomers $\mathbf{8}$ and $\mathbf{9}, \mathrm{N}-\mathrm{Cbz}$ protected Lbaikiain was oxidized with $\mathrm{H}_{2} \mathrm{O}_{2}$ in $\mathrm{HCO}_{2} \mathrm{H}$. After N deprotection by hydrogenation on $\mathrm{Pd} / \mathrm{C}$ the two isomers, obtained as a mixture, were isolated by the same chromatographic procedure as well for $\mathbf{1 0}$ and 11, giving $\mathbf{8}$ and $\mathbf{9}$ with $15 \%$ and $14 \%$ overall yield.

In 1986 Fleet and co-workers reported the synthesis of 4,5 dihydroxy L-pipecolic acid $\mathbf{8}$ (Figure 1) starting from isopropylidene derivative of D -glucoronolactone ${ }^{34} 69$ (Scheme 11).

## Scheme 11

Scheme 11: Reagents and conditions: (a) $\left(\mathrm{CF}_{3} \mathrm{SO}_{2}\right) \mathrm{O}$, pyridine, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (b) $\mathrm{NaN}_{3}, \mathrm{DMF}, 84 \%$ from 61 (c) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}$, EtOAc (d) $\mathrm{Cbz}-\mathrm{Cl}, \mathrm{NaHCO}_{3}, \mathrm{EtOAc} / \mathrm{H}_{2} \mathrm{O}, 72 \%$ over two steps (e) $\mathrm{MeONa} / \mathrm{MeOH}$ (f) $\mathrm{NaBH}_{4}, \mathrm{MeOH}, 91 \%$ over
two steps (g) $\mathrm{MeSO}_{2} \mathrm{Cl}$, pyridine, $80 \%$, (h) $\mathrm{H}_{2}$, Pd black, EtOAc, pyridine, quantitative yield (i) 0.1 M KOH , $\mathrm{EtOH} / \mathrm{H}_{2} \mathrm{O} 1: 1,82 \%$

Reacting with $\left(\mathrm{CF}_{3} \mathrm{SO}_{2}\right)_{2} \mathrm{O}$ in DCM in presence of pyridine, compound 69 gave the corresponding triflate $\mathbf{7 0}$ which was converted to the azide $\mathbf{7 1}$ with inversion of configuration in C-5. Palladium catalyzed hydrogenation followed by Cbz protection on the nitrogen atom gave compound 72. Treatment of $\mathbf{7 2}$ with a base ( MeONa ) caused the anticipated fragmentation to give, after reaction with sodium borohydride, the unsaturated diol 73. Compound 73 was selectivity protected on the primary -OH group as mesylate $\mathbf{7 4}$, than reduced in a palladium black catalyzed hydrogenation to give a single diastereoisomer of aminomesilate 75. The ring enclosure obtained by treatment with KOH gave dihydroxylated pipecolic acid 8, which was purified by ion exchange chromatography.
In the same report ${ }^{34}$, the synthesis of $3,4,5$-trihydroxy derivative $\mathbf{1 2}$, which was found to be a specific inhibitor of human liver $\beta$-D-glucuronidase ${ }^{35}$, was also described (Scheme 12).

Scheme 12

Scheme 12: Reagents and conditions: (a) $\left(\mathrm{CF}_{3} \mathrm{SO}_{2}\right)_{2} \mathrm{O}$, pyridine, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (b) Sodium trifluoroacetate (c) methanolysis $78 \%$ over three steps (d) $\left(\mathrm{CF}_{3} \mathrm{SO}_{2}\right)_{2} \mathrm{O}$, pyridine, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (e) $\mathrm{NaN}, \mathrm{DMF}$ (f) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}$, EtOAc (g) Cbz$\mathrm{Cl}, \mathrm{NaHCO}_{3}, \mathrm{EtOAc} / \mathrm{H}_{2} \mathrm{O} 44 \%$ from 60 (h) TFA/ $\mathrm{H}_{2} \mathrm{O}$ (i) $\mathrm{H}_{2}$, palladium black, $\mathrm{H}_{2} \mathrm{O} / \mathrm{AcOH}, 60 \%$ over two steps

In order to maintain the overall retention of configuration of C-5, the stereochemistry of $\mathrm{C} 5-\mathrm{OH}$ group in 69 was inverted to give the epimeric compound 76 (Scheme 12).

Thus, alcohol 76 was converted in the corresponding gluco-azide 77, then hydrogenated and protected on the nitrogen as Cbz , giving carbamate 78. After removal of isopropylidene moiety by aqueous trifluoroacetic acid, the resulting lactol was involved in a catalytic hydrogenation on
palladium black, in aqueous acetic acid. In that conditions underwent intramolecular reductive amination and hydrolysis of the lactone, to give the trihydroxypipecolic acid $\mathbf{1 2}$.

A total synthesis of 4,5-dihydroxypipecolic acid was developed by Thieme et al., based on the use of azomethine chiral auxiliaries and cyclization via nucleophylic bromide displacement ${ }^{36}$.

The starting azomethines 79 (Scheme 13), treated with LDA and ( $4 R, 5 R$ )-4,5-bis-(bromomethyl)-2,2-dimethyl-1,3-dioxolane gave the envisaged alkylation products $\mathbf{8 0}$ with high yield and stereoselectivity (95:5).

The configuration of the new stereogenic centre was governed by the configuration of the chiral auxiliary. In this case ( $S, S, S$ )-hydroxypinanone generates the $(R)$ configuration in 80 . The chiral auxiliary in $\mathbf{8 0}$ was smoothly split off by hydrolysis in the presence of citric acid to afford 2-( $\alpha$ -aminoalkyl)-oxazole 81.

## Scheme 13

Scheme 13: Reagents and conditions: (a) LDA, (4R,5R)-4,5-bis-(bromomethyl)-2,2-dimethyl-1,3-dioxolane, THF, $62-85 \%$ (b) citric acid, $\mathrm{H}_{2} \mathrm{O} / \mathrm{THF}, 60-85 \%$ (c) $\mathrm{Et}_{2} \mathrm{OH}, \mathrm{NaHCO}_{3} 71-88 \%$, (d) $\mathrm{Cbz}-\mathrm{Cl}_{1}, \mathrm{~K}_{2} \mathrm{CO}_{3}$ dioxane $/ \mathrm{H}_{2} \mathrm{O}, 97 \%$ (e) $\mathrm{O}_{2}$, rose bengal, UV light, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (f) dioxane $/ \mathrm{H}_{2} \mathrm{O}, 48 \%$ (g) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}$, MeOH (h) HCl , THF

Treatment of $\mathbf{8 1}$ with $\mathrm{NaHCO}_{3}$ in ethanol induced the intramolecular cyclization, which afforded the optically active piperidine derivative $\mathbf{8 2}$ in $88 \%$ yield. Compound $\mathbf{8 2}$, after protection as N Cbz (83) reacted with oxygen under UV-light in the presence of Rose Bengal, for the cleavage of the $\mathrm{C}-\mathrm{C}$ double bond of the oxazole ring, and following gave acid 84 . Finally enantiopure $\mathbf{8}$ was obtained as chlorohydrate after N -deprotection and exhaustive hydrolysis.

Starting from 85, (Scheme 14) Kuzuhara and Takahashi, provided a seven-steps stereoselective synthesis of enantiopure 4-deoxynojirimycin derivative $\mathbf{8 6}^{37}$, and they used it as a precursor for the synthesis of trihydroxylated $\mathbf{1 2}^{38}$ and dihydroxylated 8 .

After benzylation of C3-OH in $\mathbf{8 6}$ that gave 87, the silyl group in C-6 was removed, and the free primary - OH group in $\mathbf{8 8}$ was converted into a carbonyl function by Jones oxidation at room temperature, than converted in benzyl ester with BnBr and $\mathrm{Cs}_{2} \mathrm{CO}_{3}$. Finally, palladium catalyzed hydrogenation gave inhibitor $\mathbf{1 2}$ in good overall yield.

## Scheme 14

Scheme 14: Reagents and conditions: (a) NaH, BnBr, $n$-BuNI, DMF, $66 \%$ (b) $n$-BuNF, AcOH, THF, $98 \%$ (c) Jones Reagent (d) $\mathrm{BnBr}, \mathrm{Cs}_{2} \mathrm{CO}_{3}$, DMF, $69 \%$ over two steps (e) $\mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{AcOH}, \mathrm{EtOH}, \mathrm{H}_{2} \mathrm{O}, 53 \%$ (f) PhOCSCl , pyridine $/ \mathrm{CH}_{2} \mathrm{Cl}_{2}(\mathrm{~g}) \mathrm{Bu}_{3} \mathrm{SnH}$, AIBN, toluene, $82 \%$ over two steps

The synthesis of dihydroxylated pipecolic acid $\mathbf{8}$ began with a deoxygenation reaction at C-3 position of 86. This conversion was performed by converting the alcohol into a thiocarbonate derivative by the action of phenoxythiocarbonyl chloride, followed by deoxygenation via radical reaction with tributyltin hydride in the presence of azobis(isobutyronitryle) (AIBN) in toluene. With a similar strategies to as that from 87 to 12 , the compound 89 was finally converted into enantiopure derivative 8 .

More recently Chattopadhyay reported a stereodivergent route to N -tosyl-proteced L-pipecolic and $N$-tosyl-4,5-cis dihydroxylated derivatives ${ }^{27} \mathrm{~N}-\mathrm{Ts}-11$ and $\mathrm{N}-\mathrm{Ts}-10$ (Scheme 15, Cfr Scheme 6).

Cyclic alkene 41 (Scheme 15) was subject to dihydroxylation with osmium tetroxide and N -methylmorpholine- $N$-oxide (NMO) to give a $1: 1$ mixture of cis dihydroxylated diastereoisomers, that were separed by column chromatography. Each diastereoisomer was protected as $\mathrm{O}-\mathrm{Bn}$ to give 91 and 92 . The oxidation of the diol group in 91 and 92 with concomitant conversion of benyl group in benzoate gave pipecolic derivatives 94 and 96, which finally were converted in the $N$-tosilated cis and trans derivatives ( $\mathrm{N}-\mathrm{Ts}$ )-10 and ( $\mathrm{N}-\mathrm{Ts}$ )-11. However, no attempts of removing the N -Tosyl preotection were done.

## Scheme 15

Scheme 15: Reagents and conditions: (a) $\mathrm{OsO}_{4}$, NMO, acetone/ $\mathrm{H}_{2} 04: 1$ (b) $\mathrm{NaH}, \mathrm{BnBr}, \mathrm{THF} / \mathrm{DMSO}$ 10:1, 91 31\% over two steps, $9225 \%$ over two steps (c) $6 \mathrm{~N} \mathrm{HCl}, \mathrm{THF}, \mathbf{9 3} 81 \%, 9582 \%$, (d) $\mathrm{NaIO}_{4}, \mathrm{RuCl}_{3}$ (cat), $\mathrm{CCl}_{4} / \mathrm{CHCN} / \mathrm{H}_{2} \mathrm{O}$ (1:1:1.5) 94 53\%, 96 59\% (e) 1M KOH, MeOH, (N-Ts)-11 71\%, (N-Ts)-10 68\%

So, whereas a limited number of syntheses of compound $\mathbf{8}$ exist, in the end no practical and scalable syntheses of compounds $\mathbf{9}, \mathbf{1 0}$ and $\mathbf{1 1}$ have instead been reported so far.

In general, the scarce attention towards polyhydroxylated pipecolic acids is surprising, because just as monohydroxylated pipecolic acids 2-7 have been used as frames around which to build biologically active compounds, polyhydroxypipecolic acids $\mathbf{8 - 1 1}$ could be exploited in a similar fashion, with the advantage that the presence of a further hydroxy group can either provide further interactions with the target protein's active site or be functionalized in order to attain higher potency and selectivity, as well as to modulate lipophilicity, a parameter that influences solubility, permeability through membranes, and clearance, i.e. biological processes relevant in drug discovery.

## Chapter 4: Cyclopropanated amino acids as conformationally constrained molecular scaffold

The scope of pipecolic acids can be futher expanded by the introduction of conformational restrictions. In fact, the practice of constraining natural amino acids in their conformationally rigid analogues has been highly successful in the design and synthesis of peptidomimetics and other bioactive molecules, with improved selectivity and methabolic stability ${ }^{39}$. For example, a particular three-dimensional arrangement of the peptide side chains can be obtained by appropriately constraining, biasing or fixing the side chain conformers, in order to get a particular foldamer of the molecule. This approach requires a set of amino acids with particular steric constraints. Moreover the molecular rigidity that is attributed to cyclic molecules (like pipecolic acids), may be employed in reducing entropic costs that are associated with enzyme and receptor binding. In addition, the defined spatial arrangement of cyclic structures may be valuable in ascertaining information about the bioactive conformation, which can be used to modulate the binding properties, i. e. potency and selectivity.

On this ground, cyclic amino acid analogues containing a cyclopropane skeleton, including proline and pipecolic acids ${ }^{40}$ (Figure 4), are of broad interest as biological probes, enzyme inhibitors and conformationally analogues of native amino acids ${ }^{41}$, as the three membered ring introduces specific steric constraints into the amino acids, possibly leading to changes in peptide conformation and reactivity.

Figure 4

Figure 4: selected examples of cyclopropanated proline and pipecolic amino acids

In fact, the cyclopropane ring exibit a certain "unsatured character" which results in a restriction torsion angles about the $\mathrm{C} \alpha-\mathrm{C}=\mathrm{O}$ bond to small values, due to the conjugation of the carbonyl group with the ring ${ }^{41}$. More specifically, the 1-aminocyclopropane carboxylic acid residue has been shown to exhibit a marked preference for the conformational space $\Phi, \Psi= \pm 90^{\circ}, 0^{\circ}$ i.e. for the position $i+2$ of type I and type $2 \beta$-turns ${ }^{42}$, possibly leading to profound changes in the peptide conformation and reactivity.

### 4.1 Previous synthesis of 2,3-methanopipecolic acids

In literature are reported a variety of synthetic strategies for the synthesis of acyclic and fivemembered 2,3-methano amino acids, while only few methods have been reported for the synthesis of 2,3-methanopipecolic acids.
In the first synthesis, described by Hercouet in $1996^{43}$, lactone 97 (Scheme 16), obtained from $L$ glutammic acid ${ }^{44}$ was converted to triol $\mathbf{9 8}$ by treatment with BMS in chloroform.

Scheme 16

Scheme 16: Reagents and conditions: (a) $\mathrm{BH}_{3} \cdot \mathrm{Me}_{2} \mathrm{~S}, \mathrm{CHCl}_{3}, \mathrm{MeOH}, 78 \%$ (b) $\mathrm{SOCl}_{2}, \mathrm{CCl}_{4}, 72 \%$ (c) $\mathrm{NaIO}_{4}, \mathrm{RuCl}_{3}$ $\cdot 3 \mathrm{H}_{2} \mathrm{O}$ (cat), $96 \%$ (d) $\mathrm{PhCH}=\mathrm{NCH}_{2} \mathrm{CO}_{2} \mathrm{Me}, \mathrm{NaH}$, DME, $99 \%$ (e) $1 \mathrm{~N}^{2} \mathrm{Et}_{2} \mathrm{O} \mathrm{HCl}, 86 \%$ (f) 1 NaOH , then 6 N HCl , Dowex 50x8, 59\%

Crude pentanetriol 98, reacted with $\mathrm{SOCl}_{2}$ in refluxing $\mathrm{CCl}_{4}$ afforded cyclic sulfite 99. This sulfite was oxidized to sulphate $\mathbf{1 0 0}$ via Sharpless reaction. Diastereospecific alkylation of methylbenzhylideneglycinate with $\mathbf{1 0 0}$ gave $\mathbf{1 0 1}$ as a single isomer with $99 \%$ yield. Product $\mathbf{1 0 1}$ was hydrolyzed to get the aminoester $\mathbf{1 0 2}$ as hydrochloride, that cyclised in basic conditions $(\mathrm{NaOH})$ to the desired piperidine 103 , which was purified by ion exchange chromatography.

Following a different approach, Matsumura ${ }^{45}$ report the synthesis of 2,3 methanopipecolic acid starting from $L$-Lysine derivative 105 (Scheme 17).

Cyclization of $\mathbf{1 0 5}$ to $\mathbf{1 0 6}$ occour via electrochemical anodic oxidation of $\mathbf{1 0 5}$ in methanol, followed by an acid-catalyzed cyclization, without isolation of the oxidation intermediate ${ }^{46}$. Treatment of $\mathbf{1 0 6}$ with KHMDS and diphenyldisulfide gave a phenylthiolated compound which was oxidized with $m$-CPBA to get 2,3-unsaturated derivative 107 in good overall yield and $88 \%$ ee. Cyclopropanation reaction was performed treating 107 with dimethylsulfoxonium methylide in DMSO. The reaction gave cyclopropanated 108 with very high facial selectivity ( $96: 6 \%$ de). This selectivity could be explained in terms of steric and/or electrostatic repulsion between methoxy group of the molecule and dimetylsulfoxonium ylide. In fact, the ylide preferentially attack on the opposite face. The metoxy group in $\mathbf{1 0 8}$ was removed by reductive elimination with $\mathrm{NaBH}_{4}$ in formic acid to get $\mathbf{1 0 9}$, than the free acid $\mathbf{1 0 3}$ was obtained by hydrolysis with trimetylsilil iodide in $\mathrm{CHCl}_{3}$.

## Scope of the work

In the previous chapters we have described as the hydroxypipecolic acid scaffolds are emerging privileged structures involved in many important applications, in particular as constituents of pharmaceutically and biologically active compounds, as well as and conformational probes. Although an increasing number of works are devoted to the synthesis of mono- or polysubstituted pipecolic acid derivatives, the research of new synthetic routes to hydroxylated derivatives in enantiopure form remains a great centre of interest.

On this ground, the aim of this research work is the development of new methodologies for the synthesis of enantiopure mono- and dihydroxylated pipecolic acid derivatives (Figure 5). In particular, the work will be focus on several complementary approaches to the synthesis of 4-hydroxy-, 5-hydroxy- and 4,5-dihydroxypipecolic acids, in particular focusing, as for as it concerns the latter compounds, on the more neglected pipecolic acids 9-11 (Figure 2), and their enantiomers. Our approach will be based on the chemistry of lactam-derived enol phosphates developed in our lab, which we have recently shown to be suited to the preparation of enantiopure 4-hydroxypipecolic acids ${ }^{29}$.

Moreover, with in mind the introduction of further constraints in hydroxypipecolic acids, we focused on the introduction of a cyclopropane ring in the position 2,3 of these molecules, in order to obtain mono- and dihydroxy methanopipecolic acid derivatives 110-113 and their enantiomers ent-110-113 (Figure 5) as a new class of conformationally constrained amino acid analogues to be employed as conformational probes and in the discovery of new drugs.

For the above mentioned cyclopropanated derivatives, we envisage as a possible application the construction of RGD sequence-containing cyclopeptides, having in mind the synthesis of integrine ligands. This application is supported by preliminary calculation in MM2 which suggest the suitability of these scaffolds for building up cyclopeptides.

## Results and discussion

## Chapter 1: General synthetic strategy

Our approach to the synthesis of hydroxypipecolic acids (I, Scheme 18), as well as their cyclopropanated derivatives (II), was based on the transformation of hydroxylated lactams (V) into enecarbamate esters (III) through a Pd-catalyzed methoxycarbonylation of the corresponding enol phosphates (IV) ${ }^{47}$.

Scheme 18

Scheme 18: general synthetic pathway for hydroxylated pipecolic acids and their cyclopropanated analogues

Such enecarbamate esters were then converted into 4-hydroxypipecolic acids by exploiting the stereocontrol exerted by suitable OH group protections during the reduction step.

Stereocontrolled cyclopropanation reactions were developed and applied on the same enecarbamate ester precursors, in order to obtain 2,3-methanopipecolic derivatives with very high optical purity.
This methodology, of course, requires enantiopure hydroxylated lactams as starting material or, as an alternative, a racemate resolution at any stage of the synthesis. Both approaches were used by us during this research work for the synthesis of mono- and 4,5-dihydroxypipecolic acids ${ }^{48,49}$ as well as their cyclopropanated derivatives ${ }^{50}$, and various piperidine alkaloids such as glycosidase inhibitors fagomine ${ }^{48}$ and 1-deoxymannojirimycin ${ }^{51}$.

## Chapter 2: Synthesis of 4-hydroxypipecolic derivatives

### 2.1 Sytnthesis of enecarbamate ester precursors from (3R)-4-ciano-3-hydroxybutanoate

In our laboratory, a synthetic route for the synthesis of 4-hydroxylpipecolic acids, which started from enantio-enriched precursor 54, was previously developed. As shown in Scheme 8, the hydrogenation of lactam-derived precursor $\mathbf{5 4}$ on $\mathrm{Pd} / \mathrm{C}$ lead to the formation of the cis-derivative 55 in a $20: 1$ ratio with the undesired trans isomer. In that case, stereocontrol of the reduction on the double bond was attributed to the $t \mathrm{Bu}$.

So, if such is the case, the use of a bulkier substituent (like a silyl group) on the hydroxy group should better directing the reduction towards the less hindered face of the double bond to furnish the target cis product with a higher facial selectivity than that obtained from 54.
Unfortunately, as demonstred in a previus study ${ }^{29 \mathrm{a}}, 4$-silyloxy-substituted lactams (obtained with a similar route from $\mathbf{5 0}$ as that reported for $\mathbf{5 5}$, Scheme 19a), appear unsuitable for the preparation of the corresponding vinyl triflates and/or phosphates.
In fact, the alkaline reaction conditions employed to generate phosphates or triflates (i.e treatment with KHMDS in THF at $-78{ }^{\circ} \mathrm{C}$ ), led to partial or complete elimination reaction products (Scheme 19a).

## Scheme 19

a)

b)

Scheme 19: Reagents and conditions: (a) KHMDS, $(\mathrm{PhO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{Cl}$ or $\mathrm{PhNTf}_{2}, \mathrm{THF},-78^{\circ} \mathrm{C}$

A possible reason for the particular tendency of enolates (or triflates) to give the elimination products is the strong $\mathrm{A}^{(1,2)}$ strain generated between the olefinic proton on C-3 and the bulky equatorial silyloxy group after formation of the enolate (Scheme 19b). To reduce the strain, the 4-silyloxy group should adopt an axial orientation, but this could be prone to elimination by an E2 mechanism under the reaction conditions.

During my Ph-D, with the goal of establishing a general procedure for enantioselective synthesis of both enantiomers of 4-hydroxypiperidine derivatives, we worked on a different synthetic route to both antipodes of the 4-hydroxylated enecarbamate precursors. In this approach, the OH group and a suitable silyl protecting group will be inserted in a later stage of the synthesis, thus avoiding the problem of the elimination reaction.

### 2.2 Synthesis of enecarbamate ester precursors from $\boldsymbol{\delta}$-valerolactam ${ }^{50}$

According to the general synthetic strategy which requires enantiopure enecarbamate precursors, we thus envisaged a chemo-enzymatic approach that would enable us to prepare racemic $\mathbf{1 1 8}$ (Scheme 20) from commercial $\delta$-valerolactam 114 in a short synthetic sequence, followed by a lipase-catalyzed kinetic resolution of $\mathbf{1 1 8}$ to obtain both $(R)$ - and ( $S$ )- enantiomers in enantiopure or enantio-enriched form.

Scheme 20

Scheme 20: synthesis of enantio-enriched enamide ester precursors by EKR of 118

So, a four-step conversion of $\mathrm{N}-\mathrm{CO}_{2} \mathrm{Me} \delta$-valerolactam 115 into $\alpha, \beta$-unsatured ester $\mathbf{1 1 7}$ (Scheme 21) was realized by Pd-catalyzed methoxycarbonylation of vinyl phosphate $\mathbf{1 1 6}$ whit the same approach as shown in Scheme 19, which provided 118 in $70 \%$ overall yield. Allylic oxidation of $\mathbf{1 1 7}$ was carried out with N-bromosuccinimide (NBS) in the presence of a catalytic amount of azobisisobutyronitrile (AIBN), followed by hydrolysis with $\mathrm{ZnCl}_{2}$ in wet acetone ( $96 \%$ ) which furnished $( \pm)-118$ in $66 \%$ yield.

## Scheme 21

Scheme 21: Reagents and conditions: (a) $n-\mathrm{BuLi}, \mathrm{MeOCOCl}, \mathrm{THF},-78^{\circ} \mathrm{C}$ (b) KHMDS, $(\mathrm{PhO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{Cl}, \mathrm{THF},-78^{\circ} \mathrm{C}$ (c) $\mathrm{Pd}(\mathrm{OAC})_{2}, \mathrm{Ph}_{3} \mathrm{P}, \mathrm{CO}, \mathrm{MeOH}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DMF}, 55^{\circ} \mathrm{C}, 3 \mathrm{~h}(\mathrm{~d}) \mathrm{AIBN}, \mathrm{NBS}, \mathrm{CCl}_{4} / \mathrm{CHCl}_{3} 9: 1$, reflux, 15 min (e) $\mathrm{ZnCl}_{2}$, $96 \%$ aq. acetone, $25^{\circ} \mathrm{C}, 6 \mathrm{~h}$

With sufficient amounts of racemic ( $\pm$ )-118, we were ready to study the kinetic resolution of this alcohol by means of lipases in organic media (Scheme 22, Table 1).

## Scheme 22

Scheme 22: Reagents and conditions: (a) $\mathrm{MeONa}, \mathrm{MeOH}, 0^{\circ} \mathrm{C}, 3.5 \mathrm{~h}$

From the various commercially available lipases, we initially opted to use Candida antarctica lipase B (CAL-B) supported on acrylic resin (trade name Novozym 435), because it has been used on a few occasions, either immobilized or free in solution, for the resolution of carbacyclic allylic alcohols that structurally resemble compound $\mathbf{1 1 8}^{52}$. The enantiomeric ratio E ranged from 20 to 187 for substrate depending on the reaction conditions, thus allowing for an effective
resolution. For similar reasons, we employed Bulkolderia cepacia lipase ${ }^{53}$ (immobilized on diatomaceous earth and commercialized with the name of lipase AMANO IM), which has previously been exploited for the kinetic resolution of alcohols such as 3-ethyl-, 3-bromo-, and 3-nitro-2-cyclohexen-1-ol ${ }^{54}$, with E values from 49 to higher than 100. As in the case of simple secondary ${ }^{55}$ and cyclic allylic alcohols ${ }^{56}$ the R enantiomer of $\mathbf{1 1 8}$ was preferentially acylated in all experiments (Table 1). With CAL-B, we initially screened various acyl donors in anhydrous acetonitrile which was the best solvent for some 2 -cycloexen-1-ols ${ }^{54 \mathrm{a}}$ and, more conventionally, in toluene ${ }^{57}$. In both solvents, the best results were obtained with 4-chlorophenyl butyrate $(\mathrm{PCPB})^{58}$ as the acyl donor.
Interestingly, we determined a low E value of about 20 when vinyl acetate was used (entries 1 and 5) which is almost identical to that measured for the kinetic resolution of seudenol catalyzed by free CAL-B ${ }^{56 b}$.

With 2,2,2-trifluoroethyl butyrate (TFEB), besides low E values, the reaction was slow and never reached $50 \%$ conversion (entries 2 and 6 ). With PCPB, we screened other solvents, and found that anhydrous THF was optimal (entry 10), which is in accordance with the observation that solvents with $\log \mathrm{P}<2$ are most suitable for polar substances ${ }^{59}$. In this case, by increasing the amount of enzyme and by using a 0.2 M subdtrate concentration, we eventually obtained an E value 135 that was only just suitable for effective kinetic resolution (entry 11). We also tested vinyl butyrate as the acyl donor under the same conditions, but found that the E value decreased (entry 12 ).

Better results were obtained with lipase PS-AMANO-IM, although higher enzyme to substrate ratio ( $\mathrm{mg} / \mathrm{mmol}$ ) were required to reach acceptable conversion in reasonable times. The best result (entry 14) was obtained by carrying out the resolution in the presence of PCPB in THF at 0.8 M substrate concentration with 100 mg of lipase per mmol of $( \pm)-\mathbf{1 1 8}(\mathrm{E}=162)$. Under the same conditions with both vinyl acetate (entry 16) and vinyl butyrate (entry 17) this reaction was highly enantioselective, with measured E values of approximatively 160 and enantiomeric excesses for both enantiomers of $\mathbf{1 1 8}$ comparable to those of commercial ethyl (3R)- and (3S)-4-ciano-3-hydroxybutanoate ( $96 \% \mathrm{ee}$ ) previously employed for the preparation of enantiopure $(R)$ and ( $S$ )-55 respectively (See Scheme 8 ). We thus applied the latter conditions to resolve a sufficient amount of $\mathbf{1 1 8}$ to proceed with the synthesis.
After chromatographic separation of $(R) \mathbf{- 1 1 9}(45 \%$ yield, $95 \%$ ee) and ( $S$ ) - $\mathbf{1 1 8}$, pure $(R)$ - $\mathbf{1 1 8}$ was obtained by hydrolysis of ester $(R)$ - $\mathbf{1 1 9}$.

### 2.3 Synthesis of cis 4-hydroxypipecolic acid ${ }^{48}$

Now that the enantiopure precursor 118 was available, we could protect it with a large silyl group (TIPS, $81 \%$ yield) in order to obtain a higher selectivity for the subsequent $\mathrm{Pd} / \mathrm{C}$ catalyzed hydrogenation to cis pipecolic acid. As previously reported for $4^{29 b}$, the synthesis of ent-4 was realized by hydrogenation of O-TIPS compound ( $S$ )-120 (Scheme 23), which provided diastereopure $(2 R, 4 S)$-cis- $\mathbf{1 2 1}$ in quantitative yield. In this case we managed to obtain a diastereomeric ratio higher than that previously obtained with the $\mathrm{O}-{ }^{t} \mathrm{Bu}$ protected compound (about $20: 1$, See Scheme 8) as we could not detect any trace of the trans compound in the ${ }^{1} \mathrm{H}$ NMR spectrum of the crude reaction mixture. Exhaustive hydrolysis gave ent-4 as its hydrochloride salt in $100 \%$ yield $^{61}$. With a similar approach we synthesized the natural enantiomer of 4 .

Scheme 23: Reagents and conditions: (a) TIPSCl, imidazole, DMF, $40^{\circ} \mathrm{C}$, 5 h (b) $\mathrm{H}_{2}, \mathrm{Pd} / \mathrm{C}, \mathrm{EtOAc}, 25^{\circ} \mathrm{C}, 6 \mathrm{~h}$ (c) 2 N HCl , reflux

### 2.4 Two-step enzymatic kinetic resolution ${ }^{50}$

We considered that conformationally restricted amino acids, in order to be introduced in a peptide sequence, must have higher enantiomeric excesses than those so far obtained for alcohols $(R) \mathbf{- 1 1 8}$ and (S)-118 (See Scheme 22, Table 1) and efforts should consequently be made to obtain such synthetic intermediates in enantiopure form.
To this end, we first opted for a two-step lipase-catalyzed kinetic resolution of $N-\mathrm{CO}_{2} \mathrm{Me}$ protected compound $( \pm) \mathbf{- 1 1 8}$. However, because of the widespread use of the Cbz group for N protection in amino acids we also decided to study the enzymatic kinetic resolution of $\mathrm{N}-\mathrm{Cbz}$ derivative ( $\pm$ )-125 by various lipases and then to subject the products to the stereoselective cyclopropanation.

The two-steps kinetic resolution of $( \pm)-\mathbf{1 1 8}$ was realized by stopping the enzyme-catalyzed esterification of the alcohol, carried out under the best conditions we found (See Table 1), with a
conversion around $40 \%$. In this way, we should obtain the acylated product with high ee and only a little loss of material.

The resolution (Scheme 24) was realized by stopping the esterification of the alcohol, carried out in the presence of PS "AMANO" IM lipase and vinyl butyrate as the acylating agent in dried THF (i. e. the best conditions found for the standard kinetic resolution), with $42 \%$ conversion (determined by GC and NMR of the crude reaction mixture).
This allowed to obtain butyrate $(R)$ - with very high enantiomeric purity ( $>99.5 \% \mathrm{ee}$, determined after hydrolysis) in a sufficient amount to proceed with the synthesis. The residual (S)-alcohol, obtained in $53 \%$ yield and $73 \%$ ee after chromatography, was subjected to the same EKR conditions, stopping the reaction after 22 h when the conversion was $17 \%$. After chromatography, enantiopure ( $S$ )-118 was obtained in $\mathbf{3 5 \%}$ yield over the two steps.
By this procedure, only a minimal amount of substrate was lost and both alcohols ( $R$ )-118 and ( $S$ )-118 were obtained with higher $e e$ than by a single resolution.

## Scheme 24

Scheme 24: Reagents and conditions: (EKR I) vinyl butyrate, PS "AMANO" IM lipase, THF, $4 \AA \mathrm{MS}, 30^{\circ} \mathrm{C}, 7 \mathrm{~h}$, $42 \%$ conversion (EKR II) vinyl butyrate, PS "AMANO" IM lipase, THF, $4 \AA \mathrm{MS}, 30^{\circ} \mathrm{C}, 22 \mathrm{~h}, 17 \%$ conversion (a) $\mathrm{MeONa}, \mathrm{MeOH}, 0^{\circ} \mathrm{C}, 3.5 \mathrm{~h}$

Racemic $N$-Cbz-protected alcohol ( $\pm$ )-125 (Scheme 25 ) was conveniently prepared by the same procedure reported for $( \pm)$ - $\mathbf{1 1 8}$.

## Scheme 25

Scheme 25: Reagents and conditions: (a) $n$-BuLi, MeOCOCl, THF, $-78^{\circ} \mathrm{C}$ (b) KHMDS, $(\mathrm{PhO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{Cl}, \mathrm{THF},-78^{\circ} \mathrm{C}$ (c) $\mathrm{Pd}(\mathrm{OAC})_{2}, \mathrm{Ph}_{3} \mathrm{P}, \mathrm{CO}, \mathrm{MeOH}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DMF}, 58^{\circ} \mathrm{C}, 4 \mathrm{~h}$ (d) AIBN, NBS, $\mathrm{CCl}_{4} / \mathrm{CHCl}_{3} 9: 1$, reflux, 15 min (e) $\mathrm{ZnCl}_{2}$, $96 \%$ aq. acetone, $25^{\circ} \mathrm{C}, 6.5 \mathrm{~h}$
$N$-Cbz-protected $\delta$-valerolactam 122 was quantitatively converted into the corresponding enol phosphate 123 and this subjected to Pd-catalyzed methoxycarbonylation to give 124 in $87 \%$ yield over two steps after chromatography. Allylic oxidation finally afforded ( $\pm$ )-125 in $57 \%$ yield.

As for $\mathrm{N}-\mathrm{CO}_{2} \mathrm{Me}$ protected $( \pm) \mathbf{- 1 1 8}$, in order to determine the best conditions in terms of optical purity and yield of the products (see later for absolute configuration determination), a variety of lipases and solvents were applied to ( $\pm$ )-125. (Scheme 26, Tabella 2) Vinyl butyrate (VB, Tabella 2) and vinyl acetate (VA) were used as acylating reagents.

## Scheme 26

Scheme 26: Reagents and conditions: (a) $\mathrm{MeONa}, \mathrm{MeOH}, 0^{\circ} \mathrm{C}, 3.5 \mathrm{~h}$

The kinetic resolution was carried out in the presence of various lipase at $30^{\circ} \mathrm{C}$ with an excess of either vinyl acetate or vinyl butyrate ( 3.5 eq ) as the acylating reagent. Lipases from Aspergillus niger, Candida rugosa, Candida antarctica and Porcine Pancreatic lipase ${ }^{62}$ were tested under various conditions in toluene and tert-butyl methyl ether (TBME) with vinyl acetate but the reaction were either very slow or did not take place at all.

Table 2: [a] VA: vinyl acetate, VB: vinyl butyrate. [b] Anhydrous solvents were used. [c] Conversion determined by GLC and ${ }^{1} \mathrm{H}$-NMR. [d] Determined by HPLC analysis of $(R)-\mathbf{1 2 5}$ alcohol after hydrolysis. [e] Determined by HPLC analysis of $(S)-\mathbf{1 2 5}[\mathrm{f}]$ Reaction carried out on $0.2-0.4 \mathrm{mmol}$ of substrate at $30^{\circ} \mathrm{C}$, substrate concentration 0.8 M , enzyme $(\mathrm{mg}) /$ substrate $(\mathrm{mmol})$ ratio $=100,3.5$ equivalents of acylant reagent, molecular sieves $(4 \AA, 130 \mathrm{mg} / \mathrm{mmol})$ [g] The reaction did not proceed further and it was stopped.

The best results were obtained with PS "AMANO" IM in TBME with vinyl butyrate (E > 200). We employed that condition for a two-step kinetic resolution of $( \pm) \mathbf{- 1 2 5}$ (Scheme 27) carried out in a similar manner to that $( \pm)-\mathbf{1 1 8}$ resolution.

Scheme 27

Scheme 27: Reagents and conditions: (EKR I) vinyl butyrate, PS "AMANO" IM lipase, TBME, $4 \AA$ MS, $30^{\circ} \mathrm{C}, 1.9 \mathrm{~h}$, $44 \%$ conversion (EKR II) vinyl butyrate, PS "AMANO" IM lipase, THF, $4 \AA \mathrm{MS}, 30^{\circ} \mathrm{C}, 1.4 \mathrm{~h}, 16 \%$ conversion (a) $\mathrm{MeONa}, \mathrm{MeOH}, \mathrm{O}^{\circ} \mathrm{C}, 3.5 \mathrm{~h}$

The first esterification reaction was stopped with $44 \%$ conversion (See Appendix 3), and the remaining (S)-125 (51\% yield and $73 \%$ ee) was subject to a second reaction, interrupted with $16 \%$ conversion. This double step process gave the ( $S$ ) - $\mathbf{1 2 5}$ with $37 \%$ yield and $98.8 \% \mathrm{ee}$, and (R)-125 with $\mathbf{3 7 \%}$ and $98.7 \%$ ee (See Appendix 2).

### 2.5 Synthesis of cis 4-hydroxy-cyclopropanated derivatives: $\mathbf{O H}$-directed cyclopropanation

The OH -directed cyclopropanation of $\gamma$-hydroxy- $\alpha, \beta$-unsaturated esters has been previously reported in a handful of cases, i.e. by samarium/mercury amalgam in conjunction with diiodomethane ${ }^{63}$ and by the Furukawa modification of the Simmons-Smith reaction ${ }^{64}$. In both cases, the hydroxyl group exerted complete stereocontrol, so we explored the use of both Sm and Zn -carbenoids for the cyclopropanation of enantiopure 118, and the results are reported in Table 3. Disappointingly, the reaction under Molander's conditions ${ }^{62 b}$ (entry 1) although
reaching complete conversion after 5 h , provided the target compound in a mixture with various unidentified byproducts. Moreover, the stereoselectivity was very low, with the unexpected predominance of the trans compound (trans/cis ratio of about $1.3: 1$ ). Considering the highly oxophilic nature of samarium and the excellent stereoselectivity reported by Cossy ${ }^{63 a}$ we can only assume that the N -protecting group somehow competes with the OH group for the coordination of samarium and the delivery of the carbenoid onto the double bond. In support of this hypothesis, the $N$-Boc-directed cyclopropanation of allylic carbamates with Zn -carbenoids has recently been described by Davies ${ }^{65}$.

Scheme 28

Table 3

Table 3: [a] Reaction carried out on $0.2-0.9 \mathrm{mmol}$ of substrate. [b] Reaction monitored by TLC. [c] Relative composition determined by $1 \mathrm{H}-\mathrm{NMR}$ on the crude reaction mixture. [d] Starting material completely consumed but several unidentified products in the crude reaction mixture. [e] Yield after chromatography.

We tried the Simmons-Smith reaction under three different sets of conditions (entries 2-4): (1) with the Wittig-Furukawa reagent ${ }^{66} \mathrm{Zn}\left(\mathrm{CH}_{2} \mathrm{I}\right)_{2}$ (2) with Charette's carbenoid ${ }^{67} \mathrm{Cl}_{3} \mathrm{C}_{6} \mathrm{H}_{2} \mathrm{OZnCH}_{2} \mathrm{I}$ and (3) with Shi's carbenoid ${ }^{68} \mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{ZnCH}_{2} \mathrm{I}$.

In spite of the latter being one the most reactive carbenoids, the reaction did not reach complete conversion after 24 h (entry 3), as also observed for the reaction with the Wittig-Furukawa reagent (entry 2). Although in all cases we observed the formation of the expected cis product only, the best result in terms of cyclopropanation rate and yield after chromatography was obtained with $\mathrm{Et}_{2} \mathrm{Zn}$ and $\mathrm{CH}_{2} \mathrm{I}_{2}$ in the presence of 2,4,6-trichlorophenol (entry 4). Under these conditions the reaction was complete in 4 h , providing the cis isomer ( $1 R, 5 R, 6 S$ ) $\mathbf{- 1 2 7}$ in $86 \%$ yield.

These conditions were thus applied to $N$-Cbz protected alcohol $(R)$ - $\mathbf{1 2 5}$ to give diastereopure cyclopropanated ( $1 R, 5 R, 6 S$ )-128 (entry 5 ) in good yield (79 \%), as well as its enantiomer ( $S$ )-125 to obtain (1S,5S,6R)-ent-128 (73 \%).

### 2.6 Synthesis of cyclopropanated trans derivatives

Having assessed our approach to the synthesis of the cis-cyclopropanated derivatives $\mathbf{1 2 7}$ and 128, the preparation of both trans cyclopropanated isomers had to be developed as the next step of the study.
For the synthesis of these the trans isomers, we needed a bulky allylic protecting group that could direct the cyclopropanation onto the opposite face of the double bond.

For 4-OTBS-, OTIPS-, and OtBu-protected derivatives of 118, were already observed good to high facial selectivity in heterogeneous catalytic hydrogenation and hydroboration reactions ${ }^{29,48}$, so we were confident that a similar selectivity could be obtained in cyclopropanation, either by exploiting Michael-type reactions of S-ylides or various carbenoids.

However, not only did $O$-protected derivative 129 ( $\mathrm{R}=\mathrm{TBS}$, Scheme 29, Table 4), react very slowly with Charette's and Wittig-Furukawa's carbenoids (53-55\% conversion after 20-44 h, entries 1-2) but the cis isomer still, albeit only slightly, prevailed. This could be explained by a weak coordination of the Zn -carbenoid to the oxygen atom in the 4-position.

In fact, when completely changing the reaction mechanism, i.e. using dimethylsulfoxonium methylide in DMSO at $25^{\circ} \mathrm{C}$, steric control by the 4 -OR group took place, providing trans compounds 130, $\mathbf{1 3 1}$ and $\mathbf{1 3 3}$ in an approximately 3.8-7:1 ratio with their cis isomers (entries $3-5$ ) and in good yields ( $77-82 \%$ ) after chromatography. This ratio could not be increased under different conditions, even when carrying out the reaction in DMF at $-5^{\circ} \mathrm{C}$ (entry 6).

Scheme 29

Scheme 29: Reagents and conditions: (a) $3 \mathrm{~N} \mathrm{HCl}, \mathrm{CH}_{3} \mathrm{CN}, 0^{\circ} \rightarrow 25^{\circ} \mathrm{C}, 1 \mathrm{~h}$ (b) $\mathrm{MeONa}, \mathrm{MeOH}, 0^{\circ} \mathrm{C}$

| 9 | 129 | $\mathrm{TMSCHN}_{2}, \mathrm{Pd}(\mathrm{OAc})_{2}$, benzene, $30^{\circ} \mathrm{C}, 4 \mathrm{~d}$ | 0 | - |

Table 4: [a] Reaction carried out on $0.5-1 \mathrm{mmol}$ of substrate, monitored by TLC. [b] Determined by 1H NMR. [c] Relative composition determined by 1 H NMR on the crude reaction mixture. [d] TMSOI = Trimethylsulfoxonium iodide. [e] Yield after chromatography. [f] Low yield due to a great extent of degradation of the starting material. [g] TMSI $=$ Trimethylsulfonium iodide.

The facial selectivity was much the same (trans/cis ratio $=4.8: 1$ ) when we used dimethylsulfonium methylide for the trans cyclopropanation in DMF (entry 7) at room temperature; however, the isolated yield was very low ( $14 \%$ after chromatography) under these conditions (and even worse when carrying out the reaction in DMSO, entry 8) because of the formation of a large amount of polar byproducts, which were lost in the work up or during chromatography.

The Pd-catalyzed cyclopropanation (entry 9) carried out in the presence of trimethylsilyldiazomethane $\left(\mathrm{TMSCHN}_{2}\right)$, as reported for an electron-poor olefin ${ }^{69}$, failed completely.

Despite the fact that the trans compounds were obtained in mixtures with their cis isomers, these could be easily separated by chromatography after OH deprotection (Scheme 29), which provided the enantiopure major trans compounds ( $1 S, 5 R, 6 R$ )-127 in 69 and $67 \%$ yield from $(1 S, 5 R, 6 R) \mathbf{- 1 3 0}$ and $(1 S, 5 R, 6 R)-\mathbf{1 3 1}$, respectively, and $(1 S, 5 R, 6 R) \mathbf{- 1 2 8}$ in $73 \%$ yield from $(1 S, 5 R, 6 R)$-133. The best conditions were as usually applied to the synthesis of enantiomer (1R,5S,6S)-ent-10 from (S)-132.

Finally, to obtain these amino acid analogues in a form suitable for peptide coupling, we carried out the N -deprotection on both enantiomers of compounds cis and trans $\mathbf{1 2 8}$ by hydrogenolysis (Scheme 30) at room temperature over $10 \% \mathrm{Pd} / \mathrm{C}$, which provided free amino esters cis $\mathbf{1 1 0}$ and trans $\mathbf{1 1 0}$ both in quantitative yield ${ }^{70}$.

Scheme 30

Scheme 30: Reagents and conditions: (a) $\mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{MeOH}, 25^{\circ} \mathrm{C}, 3 \mathrm{~h}$

### 2.7 Determination of lipases enantiospecificity in EKR of racemic 4-hydroxylated $\mathbf{N - C b z}$ protected enecarbamate esters

Compound trans $(1 R, 5 S, 6 S) \mathbf{- 1 1 0}$ was converted into the corresponding $N-\mathrm{CO}_{2} \mathrm{Me}$ protected derivative $(1 R, 5 S, 6 S)$ - $\mathbf{1 2 7}$ (Scheme 31) whose positive optical rotation value is consistent to the stereospecificity of the lipase in the kinetic resolution of alcohol ( $\pm$ )- $\mathbf{- 1 2 5}$ (for trans $(1 S, 5 R, 6 R)$ $\mathbf{1 2 7}$ obtained from $(R)-54$ of known absolute configuration the $[\alpha]^{25}$ D value is -4.43 ).

## Scheme 31

Scheme 31: Reagents and conditions: (a) $\mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{MeOH}, 25^{\circ} \mathrm{C}, 3 \mathrm{~h}$

## 2.8 cis/trans stereochemical assignement in 4-hydroxy-cyclopropanated derivatives

The relative cis and trans stereochemistry in compound $\mathbf{1 2 7}$ and $\mathbf{1 2 8}$ (Scheme 28) is easily assigned by the analysis of the coupling constants in the ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum and by NOE studies. In cis compound $5-\mathrm{H}$ resonates at 4.35 ppm with a $J=10.1 \mathrm{~Hz}$ consistent with its axial orientation. This is confirmed by a NOESY 1D experiment (mixing time 800 ms ) which shows a correlation between 5-H and axial 3-H proton. In trans compound 5-H resonates at 4.28 ppm as a broad singlet due to its equatorial position, as confirmed by the lack of NOE correlation between $5-\mathrm{H}$ and the protons at C 3 . In both isomers, the $\mathrm{C}-1$ carbomethoxy group is axially oriented to remove the $\mathrm{A}^{(1,3)}$ strain with the N -protecting group ${ }^{71}$. The ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of compounds $\mathbf{1 3 0}$, $\mathbf{1 3 1}$ and $\mathbf{1 3 3}$ (Scheme 29) are quite complex due to the presence in solution of rotamers for both trans and cis isomers. However, at least one set of signals allow for the identification of the two isomers and the determination of the ratio, i.e. 3-H axial proton which is always $0.4-0.5 \mathrm{ppm}$ more downfield-shifted in the trans isomer. In this, moreover, the $5-\mathrm{H}$ is always a broad singlet due to the lack of trans diaxal couplings.

## Chapter 3: Synthesis of 4,5-dihydroxypipecolic acids

We started our study on 4,5-dihydroxylated pipecolic acids focusing on the 4,5-cis-dihydroxy compounds 10, 11 and related enantiomers ent-10 and ent-11.

According to the above strategy, for the synthesis of cis 4,5-dihydroxypipecolic acid $\mathbf{1 0}$ and 11, cis 4,5 -dihydroxylated lactam 137 would be required in enantipure form. Despite being a simple compound (and, in general, a potentially useful polyfunctionalized chiral synthon for diverse uses), the isolated enantiomers of the cis isomer $\mathbf{1 3 7}$ were unknown.

### 3.1 Synthesis of the cis 4,5-dihydroxypiridine precursors: EKR strategy

Encouraged by the good results obtained with 4-hydroxylated derivatives $1 \mathbf{1 8}$ and 125, we envisaged a lipase-catalyzed kinetic resolution of 4,5-dihydroxylated precursors.
In 4-hydroxylated derivatives, the EKR was applied for the resolution of the enecarbamate substrates, but for the 4,5-dihydroxylated precursors we initially envisaged an enzymatic resolution at an "earlier" stage, i.e. on racemic 4,5-cis-dihydroxylated lactam 137 (Scheme 32).

## Scheme 32

Scheme 32: EKR-based strategy for enhantiopure 4,5-cis-dihydroxylated lactams precursors

So, for the synthesis of the racemic 4,5-dihydroxylactam ( $\pm$ )-137, known unsaturated lactam 136 (Scheme 33), which can be prepared in a multigram scale by coupling of 3-buthenol (134) with allylamine and following RCM of the coupling product $\mathbf{1 3 5}^{\mathbf{7 2}}$, was chosen as the starting material.

In our laboratory were previously tried the Sharpless asymmetric dihyroxylation on lactam 136 by using both $\alpha$ and $\beta$ AD-mix. However, despite testing several experiments procedures and, in particular, a most promising one reported for the corresponding unsatured lactone ${ }^{73}$, it was never possible to obtain enantiomeric excesses higher than $14 \%{ }^{74}$.

## Scheme 33

Scheme 33: Reagents and conditions: (a) $\left(\mathrm{COCl}_{2}\right), \mathrm{CH}_{2} \mathrm{Cl}_{2}, 25^{\circ} \mathrm{C}, 3 \mathrm{~h}$ (b) Grubbs I generation, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, reflux, 17 h (d) $\mathrm{KMnO}_{4}(31 \mathrm{mM}), \mathrm{NaOH}(50 \mathrm{mM}), \mathrm{H}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}, 1 \mathrm{~h}$

Among the various options for the dihydroxylation of $\mathbf{1 3 6}$ to give new lactam ( $\pm$ )-137, the addition of an aqueous solution of $\mathrm{KMnO}_{4}$ to a vigorously stirred alkaline solution of the substrate in water at $0^{\circ} \mathrm{C}$ worked best in terms of product recovery and yield after work-up ${ }^{75,76}$. Reagents concentrations, pH , and addition rate were critical to avoid either overoxidation or migration of the double bond to give the corresponding $\alpha, \beta$-unsaturated lactam.

### 3.1.1 EKR attempts on racemic lactam 137

With a sufficient amount of $( \pm)-\mathbf{1 3 7}$, we were ready for preliminary EKR studies.
The first problem was the scarce solubility of this substrates in the solvents used above for EKR. So, we carried out the experiments dissolving racemic 137 in THF, which seemed to be the best solvent of 137. Three aliquots of substrate dissolved in THF ( 0.4 M ) were reacted, respectively, in the presence of CAL-B, CAL-A and PS-AMANO-IM ( $100 \mathrm{mg} / \mathrm{mmol}$ ), with an excess of vinyl butyrate as acylant reagent. Unfortunately, probably due to the low solubility of the substrate in THF, in no cases we observed the conversion of the substrate to acylated products. Moreover, $( \pm)-\mathbf{1 3 7}$ was unsoluble also in dioxane and acetonitrile.

### 3.1.2 EKR application of 4,5-dihydroxylated enecarbamate derivative

Due to the failure of the enzymatic strategy on racemic lactam 137, and envisaging a possible resolution in a "later" stage of the synthesis, we developed a synthetic route for the conversion of $( \pm)-\mathbf{1 3 7}$ in the corresponding enecarbamate derivative trough the enol-phosphates chemistry, which should be then subjected to the enzymatic resolution (Scheme 34).

## Scheme 34

Scheme 34: EKR-based strategy for enhantiopure 4,5-cis-dihydroxylated enamide precursors

This synthesis of the racemic enecarbamate precursor was previously developed for the $\mathrm{N}-\mathrm{Cbz}$ derivative 147. This was subjected to the enzimatic resolution, then applied also to the $\mathrm{N}-\mathrm{CO}_{2} \mathrm{Me}$ substrates 144, previously employed in a diastereodivergent synthesis of alkaloid 1,4dideoxymannojirimycin ${ }^{51}$. In Scheme 35 both routes where shown.
So, crude ( $\pm$ )-137 was directly transformed into the isopropylidene-protected diol ( $\pm$ )- $\mathbf{- 1 3 8}$ which was obtained in $63 \%$ yield over two steps after chromatography, and then protected as $N-\mathrm{CO}_{2} \mathrm{Me}$ or $N$-Cbz carbamates $(( \pm) \mathbf{- 1 3 9}$ and $( \pm) \mathbf{- 1 4 0}, 81 \%$ and $84 \%$ yield, respectively).

## Scheme 35

( $\pm$ )-141 (89\%) R = Me
( $\pm$ )-143 (69\%) $\mathrm{R}=\mathrm{Me}$
( $\pm$ )-142 (100\%) R = Bn
( $\pm$ )-144 (72\%) $\mathrm{R}=\mathrm{Bn}$

Scheme 35: Reagents and conditions: (a) 2,2-dimetoxypropane, $p-\mathrm{TsOH}, \mathrm{MeOH}, 55^{\circ} \mathrm{C}, 1 \mathrm{~h}$ (b) MeOCOCl or $\mathrm{BnOCOCl}, n-\mathrm{BuLi}, \mathrm{THF},-78^{\circ} \mathrm{C}$ (c) KHMDS, $(\mathrm{PhO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{Cl}, \mathrm{THF},-78^{\circ} \mathrm{C}$ (d) $\mathrm{Pd}(\mathrm{OAC})_{2}, \mathrm{Ph}_{3} \mathrm{P}, \mathrm{CO}, \mathrm{MeOH}, \mathrm{Et}_{3} \mathrm{~N}$, DMF, $60^{\circ} \mathrm{C}, 2.5 \mathrm{~h}(\mathrm{R}=\mathrm{Me})$ or $5 \mathrm{~h}(\mathrm{R}=\mathrm{Bn})$

Quantitative generation of the corresponding enol phosphates ( $\pm$ )-141 and ( $\pm$ )-142 was accomplished by treatment of the lactams with KHMDS at $-78^{\circ} \mathrm{C}$ in THF, followed by the addition of diphenylchlorophosphate. Pd-catalyzed metoxycarbonylation of the two phosphates was carried out according to the usual method, in anhydrous DMF and at 1 atm (CO balloon) and
finally gave the key ester intermediates $( \pm) \mathbf{- 1 4 3}$ and $( \pm) \mathbf{- 1 4 4}$ in 69 and $72 \%$ yield after two steps, respectively. In that conditions the $N-\mathrm{Cbz}$ phosphate reacted slowly than the $N-\mathrm{CO}_{2} \mathrm{Me}$ protected. In fact, phosphate ( $\pm$ )-142 was completely converted only after 5 h at $60^{\circ} \mathrm{C}$, against the 2.5 h of the $\mathrm{N}-\mathrm{CO}_{2} \mathrm{Me}$ phosphate $( \pm)$ - $\mathbf{1 4 1}$.

During the synthesis we also tried to obtain isopropilidene-protected lactam 140 starting from diol 146 (Scheme 36), provided in scarce yield (16\%) by N-Cbz protection of 136. The following OH protection as isopropylidene (2,2-dimethoxypropane and catalytic $p$ - $\mathrm{TsOH}, \mathrm{MeOH} 55^{\circ} \mathrm{C}$ ) failed, affording only unidentified polar degradation products.

## Scheme 36

Scheme 36: Reagents and conditions: (a) $n$ - $\mathrm{BuLi}, \mathrm{BnOCOCl}, \mathrm{THF},-78^{\circ} \mathrm{C}$ (b) $\mathrm{KMnO}_{4}(31 \mathrm{mM}), \mathrm{NaOH}(50 \mathrm{mM})$, $\mathrm{H}_{2} \mathrm{O}, 0^{\circ} \mathrm{C}, 1 \mathrm{~h}$ (c) 2,2-dimetoxypropane, $p$ - $\mathrm{TsOH}, \mathrm{MeOH}, 55^{\circ} \mathrm{C}, 1 \mathrm{~h}$

In order to have the substrate ready for the enzymatic kinetic resolution, we performed the isopropylidene deprotection of $( \pm) \mathbf{- 1 4 4}$ in a TFA/ $\mathrm{CHCl}_{3} / \mathrm{H}_{2} \mathrm{O} 5: 1: 0.1$ mixture (Scheme 37).

Scheme 37

Scheme 37: Reagents and conditions: (a) $\mathrm{TFA} / \mathrm{CHCl}_{3} / \mathrm{H}_{2} \mathrm{O} 5: 1: 0.1,25^{\circ} \mathrm{C}, 11 \mathrm{~min}(\mathrm{~b}) \mathrm{TFA} / \mathrm{CHCl}_{3} / \mathrm{H}_{2} \mathrm{O} 5: 1: 0.1$, $25^{\circ} \mathrm{C}, 0.5 \mathrm{~h}$

Under these conditions, compound $( \pm) \mathbf{- 1 4 4}$ reached complete conversion after 30 minutes, but the allylic hydroxyl group of the resulting cis alcohol 147 was prone to partial isomerisation due to the acid envirornment, forming also the undesired trans product $( \pm) \mathbf{- 1 4 8}$. Fortunately, this phenomena could be strongly limited by carrying out the reaction for shorter times (optimum 11 min, stopped with $66 \%$ conversion). In that way, we managed to obtain only the required compound 147 in a $2: 1$ mixture with the unreacted substrate. The two compounds could be isolated by flash column chromatography, and $( \pm) \mathbf{- 1 4 4}$ subjected again to deprotection.

With a sufficient amount of racemic 147, we were ready for EKR (Scheme 38, Table 5) experiments (see Appendix 6 for absolute configuration determination).

Scheme 38

( $\pm$ )-147

Table 5

( $4 S, 5 R$ )-147
Scheme 38: Reagents and conditions: (a) $\mathrm{MeONa}, \mathrm{MeOH}, 0^{\circ} \mathrm{C}, 3.5 \mathrm{~h}$

The kinetic resolution was carried out in the presence of the three lipases that gave the best results for the resolution of the 4-hydroxylated alcohols, i.e. Bulkorderia cepacia lipase (PS-AMANO-IM) and Candida antarctica lipase B and A (CAL-B and CAL-A), with an excess of vinyl acetate, vinyl butyrate or vinyl stearate as the acylating reagent. As previously reported for the resolution of 4-hydroxylated compounds, the reactions were performed in various anhydrous solvents.

Table 5: [a] VA: vinyl acetate, VB: vinyl butyrate, VS: vinyl stearate. [b] Anhydrous solvents were used. [c] Conversion determined by HPLC (column Acclaim 120 C 18 , see ref ${ }^{77}$ ) and $1 \mathrm{H}-\mathrm{NMR}$. [d] Determined by HPLC analysis (column Cyclobond I2000, see ref ${ }^{78}$ ). [e] Determined by HPLC analysis (column Lux Cellulose 4, see ref ${ }^{79}$ ). [f] Calculated as $\ln [1-\mathrm{c}(1+e e p)] / \ln [1-\mathrm{c}(1-\mathrm{eep})]$. [g] Reaction carried out on $0.2-0.4 \mathrm{mmol}$ of substrate at $30{ }^{\circ} \mathrm{C}$, substrate concentration 0.2 M , enzyme $(\mathrm{mg}) /$ substrate $(\mathrm{mmol})$ ratio $=100,3.5$ equivalents of acylant reagent, molecular sieves ( $4 \AA, 130 \mathrm{mg} / \mathrm{mmol}$ ). [h] Substrate concentration $=0.8 \mathrm{M}$

Because enzymes could acylate the hydroxy group at position 4, 5 or both (only in a few cases ${ }^{80}$ ), for each experiment we determined the regioselectivity of the enzymes and the enantiomeric excess of the acylated alcohols (after hydrolysis), as well as the $e e$ of the unreacted diol. As in the case of simple 4-hydroxylate alcohols the $(4 S, 5 R)$ enantiomer of 147 was preferentially acylated in all experiments.
Each enzyme showed a proper regioselectivity. CAL-B (entries 3-10) preferentially acylated the OH-group in position 4, as well as CAL-A (entries 1 and 2), while using PS-AMANO-IM the 5acylated isomer prevailed (entries 11 and 12).

Unfortunately, the ratio between the 4 -acylated and 5 -acylated regioisomers at a certain conversion rate was not stable during the time and could not be easily determined. In fact, we observed a time-related decrease of 4-acylated/5-acylated ratio when the products were in solution. We explained it as a spontaneous migration of the acyl group from oxygen in position 4 to position 5, as previously reported by Armesto et all. on quinic and shikimic acid derivatives ${ }^{81}$. This migration took place also during our efforts in chromatographyc separation of the regioisomers.

So, although the $e e$ of 5-acylated compound formed by migration was necessarily the same of that of the original 4-acylated regioisomer, we were not able to determine the relative amount of 5 -acylated isomer formed by direct action of the enzyme. Consequently, by measuring the ee of acylated products after hydrolysis (by HPLC), the enantioselectivity in position 5 or 4 could not be determined.

In order to minimize this problem, we focused on the most regioselective enzyme CAL-B (entry 3-10). Using vinyl butyrate as acylating agent, reaction time and enantiomeric excesses strongly depended on the employed solvent. In high-polarity solvents like acetone (entry 5), dioxane (entry 6 ) and acetonitrile (entry 7 ), reactions were faster and with an higher $4 / 5$-acylated ratio with respect to what observed in low-polarity solvents (dichlormethane, toluene, entry 8 and 9). The experiment carried out with vinyl stearate (VS) acylating agent lead to the worst results (entry 10).

Even under the best conditions we never managed to obtain products with sufficiently high ee (the enantiomeric ratio E was near 20 for the reaction performed in polar solvents), so this approach appeared unsuitable for the resolution of racemic $\mathbf{1 4 7}$ (although the results obtained in acetone and acetonitrile were promising and deserving further experiments).

### 3.2 Chemical resolution of racemic cis-4,5-dihydroxylated enecarbamate ester 147

Due to the failure of the enzymatic approach, we envisioned a chemical resolution of racemic 147 by esterification of racemic acid derivative $\mathbf{1 5 2}$ with enantiopure alcohols, having in mind a possible chromatographic separation of the two diastereoisomeric esters furnished by the reaction (Scheme 39). The experiments were carried out with enantiopure (-)-menthol and ( $S, S$ )hydrobenzoin. Unfortunately, even though various eluition mixture were tested, diasteromeric esters $\mathbf{1 5 3}$ and $\mathbf{1 5 4}$ resulted as to be unseparable by flash column chromatography.

Scheme 39

Scheme 39: Reagents and conditions: (a) 1 M LiOH , dioxane, $60^{\circ} \mathrm{C}, 21 \mathrm{~h}$ (b) $\mathbf{R}^{*}-\mathrm{OH}, \mathrm{DCC}, \mathrm{DMAP}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, $0^{\circ} \mathrm{C} \rightarrow 25^{\circ} \mathrm{C}, 3 \mathrm{~h}(\mathrm{R}-\mathrm{OH}=$ menthol $)$ or $21 \mathrm{~h}(\mathrm{R}-\mathrm{OH}=$ hydrobenzoin $)$

### 3.3 Synthesis of the cis-4,5-dihydroxylated precursors from enantiopure lactones

Due to the poor results of the enzymatic and chemical resolution of racemic 147, we envisaged a completely different route to build our synthetic precursors in enantiopure form, starting from enantiopure hydroxylated lactones from the chiral pool.
For the synthesis of enantiopure 137 in enantiopure form, we envisaged a route which starts from enantiopure 2-deoxyribose 155. Being both enantiomers of 2-deoxyribose commercially available, we realized the synthesis of enantiopure cis 4,5-dihydroxy $\delta$-valerolactam $\mathbf{1 3 7}$
(Scheme 40) from commercial 2-deoxy-D-ribose $\mathbf{1 5 5}$, as well as the synthesis of its enantiomer ent-137 from 2-deoxy-L-ribose ent-155.

## Scheme 40

Scheme 40: Reagents and conditions: (a) $\mathrm{Br}_{2}, \mathrm{H}_{2} \mathrm{O}, 25^{\circ} \mathrm{C}, 5 \mathrm{~d}$; (b) TsCl , pyridine, $-15^{\circ} \mathrm{C}, 2 \mathrm{~h}$, then $0^{\circ} \mathrm{C}, 5 \mathrm{~h}$; (c) $\mathrm{SOBr}_{2}$, rt, 4.5 h ; (d) $\mathrm{NaN}_{3}, \mathrm{CH}_{3} \mathrm{CN}, 18-\mathrm{C}-6$ or 15-C-5, reflux, $15-20 \mathrm{~h}$; (e) $\mathrm{H}_{2}$ (1 atm), $10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{MeOH}, 24 \mathrm{~h}$ (f) 2,2-dimethoxypropane, $p$ - $\mathrm{TsOH}, \mathrm{MeOH}, 55^{\circ} \mathrm{C}, 1 \mathrm{~h}$; (g) $\mathrm{CH}_{3} \mathrm{OCOCl}, n$ - $\mathrm{BuLi},-78^{\circ} \mathrm{C}$; (h) ( PhO$)_{2} \mathrm{POCl}, \mathrm{KHMDS}$, THF, $-78{ }^{\circ} \mathrm{C}$; (i) $10 \% \mathrm{Pd}(\mathrm{OAc})_{2}, 20 \% \mathrm{Ph}_{3} \mathrm{P}, \mathrm{CO}, \mathrm{MeOH}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DMF}, 75^{\circ} \mathrm{C}, 1 \mathrm{~h}$; (e) $\mathrm{H}_{2}(1$

To this end, 2-deoxy-D-ribose 155 was initially subjected to treatment with $\mathrm{Br}_{2}$ in water for 5 days, which provided 2-deoxy-D-ribonolactone 156 in excellent yield (88\%) after chromatography ${ }^{82}$. This compound proved stable in aprotic solvents, but in protic mediums such as methanol it slowly equilibrates to give a minor isomer which could be the corresponding sixmembered lactone (i.e. the cis-4,5-dihydroxytetrahydropyran-2-one) or the intermediate aldonic acid, according to Han et al. ${ }^{82 a, b}$. We found a ratio of about $2.5: 1$ in favor of the 2-deoxy-Dribonolactone, a ratio which did not change after heating at $50{ }^{\circ} \mathrm{C}^{83}$. The (partial) conversion of 156 into the corresponding primary $O$-tosyl derivative 157 was realized as reported by treatment with TsCl in pyridine at $-15^{\circ} \mathrm{C}$ and then leaving at $0{ }^{\circ} \mathrm{C}$ for $5 \mathrm{~h}^{84}$ conditions which furnished compound 157 in $54 \%$ yield after chromatography. This was the best yield we obtained under these conditions, as prolonging the reaction times to completely convert 156 into 157 led to the partial tosylation of the secondary OH group, too. Similarly, several attempts at selectively converting the primary hydroxy group into a mesylate ( $\mathrm{MsCl}, \mathrm{Et}_{3} \mathrm{~N}$, in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $-30^{\circ} \mathrm{C}$ ) always failed due to the concurrent mesylation of the secondary alcohol, followed by elimination of
methansulfonic acid during chromatography. Instead, bromination of compound 156 by treatment with thionyl bromide in anhydrous DMF at room temperature ( 4.5 h ) occurred selectively at the primary position, but provided lactone ( + )- $\mathbf{1 5 8}$ in $47 \%$ yield after chromatography. However, it was possible, after the work-up of the reaction, to recover an amount of unreacted starting material ( $31 \%$ ) which was chromatographed and reacted again with $\mathrm{SOBr}_{2}$ under the same conditions, thus providing bromolactone ( + ) $\mathbf{- 1 5 8}$ in $61 \%$ total yield ${ }^{85}$. Transformation of both 157 and 158 into 2-deoxy-5-azido-D-ribonolactone 159 was accomplished by treatment with $\mathrm{NaN}_{3}$ in refluxing acetonitrile and in the presence of 18 -crown6, which provided key intermediate 159 in $87 \%$ (from 157) and $95 \%$ (from 158).

Eventually, hydrogenation of $\mathbf{1 5 9}$ at atmospheric pressure (balloon) over $10 \% \mathrm{Pd} / \mathrm{C}$ gave pure dihydroxylated lactam $(4 S, 5 R)$-137 in $91 \%$ yield and whose 4,5-cis relative stereochemistry was confirmed by X-ray analysis (Figure 6). According to the same strategy, by converting 2-deoxy-L-ribose (ent-155) into the corresponding bromine ( $47 \%$ over two steps), and this into azide (97\%), we were also able to prepare its enantiomer ( $4 R, 5 S$ )-ent-137 in 43\% overall yield.

## Figure 6

Figure 6: $X$-ray of $(4 S, 5 R)-137$ nitrogen in blue, oxygen in red

Lactam 137 was converted into enantiopure enecarbamate ester 143 according to the procedure we have disclosed for the synthesis of the corresponding racemic compound. Thus protection of $(4 S, 5 R) \mathbf{- 1 3 7}$ as the acetonide (-)-138 ( $92 \%$ ) (Scheme 41) , and then N -protection as carbamate ( -)-139 ( $84 \%$ ) set the stage for the quantitative generation of the corresponding enol phosphate $\mathbf{1 4 1}$ by treatment of the lactam with KHMDS at $-78{ }^{\circ} \mathrm{C}$ in THF followed by the addition of diphenylchlorophosphate.

Pd-catalyzed methoxycarbonylation of the phosphate in anhydrous DMF and at 1 atm (CO balloon) was carried out at $75^{\circ} \mathrm{C}$ in the presence of an excess of MeOH to give the key ester intermediates $(+)-\mathbf{1 4 3}$ in $\mathbf{7 8 \%}$ yield after two steps.

Its enantiomer (-)-ent- $\mathbf{1 4 3}$ was prepared according to the same procedure starting from $(4 R, 5 S)$ -ent-137, with $51 \%$ overall yield.

## Scheme 41

Scheme 41: Reagents and conditions: (a) 2,2-dimethoxypropane, p-TsOH, $\mathrm{MeOH}, 55^{\circ} \mathrm{C}, 1 \mathrm{~h}$; (b) $\mathrm{CH}_{3} \mathrm{OCOCl}, n-$ $\mathrm{BuLi},-78^{\circ} \mathrm{C}$; (c) $(\mathrm{PhO})_{2} \mathrm{POCl}, \mathrm{KHMDS}, \mathrm{THF},-78{ }^{\circ} \mathrm{C}$; (d) $10 \% \mathrm{Pd}(\mathrm{OAc})_{2}, 20 \% \mathrm{Ph}_{3} \mathrm{P}, \mathrm{CO}, \mathrm{MeOH}, \mathrm{Et} 3 \mathrm{~N}, \mathrm{DMF}, 75$ ${ }^{\circ} \mathrm{C}, 1 \mathrm{~h}$;

### 3.4 Synthesis of 4,5-cis-dihydroxypipecolic acid 10

To attain natural 4,5-cis-dihydroxypipecolic acid L-10, we subjected the enamine double bond of 143 to heterogeneous catalytic hydrogenation over $10 \% \mathrm{Pd} / \mathrm{C}$ at 1 atm , which gave cis ester (-)160 (Scheme 42) in quantitative yield and complete facial selectivity (by ${ }^{1} \mathrm{H} N \mathrm{NR}$ ).

Exhaustive deprotection in refluxing aqueous 4 N HCl eventually concluded the first total synthesis of free L-pipecolic acid $\mathbf{1 0}$ which was obtained in high $27 \%$ overall yield in 9 steps and of which we could measure the optical rotation so far unknown ${ }^{17,19}$.

## Scheme 42

Scheme 42: Reagents and conditions: (e) $\mathrm{H}_{2}(1 \mathrm{~atm}), 10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{NaHCO}_{3}, \mathrm{EtOAc}, 4 \mathrm{~h} ; 4 \mathrm{~N}$ HCL, reflux 4 h

For the synthesis of the other 4,5-cis dihydroxylated pipecolic acid, that is compound 11, the enamine substrate ent-143 was subjected to a conjugate reduction by Super-Hydride $\left(\mathrm{LiEt}_{3} \mathrm{BH}\right)$ at $-10^{\circ} \mathrm{C}$ (Scheme 43). After quenching the anion with a saturated $\mathrm{NaHCO}_{3}$ solution, ${ }^{1} \mathrm{H}-\mathrm{NMR}$ analysis of the crude reaction mixture revealed the formation of a $2.6: 1$ mixture between thermodynamically more stable ester (-)-161 and cis,cis isomer ent-160. The two diastereoisomers were easily separated by chromatography, thus obtaining pure 161 in $68 \%$ yield and its minor isomer ent-160 in $22 \%$ yield. On the basis of previous experience, the latter was subjected to epimerization by treatment with TBAF in THF $^{29 a}$ which provided an approximately 1:1 mixture of the two compounds ( $\mathbf{1 6 1}$ and ent-160) after 19 h at room temperature ${ }^{86}$. After another chromatography the total yield in target compound 161 was $78 \%$ over the two steps. Deprotection of $\mathbf{1 6 1}$ in refluxing 4 N HCl eventually provided pure compound $\mathbf{1 1}$ in quantitative yield ${ }^{87}$, and analogous treatment of ent-160 provided the unnatural enantiomer of 2,4-cis 4,5-cis isomer ent-10.

### 3.5 Synthesis of the trans 4,5-dihydroxypipecolic precursors from enantiopure lactones

For the synthesis of the 4,5-trans compound 9 we envisaged a route which starts from enantiopure 5 -hydroxy- $\delta$-valerolactam, whose synthesis has been reported by Herdeis from glutamic acid ${ }^{88}$, and in which the required $4-\mathrm{OH}$ group would be installed on the heterocyclic skeleton at a later stage of the synthesis, relying on the preferential axial attack in the key allylic bromination step and the possible trans-directing effect exerted by the bulky silyloxy group in compound 169 (Scheme 28) ${ }^{89}$.
Having in mind to employ the resulting 4,5-trans-dihydroxylated enecarbamate as substrates for the synthesis of pipecolic acids as well as their cyclopropanated derivatives (which requires a N protecting group removable by hydrogenation) we performed the synthesis of both $N-\mathrm{CO}_{2} \mathrm{Me}$ protected and $N$-Cbz protected enecarbamate precursors 175 and 176, respectively (Scheme 44).

## Scheme 44

Scheme 44: Reagents and conditions: (a) $\mathrm{MsCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-30^{\circ} \mathrm{C} \rightarrow 25^{\circ} \mathrm{C}, 2 \mathrm{~h}$ (b) $\mathrm{NaN}_{3}, 18$-crown- 6 , MeCN , reflux, 10 h (c) $\mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{MeOH}, 25^{\circ} \mathrm{C}, 21 \mathrm{~h}$ (d) TBSCl , imidazole, DMF, $38^{\circ} \mathrm{C}$, Xh (e) MeOCOCl or $\mathrm{BnOCOCl}, n-\mathrm{BuLi},-78^{\circ} \mathrm{C}$ (f) KHMDS, $(\mathrm{PhO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{Cl}, \mathrm{THF},-78^{\circ} \mathrm{C}(\mathrm{g}) \mathrm{Pd}(\mathrm{OAC})_{2}, \mathrm{Ph}_{3} \mathrm{P}, \mathrm{CO}, \mathrm{MeOH}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DMF}$, $70^{\circ} \mathrm{C}, 2.5 \mathrm{~h}$ (h) AIBN, NBS, $\mathrm{CCl}_{4} / \mathrm{CHCl}_{3} 9: 1$, reflux, 1.5 h (i) Silver acetate, $\mathrm{AcOH}, 15 \mathrm{~min}, 2{ }^{\circ} \mathrm{C}$; (l) MeONa, $\mathrm{MeOH}, 0^{\circ} \mathrm{C}, 1 \mathrm{~h}$

Their synthesis was realized starting from $5-\mathrm{OH}$ protected lactam 164, (Scheme 43) which was prepared from commercial (S)-(+)- $\gamma$-hydroxymethyl- $\gamma$-butyrolactone $\mathbf{1 6 2}$ as reported by

Herdeis ${ }^{88}$, trough cyclization of azide $\mathbf{1 6 3}$ and silyl protection of the resulting alcohol. After Nprotection as methyl carbamate or benzyl carbamate, compounds $\mathbf{1 6 5}$ and 166 were converted into the corresponding enol phosphates 167 and 168, then into enecarbamate esters 169 and 170 ( $82 \%$ and $60 \%$ yield, respectively) as usual. The allylic bromination of both precursors was carried out by treatment with $N$-bromosuccinimide (NBS) in the presence of catalytic azobisisobutyronitrile (AIBN) in a refluxing mixture of $\mathrm{CCl}_{4} / \mathrm{CHCl}_{3}{ }^{90}$.

Interestingly, whereas the reaction on the corresponding 5 -unsubstituted enamide ester was complete in 15 min , under the same conditions thorough consumption of our substrates occurred only after 1.5 h .

On the other hand, we were glad to observe that allyl bromide 171 was obtained as a single trans diastereomer and with the two groups ( Br and OTBS) axially oriented. This assignment was made on the basis of the very low coupling constant values (less than 4 Hz ) of protons $4-\mathrm{H}$ and 5-H of 171, which resonates at 4.32 and 4.22 ppm almost as broad singlets, and the lack of nOe correlations between $6-\mathrm{H}_{\mathrm{ax}}$ and any of the two protons mentioned above. Our failed attempts to convert bromide 171 into a 4,5-cis diol derivative by a $\mathrm{S}_{\mathrm{N}} 2$ displacement of the bromine with an $O$-nucleophile (e.g. with AcOK in anhydrous DCM in the presence of 18 -crown- 6 at $25{ }^{\circ} \mathrm{C}$ or with AcOLi in DMF at $45^{\circ} \mathrm{C}$ ) can be explained by the steric impediment exerted by the large, axially oriented, OTBS group. Instead, cationic processes were all successful to provide 4,5trans diol derivative, in particular treatment of bromide with silver acetate (2 equiv.) in acetic acid furnished (-)-173 with the highest yield ( $75 \%$ over two steps) ${ }^{91}$.

Again, the trans stereochemical assignment of compound $\mathbf{1 7 3}$ is based on the analysis of the coupling constants in its ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectrum: both $4-\mathrm{H}(4.95 \mathrm{ppm})$ and $5-\mathrm{H}(3-91 \mathrm{ppm})$ protons possess very low coupling constants (less than 3 Hz ) which is in accordance with their equatorial position. Moreover, there is no nOe enhancement of $4-\mathrm{H}$ and $5-\mathrm{H}$ when selecting $6-\mathrm{H}_{\mathrm{ax}}$ in NOESY 1D experiments.

The trans selectivity in both radical and cationic processes to give $\mathbf{1 7 3}$ and $\mathbf{1 7 4}$, respectively, can be only in part accounted for on the basis of steric reasons, as instead stereoelectronic effects could play a major role in stabilizing the transition state ${ }^{89}$. The axial introduction of the bromine on the half-chair conformation with the axial OTBS group at C-5 permits the maintenance of maximum $\pi$-overlap in the allylic radical during the reaction and, moreover, there could be a possible further stabilization by hyperconjugative delocalization of the forming $\mathrm{Br}-\mathrm{C} \sigma$-bond with the $\sigma^{*}$ orbital of C-OTBS bond (Figure 7).

## Figure 7

Figure 7: stereochemistry in the allylic oxidation (a) of compound $\mathbf{1 6 9}$ and $\mathrm{SN}_{1}$ substitution (b) of $\mathbf{1 7 1}$

The procedure with silver acetate in acetic acid was also applied on trans $\mathrm{N}-\mathrm{Cbz}$ bromide 172, providing 174 in $40 \%$ yield over two steps.

The acetyl group in $\mathbf{1 7 3}$ and $\mathbf{1 7 4}$ was following removed to give alcohols $\mathbf{1 7 5}$ and $\mathbf{1 7 6}$ (both with $73 \%$ yield).

### 3.6 Synthesis of 4,5-trans-dihydroxypipecolic acids

For the synthesis of the 4,5-trans compound $\mathbf{9}$, the $\mathrm{N}-\mathrm{CO}_{2} \mathrm{Me}$ protected enecarbamate ester $\mathbf{1 7 5}$ was hydrogenated as usual yielding a $3.1: 1$ mixture (by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ) of 2,4 -trans-4,5-trans compound (-)-178 and 2,4-cis-4,5-trans isomer $\mathbf{1 7 7}$ (Scheme 45).

Scheme 45

Scheme 45: Reagents and conditions: (a) $\mathrm{H}_{2}(1 \mathrm{~atm}), 10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{NaHCO}_{3}, \mathrm{EtOAc}, 20 \mathrm{~h}$; (b) 4 N HCl , reflux, 24 h

As expected, the effect of bulky silyloxy group was prevailing in dictating which face of the double bond would be adsorbed on the Pd-catalyst, although the stereoselectivity was lower than we had hoped. In any case, major isomer $\mathbf{1 7 8}$ was easily separated by chromatography ( $71 \%$ yield) and fully deprotected in refluxing aqueous 4 N HCl to give target pipecolic acid 9 in
quantitative yield. Unfortunately, it was not possible to isolate the minor isomer 177 if not in mixture with small amounts of 178.

### 3.7 NOESY study on 4,5-dihydroxypipecolic acids

Because of the lack of high field NMR studies on these 4,5-dihydroxypipecolic acids, besides recording NMR spectra, we also performed NOESY 1D and 2D experiments to assess the spatial orientation of the three substituents on the piperidine ring. As shown in Figura 8, in all cases the carboxylic group at 2-position is equatorially oriented, as shown by the ever present nOe crosspeak between 2-H (axially oriented) and $6-\mathrm{H}_{\mathrm{ax}}$, thus dictating the spatial orientation of the two hydroxyl groups. In compound $\mathbf{9}$, the two protons at C-4 and C-5 resonate at 4.04 and 3.94 ppm almost as broad singlets with very low coupling constants ( $J<3.5 \mathrm{~Hz}$ ), consistent with their equatorial position.

## Figure 8

9

10

11

Figure 8: stereochemistry assignement by nOe

In compound 10, a nOe correlation exists also between $2-\mathrm{H}$ and $4-\mathrm{H}$, showing the equatorial orientation of the $4-\mathrm{OH}$ group. In this compound, only $5-\mathrm{H}$ appears as a broad singlet at 4.16 ppm consistent with the axial position of the $5-\mathrm{OH}$ group. The reverse apply for compound 11, for which we found a nOe correlation between $3-\mathrm{H}_{\mathrm{ax}}$ and $5-\mathrm{H}$, and it is the equatorially oriented 4-H ( 4.13 ppm ) which has very low coupling constant values now. The equatorial orientation of $5-\mathrm{OH}$ is further confirmed by the high value for the ${ }^{3} J$ between $5-\mathrm{H}$ and $6-\mathrm{H}_{\mathrm{ax}}(10 \mathrm{~Hz})$, consistent with the axial orientation of $5-\mathrm{H}$.

### 3.8 Synthesis of 4,5-dihydroxy-cyclopropanated derivatives

In a similar fashion to reported for 4-hydroxy-enecarbamates 118 and 125, also the $N$ - Cbz enecarbamate ester $\mathbf{1 7 6}$ was converted into the cis and trans cyclopropanated (whith respect to the orientation of the allylic OH group) derivatives, by exploiting the stereocontrol exerted by nude or bulky protected allylic OH group.

### 3.8.1 Synthesis of cyclopropanated derivatives: OH -directed cyclopropanation

The best strategies that were suitable to attain the 4-monohydroxy cis and trans cyclopropanated derivatives were applied to the enantiopure 4,5-dihydroxylated substrate 176.
In particular, the OH -directed cyclopropanation by Charette's Zn -carbenoid (i. e. $\mathrm{Et}_{2} \mathrm{Zn}$ and $\mathrm{CH}_{2} \mathrm{I}_{2}$ in the presence of 2,4,6-trichlorophenol) resulted as to be the better route to attain the cis product $\mathbf{1 7 9}$ (Scheme 46) with absolute diastereoselectivity (by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ) and very high yield after chromatography ( $95 \%$ ).

Scheme 46

Scheme 46: Reagents and conditions: (a) $\mathrm{Et}_{2} \mathrm{Zn}, \mathrm{CH}_{2} \mathrm{I}_{2}, 2,4,6$-trichlorphenol, $\mathrm{CH}_{2} \mathrm{Cl}_{2},-40^{\circ} \mathrm{C} \rightarrow 25^{\circ} \mathrm{C}, 22 \mathrm{~h}$; (b) 3 N $\mathrm{HCl}, \mathrm{CH}_{3} \mathrm{CN}, 0^{\circ} \mathrm{C} \rightarrow 25^{\circ} \mathrm{C}, 1 \mathrm{~h}$; (c) $\mathrm{H}_{2}(1 \mathrm{~atm}), 10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{EtOAc}, 20 \mathrm{~h}$

The attribution of the relative cis stereochemistry in compound $\mathbf{1 7 9}$ was easily assigned by NOE studies. In particular, NOESY 1D experiments (mixing time 800 ms ) showed a correlation between $5-\mathrm{H}$ and the axial $3-\mathrm{H}$ proton, as well as a correlation between endo $7-\mathrm{H}$ and $4-\mathrm{H}$, consistent with the proposed structure.

After removal of the TBS group with 3 N HCl in ACN which gave intermediate $\mathbf{1 8 0}$ (73\%), hydrogenation on $\mathrm{Pd} / \mathrm{C}$ finally provided derivative cis- $\mathbf{1 1 2}$ in quantitative yield.

### 3.8.2 Synthesis of cyclopropanated derivatives: bulky group-directed cyclopropanation

For the synthesis of the trans derivative trans-112, we exploited the reaction of dimetilsulfoxonium methilyde on 4,5-disilyloxy-protected 181 (Scheme 47), obtained in 99\% yield after TBS protection of the free hydroxy group in 176. Reaction with ylide provided, just like the same reaction with the in 4-hydroxylated derivative, a mixture of the desired trans $\mathbf{1 8 2}$ and cis derivatives ( $66 \%$ yield), with a $6: 1$ ratio (by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ ).
In this case, the attribution of trans stereochemistry was assigned by the lack of NOE correlation between 5-H and the protons at C3.

## Scheme 47

Scheme 47: Reagents and conditions: (a) TBSCl, imidazole, DMF, $38^{\circ} \mathrm{C}, 2.5 \mathrm{~h}$; (b) trimethylsulfoxonium iodide, NaH , DMSO, $25^{\circ} \mathrm{C}$, 4 h ; (c) $3 \mathrm{~N} \mathrm{HCl}, \mathrm{CH}_{3} \mathrm{CN}, \mathrm{CH}_{3} \mathrm{CN}, 0^{\circ} \mathrm{C} \rightarrow 25^{\circ} \mathrm{C}, 2 \mathrm{~h}$; (d) $\mathrm{H}_{2}$ (1 atm), $10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{EtOAc}, 20 \mathrm{~h}$

Unfortunately, while trans 4-hydroxy-cyclopropanated derivative could be separated from the cis compound after hydrolysis of the silyloxy group, the two unprotected diastereoisomers $\mathbf{1 8 3}$ and 180 resulted unseparable by chromatography.

Despite this result, we continued the synthesis with deprotection of the nitrogen by hydrogenation on $\mathrm{Pd} / \mathrm{C}$ which provided trans-112 in $83 \%$ in a $6: 1$ diastereomeric ratio.

## Chapter 4: synthesis of 5-hydroxylated pipecolic derivatives

### 4.1 Synthesis of 5-hydroxypipecolic acids ${ }^{49}$

Having assessed our approach to the synthesis of three of the four natural 4,5-dihydroxypipecolic acids 9-11, we were tempted to exploit 5-silyloxy-protected compound $\mathbf{1 6 9}$ for the preparation of both cis and trans 5-hydroxypipecolic acid $\mathbf{6}$ and 7, although the synthesis of these compounds has been already reported by a few authors in the past ${ }^{92}$.

Thus, hydrogenation of 169 (Scheme 48) provided cis compound 184 ( $95 \%$ yield, stereochemical attribution based on nOe correlation between $3-\mathrm{H}_{\mathrm{ax}}$ and $5-\mathrm{H}$ and a large ${ }^{3} J$ value between $6-\mathrm{H}_{\mathrm{ax}}$ and $5-\mathrm{H}$ in a compound with the $2-\mathrm{CO}_{2} \mathrm{Me}$ group axially-oriented - see infra) in a 8:1 ratio with its trans isomer.

Scheme 48

Scheme 48: Reagents and conditions: (a) $\mathrm{H}_{2}(1 \mathrm{~atm}), 10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{NaHCO}_{3}, \mathrm{EtOAc}, 20 \mathrm{~h}$; (b) $3 \mathrm{~N} \mathrm{HCl}, \mathrm{CH}_{3} \mathrm{CN}, 25^{\circ} \mathrm{C}$, 2h; (c) 4N HCl, reflux, 24 h

The facial selectivity of this experiment is much higher than we obtained for hydrogenation of 175 under the same conditions (See Scheme 35). This suggests a slight steric hindrance exerted by the $4-\mathrm{OH}$ in $\mathbf{1 7 5}$, as similarly observed when hydrogenating under the same conditions 4 -hydroxy-substituted compounds ${ }^{29 a}$.
The minor diastereoisomer was removed from the mixture by chromatography after OH deprotection to give diastereopure, known compound cis $\mathbf{1 8 5}{ }^{92 \mathrm{~g}-\mathrm{h}, 93}$. After N -deprotection in refluxing 4 N HCl , pure cis 5-hydroxypipecolic acid $\mathbf{6}$ was obtained in $43 \%$ overall yield from precursor 164.

Conjugate reduction of the double bond in ent-169 (Scheme 49) was as expected poorly stereoselective, providing the thermodynamically less stable trans isomer 186 in a $1: 1.5$ ratio with cis compound ent-184.

## Scheme 49

Scheme 49: Reagents and conditions: (a) $\mathrm{LiEt}_{3} \mathrm{BH}, \mathrm{THF},-10^{\circ} \mathrm{C}, 70 \min (\mathrm{~b}) 3 \mathrm{~N} \mathrm{HCl}, \mathrm{CH}_{3} \mathrm{CN}, 0^{\circ} \mathrm{C} \rightarrow 25^{\circ} \mathrm{C}, 2 \mathrm{~h}$; (c) 4 N HCl , reflux, 24 h ;

This ratio is easily explained considering the forced axial orientation of the $2-\mathrm{CO}_{2} \mathrm{Me}$ group necessary to remove the $\mathrm{A}^{(1,3)}$ strain with the N -protection ${ }^{94}$. In such a case, in trans compound 186 the 5-OTBS group is consequently axially oriented and thus less favored for the 1,3-diaxial repulsive interaction with $3-\mathrm{H}$. As above, deprotection gave free alcohols ent-185 and $\mathbf{1 8 7}$ which, after chromatographic separation, were converted into ent-6 (100\%) and natural pipecolic acid 7 (100\%).

### 4.2 Synthesis of cis 5-hydroxy-cyclopropanated derivatives

In addition to preparing 5-hydroxypipecolic acids, we tried to use the 5-hydroxylated substrates for the synthesis of cyclopropanated derivatives.

We thus investigated the application of the Zn -carbenoids previously applied to 4-mono and 4,5dihydroxylated substrates, for OH -directed cyclopropanation of the homoallylic alcohol $\mathbf{1 8 8}$ (Scheme 42), obtained after OH deprotection on N-Cbz precursor 170.
In the "mild" reaction conditions used above for 118 and $125\left(-15^{\circ} \mathrm{C}\right.$ or $-40^{\circ} \mathrm{C}$ than room temperature), alcohol $\mathbf{1 8 8}$ reacted very slow either with Charette's and Furukawa's Zn-
carbenoids ( $<50 \%$ conversion, determined by $1 \mathrm{H}-\mathrm{NMR}$ after, respectively, 96 an 72 h at room temperature).

Despite this low conversion rate, which could be explained by the not optimal spacial relationship between the homoallylic hydroxy group and the alkene ${ }^{95}$, we were glad to observe that the hydroxy group still exerted complete stereocontrol, leading to the cis isomer $\mathbf{1 8 9}$ only (Scheme 50).
In order to reach the reaction to complete conversion in a shorter time ${ }^{96}$ we first tried to increase the carbenoid concentration ( 3 eq of $\mathrm{Et}_{2} \mathrm{Zn}$ and 6 eq of $\mathrm{CH}_{2} \mathrm{I}_{2}$, instead of 2 and 4, respectively), then to carry out the reaction in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ in refluxing conditions.

## Scheme 50

Scheme 50: Reagents and conditions: (a) $3 \mathrm{~N} \mathrm{HCl}, \mathrm{CH}_{3} \mathrm{CN}, 0^{\circ} \mathrm{C} \rightarrow 25^{\circ} \mathrm{C}, 1.5 \mathrm{~h}$; (b) $\mathrm{Et}_{2} \mathrm{Zn}, \mathrm{CH}_{2} \mathrm{I}_{2}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-15^{\circ} \mathrm{C} \rightarrow$ reflux, 16h,

In that conditions, the reaction was complete reached to complete conversion in 16 h , providing cis-189 with complete diastereoselectivity, and in $41 \%$ yield after chromatography. Finally, the Cbz group was removed as usual, affording compound cis $(R)-111$ in $96 \%$ yield.

## Conclusion

In conclusion with this work we believe we have demonstrated the flexibility and easiness of our approach to the synthesis of polyhydroxylated pipecolic acids and their cyclopropanated derivatives based on the chemistry of lactam-derived enol phosphates. Starting from commercial, inexpensive material, in a few steps we were able to prepare all isomers of 4,5dihydroxypipecolic acids and the simpler 4- hydroxy and 5-hydroxy derivatives. As a furher application of this chemistry, starting from the same common $\alpha, \beta$-unsaturated enantiopure precursors we developed a methodology to attain their 2,3-cyclopropanated derivatives, which are a new kind of conformationally constrained hydroxypipecolic acids, potentially useful for the preparation of new drugs.

The synthesis of mono-hydroxylated and 4,5-dihydroxylated pipecolic acids, as well as their cyclopropanated derivatives, required the synthesis of enantiopure enecarbamate esters as substrates for the stereoselective elaboration of the double bond.

For the synthesis of 4-hydroxylated enecarbamate ester precursors $\mathbf{1 1 8}$ and $\mathbf{1 2 5}$ the key step in the process was the Pd-catalyzed methoxycarbonylation of racemic enol phosphates generated from elaboration of $\delta$-valerolactam. Both enantiomers of the resulting 4-hydroxylated enecarbamate ester precursors $\mathbf{1 1 8}$ and $\mathbf{1 2 5}$ were obtained with high optical purity (ee 98.5$99.5 \%$ ) by enantioselective enzymatic kinetic resolution of the corresponding racemic compounds.

Stereoselective hydrogenation on the O-silyl protected derivative, followed by exhaustive hydrolysis generate the cis-4-hydroxypipecolic acid ent-4 with a higher de with respect to that previously obtained from $\mathrm{O}^{t} \mathrm{Bu}$-protected compounds ${ }^{29 \mathrm{a}}$.
Enecarbamate substrates were also involved in cyclopropanation reactions, in which the stereochemical control was ensured by the 4-OH group itself, either free or protected. Charette's Zn -carbenoid for the OH -directed cyclopropanation and Michael-type addition of dimethylsulfoxonium methylide in DMSO for the synthesis of the trans products provided the 2,3-methanopipecolic acid derivatives with the highest yield and facial selectivity. The compounds so obtained are rigidified homoserine analogues which could find applications in medicinal chemistry as conformational probes and in drug discovery.

The synthesis of 4,5-cis 4,5-dihydroxypipecolic acids required the preparation from 2-deoxy-D(and L) ribose of enantiopure cis 4,5-dihydroxy- $\delta$-valerolactam 137 , which is a new compound and we believe useful as a starting material for the synthesis of other natural products. The key step in the process was the Pd-catalyzed methoxycarbonylation of the enol phosphate generated from 138, which provided an enecarbamate ester easily converted by stereoselective reduction either to $\mathbf{1 0}$ or $\mathbf{1 1}$ (obtained in 27 and $17 \%$ yield, respectively, over ten steps).
Although in this work we did not specifically focused on the preparation of the unnatural enantiomers of $\mathbf{1 0}$ and 11, we have in any case set the stage for their synthesis as we have prepared the enantiopure precursor 138 from both 2-deoxy-D- and L-ribose.

The synthesis of the 4,5-trans 4,5-dihydroxypipecolic acid was instead realized through a highly stereoselective allylic bromination of the enecarbamate ester obtained by methoxycarbonylation of the enol phosphate derived from a known 5-hydroxy- $\delta$-valerolactam derivative. After substitution to give the 4 -hydroxy- $\mathrm{N}-\mathrm{CO}_{2} \mathrm{Me}$ protected derivative $\mathbf{1 7 5}$, the reduction of the double bond and subsequent hydrolysis provided target compound 9 (in $22 \%$ yield over 8 steps). As for 4,5-cis dihydroxypipecolic acids, unnatural enantiomers of 9 and 6-7 can be prepared by the same route as their precursor $(R)-(-)-\gamma$-hydroxymethyl- $\gamma$-butyrolactone is commercially available. As our approach allows the synthesis of several hundred mg of final compound, the potential of these 4,5-dihydroxypipecolic acids as conformationally constrained scaffolds in medicinal chemistry could now be assessed.

Moreover, starting from $\mathrm{N}-\mathrm{Cbz}$ protected substrates 176 and 170, we obtained their cis cyclopropanated derivatives in high optical purity employing Charette's and Furukawa's Zncarbenoids for the OH -directed reaction of 176 and $\mathbf{1 7 0}$, respectively, followed by N deprotection. Dimethylsulfoxonium methilyde in DMSO were employed for the synthesis of compound trans-112 (even though this was obtained in a $6: 1$ ratio with the cis diastereoisomer). As well as the 4-hydroxylated derivatives described above, the compounds so obtained are rigidified amino acid analogues which could find applications in medicinal chemistry as conformational probes and in drug discovery.

During my research work, besides the targets discussed above, their precursors, in racemic or enantiopure form, were also employed for the synthesis of alkaloids like fagomine ${ }^{48}$ and 1deoxymannojirimycin ${ }^{51}$.

## Appendix 5: Chiral HPLC analysis of diol 147

Substrate concentration $=5 \mathrm{mM}$ in MeOH. Eluant: $n$-hexane/IPA 50:50; isocratic elution, $\lambda=254$
Column: Lux Cellulose 4
$\mathrm{R}_{\mathrm{t}} \mathbf{1 4 7}=20.97, \mathrm{R}_{\mathrm{t}}$ ent $-\mathbf{1 4 7}=22.97 \mathrm{~min}$

## Appendix 6: Determination of lipases enantiospecificity in EKR of racemic cis-4,5dihydroxylated enamide esters

Since Scheme 40, both enantiomer of cis-lactam 137 were available, so we could determine the enantioselectivity of the lipases in the racemic resolution of $\mathbf{1 4 7}$ by assignement of the absolute configuration of the EKR products.

Diol (-)-147, directly obtained from the EKR (i.e the non-acylated isomer) was converted into the corresponding enamide ester (-)-144 (Scheme 51) whose negative optical rotation value is consistent to the stereospecificity of the lipase in the kinetic resolution of diol ( $\pm$ )-147 (for compound (4S,5R)-144 obtained from enantiopure $\mathbf{1 3 8}$ of known absolute configuration the $[\alpha]^{22}{ }_{D}$ value is +33.5 ).

## Scheme 51

(4R,5S)-ent-147 (from EKR)
Scheme 51: Reagents and conditions: (a) $\mathrm{BnOCOCl}, n-\mathrm{BuLi},-78{ }^{\circ} \mathrm{C}$; (b) ( PhO$)_{2} \mathrm{POCl}, \mathrm{KHMDS}, \mathrm{THF},-78{ }^{\circ} \mathrm{C}$; (c) $10 \% \mathrm{Pd}(\mathrm{OAc})_{2}, 20 \% \mathrm{Ph}_{3} \mathrm{P}, \mathrm{CO}, \mathrm{MeOH}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DMF}, 75^{\circ} \mathrm{C}, 1 \mathrm{~h}$ (d) 2,2-dimethoxypropane, $p$ - $\mathrm{TsOH}, \mathrm{MeOH}, 55^{\circ} \mathrm{C}$, 1.5 h

## Experimental

General. Melting points are uncorrected. Chromatographic separations were performed under pressure on silica gel by flash-column techniques; $\mathrm{R}_{f}$ values refer to TLC carried out on $25-\mathrm{mm}$ silica gel plates (Merck $\mathrm{F}_{254}$ ), with the same eluent as indicated for the column chromatography. THF was distilled from Na /benzophenone. $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and $n$-hexane were distilled from $\mathrm{CaH}_{2}$. Commercial anhydrous DMSO, DMF and MeOH were used. Commercial TBDME was used. CAL-B was purchased from Sigma-Aldrich and has a reported activity $\geq 10.000 \mathrm{U} / \mathrm{g}$. Enzyme PS-AMANO-IM Lipase was a gift from Amano Enzyme Inc., and has a reported activity $\geq 500$ $\mathrm{U} / \mathrm{g}{ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$ spectra were recorded with a Mercury 400 instrument in $\mathrm{CDCl}_{3}$ solution, unless otherwise stated. Solvent reference line were set at $7.26 \mathrm{ppm}\left(\mathrm{CDCl}_{3}\right), 4.79 \mathrm{ppm}$ $\left(\mathrm{D}_{2} \mathrm{O}\right)$ and $3.31 \mathrm{ppm}\left(\mathrm{CD}_{3} \mathrm{OD}\right)$. Mass spectra were carried out by direct inlet on a LCQ FleetTM Ion Trap LC/MS system (Thermo Fisher Scientific) with an electrospray ionization (ESI) interface in the positive mode. Microanalyses were carried out with a Perkin-Elmer 2400/2 elemental analyser. Optical rotations were determined with a JASCO DIP-370 instrument. HPLC analyses were carried out on a Dionex Ultimate 3000 instrument.

HPLC column for monitoring enzymatic reactions on racemic 147 was Acclaim $120 \mathrm{C} 18,250 \mathrm{x}$ $4.60 \mathrm{~nm}, 5 \mu \mathrm{~m}$; eluition program: from $55 \% \mathrm{ACN}$ for $2.5^{\prime}$ to $90 \% \mathrm{ACN}$ for $3^{\prime}$ in $3.5^{\prime}$, then $55 \%$ ACN for $2.5^{\prime}$ in $0^{\prime} ; \lambda=254,223 \mathrm{~nm} ; ~\left(\mathrm{R}_{\mathrm{t} \text {-diol }}=3.81 \mathrm{~min}, \mathrm{R}_{\mathrm{t}-5 \text {-butyrate }}=7.05 \mathrm{~min}, \mathrm{R}_{\mathrm{t}-4 \text {-butyrate }}=7.69\right.$ $\min , \mathrm{R}_{\mathrm{t}-4,5 \text {-dibutyrate }}=10.23 \mathrm{~min}, \mathrm{R}_{\mathrm{t}-5 \text {-acetate }}=4.99 \mathrm{~min}, \mathrm{R}_{\mathrm{t}-4 \text {-acetate }}=5.55 \mathrm{~min}, \mathrm{R}_{\mathrm{t}-4,5 \text {-diacetate }}=7.75$ min ).

HPLC columns for calculate the enantiomeric ratio of diols were:
Lux Cellulose 4, $250 \times 4.60 \mathrm{~nm}, 5 \mu \mathrm{~m}$, eluition program: $50 \%$ IPA $-50 \% n$-hexane, $\lambda=254,223$ $\mathrm{nm},\left(\mathrm{R}_{\mathrm{t}} \mathbf{1 4 7}=20.97, \mathrm{R}_{\mathrm{t}}\right.$ ent $\left.\mathbf{- 1 4 7}=22.97 \mathrm{~min}\right)$ and Cyclobond $\mathrm{I} 2000,250 \times 4.60 \mathrm{~nm}, 5 \mu \mathrm{~m}$, eluition program: $85 \% \mathrm{H}_{2} \mathrm{O}-15 \% \mathrm{MeOH}, \lambda=254,223 \mathrm{~nm},\left(\mathrm{R}_{\mathrm{t}} \mathbf{1 4 7}=20.09, \mathrm{R}_{\mathrm{t}}\right.$ ent-147$=21.29$ min ).

51
Ethyl (R)-3-tert-Butoxy-4-cyanobutanoate [(-)-51]. To a solution of (R)-50 (1.257 g, 8.0 $\mathrm{mmol})$ in $t \mathrm{BuOAc}(100 \mathrm{~mL})$ was added dropwise $\mathrm{HClO}_{4}(48 \mu \mathrm{~L}, 0.8 \mathrm{mmol})$ and the mixture was left at $25^{\circ} \mathrm{C}$ under stirring. After 24 h , a saturated $\mathrm{Na}_{2} \mathrm{CO}_{3}$ aqueous solution ( 50 mL ) was added, the mixture was extracted with $\operatorname{EtOAc}(3 \times 30 \mathrm{~mL})$ and the combined organic layers were washed with $\mathrm{NaHCO}_{3}$ (satd) $(50 \mathrm{~mL})$ and dried over $\mathrm{K}_{2} \mathrm{CO}_{3}$. After filtration and evaporation of the solvent, compound $\mathbf{5 1}$ ( $1.65 \mathrm{~g}, 97 \%$ ) was obtained as a pale yellow liquid which can directly be used in the next step. Chromatography (EtOAc- $n$-hexane, $1: 3, \mathrm{R}_{f} 0.3$ ), gave $\mathbf{5 1}$ as a pale yellow oil ( $1.602 \mathrm{~g}, 94 \%$ ). $[\alpha]^{20}{ }_{\mathrm{D}}=-9.0\left(c 2.00, \mathrm{CHCl}_{3}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right) \delta 4.15-$ $4.03(\mathrm{~m}, 1 \mathrm{H}+2 \mathrm{H}), 2.62-2.54(\mathrm{~m}, 4 \mathrm{H}), 1.26-1.15(\mathrm{~m}, 9 \mathrm{H}+3 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 50.33\right.$ $\mathrm{MHz}) \delta 170.4$ (s), 117.5 (s), 75.1 (s), 64.3 (d), 60.7 (t), 41.2 ( t$), 28.1$ (q, 3 C ), 25.4 ( t$), 14.1$ (q); MS $m / z(\%) 198\left(\mathrm{M}^{+}-15,15\right), 140(35), 112$ (28), 57 (100). Anal. Calcd for $\mathrm{C}_{11} \mathrm{H}_{19} \mathrm{NO}_{3}: \mathrm{C}$, 61.95; H, 8.98; N, 6.57. Found: C, 61.98; H, 8.77; N, 6.28.

52
( $\boldsymbol{R}$ )-4-tert-Butoxypiperidin-2-one [(+)-52]. To a stirred solution of $\mathbf{5 1}$ ( $506 \mathrm{mg}, 2.38 \mathrm{mmol}$ ), in $\mathrm{MeOH}(10 \mathrm{~mL})$ was added $\mathrm{PtO}_{2}(54 \mathrm{mg}, 0.2 \mathrm{mmol})$ under $\mathrm{N}_{2}$ atmosphere. The mixture was flushed with $\mathrm{H}_{2}$ and then left under static pressure of $\mathrm{H}_{2}$ (balloon) at $25{ }^{\circ} \mathrm{C}$. After 48 h the reaction was complete (by TLC). The catalyst was filtered, washing with MeOH , and the solution was concentrated under vacuum, to give pure 52 ( $408 \mathrm{mg}, 100 \%$ ) as a white solid. The same reaction can be carried out in absolute EtOH , in which case is complete in $24 \mathrm{~h} .(+)-52$ : m.p. $=102.5-103.5^{\circ} \mathrm{C} .[\alpha]^{20}{ }_{\mathrm{D}}=+17.4\left(c 0.35, \mathrm{CHCl}_{3}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta 5.78(\mathrm{br} \mathrm{s}$, $1 \mathrm{H}), 3.96-3.89(\mathrm{~m}, 1 \mathrm{H}), 3.50-3.43(\mathrm{~m}, 1 \mathrm{H}), 3.34-3.20(\mathrm{~m}, 1 \mathrm{H}), 2.55(\mathrm{dd}, J=17.6,5.0 \mathrm{~Hz}, 1$ H), $2.34(\mathrm{dd}, ~ J=17.6,6.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.91-1.83(\mathrm{~m}, 1 \mathrm{H}), 1.79-1.71(\mathrm{~m}, 1 \mathrm{H}), 1.12(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{CDCl}_{3}, 100.4 \mathrm{MHz}\right) \delta 171.6(\mathrm{~s}), 74.0(\mathrm{~s}), 64.0(\mathrm{~d}), 40.7(\mathrm{t}), 38.4(\mathrm{t}), 30.2(\mathrm{t}), 28.3(\mathrm{q}, 3 \mathrm{C})$. MS $m / z$ (\%) $156\left(\mathrm{M}^{+}-15,3\right), 115$ (48), 98 (28), 87 (18), 72 (21), 59 (100). Anal. Calcd for $\mathrm{C}_{9} \mathrm{H}_{17} \mathrm{NO}_{2}$ : C, 63.13; H, 10.01; N, 8.18. 54
Dimethyl (R)-4-tert-Butoxy-5,6-dihydropyridine-1,2(4H)-dicarboxylate [(+)-54]. To a solution of KHMDS ( 4.7 mL of a 0.5 M solution in toluene, 2.35 mmol ) in THF ( 12.5 mL ), cooled at $-78{ }^{\circ} \mathrm{C}$ and under nitrogen atmosphere, was added a solution of 53 ( $430 \mathrm{mg}, 1.88$ mmol ) in THF ( 5 mL ) and the resulting mixture was stirred for 1.5 h . Afterward a solution of $(\mathrm{PhO}){ }_{2} \mathrm{P}(\mathrm{O}) \mathrm{Cl}(487 \mu \mathrm{~L}, 2.35 \mathrm{mmol})$ in THF $(4 \mathrm{~mL})$ was added, leaving under stirring for 1 h at $78{ }^{\circ} \mathrm{C}$ before allowing the temperature to rise to $0^{\circ} \mathrm{C}$. Then, a $10 \% \mathrm{NaOH}$ aqueous solution (38 mL ) was added, the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 30 \mathrm{~mL})$, washed with $10 \% \mathrm{NaOH}(24$ mL ), and dried over anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}$ for 30 min . After filtration and evaporation of the solvent (without heating and leaving a small volume of solvent), the crude phosphate was chromatographed (EtOAc-n-hexane, 30:70, $+1 \% \mathrm{Et}_{3} \mathrm{~N}, \mathrm{R}_{f} 0.27$ ) on a short layer of silica gel ( 3.5
cm of silica gel in a column with internal diameter of 3 cm ) to give the phosphate ( $856 \mathrm{mg}, 99 \%$ ) as a pale yellow oil.
Phosphate: ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right) \delta 7.32-7.17(\mathrm{~m}, 10 \mathrm{H}), 4.92(\mathrm{br} \mathrm{s}, 1 \mathrm{H}), 3.65-3.60(\mathrm{~m}, 1$ H), 3.52( $\mathrm{s}, 3 \mathrm{H}$ ), 3.49-3.21 (m, 2 H ), 1.82-1.64 (m, 2 H ), $1.14(\mathrm{~s}, 9 \mathrm{H}) ;{ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}, 50.33$ MHz) $\delta 154.1$ (s), 150.4 (s), 141.1 (s), 129.7 (d, 4 C), 125.3 (d, 2 C), 120.1 (d, 4 C), 102.2 (d), 74.1 ( s ), 61.9 (d), 53.1 (q), 42.9 ( t$), 32.7$ ( t$), 28.1$ ( $\mathrm{q}, 3 \mathrm{C}$ ).

Phosphate ( $856 \mathrm{mg}, 1.86 \mathrm{mmol}$ ) was immediately dissolved in DMF ( 4.8 mL ), $\mathrm{Pd}(\mathrm{OAc})_{2}(42$ $\mathrm{mg}, 0.186 \mathrm{mmol})$ and $\mathrm{Ph}_{3} \mathrm{P}(97 \mathrm{mg}, 0.372 \mathrm{mmol})$ were added and the solution was stirred 10 min under a CO atmosphere (balloon). Then $\mathrm{Et}_{3} \mathrm{~N}(516 \mu \mathrm{~L}, 3.72 \mathrm{mmol})$ and $\mathrm{MeOH}(3 \mathrm{~mL}, 74.4$ mmol ) were added and stirring was continued at $55^{\circ} \mathrm{C}$ (external bath) for 3 h under static CO pressure. The solution was filtered through Celite, and the MeOH was evaporated. The residue was diluted with water $(40 \mathrm{~mL})$, extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 40 \mathrm{~mL})$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and evaporation of the solvent, the oily residue was chromatographed (EtOAc-nhexane, $\left.1: 2,+1 \% \mathrm{Et}_{3} \mathrm{~N}, \mathrm{R}_{f} 0.33\right)$ to give ( + )-54 ( $408 \mathrm{mg}, 81 \%$ ) as a thick pale yellow oil.

## Methyl 2-oxopiperidine-1-carboxylate (115)

To a solution of methyl 2-oxopiperidine-1-carboxylate $\mathbf{1 1 4}$ ( $991 \mathrm{mg}, 10 \mathrm{mmol}$ ) in THF ( 92 mL ), cooled to $-78{ }^{\circ} \mathrm{C}$, $n-\mathrm{BuLi}(6.3 \mathrm{~mL}, 1.6 \mathrm{M}$ solution in hexane, 10 mmol$)$ was slowly added. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 15 min and then methyl chloroformate ( $850 \mu \mathrm{~L}, 11 \mathrm{mmol}$ ) was added drop-wise. After 10 min the solution was allowed to reach $0{ }^{\circ} \mathrm{C}$, saturated aqueous $\mathrm{NaHCO}_{3}(50 \mathrm{~mL})$ was added and the organic layer was separated. The aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \times 40 \mathrm{~mL})$ and the combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The residue was purified by flash chromatography ( $n$-hexane/EtOAc 1:1, $\mathrm{R}_{f}$ 0.27 ) to give $\mathbf{1 1 5}(1.30 \mathrm{~g}, 8.27 \mathrm{mmol}, 83 \%)$ as a white solid.
115. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta=3.84\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.74-3.71(\mathrm{~m}, 2 \mathrm{H}, 6-\mathrm{H}), 2.54-2.50$ (m, 2 H, 3-H), 1.85-1.80 (m, $4 \mathrm{H}, 4-\mathrm{H}$ and $5-\mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100.4 \mathrm{MHz}\right) \delta=171.2$ ( $\mathrm{s}, \mathrm{CO}$ ), $155.0(\mathrm{~s}, \mathrm{CO}), 53.8\left(\mathrm{q}, \mathrm{OCH}_{3}\right), 46.5(\mathrm{t}, \mathrm{C}-6), 34.8(\mathrm{t}, \mathrm{C}-3), 22.6(\mathrm{t}, \mathrm{C}-4), 20.3(\mathrm{t}, \mathrm{C}-5)$ ppm . ESI-MS $m / z(\%)=158(9)[\mathrm{M}+1]^{+}, 126(100), 82(49)$.

116

## Methyl 6-[(diphenoxyphosphoryl)oxy]-3,4-dihydropyridine-1(2H)-carboxylate (116)

To a solution of KHMDS ( 20.8 mL of a 0.5 M solution in toluene, 10.38 mmol ) in THF ( 54.8 $\mathrm{mL})$, cooled at $-78^{\circ} \mathrm{C}$ and under nitrogen atmosphere, was added a solution of $\mathbf{1 1 5}(1.30 \mathrm{~g}, 8.3$ $\mathrm{mmol})$ in THF ( 21.7 mL ) and the resulting mixture was stirred for 1.5 h . Afterward a solution of $(\mathrm{PhO}){ }_{2} \mathrm{P}(\mathrm{O}) \mathrm{Cl}(2.1 \mathrm{~mL}, 10.38 \mathrm{mmol})$ in THF $(17.1 \mathrm{~mL})$ was added, leaving under stirring for 1 h at $-78{ }^{\circ} \mathrm{C}$ before allowing the temperature to rise to $0{ }^{\circ} \mathrm{C}$. Then, a $10 \% \mathrm{NaOH}$ aqueous solution $(160 \mathrm{~mL})$ was added, the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 130 \mathrm{~mL})$, washed with $10 \%$ $\mathrm{NaOH}(100 \mathrm{~mL})$ and water ( 100 mL ), and dried over anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}$ for 1 hour. After filtration and evaporation of the solvent (without heating and leaving a small volume of solvent), the crude phosphate was chromatographed (EtOAc $/ n$-hexane, $1: 3,+1 \% \mathrm{Et}_{3} \mathrm{~N}, \mathrm{R}_{f} 0.19$ ) on a short layer of silica gel ( 4 cm of silica gel in a column with internal diameter of 4 cm ) to give $\mathbf{1 1 6}$ $(3.20 \mathrm{~g}, 99 \%)$ as a pale yellow oil.

Cbz
123
1-Benzyl 2-Methyl 5,6-Dihydropyridine-1,2(4H)-dicarboxylate (123)
To a solution of KHMDS ( 20.8 mL of a 0.5 M solution in toluene, 10.4 mmol ) in THF ( 54 mL ), cooled at $-78^{\circ} \mathrm{C}$ and under nitrogen atmosphere, was added a solution of $N$-Cbz-protected $\delta$ valerolactam $122(1.96 \mathrm{~g}, 8.39 \mathrm{mmol})$ in THF $(20 \mathrm{~mL})$ and the resulting mixture was stirred for 1.5 h . Afterward a solution of $(\mathrm{PhO})_{2} \mathrm{P}(\mathrm{O}) \mathrm{Cl}(2.15 \mathrm{~mL}, 10.36 \mathrm{mmol})$ in THF $(16.0 \mathrm{~mL})$ was slowly added, leaving under stirring for 1 h at $-78^{\circ} \mathrm{C}$ before allowing the temperature to rise to 0 ${ }^{\circ} \mathrm{C}$. Then, a $10 \% \mathrm{NaOH}$ aqueous solution $(165 \mathrm{~mL})$ was added, the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 95 \mathrm{~mL})$, the combined organic layers washed with $10 \% \mathrm{NaOH}(60 \mathrm{~mL})$ and dried over anhydrous $\mathrm{K}_{2} \mathrm{CO}_{3}$ for 30 min . After filtration and evaporation of the solvent (without heating and leaving a small volume of solvent), the crude phosphate was chromatographed (EtOAc-nhexane, $1: 2.5,+1 \% \mathrm{Et}_{3} \mathrm{~N}, \mathrm{R}_{f} 0.25$ ) on a short layer of silica gel ( 4.5 cm of silica gel in a column with internal diameter of 3 cm ) to give the enol phosphate 123 as pale yellow oil ( $3.875 \mathrm{~g}, 99 \%$ ). 123. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $7.38-7.26(\mathrm{~m}, 10 \mathrm{H}$ ), $7.25-7.13(\mathrm{~m}, 5 \mathrm{H}), 5.14$ (pseudo $\mathrm{q}, J=$ $3.9 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}), 5.08$ (s, $2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Ph}$ ), $3.70-3.61$ (m, $2 \mathrm{H}, 6-\mathrm{H}$ ), 2.24-2.11 (m, $2 \mathrm{H}, 4-\mathrm{H}$ ), $1.81-$ $1.69,2 \mathrm{H}, 5-\mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100.4 \mathrm{MHz}\right) \delta=154.0(\mathrm{~s}, \mathrm{CO}), 150.4(\mathrm{~s}, 2 \mathrm{C}), 139.9(\mathrm{~s}, \mathrm{C}-2)$, 135.9 ( s ), 129.7 ( $\mathrm{d}, 4 \mathrm{C}$ ), 128.4 (d, 2C), 128.0 (d), 127.9 (d, 2 C), 125.4 (d, 2 C), 120.0 (d, 4 C), 100.5 (d, C-3), 67.8 (t, $\mathrm{CH}_{2} \mathrm{Ph}$ ), 45.7 (t, C-6), 22.6 (t, C-4), 21.6 (t, C-5) ppm. ESI-MS m/z (\%): $953(100)\left[2 \mathrm{M}^{+}+23\right], 488(10)\left[\mathrm{M}^{+}+23\right], 466(8)\left[\mathrm{M}^{+}+1\right]$.

124

## 1-Benzyl 2-Methyl 5,6-Dihydropyridine-1,2(4H)-dicarboxylate (124)

Phosphate $\mathbf{1 2 3}$ was immediately dissolved in DMF $(20 \mathrm{~mL})$ and to the resulting solution were added $\mathrm{Pd}(\mathrm{OAc})_{2}(189 \mathrm{mg}, 0.84 \mathrm{mmol})$ and $\mathrm{Ph}_{3} \mathrm{P}(439 \mathrm{mg}, 1.67 \mathrm{mmol})$ under nitrogen atmosphere. The solution was stirred 10 min under a CO atmosphere (balloon), then $\mathrm{Et}_{3} \mathrm{~N}$ (2.3 $\mathrm{mL}, 16.7 \mathrm{mmol})$ and $\mathrm{MeOH}(7.0 \mathrm{~mL}, 335 \mathrm{mmol})$ were added and stirring was continued at $58{ }^{\circ} \mathrm{C}$ (external bath) for 4 h under static CO pressure and then left at room temperature overnight. The solution was diluted with water ( 150 mL ), extracted with $\mathrm{Et}_{2} \mathrm{O}(5 \times 100 \mathrm{~mL})$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and evaporation of the solvent, the oily residue was chromatographed (EtOAc- $n$-hexane, $1: 4, \mathrm{R}_{f} 0.28$ ) to give $\mathbf{1 2 4}(2.03 \mathrm{~g}, 88 \%)$ as a thick pale yellow oil.
124. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta=7.40-7.28(\mathrm{~m}, 5 \mathrm{H}, \mathrm{Ph}), 6.07(\mathrm{t}, J=3.9 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}), 5.14$ (s, $2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Ph}$ ), 3.67-3.64 (m, $2 \mathrm{H}, 6-\mathrm{H}$ ), 3.56 (br s, $3 \mathrm{H}, \mathrm{OCH}_{3}$ ), 2.27-2.22 (m, $2 \mathrm{H}, 4-\mathrm{H}$ ), 1.86$1.81(\mathrm{~m}, 2 \mathrm{H}, 5-\mathrm{H}) \mathrm{ppm} .{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100.4 \mathrm{MHz}\right) \delta=165.1(\mathrm{~s}, \mathrm{CO}), 154.0(\mathrm{~s}, \mathrm{CO}), 135.8$ (s), 132.4 ( $\mathrm{s}, \mathrm{C}-2$ ), 128.5 (d, 2 C), 128.2 (d), 128.1 (d, 2 C), 123.1 (d, C-3), $68.0\left(\mathrm{t}, \mathrm{CH}_{2} \mathrm{Ph}\right), 51.9$ $\left(\mathrm{q}, \mathrm{OCH}_{3}\right), 43.7(\mathrm{t}, \mathrm{C}-6), 22.9(\mathrm{t}, \mathrm{C}-4), 22.7(\mathrm{t}, \mathrm{C}-5) \mathrm{ppm} . \mathrm{MS} \mathrm{m} / \mathrm{z}(\%)=276(2)[\mathrm{M}+1]^{+}, 232$ (100). $\mathrm{C}_{15} \mathrm{H}_{17} \mathrm{NO}_{4}$ (275.30) requires C 65.44; H 6.22; N 5.09. Found: C 65.27; H 6.11; N 5.01.

bz
( $\pm$ )-125

## 1-Benzyl 2-Methyl 4-Hydroxy-5,6-dihydropyridine-1,2(4H)-dicarboxylate ( $\pm$ )-125

A solution of 124 ( $663 \mathrm{mg}, 2.41 \mathrm{mmol}$ ), $N$-bromosuccinimide ( $545 \mathrm{mg}, 3.06 \mathrm{mmol}$ ) and a catalytic amount of azobisisobutyronitrile ( $34 \mathrm{mg}, 0.21 \mathrm{mmol}$ ) in a $9: 1$ mixture of anhydrous $\mathrm{CCl}_{4}$ and $\mathrm{CHCl}_{3}(83 \mathrm{~mL})$ was refluxed with vigorous stirring for 15 min . After cooling, the reaction mixture was diluted with $\mathrm{CHCl}_{3}(65 \mathrm{~mL})$, washed with water $(70 \mathrm{~mL})$ and evaporated to give the $4-\mathrm{Br}$ derivative as a yellow oil.

4-Br derivative. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 200 \mathrm{MHz}\right) \delta=7.40-7.20(\mathrm{~m}, 5 \mathrm{H}, \mathrm{Ph}), 6.04(\mathrm{~d}, J=4.4 \mathrm{~Hz}, 1$ H, 3-H), 5.20 (part A of an AB system, $J=12.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Ph}$ ), 5.09 (part B of an AB system, $\left.J=12.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.88-4.81(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C} H \mathrm{Br}), 4.32-4.20(\mathrm{~m}, 1 \mathrm{H}, 6-\mathrm{H}), 3.56(\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{OCH}_{3}$ ), 3.65-3.20 (m, $\left.1 \mathrm{H}, 3-\mathrm{H}^{\prime}\right), 2.50-2.20(\mathrm{~m}, 2 \mathrm{H}, 5-\mathrm{H}) \mathrm{ppm}$.

This oil was dissolved in $96 \%$ aqueous acetone ( 68 mL ), six drops of water were added, and $\mathrm{ZnCl}_{2}(1.362 \mathrm{~g}, 10 \mathrm{mmol})$ was added portionwise to the resulting solution over 4 h . After further 2.5 h , the reaction mixture was diluted with $\mathrm{CHCl}_{3}(60 \mathrm{~mL})$, washed with water ( 100 mL ), saturated aqueous $\mathrm{NaHCO}_{3}(100 \mathrm{~mL})$ and brine $(65 \mathrm{~mL})$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and evaporation of the solvent, the crude product was chromatographed (EtOAc-n-hexane, 2:1, $\mathrm{R}_{f} 0.40$ ) to give ( $\pm$ )- $\mathbf{1 2 5}$ ( $399 \mathrm{mg}, 57 \%$ ) as a thick pale yellow oil.

trans-127
Dimethyl (1S,5R,6R)-5-Hydroxy-2-azabicyclo[4.1.0]heptane-1,2-dicarboxylate [trans (-)127]
Cyclopropanation by dimethylsulfoxonium methylide of $(\boldsymbol{R}) \mathbf{- 1 2 9}$. Dry DMSO ( 0.9 mL ) was added to $\mathrm{NaH}(60 \%$ in weight in mineral oil, $24 \mathrm{mg}, 0.6 \mathrm{mmol}$ ) previously washed with dry $n$ hexane $(2 \times 1.5 \mathrm{~mL})$ under nitrogen atmosphere. To the resulting suspension was added trimethylsulfoxonium iodide ( $122 \mathrm{mg}, 0.56 \mathrm{mmol}$ ) in three portions and the mixture was left 30 min under stirring at room temperature. After cooling with a water bath at $15{ }^{\circ} \mathrm{C}$, a solution of $(R) \mathbf{- 1 2 9}(122 \mathrm{mg}, 0.37 \mathrm{mmol})$ in DMSO $(500 \mu \mathrm{~L})$ was added dropwise. The water bath was removed and the reaction mixture was left under stirring for 2 h . Water ( 12 mL ) was added and the mixture extracted with $\mathrm{Et}_{2} \mathrm{O}(7 \times 9 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated. Chromatography (EtOAc- $n$-hexane, 1:5, $\mathrm{R}_{f} 0.24$ ) gave compound 130 ( $104 \mathrm{mg}, 82 \%$ ) as a 4.7:1 mixture of trans and cis isomers.

Trans isomer: ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right)(1.8: 1$ mixture of rotamers) $\delta=4.12-4.09(\mathrm{~m}, 1 \mathrm{H}$, $5-\mathrm{H}$ ), 3.78 (dt, $J=12.9,4.2 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}$, major rotamer), 3.71 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{OCH}_{3}$, minor rotamer), 3.69 and 3.68 (s, $3 \mathrm{H}+3 \mathrm{H}, \mathrm{OCH}_{3}$, both rotamers), 3.62 ( $\mathrm{dt}, J=12.3,4.1 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}$, minor rotamer), 3.23 (ddd, $J=12.3,10.7,2.7 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}^{\prime}$, minor rotamer), 3.14 (ddd, $J=12.9,10.9$, $2.9 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}$ ', major rotamer), 1.91 (dd, $J=10.3,5.5 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}$, minor rotamer), 1.85 (dd, $J=10.3,5.3 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}$, major rotamer), $1.76-1.57(\mathrm{~m}, 2 \mathrm{H}, 6-\mathrm{H}$ and $4-\mathrm{H}), 1.51-1.39(\mathrm{~m}$, $\left.1 \mathrm{H}, 4-\mathrm{H}^{\prime}\right), 0.88$ (s, $9 \mathrm{H}, \mathrm{TBS}$ ), 0.73 (dd, $J=7.8,5.5 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}^{\prime}$, minor rotamer), 0.70 (dd, $J$ $=8.2,5.5 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}$, major rotamer), $0.084(\mathrm{~s}, 6 \mathrm{H}, \mathrm{TBS}) \mathrm{ppm}$.
The mixture of trans and cis $\mathbf{1 3 0}(79 \mathrm{mg}, 0.22 \mathrm{mmol})$ was dissolved in acetonitrile ( 10 mL ) and, after cooling at $0{ }^{\circ} \mathrm{C}$, a 3 N solution of $\mathrm{HCl}(10 \mathrm{~mL})$ was added dropwise. The cooling bath was removed and the mixture left under stirring 1 h . A satd solution of $\mathrm{NaHCO}_{3}(20 \mathrm{~mL})$ was slowly
added until pH 7 , the aqueous layer extracted with $\mathrm{EtOAc}(6 \times 20 \mathrm{~mL})$ and the combined organic layers dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated. Chromatography $\left(\mathrm{Et}_{2} \mathrm{O}, \mathrm{R}_{f} 0.23\right)$ gave $(1 S, 5 R, 6 R)-\mathbf{1 2 7}(35 \mathrm{mg}, 69 \%)$ as a colorless oil.

Cyclopropanation by dimethylsulfoxonium methylide of $(\boldsymbol{R})-54$. The reaction was carried out as reported above for $(R) \mathbf{- 1 2 9}$. Starting from $(R)-54(87 \mathrm{mg}, 0.32 \mathrm{mmol})$, chromatography (EtOAc- $n$-hexane, $1: 4, \mathrm{R}_{f} 0.22$ ) of the crude reaction mixture gave compound $\mathbf{1 3 1}$ ( $70 \mathrm{mg}, 77 \%$ ) as a 3.8:1 mixture of trans and cis isomers.

Trans isomer: ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right)(2.3: 1$ mixture of rotamers) $\delta=3.78-3.65(\mathrm{~s}+\mathrm{m}, 7$ $\mathrm{H}, \mathrm{OCH}_{3}$ and $5-\mathrm{H}$ ), 3.28 (ddd, $J=12.5,8.2,4.3 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}$ ', minor rotamer), 3.21 (ddd, $J=$ $12.9,8.6,4.3 \mathrm{~Hz}, 3-\mathrm{H}^{\prime}$, major rotamer), $1.92(\mathrm{dd}, J=10.1,5.5 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}$, minor rotamer), $1.85(\mathrm{dd}, J=9.8,5.1 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}$, major rotamer), 1.78-1.68(m, $1 \mathrm{H}, 6-\mathrm{H}), 1.68-1.60(\mathrm{~m}, 1 \mathrm{H}$, 4-H), 1.58-1.49 (m, $\left.1 \mathrm{H}, 4-\mathrm{H}^{\prime}\right), 1.21$ (s, 9 H ), 0.75 (dd, $J=7.8,5.1 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}^{\prime}$, minor rotamer), 0.72 (dd, $J=7.8,5.1 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}$ ', major rotamer) ppm.

The mixture of trans and cis $\mathbf{1 3 1}(70 \mathrm{mg}, 0.25 \mathrm{mmol})$ was dissolved in acetonitrile ( 3.2 mL ) and $p \mathrm{TsOH} \cdot \mathrm{H}_{2} \mathrm{O}(58 \mathrm{mg}, 0.3 \mathrm{mmol})$ was added under stirring at room temperature. After 21 h , another portion of $p \mathrm{TsOH} \cdot \mathrm{H}_{2} \mathrm{O}(24 \mathrm{mg})$ was added and the mixture left under stirring for another 6 h . The mixture was filtered on a short layer of a Celite $/ \mathrm{NaHCO}_{3}$ (1:1) mixture and concentrated. Chromatography ( $\mathrm{Et}_{2} \mathrm{O}, \mathrm{R}_{f} 0.23$ ) gave trans $(1 S, 5 R, 6 R)-127(38 \mathrm{mg}, 67 \%)$ as a colorless oil.
(1S,5R,6R)-(-)-127. $[\alpha]^{25}{ }_{\mathrm{D}}=-4.43\left(\mathrm{c} 0.47, \mathrm{CHCl}_{3}\right) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right)(2: 1$ mixture of rotamers) $\delta=4.28(\mathrm{br} \mathrm{s}, 1 \mathrm{H}, \mathrm{H}-5), 3.86(\mathrm{dt}, J=13.3,3.9 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}$, major rotamer), 3.73 (s, $3 \mathrm{H}, \mathrm{OCH}_{3}$, minor rotamer), 3.71 and $3.70\left(\mathrm{~s}, 3 \mathrm{H}+3 \mathrm{H}, \mathrm{OCH}_{3}\right.$, both rotamers, and $1 \mathrm{H}, 3-\mathrm{H}$, minor rotamer), 3.19 (td, $J=13.6,2.1 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}$ ', minor rotamer), $3.09(\mathrm{td}, J=13.3,2.3 \mathrm{~Hz}$, $1 \mathrm{H}, 3-\mathrm{H}$ ', major rotamer), 1.97 (dd, $J=10.5,5.5 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}$, minor rotamer), 1.93-1.87 (m, 1 $\mathrm{H}, 7-\mathrm{H}$, major rotamer, and $1 \mathrm{H}, 6-\mathrm{H}$, minor rotamer), $1.87-1.67(\mathrm{~m}, 1 \mathrm{H}, 6-\mathrm{H}$, major rotamer, and $1 \mathrm{H}, 4-\mathrm{H}), 1.58-1.46\left(\mathrm{~m}, 1 \mathrm{H}, 4-\mathrm{H}^{\prime}\right), 0.78\left(\mathrm{dd}, J=8.0,5.5 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}^{\prime}\right.$, minor rotamer), 0.75 (dd, $J=8.0,5.3 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}$, major rotamer) ppm. ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}, 100.4 \mathrm{MHz}\right)$ (mixture of rotamers) $\delta=172.5(\mathrm{~s}, \mathrm{CO}), 157.0(\mathrm{~s}, \mathrm{CO}), 63.2$ and $63.1(\mathrm{~d}, \mathrm{C}-5), 52.9$ and $52.8(\mathrm{q}$, $\left.\mathrm{OCH}_{3}\right), 52.5\left(\mathrm{q}, \mathrm{OCH}_{3}\right), 39.0$ and $38.6(\mathrm{~s}, \mathrm{C}-1), 36.5$ and $35.9(\mathrm{t}, \mathrm{C}-3), 31.1$ and $31.0(\mathrm{~d}, \mathrm{C}-6)$, 30.9.0 and 30.8 (t, C-4), 20.5 and $20.0(\mathrm{t}, \mathrm{C}-7) \mathrm{ppm} . \mathrm{MS} m / z(\%)=230(9)[\mathrm{M}+1]^{+}, 211$ (29), 197 (100), 80 (16).

$(1 R, 5 R, 6 S)$-cis- $\mathbf{1 1 0}$
Methyl (1R,5R,6S)-5-Hydroxy-2-azabicyclo[4.1.0]heptane-1-carboxylate [cis (+)-110]
To a solution of alcohol $(1 R, 5 R, 6 S)-\mathbf{1 2 8}(210 \mathrm{mg}, 0.69 \mathrm{mmol})$ in ethyl acetate $(19 \mathrm{~mL})$ was added, under nitrogen atmosphere, $10 \% \mathrm{Pd} / \mathrm{C}(52 \mathrm{mg})$ and the resulting suspension stirred under an $\mathrm{H}_{2}$ atmosphere (balloon) at room temperature for 3 h . After filtration over a Celite layer and evaporation of the solvent, pure amino ester cis $(+) \mathbf{- 1 1 0}(118 \mathrm{mg})$ was obtained in quantitative yield as a colorless oil.
cis-110. $[\alpha]^{25}{ }_{\mathrm{D}}=+80.9\left(\mathrm{c} 0.78, \mathrm{CHCl}_{3}\right) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta=4.32-4.25(\mathrm{~m}, 1 \mathrm{H}, 5-$ H), $3.72\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 2.84(\mathrm{dt}, J=12.7,4.1 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}), 2.57(\mathrm{td}, J=12.7,2.3 \mathrm{~Hz}, 1 \mathrm{H}, 3-$ $H^{\prime}$ ), 2.10-2.03 (m, $1 \mathrm{H}, 4-\mathrm{H}$ ), 1.90-1.76 (m, $3 \mathrm{H}, 6-\mathrm{H}, \mathrm{OH}$, and NH), 1.57 (dd, $J=9.8,4.7 \mathrm{~Hz}, 1$ $\mathrm{H}, 7-\mathrm{H}), 1.24-1.13\left(\mathrm{~m}, 1 \mathrm{H}, 4-\mathrm{H}^{\prime}\right), 1.05\left(\mathrm{dd}, \mathrm{J}=7.4,4.7 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}^{\prime}\right) \mathrm{ppm} .{ }^{13} \mathrm{C}$ NMR ( $\mathrm{CDCl}_{3}$, $100.4 \mathrm{MHz}) \delta=174.7(\mathrm{~s}, \mathrm{CO}), 64.6(\mathrm{~d}, \mathrm{C}-5), 52.5\left(\mathrm{q}, \mathrm{OCH}_{3}\right), 42.6(\mathrm{~s}, \mathrm{C}-1), 41.7(\mathrm{t}, \mathrm{C}-3), 31.4$ (d, C-6), 28.1 (t, C-4), 21.8 (t, C-7) ppm. ## Conversion of trans ( $\mathbf{1 R , 5 S , 6 S}$ )-110 into (1R,5S,6S)-127.

To a solution of trans $(1 R, 5 S, 6 S)-\mathbf{1 1 0}(15 \mathrm{mg}, 0.088 \mathrm{mmol})$ in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}(880 \mu \mathrm{~L})$ cooled at 0 ${ }^{\circ} \mathrm{C}$, were added dropwise $\mathrm{Et}_{3} \mathrm{~N}(16 \mu \mathrm{~L}, 0.114 \mathrm{mmol})$ and methyl chloroformate $(9 \mu \mathrm{~L}, 0.114$ $\mathrm{mmol})$. The resulting mixture was stirred for 20 min before adding further $\mathrm{Et}_{3} \mathrm{~N}(16 \mu \mathrm{~L}, 0.114$ $\mathrm{mmol})$ and methyl chloroformate ( $9 \mu \mathrm{~L}, 0.114 \mathrm{mmol}$ ). The solution was then stirred at $25^{\circ} \mathrm{C}$ for 1 h , then diluted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \mathrm{~mL})$, washed with brine ( 2.5 mL ) and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After evaporation of the solvent, the crude was dissolved in $\mathrm{MeOH}(200 \mu \mathrm{~L})$ and $\mathrm{K}_{2} \mathrm{CO}_{3}(1 \mathrm{mg})$ was added leaving under stirring for 1 h . The solution was concentrated and chromatographed $\left(\mathrm{Et}_{2} \mathrm{O}\right.$, $\left.\mathrm{R}_{f} 0.24\right)$ to give compound trans $(1 S, 5 R, 6 R)-\mathbf{1 2 7}(8 \mathrm{mg}, 40 \%)$ as a colorless oil and $[\alpha]^{25} \mathrm{D}=$ $+4.61\left(\mathrm{c} 0.41, \mathrm{CHCl}_{3}\right)$.

( $\pm$ )-137
( $\pm$ )-4,5-Dihydroxypiperidin-2-one [ $( \pm$ )-137].
A solution of 3,6-dihydro- 1 H -pyridin-2-one $136(507 \mathrm{mg}, 5.22 \mathrm{mmol})$ in $\mathrm{MeOH}(8 \mathrm{~mL})$ was cooled in an ice bath and aqueous $50 \mathrm{mM} \mathrm{NaOH}(40 \mathrm{~mL})$ was added, followed by aqueous 31 mM KMnO 44 ( 129 mL ), that was added dropwise in $30^{\prime}$. The resulting brown solution was stirred for $10^{\prime}$ and, after removal of the ice bath, MeOH was added $(80 \mathrm{~mL})$. After 30 ', the suspension was filtered through a Celite pad to remove the dark brown salts and the filtrate was concentrated, neutralized with $1 \mathrm{~N} \mathrm{HCl}(5.5 \mathrm{~mL})$ and concentrated in vacuo to give lactam 9 $(680 \mathrm{mg})$ which was used in the next step without prior purification.
A sample of the crude reaction mixture was purified by flash chromatography (eluant: EtOAc$\mathrm{MeOH}, 3: 2 ; \mathrm{R}_{f} 0.33$ ) for the characterization, affording pure $( \pm)$ - $\mathbf{1 3 7}$ as a white powder. ( $\pm$ )-137. m.p. $144.0-144.9^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{D}_{2} \mathrm{O}, 400 \mathrm{MHz}\right) \delta(\mathrm{ppm}): 4.21-4.15(\mathrm{~m}, 2 \mathrm{H}, 4-\mathrm{H}, 5-\mathrm{H})$, 3.46 (dd, $\left.J=13.0,4.3 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H}^{\prime}\right), 3.37$ (dd, $\left.J=13.0,5.1 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H}^{\prime \prime}\right), 2.68$ (dd, $J=17.5$, $\left.5.5 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}^{\prime}\right), 2.50\left(\mathrm{dd}, J=17.5,7.8 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}^{\prime \prime}\right) .{ }^{13} \mathrm{C}$ NMR ( $\left.\mathrm{D}_{2} \mathrm{O}, 100.4 \mathrm{MHz}\right) \delta(\mathrm{ppm}):$

( $\pm$ )-147
( $\pm$ )-4,5-dihydroxy-5,6-dihydro-4H-pyridine-1,2-dicarboxylic Acid 1,2 1-Benzyl Ester 2Methyl Ester ( $( \pm)$-147).
To a solution of $( \pm) \mathbf{- 1 4 4}(182 \mathrm{mg}, 0.52 \mathrm{mmol})$ in $\mathrm{CHCl}_{3}$ was added TFA $(1 \mathrm{~mL})$ then $\mathrm{H}_{2} \mathrm{O}$ $(100 \mu \mathrm{~L})$, and the mixture stirred for 11 min at room temperature. After cooling in an ice bath, the reaction mixture was added $\mathrm{K}_{2} \mathrm{CO}_{3}(1.11 \mathrm{~g}, 8.0 \mathrm{mmol})$ and stirred for 3 min . A saturated aqueous solution of $\mathrm{NHCO}_{3}$ was added $(10 \mathrm{~mL})$. The aqueous phase was extracted with $\mathrm{CHCl}_{3}(3 \times 5 \mathrm{ml})$
and the overall organic phases were dried on $\mathrm{K}_{2} \mathrm{CO}_{3}$. After filtration and evaporation of the solvent, the crude $( \pm)$ - $\mathbf{1 4 7}$, obtained as a $2: 1$ mixture with the unreacted substrate $( \pm) \mathbf{- 1 4 4}$, was chromatographed $\left(\mathrm{CHCl}_{3}\right.$-acetone, $\left.2: 1, \mathrm{R}_{f}=0.28\right)$ to give $( \pm)-147(104 \mathrm{mg}, 0.34 \mathrm{mmol}, 65 \%)$ as a white gummy solid. Unreacted ( $\pm$ )- $\mathbf{1 4 4}$ was recovered ( $35 \mathrm{mg}, 20 \%$ yield).
( $\pm$ )-147. ${ }^{1} \mathrm{H}-\mathrm{NMR}(400 \mathrm{MHz}) \delta(\mathrm{ppm}): 7.38-7.30(\mathrm{~m}, 5 \mathrm{H}, \mathrm{Ph}), 5.87(\mathrm{~d}, J=3.7 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H})$, 5.15 ( $\mathrm{s}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Ph}$ ), 4.31-4.28 (m, $1 \mathrm{H}, 4-\mathrm{H}$ ), 3.97-3.91 (m, $1 \mathrm{H}, 5-\mathrm{H}$ ), 3.83-3.68 (m, $2 \mathrm{H}, 6-$ $\mathrm{H}_{\mathrm{eq}}$ ), $3.56\left(\mathrm{bs}, 3 \mathrm{H}, \mathrm{CH}_{3}\right.$ ), $2.74\left(\mathrm{dd}, J=5.86,42.7 \mathrm{~Hz}, 2 \mathrm{H}, 6-\mathrm{H}_{\mathrm{ax}}\right.$ ). ${ }^{13} \mathrm{C}$ NMR ( 100.32 MHz ) $\delta$ (ppm) 164.7 (s, COMe), 154.4 ( $\mathrm{s}, C \mathrm{OBn}$ ), 135.3 ( $\mathrm{s}, \mathrm{C}-2$ ), 133.3 ( $\mathrm{s}, \mathrm{Ph}$ ), 128.4 (m, $4 \mathrm{C}, \mathrm{Ph}$ ), 120.3 (s, C-3), 68.5 ( $\mathrm{s}, \mathrm{C}-4$ ), 66.1 ( $\mathrm{s}, \mathrm{C}-5$ ), 64.6 ( $\mathrm{s}, \mathrm{CH}_{2} \mathrm{Bn}$ ), 52.3 ( $\mathrm{s}, \mathrm{OCH}_{3}$ ), 47.3 (s, C-6). MS (ESI) $m / z(\%): 308.50\left(\mathrm{M}^{+}+1\right), 330.33\left(\mathrm{M}^{+}+23\right)$

General procedure for lipase-catalyzed Kinetic Resolution of ( $\pm$ )-147:
(4R,5S)-4,5-dihydroxy-5,6-dihydro-4H-pyridine-1,2-dicarboxylic Acid 1,2 1-Benzyl Ester 2Methyl Ester (ent-147) and (4S,5R)-4-acyloxy-5-hydroxy-5,6-dihydro-4H-pyridine-1,2dicarboxylic Acid 1,2 1-Benzyl Ester 2-Methyl Ester (149) and (4S,5R)-4-hydroxy-5-acyloxy-5,6-dihydro-4H-pyridine-1,2-dicarboxylic Acid 1,2 1-Benzyl Ester 2-Methyl Ester (159) and (4S,5R)-4,5-diacyloxy-5,6-dihydro-4H-pyridine-1,2-dicarboxylic Acid 1,2 1Benzyl Ester 2-Methyl Ester (151)
$4 \AA$ MS ( $130 \mathrm{mg} / \mathrm{mmol}$ substrate) were added to a solution of $( \pm)-147(176 \mathrm{mg}, 0.604 \mathrm{mmol})$ in anhydrous solvent $(1.5 \mathrm{~mL})$ at $30{ }^{\circ} \mathrm{C}$, followed by lipase ( $100 \mathrm{mg} / \mathrm{mmol}$ substrate), under $\mathrm{N}_{2}$ atmosphere. After 20 min , acylating agent ( 3.5 eq ) was added and the reaction was left under
vigorous stirring and monitored by HPLC. The reaction was stopped by filtration over a thin layer of Celite. After evaporation, the crude product was chromatographed (EtOAc-n-hexane, 1:2) to give ent-147 $\left(\mathrm{R}_{f}=0.15\right)$ (for ee obtained in each experiment, see Table 3$)$, $\mathbf{1 4 9}\left(\mathrm{R}_{f-149 \mathrm{~b}}=\right.$ $0.45), \mathbf{1 5 0}\left(\mathrm{R}_{f-\mathbf{1 5 0 b}}=0.61, \mathrm{R}_{f-\mathbf{1 5 0 c}}=0.66\right)$ and $\mathbf{1 5 1}\left(\mathrm{R}_{f-151 \mathrm{c}}=0.86\right)$.

147
(4S,5R)-4,5-dihydroxy-5,6-dihydro-4H-pyridine-1,2-dicarboxylic Acid 1,2 1-Benzyl Ester 2Methyl Ester (147)

To the solution of acylated $\mathbf{1 4 9}, \mathbf{1 5 0}$ (and $\mathbf{1 5 1}$ when it is present) in dry MeOH ( 10 eq), cooled in an ice bath, was added $\mathrm{MeONa}\left(13 \mathrm{mg}, 0.24 \mathrm{mmol}\right.$ ), and the mixture stirred for 3.5 h at $0{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ atmosphere. Then glacial acetic acid $(14 \mu \mathrm{~L})$ was added and the solvent was evaporated in vaquo without heating. The residue was diluted with water ( 20 mL ), extracted with $\mathrm{CHCl}_{3}$ (3 $\times 20 \mathrm{~mL}$ ) and dried over $\mathrm{K}_{2} \mathrm{CO}_{3}$. After filtration and evaporation of the solvent, the crude 147 was obtained as a colorless oil.
147. Spectroscopic data as reported above for $( \pm)-147$. For $e e$ obtained in each experiments, see Table 3

156

## (4S,5R)-4-Hydroxy-5-(hydroxymethyl)dihydrofuran-2(3H)-one [(+)-(156)].

Bromine ( $4.0 \mathrm{~mL}, 78.0 \mathrm{mmol}$ ) was slowly added to a solution of 2-deoxy-D-ribose $\mathbf{1 5 5}$ ( 2.01 g , $15.0 \mathrm{mmol})$ in water $(12 \mathrm{~mL})$. The flask was then sealed and the red solution was stirred at room temperature for 5 days. After dilution with water $(10 \mathrm{~mL}), \mathrm{Ag}_{2} \mathrm{CO}_{3}$ was added until pH reached 7 (complete decolourization occurred). The suspension was filtered on a celite pad and the filtrate evaporated under vacuum. The residue was purified by flash chromatography (eluent: EtOAc$\left.\mathrm{MeOH}, 10: 1 ; \mathrm{R}_{f} 0.50\right)$ affording pure lactone $156(1.74 \mathrm{~g}, 88 \%)$ as a colourless oil. ${ }^{[82 \mathrm{a}, 83]}$

158
(4S,5S)-5-(Bromomethyl)-4-hydroxydihydrofuran-2(3H)-one [(+)-(158)].
A solution of lactone $156(850 \mathrm{mg}, 6.4 \mathrm{mmol})$ in anhydrous DMF $(9.5 \mathrm{~mL})$ was cooled at $0{ }^{\circ} \mathrm{C}$ and thionyl bromide ( $595 \mu \mathrm{~L}, 7.7 \mathrm{mmol}$ ) was dropwise added. After 2 min the cooling bath was removed and the orange solution left under stirring for 4.5 h . The reaction was quenched by adding anhydrous methanol ( $332 \mu \mathrm{~L}$ ) and, after 10 min , water $(95 \mathrm{~mL})$. The product was extracted with EtOAc ( $4 \times 80 \mathrm{~mL}$ ) and the combined organic extracts were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and evaporation of the solvent, crude $\mathbf{1 5 8}$ was obtained and purified by flash chromatography (eluent: $n$-hexane-EtOAc, $1: 1 ; \mathrm{R}_{f} 0.25$ ). Pure bromide 158 ( $587 \mathrm{mg}, 47 \%$ ) was so obtained as a colourless oil. The aqueous layer was concentrated under vacuum and the residue chromatographed (eluent: EtOAc, $\mathrm{R}_{f} 0.21$ ) to give alcohol 156 ( 262 mg ). This was treated again with $\mathrm{SOBr}_{2}$ as reported above providing pure $158(181 \mathrm{mg})$ in a total yield of $61 \%$. 158. $[\alpha]_{\mathrm{D}}{ }^{26}+12.5$ (c 1.22, EtOAc). ${ }^{1} \mathrm{H}$ NMR ( 400 MHz ) $\delta(\mathrm{ppm}): 4.63-4.58(\mathrm{~m}, 1 \mathrm{H}, 4-\mathrm{H}), 4.58-$ $4.53(\mathrm{~m}, 1 \mathrm{H}, 5-\mathrm{H}), 3.61\left(\mathrm{dd}, J=11.2,3.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Br}\right), 3.53(\mathrm{dd}, J=11.2,6.0 \mathrm{~Hz}, 1 \mathrm{H}$, $\left.\mathrm{CH}_{2} \mathrm{Br}\right), 2.99(\mathrm{dd}, J=18.4,7.2 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}), 2.58$ (dd, $\left.J=18.4,3.9 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}^{\prime}\right) .{ }^{13} \mathrm{C}$ NMR $(100.32 \mathrm{MHz}) \delta(\mathrm{ppm}): 175.7(\mathrm{~s}, \mathrm{CO}), 85.6(\mathrm{~d}, \mathrm{C} 5), 70.1(\mathrm{~d}, \mathrm{C} 4), 37.9\left(\mathrm{t}, \mathrm{CH}_{2} \mathrm{Br}\right), 31.5(\mathrm{t}, \mathrm{C} 3)$. 159
(4S,5R)-5-Azidomethyl-4-hydroxydihydrofuran-2-one [(+)-(159)].
From tosylate 157. Tosylate $157(825 \mathrm{mg}, 2.88 \mathrm{mmol})$ was dissolved into anhydrous acetonitrile $(12.5 \mathrm{~mL})$ under nitrogen atmosphere; 18-crown-6 ether ( $152 \mathrm{mg}, 0.58 \mathrm{mmol}$ ) and $\mathrm{NaN}_{3}$ ( 280 $\mathrm{mg}, 1.5 \mathrm{eq})$ were rapidly added to this solution and the mixture was heated under reflux. After 7 h a further amount of $\mathrm{NaN}_{3}(0.2 \mathrm{eq})$ was added and the suspension refluxed until completion (in all 15 h ). After cooling at room temperature, the suspension was filtered on a Celite pad and the filtrate concentrated under vacuum. The residue was purified by flash chromatography (eluent: $n$-hexane-EtOAc, 2:3; $\mathrm{R}_{f} 0.23$ ), affording pure azide 159 ( $401 \mathrm{mg}, 87 \%$ ) as a colourless oil.
From bromide 158. Bromide 158 ( $580 \mathrm{mg}, 2.97 \mathrm{mmol}$ ) was dissolved into anhydrous acetonitrile ( 13 mL ) under nitrogen atmosphere; 15-crown-5 ether ( $118 \mu \mathrm{~L}, 0.59 \mathrm{mmol}$ ) and
$\mathrm{NaN}_{3}(387 \mathrm{mg}, 2.0 \mathrm{eq})$ were rapidly added to this solution and the mixture was heated under reflux. After 8 h a further amount of $\mathrm{NaN}_{3}(0.5 \mathrm{eq})$ was added and the suspension refluxed until completion ( 20 h ; TLC monitoring). After cooling at room temperature, the suspension was filtered on a mixed silica gel-celite pad and the filtrate concentrated under vacuum. Azide 159 ( $443 \mathrm{mg}, 95 \%$ ) was so obtained as a colourless oil and no further purifications were required.

137

## (4S,5R)-4,5-Dihydroxypiperidin-2-one (+)-137)

Azide 159 ( $840 \mathrm{mg}, 5.35 \mathrm{mmol}$ ) was dissolved into anhydrous methanol ( 35 mL ) under nitrogen atmosphere. Then, $10 \% \mathrm{Pd} / \mathrm{C}$ catalyst $(3 \% \mathrm{~mol})$ was added and the reaction flask flushed first with $\mathrm{N}_{2}$ and then with hydrogen and left under hydrogen atmosphere (balloon) at room temperature for 24 h . The suspension was filtered on a Celite pad and the filtrate concentrated under vacuum, affording pure lactam 137 as a white solid ( $638 \mathrm{mg}, 91 \%$ ) with spectroscopic data identical to those of the racemic compound (EJOC 2012).
137. M.p. $160.9-162.0{ }^{\circ} \mathrm{C} .[\alpha]_{\mathrm{D}}{ }^{23}+17.8\left(c 0.62, \mathrm{CH}_{3} \mathrm{OH}\right)$. Spectoscopic data as reported for the racemic compound $( \pm)$ - $\mathbf{1 3 7}$

ent-137

## (4S,5R)-4,5-Dihydroxypiperidin-2-one (ent-137)

Prepared as reported above for (+)-137. Starting from 2-deoxy-L-ribose (ent-155) (700 mg, 5.22 mmol ) pure lactone ent-137 ( $545 \mathrm{mg}, 79 \%$ ) was obtained as a colourless oil. ent-137. $[\alpha]_{D}^{23}\left(c 1.04, \mathrm{H}_{2} \mathrm{O}\right)$. Analytical and spectroscopic data as reported above.

138
(3aR,7aS)-2,2-Dimethyltetrahydro[1,3]dioxolo[4,5-c]pyridin-6(3aH)-one [(-)-(138)].
Lactam ( $4 S, 5 R$ )-137 ( $630 \mathrm{mg}, 4.80 \mathrm{mmol}$ ) was dissolved in anhydrous methanol ( 4.3 mL ) and a catalytic amount of $p$-toluenesulfonic acid was added ( $183 \mathrm{mg}, 0.96 \mathrm{mmol}$ ) followed by 2,2dimethoxypropane ( $10.6 \mathrm{~mL}, 86 \mathrm{mmol}$ ). The mixture was warmed at $55^{\circ} \mathrm{C}$ for 2.5 h and, after cooling, diluted with $\mathrm{MeOH}(4.5 \mathrm{~mL})$ and neutralized by $\mathrm{K}_{2} \mathrm{CO}_{3}(73 \mathrm{mg}, 0.53 \mathrm{mmol})$. After filtration on a Celite pad and evaporation of the solvent, crude $\mathbf{1 3 8}$ was obtained and purified by flash chromatography (eluent: $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}, 20: 1 ; \mathrm{R}_{f} 0.18$ ), affording pure 138 as a white powder ( $756 \mathrm{mg}, 92 \%$ ) with spectroscopic data identical to those of the racemic compound.
$(-)$-138. M.p. $118.2-119.2{ }^{\circ} \mathrm{C} .[\alpha]_{\mathrm{D}}{ }^{24}-121.9\left(c \quad 0.75, \mathrm{CHCl}_{3}\right)$. Analytical and spectroscopic data as reported above for the racemic compound $( \pm)-\mathbf{1 3 8}$

139

## (3aR,7aS)-Methyl

## 2,2-Dimethyl-6-oxotetrahydro[1,3]dioxolo[4,5-c]pyridine-5(4H)-

 carboxylate [(-)-(139)].A solution of lactam $\mathbf{1 3 8}(750 \mathrm{mg}, 4.38 \mathrm{mmol})$ in dry THF ( 44 mL ) was cooled at $-78^{\circ} \mathrm{C}$ and a 1.6 M solution of $n-\mathrm{BuLi}(2.74 \mathrm{~mL}, 4.38 \mathrm{mmol})$ was slowly added, keeping the temperature below $-70^{\circ} \mathrm{C}$ during the addition. The mixture was stirred for 15 min and then methyl chloroformate ( $338 \mu \mathrm{~L}, 4.38 \mathrm{mmol}$ ) was added dropwise; after 10 min , the cooling bath was removed and the temperature allowed to warm to $0{ }^{\circ} \mathrm{C}$. Saturated $\mathrm{NaHCO}_{3}(20 \mathrm{~mL})$ and water $(20 \mathrm{~mL})$ were added and the product extracted with dichloromethane $(4 \times 15 \mathrm{~mL})$. The combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and evaporated in vacuo to give crude 139. After purification by flash chromatography (eluent: $n$-hexane-EtOAc, 1:2; $\mathrm{R}_{f} 0.32$ ) pure $\mathbf{1 3 9}$ was obtained as a white solid ( $843 \mathrm{mg}, 84 \%$ ) with spectroscopic data identical to those of the racemic compound.
139. M.p. $70.2-72.1^{\circ} \mathrm{C} .[\alpha]_{\mathrm{D}}{ }^{24}-63.9\left(c 0.91, \mathrm{CHCl}_{3}\right)$. Spectoscopic data as reported above for racemic ( $\pm$ )-139.

141
(3aR,7aS)-Methyl
6-(Diphenoxyphosphoryloxy)-2,2-dimethyl-3a,7a-dihydro-4H-[1,3]dioxolo[4,5-c]pyridine-5(4H)-carboxylate (141).
Prepared as reported above for the racemic compound, starting from enantiopure 139 ( 840 mg , 3.66 mmol ), affording pure $\mathbf{1 4 1}$ as a colourless oil ( $1.68 \mathrm{~g}, 99 \%$ ). This was used immediately for the next step. Spectroscopic data identical to those of the racemic compound.

143
(3aR,7aS)-Dimethyl 2,2-Dimethyl-3a,7a-dihydro[1,3]dioxolo[4,5-c]pyridine-5,6(4H)dicarboxylate [(+)-(143)].

In a round bottom flask was prepared a solution of phosphate $141(1.68 \mathrm{~g}, 3.64 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}$ $(82 \mathrm{mg}, 0.36 \mathrm{mmol})$ and $\mathrm{Ph}_{3} \mathrm{P}(191 \mathrm{mg}, 0.73 \mathrm{mmol})$ in anhydrous DMF $(8.6 \mathrm{~mL})$ under nitrogen atmosphere. The flask was flushed and saturated with carbon monoxide and, after $10 \mathrm{~min}, \mathrm{Et}_{3} \mathrm{~N}$ $(1.0 \mathrm{~mL}, 7.28 \mathrm{mmol})$ and anhydrous $\mathrm{CH}_{3} \mathrm{OH}(5.9 \mathrm{~mL}, 146 \mathrm{mmol})$ were added. The mixture was saturated with CO (balloon) and heated at $75^{\circ} \mathrm{C}$ (external bath) for 1 h . After cooling, water ( 86 mL ) was added and the product extracted with $\mathrm{Et}_{2} \mathrm{O}(4 \times 50 \mathrm{~mL})$. The combined organic extracted were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$; after filtration and evaporation of the solvent, crude $\mathbf{1 4 3}$ was purified by flash chromatography (eluant: $n$-hexane-EtOAc, $2: 1,1 \% \mathrm{Et}_{3} \mathrm{~N} ; R_{f} 0.27$ ), to afford pure $\mathbf{1 4 3}$ as a thick colourless oil ( $770 \mathrm{mg}, 78 \%$ ) and with spectroscopic data identical to those of the racemic compound.
143. $[\alpha]_{\mathrm{D}}{ }^{26}+40.0\left(c 1.12, \mathrm{CHCl}_{3}\right)$.

ent-143
(3aS,7aR)-Dimethyl
2,2-Dimethyl-3a,7a-dihydro[1,3]dioxolo[4,5-c]pyridine-5,6(4H)dicarboxylate [(-)-ent-25]

Prepared as reported for (+)-143, in two steps, starting from (+)-137 (227 mg, 0.99 mmol ) and affording pure (-)-143 (185 mg, 69\%) as colourless oil.
ent-143. $[\alpha]_{D}{ }^{25}-39.3\left(c \quad 0.78, \mathrm{CHCl}_{3}\right)$. Analytical and spectroscopic data as reported above.

## Attribution of absolute configuration of diol 147 from EKR (Scheme 38)

Conversion of enantiopure lactam 138 in enamide ester 144: Prepared as reported for ( $\pm$ )-144 starting from enantiopure 138, affording enantiopure 144 in $52 \%$ yield over 3 steps, with spectroscopic data identical to those racemic compound and $[\alpha]_{\mathrm{D}}{ }^{22}+33.5\left(c 1.02, \mathrm{CHCl}_{3}\right)$.

Conversion of diol ent-147 (directly obtained from EKR) in enamide ester ent-144: prepared as reported above for 138, starting from ent-147, affording after chromatography ( $n$-hexaneEtOAc 1:1, $\mathrm{R}_{f}=0.22$ ) pure ent-144 in $62 \%$ yield and $[\alpha]_{\mathrm{D}}{ }^{26}-25.3\left(c 0.21, \mathrm{CHCl}_{3}\right)$.

160
(3aR,6S,7aS)-Dimethyl

## 2,2-dimethyltetrahydro[1,3]dioxolo[4,5-c]pyridine-5,6(4H)-

 dicarboxylate $[(-)-(160)]$.A suspension of $\mathrm{NaHCO}_{3}(155 \mathrm{mg}, 1.84 \mathrm{mmol}, 2.5 \mathrm{eq})$ and $10 \% \mathrm{Pd} / \mathrm{C}(126 \mathrm{mg}, 0.12 \mathrm{mmol}, 0.16$ eq) in EtOAc ( 19.4 mL ) was flushed with $\mathrm{H}_{2}$ and vigorously stirred under $\mathrm{H}_{2}$ atmosphere for 30 min. A solution of $\mathbf{1 4 3}(200 \mathrm{mg}, 0.74 \mathrm{mmol})$ in EtOAc ( 1.7 mL mL ) was then added and the resulting mixture flushed with $\mathrm{H}_{2}$ and stirred under $\mathrm{H}_{2}$ (balloon) at room temperature for 4 h . After filtration on a Celite pad, the filtrate was concentrated under vacuum to give pure $\mathbf{1 6 0}$ as a colourless oil ( $195 \mathrm{mg}, 97 \%$ ) with spectroscopic data identical to those of the racemic compound.
160. $[\alpha]_{\mathrm{D}}{ }^{25}-7.1\left(c 0.93, \mathrm{CHCl}_{3}\right) .{ }^{1} \mathrm{H}$ NMR $(400 \mathrm{MHz})(1.3: 1$ mixture of rotamers) $\delta(\mathrm{ppm}): 4.54$ $(\mathrm{t}, J=6.4 \mathrm{~Hz}, 1 \mathrm{H}, 2-\mathrm{H}$, major), $4.40(\mathrm{t}, J=6.8 \mathrm{~Hz}, 1 \mathrm{H}, 2-\mathrm{H}$, minor $), 4.29-4.15(\mathrm{~m}, 2 \mathrm{H}, 4-\mathrm{H}, 5-$

(5S)-1-Benzyl 2-methyl 5-(tert-Butyldimethylsilanyloxy)-5,6-dihydropyridine-1,2(4H)dicarboxylate [(+)-170]
In a round bottom flask was prepared a solution of phosphate $168(1.68 \mathrm{~g}, 3.25 \mathrm{mmol}), \mathrm{Pd}(\mathrm{OAc})_{2}$ ( $73 \mathrm{mg}, 0.33 \mathrm{mmol}$ ) and $\mathrm{Ph}_{3} \mathrm{P}(170 \mathrm{mg}, 0.65 \mathrm{mmol})$ in anhydrous DMF $(7.7 \mathrm{~mL})$ under nitrogen atmosphere. The flask was flushed and saturated with carbon monoxide and, after $10 \mathrm{~min}, \mathrm{Et}_{3} \mathrm{~N}$ $(0.9 \mathrm{~mL}, 6.5 \mathrm{mmol})$ and anhydrous $\mathrm{CH}_{3} \mathrm{OH}(5.9 \mathrm{~mL}, 146 \mathrm{mmol})$ were added. The mixture was saturated with CO (balloon) and heated at $60^{\circ} \mathrm{C}$ (external bath) for 8 h . After cooling, water ( 80 mL ) was added and the product extracted with $\mathrm{Et}_{2} \mathrm{O}(4 \times 50 \mathrm{~mL})$. The combined organic extracted were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$; after filtration and evaporation of the solvent, crude $\mathbf{1 7 0}$ was purified by flash chromatography (eluant: $n$-hexane-EtOAc, 6:1, $R_{f} 0.11$ ), to afford pure $\mathbf{1 7 0}$ as a thick colourless oil ( $800 \mathrm{mg}, 60 \%$ ) and with spectroscopic data identical to those of the racemic compound.

(4R,5R)-Dimethyl

## 4-Acetyloxy-5-(tert-Butyldimethylsilanyloxy)-5,6-dihydropyridine-

 1,2(4H)-dicarboxylate [(-)-173]A solution of $169(906 \mathrm{mg}, 2.75 \mathrm{mmol}), \mathrm{N}$-bromosuccinimide ( $622 \mathrm{mg}, 3.49 \mathrm{mmol}$ ) and a catalytic amount of AIBN ( $77 \mathrm{mg}, 0.47 \mathrm{mmol}$ ) in a 9:1 mixture of $\mathrm{CCl}_{4}$ and $\mathrm{CHCl}_{3}(99 \mathrm{~mL})$ was refluxed under vigorous stirring for 1.5 h . After cooling, the mixture was diluted with $\mathrm{CHCl}_{3}$ ( 80 $\mathrm{mL})$, washed with water $(90 \mathrm{~mL})$ and concentrated under vacuum to give crude bromide $\mathbf{1 7 1}$ as a yellow oil that was immediately used for the next step without further purification.
(-)-171. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) \delta(\mathrm{ppm}): 6.09(\mathrm{dd}, J=4.3,1.0 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}), 4.33-4.30$ (m, $1 \mathrm{H}, 4-\mathrm{H}), 4.27-4.24(\mathrm{~m}, 1 \mathrm{H}, 5-\mathrm{H}), 4.11(\mathrm{dd}, J=12.1,4.14 .7 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H}$, $\left.\mathrm{OCH}_{3}\right), 3.70\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.53\left(\mathrm{~d}, J=12.1, \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H}^{\prime}\right), 0.83\left[\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right], 0.08[\mathrm{~s}$, $6 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$ ]

Silver acetate ( $688 \mathrm{~g}, 4.13 \mathrm{mmol}$ ) was added to a solution of $\mathbf{1 7 1}(898 \mathrm{mg}, 2.20 \mathrm{mmol})$ in glacial $\mathrm{CH}_{3} \mathrm{CO}_{2} \mathrm{H}(115 \mathrm{~mL})$ and the resulting mixture stirred at room temperature for 15 min . The suspension was then filtered on a celite pad and the filtrate diluted with $\mathrm{Et}_{2} \mathrm{O}(300 \mathrm{~mL})$, washed with satd $\mathrm{NaHCO}_{3}$ to neutralization ( $6 \times 150 \mathrm{~mL}$ ) and dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and evaporation of the solvent, crude 173 was obtained and purified by flash chromatography (EtOAc-n-hexane, 1:4, $\mathrm{R}_{f} 0.30$ ), affording pure 173 ( $1.03 \mathrm{~g}, 75 \%$ over two steps) as a thick pale yellow oil.

178
(2S,4R,5R)-Dimethyl 5-(tert-Butyldimethylsilyloxy)-4-hydroxypiperidine-1,2-dicarboxylate [(-)-178]
Prepared as reported for (-)-160, starting from $\mathbf{1 7 5}(650 \mathrm{mg}, 1.88 \mathrm{mmol})$ and leaving the mixture under stirring and hydrogen atmosphere for 24 h . After filtration on a celite pad and removal of
the solvent under vacuum, a crude $3: 1$ mixture of $\mathbf{1 7 8}$ and 177 was obtained. The major diastereoisomer $\mathbf{1 7 8}$ ( $346 \mathrm{mg}, 53 \%$ ) was obtained in pure form by flash chromatography (eluent: $n$-hexane- $\mathrm{Et}_{2} \mathrm{O}, 2: 3 ; \mathrm{R}_{f} 0.25$ ), as a thick colourless oil. The fraction containing the mixture of both isomers $\mathbf{1 7 8}$ and $\mathbf{1 7 7}$ was further chromatographed to give another amount of pure $\mathbf{1 7 8}$ (117 mg ; overall yield $71 \%$ ).

cis-179
2-Benzyl 1-Methyl
(1S,4R,5R,6R)-4-(tert-Butyldimethylsilanyloxy)-5-hydroxy-2-azabicyclo[4.1.0]heptane-1,2-dicarboxylate [(-)-179]
To a solution of 2,4,6-trichlorophenol ( $33 \mathrm{mg}, 0.167 \mathrm{mmol}$ ) in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.9 \mathrm{~mL})$, cooled to $-40^{\circ} \mathrm{C}$, was added $\mathrm{Et}_{2} \mathrm{Zn}(167 \mu \mathrm{~L}$ of a 1 M solution in hexane, 0.167 mmol$)$ under nitrogen atmosphere. The mixture was left under stirring for 15 min , then $\mathrm{CH}_{2} \mathrm{I}_{2}(101 \mu \mathrm{~L}, 1.26$ mmol ) was added dropwise and, after another 15 min at $-40^{\circ} \mathrm{C}$, a solution of alcohol $\mathbf{1 7 6}$ (35 $\mathrm{mg}, 0.083 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(300 \mu \mathrm{~L})$ was added dropwise. The cooling bath was removed and reaction mixture was left under stirring for 22 h . The suspension was then cooled in a ice bath and a $10 \%$ solution of citric acid ( 3 mL ) was added dropwise under vigorous stirring. The cooling bath was removed and when the solution became clear, the layers were separated, the aqueous layer extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 3 \mathrm{~mL})$ and the combined organic layers washed with a $10 \%$ solution of $\mathrm{Na}_{2} \mathrm{CO}_{3}(2 \times 3 \mathrm{~mL})$ and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and evaporation of the solvent, crude cis-179 was obtained and purified by chromatography ( $n$-exane-EtOAc 5:2, $\mathrm{R}_{f}$ $0.18)$, to give compound cis-179 ( $23 \mathrm{mg}, 95 \%$ ) as a colorless oil.
179. $[\alpha]_{\mathrm{D}}{ }^{24}-27.3\left(c \quad 0.88, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, 1.7: 1$ mixture of rotamers) $\delta$ (ppm): 7.36-7.29 (m, 5 H, Ph), 5.29 (part A of an AB system, $J=12.5,1 \mathrm{H}, \mathrm{CH} \mathrm{H}_{2} \mathrm{Bn}$, major), 5.21 (part A of an AB system, $J=12.3,1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Bn}$, minor), 5.11 (part B of an AB system, $J=12.5,1 \mathrm{H}$, $\mathrm{CH}_{2} \mathrm{Bn}$, minor), 5.04 (part B of an AB system, $J=12.5,1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Bn}$, major), 4.07-4.04 (m, 1 H , $5-\mathrm{H}$ both rotamers), 3.96 (dd, $J=12.3,4.0,1 \mathrm{H}, 3-\mathrm{H}$, major), 3.82 (dd, $J=12.3,4.1,1 \mathrm{H}, 3-\mathrm{H}$, minor rotamer), $3.70\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right.$, minor), $3.51\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right.$, major), 3.39-3.33 (m, $1 \mathrm{H}, 4-\mathrm{H}$, major) 3.32-3.26 (m, $1 \mathrm{H}, 4-\mathrm{H}$, minor), 2.75 (dd, $J=12.9,9.8,1 \mathrm{H}, 3-\mathrm{H}^{\prime}$, minor), 2.72 (dd, $J=$ $12.9,9.8,1 \mathrm{H}, 3-\mathrm{H}^{\prime}$, major), $2.10-2.01(\mathrm{~m}, 2 \mathrm{H}, 6-\mathrm{H}+\mathrm{OH}), 1.95\left(\mathrm{dd}, J=10.1,5.5,1 \mathrm{H}, 7-\mathrm{H}_{\mathrm{ex} 0}\right.$, minor), 1.89 (dd, $J=10.1,5.5,1 \mathrm{H}, 7-\mathrm{H}_{\text {exo }}$, major), $1.12-1.08\left(\mathrm{~m}, 1 \mathrm{H}, 7-\mathrm{H}_{\text {endo }}\right.$, both rotamers), 0.88 [s, $9 \mathrm{H}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}$, major], 0.84 [ $\mathrm{s}, 9 \mathrm{H}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}$ minor], 0.11 [ $\mathrm{s}, 3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$, major], 0.10 [s, $3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$, major], 0.03 [s, $3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$, minor], -0.01 [s, $3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$ minor]. ${ }^{13} \mathrm{C}$ NMR ( $100.4 \mathrm{MHz}, \mathrm{CHCl}_{3}$ ) (mixture of rotamers) $\delta(\mathrm{ppm}): 171.9$ and 171.3 (s, CO), 156.0 and $155.5(\mathrm{~s}, \mathrm{NCO}), 136.4$ and $136.1\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{C}_{\text {arom }}\right), 128.4$ and $128.2\left(\mathrm{t}, 2 \mathrm{C}, \mathrm{C}_{\text {arom }}\right), 72.1$ and $71.9\left(\mathrm{~s}, \mathrm{CH}_{2} \mathrm{Bn}\right), 70.1$ and $70.9(\mathrm{~s}, \mathrm{C}-5), 67.6$ and $67.4(\mathrm{~s}, \mathrm{C}-4), 52.6$ and $52.4\left(\mathrm{~s}, \mathrm{OCH}_{3}\right), 47.5$ and $47.0(\mathrm{~s}, \mathrm{C}-1), 41.8$ and $41.0(\mathrm{~s}, \mathrm{C}-3), 29.1$ and $28.7(\mathrm{~s}, \mathrm{C}-6), 25.6\left[\left(\mathrm{~d}, 3 \mathrm{C}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right], 21.2\right.$ and $20.8(\mathrm{~s}, \mathrm{C}-7), 17.9\left[\left(\mathrm{~s}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right],-4.6\right.$ and -4.7 and $-4.8\left[\left(\mathrm{~s}, 2 \mathrm{C}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right]\right.$.

182 (dr $6: 1$ )
2-Benzyl 1-Methyl (1R,4R,5R,6S)-4,5-Bis-(tert-Butyldimethylsilanyloxy)-2-azabicyclo[4.1.0]heptane-1,2-dicarboxylate [(-)-182]

Cyclopropanation by dimethylsulfoxonium methylide of $\mathbf{1 8 1}$. Dry DMSO ( 0.7 mL ) was added to $\mathrm{NaH}(60 \%$ in weight in mineral oil, $8 \mathrm{mg}, 0.19 \mathrm{mmol})$ previously washed with dry $n$ hexane ( $2 \times 1 \mathrm{~mL}$ ) under nitrogen atmosphere. To the resulting suspension was added trimethylsulfoxonium iodide ( $38 \mathrm{mg}, 0.17 \mathrm{mmol}$ ) in three portions and the mixture was left 40
min under stirring at room temperature. After cooling with a water bath at $15^{\circ} \mathrm{C}$, a solution of $181(62 \mathrm{mg}, 0.12 \mathrm{mmol})$ in DMSO-DMF 1:1 $(400 \mu \mathrm{~L})$ was added dropwise. The water bath was removed and the reaction mixture was left under stirring for 4 h . Water ( 6 mL ) was added and the mixture extracted with $\mathrm{Et}_{2} \mathrm{O}(7 \times 5 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and concentrated. Chromatography (EtOAc- $n$-hexane, 1:10, $\mathrm{R}_{f} 0.10$ ) gave compound $183(43 \mathrm{mg}, 82 \%$ ) as a $6: 1$ mixture of trans and cis isomers.
183. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right.$, trans isomer, 1.7:1 mixture of rotamers) $\delta(\mathrm{ppm}): 7.37-7.27$ (m, 5H, Ph), 5.28 (part A of an AB system, $J=12.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Ph}$, minor rotamer), 5.23 (part A of an AB system, $J=12.7 \mathrm{~Hz}, 1 \mathrm{H}, C H_{2} \mathrm{Ph}$, major rotamer), 5.05 (part B of an AB system, $J=$ $12.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Ph}$, major rotamer), 4.98 (part B of an AB system, $J=12.3,1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Ph}$, minor rotamer) 3.92 ( $\mathrm{s}+\mathrm{dd}, 13.1,3.1 \mathrm{~Hz}, 2 \mathrm{H}, 5-\mathrm{H}$, both rotamers + 3-H, major), 3.71 (s, 3 H , $\mathrm{OCH}_{3}$, minor), $3.56\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right.$, major), 3.22 (d, $J=13.1 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}^{\prime}$, minor), $3.10(\mathrm{~d}, J=$ $13.1 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}$ ', major), 1.81 (dd, $J=10.5,4.5 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}_{\text {exo }}$, minor), 1.72 (dd, $J=10.7$, $4.3,1 \mathrm{H}, 7-\mathrm{H}_{\text {exo }}$, major), $1.42-1.37\left(\mathrm{~m}, 1 \mathrm{H}, 7-\mathrm{H}_{\text {endo }}\right.$, both rotamers), $0.88\left[\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right.$, major], 0.87 [s, $9 \mathrm{H}, \operatorname{SiC}\left(\mathrm{CH}_{3}\right)_{3}$, minor], $0.81\left[\mathrm{~s}, 9 \mathrm{H}, \operatorname{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right.$, major], 0.79 [s, 9 H , $\mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}$, minor], 0.10 [ $\mathrm{s}, 3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$ major], 0.08 [ $\mathrm{s}, 3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$, both rotamers], 0.07 [ s , $3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$, major], 0.05 [ $\mathrm{s}, 3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$, major], 0.04 [s, $3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$, major], 0.01 [ $\mathrm{s}, 3 \mathrm{H}$, $\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$, minor], -0.08 [s, $3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$, monor].

ent-116 (dr $6: 1$ )

## 1-Methyl ( $1 R, 4 R, 5 R, 6 S$ )-4,5-Dihydroxy-2-azabicyclo[4.1.0]heptane-1-carboxylate

The mixture of trans and cis $\mathbf{1 8 2}(79 \mathrm{mg}, 0.22 \mathrm{mmol})$ was treated as reported for $\mathbf{1 8 0}$, affording, after chromatography (EtOAc, $\mathrm{R}_{f} 0.27$ ), diol $\mathbf{1 8 3}$ as a 6:1 mixture with the cis isomer ( 10 mg , 44\%) as a white solid.
183. ${ }^{1} \mathrm{H}$ NMR ( $200 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) (trans isomer, mixture or rotamers $\delta(\mathrm{ppm})$ : 7.36-7.28 (m, 5 $\mathrm{H}, \mathrm{Ph}), 5.12\left(\mathrm{AB}\right.$ system, $\left.2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Bn}\right) 3.94-3.70(\mathrm{~m}, 2 \mathrm{H}, 5-\mathrm{H}+3-\mathrm{H}), 3.70\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right.$, minor), $3.53\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right.$, major), 3.34-3.28 (m, $1 \mathrm{H}, 3-\mathrm{H}^{\prime}$, both rotamers), 2.33 (br s, 2 H , OH ), 1.94 (dd, $J=10.4,4.9 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}$, minor), 1.85 (dd, $J=10.4,4.7 \mathrm{~Hz}, 1 \mathrm{H}, 7-\mathrm{H}$, major), 1.79-1.70 (m, $1 \mathrm{H}, 6-\mathrm{H}^{\prime}$, both rotamers), $1.30-1.23\left(\mathrm{~m}, 1 \mathrm{H}, 7-\mathrm{H}^{\prime}\right.$, both rotamers).

Diol $\mathbf{1 8 3}$ was treated as reported for cis-112, affording pure ent-116 in $83 \%$ yield (6:1 ratio with the cis isomer) as a pale yellow oil.
ent-116. ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) (trans isomer) $\delta(\mathrm{ppm}): 4.02-4.01(\mathrm{br}, 1 \mathrm{H}, 5-\mathrm{H}), 3.72(\mathrm{~s}, 3$ $\mathrm{H}, \mathrm{OCH}_{3}$ ), 3.62-3.60 (br, $1 \mathrm{H}, 3-\mathrm{H}$ ), 3.03 (dd, $J=12.7,2.3 \mathrm{~Hz}, 1 \mathrm{H}, 4-\mathrm{H}$ ), 2.67 (dd, $J=12.7,4.9$ $\left.\mathrm{Hz}, 1 \mathrm{H}, 3-\mathrm{H}^{\prime}\right)$, 2.43-2.42 (br, $3 \mathrm{H}, \mathrm{NH}, \mathrm{OH}$ ), 1.62-1.67 (m, $1 \mathrm{H}, 6-\mathrm{H}$ ), 1.53 (dd, $J=10.7,4.7 \mathrm{~Hz}$, $\left.1 \mathrm{H}, 7-\mathrm{H}^{\prime}\right)$.

184

## (2S,5S)-Dimethyl 5-(tert-Butyldimethylsilanyloxy)piperidine-1,2-dicarboxylate [(-)-184].

Prepared as reported for $(-) \mathbf{- 1 6 0}$, starting from $\mathbf{1 6 9}(920 \mathrm{mg}, 2.79 \mathrm{mmol})$ and leaving the mixture under stirring and hydrogen atmosphere for 21 h . After filtration on a celite pad and removal of the solvent under vacuum, the so obtained crude 184 was purified by flash chromatography (eluent: $n$-hexane-EtOAc, 6:1; $\mathrm{R}_{f} 0.24$ ), affording pure 184 ( $878 \mathrm{mg}, 95 \%$ ) as a colourless oil, in mixture with a small amount of the trans diastereoisomer.
184. $[\alpha]_{\mathrm{D}}{ }^{30}-24.5$ (c 0.74, MeOH) $\left\{l i t .{ }^{[92 \mathrm{~g}]}[\alpha]_{\mathrm{D}}{ }^{20}-15.4\right.$ (c 1.0, MeOH) $\}{ }^{1} \mathrm{H}$ NMR ( 400 MHz ) (1.3:1 mixture of rotamers, dr 8:1) $\delta(\mathrm{ppm}): 4.88(\mathrm{~d}, J=4.4 \mathrm{~Hz}, 1 \mathrm{H}, 2-\mathrm{H}$, major), $4.72(\mathrm{~d}, J=$ $5.1 \mathrm{~Hz}, 1 \mathrm{H}, 2-\mathrm{H}$, minor), 4.17 (dd, $J=12.9,4.9 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H}_{\text {eq }}$, minor), 3.99 (dd, $J=12.9,4.9$ $\mathrm{Hz}, 1 \mathrm{H}, 6-\mathrm{H}_{\text {eq }}$, major), 3.74 and $3.70\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CO}_{2} \mathrm{CH}_{3}\right.$ and $\mathrm{NCO}_{2} \mathrm{CH}_{3}$, both rotamers), 3.60-3.51 (m, $1 \mathrm{H}, 5-\mathrm{H}), 2.75\left(\mathrm{dd}, J=12.9,10.5 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H}_{\mathrm{ax}}\right.$, major), $2.67(\mathrm{dd}, J=12.9,10.5 \mathrm{~Hz}, 1 \mathrm{H}$, $6-\mathrm{H}_{\mathrm{ax}}$, minor), $2.31-2.23\left(\mathrm{~m}, 1 \mathrm{H}, 3-\mathrm{H}_{\mathrm{eq}}\right), 1.88-1.81\left(\mathrm{~m}, 1 \mathrm{H}, 4-\mathrm{H}_{\mathrm{eq}}\right), 1.74-1.62\left(\mathrm{~m}, 1 \mathrm{H}, 3-\mathrm{H}_{\mathrm{ax}}\right)$, $1.31-1.19\left(\mathrm{~m}, 1 \mathrm{H}, 4-\mathrm{H}_{\mathrm{ax}}\right), 0.87\left[\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right], 0.07\left[\mathrm{~s}, 3 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right], 0.06[\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}$ ] ppm. ${ }^{13} \mathrm{C}$ NMR ( 100.4 MHz ) $\delta(\mathrm{ppm}):{ }^{13} \mathrm{C}$ NMR ( 100.4 MHz ) (mixture of rotamers) $\delta$ (ppm): $171.6\left(\mathrm{~s}, \mathrm{CO}_{2} \mathrm{Me}\right), 156.7$ and $156.2\left(\mathrm{~s}, \mathrm{NCO}_{2} \mathrm{Me}\right), 67.4 .2$ and $67.2(\mathrm{~d}, \mathrm{C}-5), 53.7$ and 53.4 (d, C-2), $53.1\left(\mathrm{q}, \mathrm{OCH}_{3}\right), 52.4$ and $52.3\left(\mathrm{q}, \mathrm{OCH}_{3}\right), 48.5$ and $48.3(\mathrm{t}, \mathrm{C}-6), 31.1$ and $31.0(\mathrm{t}, \mathrm{C}-3)$, $25.8\left[\left(\mathrm{q}, 3 \mathrm{C}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right], 25.4\right.$ and $25.0(\mathrm{C}-4), 18.1\left[\left(\mathrm{~s}, \mathrm{SiC}\left(\mathrm{CH}_{3}\right)_{3}\right],-4.7\left[\left(\mathrm{q}, 2 \mathrm{C}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{2}\right]\right.\right.$. Found: C, 54.19; H, 9.02; N, 3.99.

185

## (2S,5S)-Dimethyl 5-Hydroxypiperidine-1,2-dicarboxylate [(-)-185].

A solution of compound $\mathbf{1 6 9}(878 \mathrm{mg}, 2.65 \mathrm{mmol})$ in acetonitrile $(80 \mathrm{~mL})$ was cooled at $0{ }^{\circ} \mathrm{C}$ and aqueous 3 N HCl was dropwise added ( 80 mL ). After 10 min the ice bath was removed and
the mixture was left under stirring at room temperature for 2 h . Satd $\mathrm{NaHCO}_{3}$ solution was then slowly added until complete neutralization and the product extracted with EtOAc ( $5 \times 160 \mathrm{~mL}$ ). The combined organic extracts were dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and evaporation of the solvent, crude $\mathbf{1 8 5}$ was obtained and purified by flash chromatography (eluent: $n$-hexane-EtOAc, 2:3; $\mathrm{R}_{f} 0.35$ ), affording pure compound $\mathbf{1 8 5}$ as a single diasteroisomer ( $448 \mathrm{mg}, 78 \%$ ). Colourless oil.
185. $[\alpha]_{\mathrm{D}}{ }^{24}-40.3(c 0.42, \mathrm{MeOH})\left\{l i t .{ }^{[92 \mathrm{~g}]}[\alpha]_{\mathrm{D}}{ }^{20}-24.1(c \quad 1.0, \mathrm{MeOH})\right\} .{ }^{1} \mathrm{H}$ NMR ( 400 MHz ) (1.3:1 mixture of rotamers) $\delta(\mathrm{ppm}): 4.88(\mathrm{~d}, J=5.5 \mathrm{~Hz}, 1 \mathrm{H}, 2-\mathrm{H}$, major), $4.73(\mathrm{~d}, J=4.9 \mathrm{~Hz}, 1$ $\mathrm{H}, 2-\mathrm{H}$, minor), 4.27 (br d, $J=12.3 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H}_{\mathrm{eq}}$, minor), 4.13 (br d, $J=12.5 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H}_{\mathrm{eq}}$, major), $3.74\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CO}_{2} \mathrm{CH}_{3}\right), 3.73$ and $3.69\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{NCO}_{2} \mathrm{CH}_{3}\right), 3.67-3.59(\mathrm{~m}, 1 \mathrm{H}, 5-\mathrm{H}), 2.20$ (br $\mathrm{t}, J=11.9,1 \mathrm{H}, 6-\mathrm{H}_{\mathrm{ax}}$, major), 2.71 ( br $\mathrm{t}, J=11.7,1 \mathrm{H}, 6-\mathrm{H}_{\mathrm{ax}}$, minor), 2.29 (br d, $J=14.1$ $\left.\mathrm{Hz}, 1 \mathrm{H}, 3-\mathrm{H}_{\mathrm{eq}}\right), 2.01-1.93\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{OH}\right.$ and $\left.4-\mathrm{H}_{\mathrm{eq}}\right), 1.77-1.68\left(\mathrm{~m}, 1 \mathrm{H}, 3-\mathrm{H}_{\mathrm{ax}}\right), 1.28-1.18(\mathrm{~m}, 1$ $\mathrm{H}, 4-\mathrm{H}_{\mathrm{ax}}$ )

6 HCl

## (2S,5S)-5-Hydroxypipecolic Acid [(-)-6•HCl]

Prepared as reported for $(-) \mathbf{- 1 0}$, starting from $(-) \mathbf{- 1 8 5}(100 \mathrm{mg}, 0.46 \mathrm{mmol})$ and obtaining pure ( -)-6 as hydrochloride ( $83 \mathrm{mg}, 99 \%$ ).

cis-189

## 2-Benzyl 1-Methyl (1R,4S,6S)-4-Hydroxy-2-azabicyclo[4.1.0]heptane-1,2dicarboxylate [(+)-cis-188]

To a solution of $188(44 \mathrm{mg}, 0.15 \mathrm{mmol})$ in anhydrous $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1.5 \mathrm{~mL})$, cooled to $-15{ }^{\circ} \mathrm{C}$, $\mathrm{Et}_{2} \mathrm{Zn}(450 \mu \mathrm{~L}$ of a 1 M solution in hexane, 0.45 mmol$)$ then $\mathrm{CH}_{2} \mathrm{I}_{2}(72 \mu \mathrm{~L}, 0.90 \mathrm{mmol})$ were added dropwise under $\mathrm{N}_{2}$ atmosphere. The cooling bath was removed and reaction mixture was left under stirring for 1 h at room temperature, then refluxed for 18 h . The suspension was then cooled in a ice bath and a $10 \%$ solution of citric acid ( 4 mL ) was added dropwise under vigorous stirring. The cooling bath was removed and when the solution became clear, the layers were separated, the aqueous layer extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 4 \mathrm{~mL})$ and the combined organic layers were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration and evaporation of the solvent, crude cis-189 was purified by chromatography ( $n$-hexane/EtOAn, $1: 1 ; \mathrm{R}_{f} 0.21$ ), which give compound cis-189 (19 $\mathrm{mg}, 41 \%$ ) was obtained as a colorless oil.
cis-189. $[\alpha]_{\mathrm{D}}{ }^{25}+22.7$ (c $\left.0.92, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) (2.8:1 mixture of rotamers) $\delta(\mathrm{ppm})$ : 7.36-7.25 (m, $5 \mathrm{H}, \mathrm{Ph}$ ), 5.26 (part A of an AB system, $J=12.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Bn}$ ), 5.09 (part B of an AB system, $J=12.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{Bn}$ ), 4.64-3.88 (m, $2 \mathrm{H}, 4-\mathrm{H}$, both rotamers + 3H , major rotamer), $3.85\left(\mathrm{dd}, J=12.3,4.1,1 \mathrm{H}, 6-\mathrm{H}\right.$, minor rotamer), $3.69\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right.$, minor), $3.55\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right.$, major), $3.07\left(\mathrm{dd}, J=13.7,2.5,1 \mathrm{H}, 3-\mathrm{H}^{\prime}\right.$, minor), 2.91-2.71(m, $1 \mathrm{H}, 3-\mathrm{H}^{\prime}$, major), 2.16-1.91 (m, $2 \mathrm{H}, 5-\mathrm{H}+7-\mathrm{H}$, both rotamers), $1.85(\mathrm{dd}, J=10.2,4.7 \mathrm{~Hz}, 1 \mathrm{H}, 6-\mathrm{H}$, both rotamers), 1.72-1.60 (m, $1 \mathrm{H}, 5-\mathrm{H}^{\prime}$, both rotamers), 1.28-1.20 (m, $1 \mathrm{H}, 7-\mathrm{H}^{\prime}$, both rotamers). ${ }^{13} \mathrm{C}$ NMR (100.4 MHz, $\mathrm{CDCl}_{3}$ ) (mixture of rotamers) $\delta(\mathrm{ppm}): 172.9$ and $172.5(\mathrm{~s}), 157.7$ and 156.6 (s), 136.7 and 136.6 (s), 128.3 and 127.8 (q), 67.3 (s), 64.9 (s), 52.4 and 52.2 (s), 47.4 and 46.8 (s), 38.7 and 38.4 (s), 28.8 and 27.9 (s), 24.0 and 23.7 (s), 22.5 and 22.2 (s). MS/MS (ESI of [M $\left.+1]^{+}\right) \mathrm{m} / \mathrm{z}(\%): 306\left([\mathrm{M}+1]^{+}, 3\right), 262(100)$.

cis-111

## 1-Methyl-(1R,4S,6S)-4-Hydroxy-2-azabicyclo[4.1.0]heptane 1-carboxylate [(+)-cis-111]

Prepared as reported for ( + )-cis-110, starting from cis-189 ( $17 \mathrm{mg}, 0.06 \mathrm{mmol}$ ) and obtaining pure ( + )-cis- $\mathbf{1 1 1}$ as a pale yellow oil ( $10 \mathrm{mg}, 96 \%$ ).
cis-111. $[\alpha]_{\mathrm{D}}{ }^{24}+91.0\left(c 0.91, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta(\mathrm{ppm}): 3.88-3.85(\mathrm{~m}, 1 \mathrm{H}$, $4-\mathrm{H}$ ), $3.71\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right.$ ), 2.83 (ddd, $\left.J=12.7,3.9,1.4 \mathrm{~Hz}, 1 \mathrm{H}, 3-\mathrm{H}\right), 2.69-2.65\left(\mathrm{~m}, 3 \mathrm{H}, 3-\mathrm{H}^{\prime}+\right.$ $\mathrm{OH}+\mathrm{NH}), 2.10-1.98(\mathrm{~m}, 2 \mathrm{H}, 5-\mathrm{H}+7-\mathrm{H}), 1.64-1.54\left(\mathrm{~m}, 5-\mathrm{H}^{\prime}+6-\mathrm{H}\right), 1.15(\mathrm{dd}, J=7.03,3.5$ $\left.\mathrm{Hz}, 1 \mathrm{H}, 7-\mathrm{H}^{\prime}\right) .{ }^{13} \mathrm{C}$ NMR ( $100.4 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta(\mathrm{ppm}): 175.4$ (s, CO), $64.0(\mathrm{~s}), 52.4$ (s), 47.5 (s), 39.5 (s), 28.7 (s), 26.1 (s), 19.6 (s). MS (ESI) $m / z(\%) 172$ ([M] $]^{+}, 100$ )

## Ringraziamenti

Un ringraziamento speciale alla Dottoressa Dina Scarpi, senza la quale avrei potuto fare ben poco riguardo a questo progetto.

Grazie a Laura Bartali, vera amica con la quale ho condiviso gioie \& dolori della vita di laboratorio e oltre.

Grazie a Lorenzo Sernissi, compagno di mille speculazioni scientifiche (irrisolte) \& di bischerate.

Grazie a tutte le altre persone, e sono tante, che mi hanno supportato \& sopportato in questi tre anni, specialmente in questo ultimo periodo.

A tutti voi, grazie.

Andrea Casini

${ }^{57}$ Toluene was used in the lipase-mediated kinetic resolution of 5-hydroxy-5,6-dihydro-2(1H)-pyridones. In our case, the results were poorer with this solvent than with more polar ones, see: Gòmez, R.; Alcudia, A.; Liebeskind, L. S.; Org. Lett 2001, 3, 3381. Furhermore, alcohol 118 was insoluble in hexane so the conditions reported for seudenol by Roticci et al. could not be applied.
${ }^{58}$ PCPB was prepared as reported: Fransson, A.-B. L.; Xu, Y.; Leijondahl, K.; Bäckvall, J.-E.; J. Org. Chem. 2006, 71, 6309
${ }^{59}$ Armesto, N.; Ferrero, M.; Fernàndez, S.; Gotor, V.; J. Org. Chem. 2002, 67, 4978 and references cited therein
${ }^{60}$ The enantioselectivity in an enzymatic kinetic resolution process is expressed by the enantiomeric ratio, E, which is the ratio between the specificity constants $\left(k_{\mathrm{cat}} / K_{\mathrm{M}}\right)$ of the enzyme for the competing R and S enantiomers: $\mathrm{E}=$ $\left(k_{\text {cat }} / K_{\mathrm{M}}\right)_{\mathrm{R}} /\left(k_{\text {cat }} / K_{\mathrm{M}}\right)_{\mathrm{s}}$. E was calculated using the formula $\mathrm{E}=\ln \left[\left(1-\mathrm{ee}_{\mathrm{s}}\right) /\left(1+\mathrm{ee}_{\mathrm{s}} / \mathrm{ee}_{\mathrm{p}}\right)\right] / \ln \left[\left(1+\mathrm{ee}_{\mathrm{s}}\right) /\left(1+\mathrm{ee}_{\mathrm{s}} / \mathrm{ee}_{\mathrm{p}}\right)\right] . \mathrm{J} . \mathrm{L}$.
