ABSTRACT

An updated inventory of the vascular flora alien to Italy, providing details on the occurrence at regional level, is presented. The checklist includes 1597 species, subspecies, and hybrids, distributed in 725 genera and 152 families; 2 taxa are lycopophytes, 11 ferns and fern allies, 33 gymnosperms, and 1551 angiosperms. 157 taxa are archaeophytes and 1440 neophytes. The alien taxa currently established in Italy are 791 (570 naturalized and 221 invasive), while 705 taxa are casual aliens, 4 are not assessed, 7 are of unknown regional distribution, 47 have not been confirmed in recent times, 3 are considered extinct or possibly extinct in the country, and 40 are doubtfully occurring in Italy. This checklist allows to establish an up-to-date number (9792) of taxa constituting the whole (native and alien) Italian flora.

ARTICLE HISTORY

Received 12 February 2018
Accepted 13 February 2018

KEYWORDS

Floristic diversity;
Mediterranean flora; non-native flora; plant invasion; taxonomy

Introduction

Similarly to other European countries, Italy has a long tradition in the study of alien plants, which started around the late nineteenth century with the publication of contributions on single species recognized as non-native (Ardenghi et al. 2015b, and literature cited therein), followed by more detailed and extensive checklists (Béguinot and Mazza 1916a, 1916b; Viegi et al. 1974). After the publication of *Flora d’Italia* (Pignatti 1982), the

first enumeration of the vascular flora alien to Italy resulted in the publication of the first checklist of the Italian vascular flora (Conti et al. 2005, updated by Conti et al. 2007); this included only the established (naturalized and invasive) taxa, for a total of 782 species and subspecies, archaeophytes excluded. A growing interest in the non-native flora, with special regard to distribution and invasiveness across the country, led to the publication of a first comprehensive inventory of the alien flora of Italy

(Celesti-Grapow et al. 2009a, 2009b), listing 1023 species and subspecies, of which 103 archaeophytes and 920 neophytes.

In the following years, a relevant amount of data concerning the vascular flora alien to Italy appeared in the columns *Notulae alla checklist della flora vascolare italiana* (2005–2009), *Notulae alla flora esotica d'Italia* (2009–2015), and *Notulae to the Italian alien vascular flora* (2016 onwards, Galasso et al. 2016a, 2016b, 2017a, 2017b), published in the journals *Informatore Botanico Italiano* and *Italian Botanist*, as well as in regional inventories (e.g., Banfi and Galasso 2010; Arrigoni and Viegi 2011; Podda et al. 2012; Bouvet 2013; Celesti et al. 2016; Puddu et al. 2016; Roma-Marzio et al. 2016; Del Guacchio and La Valva 2017; Lucchese 2017), taxonomic contributions (e.g., Ardenghi et al. 2015a; Iammonico 2015), and single records of national or continental relevance (e.g., Ardenghi 2013; Galasso et al. 2014; Stinca et al. 2014; Iberite and Iammonico 2015; Sani et al. 2015; Scafidi et al. 2016; Stinca et al. 2016; Alessandrini et al. 2017; Ardenghi et al. 2017; Salerno and Stinca 2017; Stinca et al. 2017). In order to summarize all the available floristic data and taxonomic knowledge of the Italian alien vascular flora, an updated checklist was needed.

In this context, we decided to publish an inventory exclusively dedicated to the alien vascular flora (archaeophytes and neophytes) (Galasso et al. 2016c), separately from the checklist of the native (including doubtfully native) taxa (Bartolucci et al. 2016, 2018).

This paper is the result of a choral work (see also Peruzzi 2018) which involved many researchers who have voluntarily contributed relevant information about distribution and systematic or nomenclatural issues, as regional and/or taxonomic advisers (Appendix S1).

The aim of this contribution is to provide an updated inventory of the vascular flora alien to Italy, to serve as a taxonomic and nomenclatural platform for further research in floristic, taxonomic, geobotanical, or environmental studies.

Materials and methods

To update the checklist of the vascular flora alien to Italy, we followed the latest nomenclatural, taxonomic, and systematic studies available in literature (see Bartolucci et al. 2018).

In order to recognize the taxa as non-native to Italy, we used the national standardized system developed by the research group who previously worked on this topic (Celesti-Grapow et al. 2009a, 2009b, 2010), based on the definitions provided by Pyšek et al. (2004):

- alien (synonyms: non-native, non-indigenous, introduced, exotic, allochthonous): a plant occurring in a given area, whose presence in Italy is due to intentional or unintentional human activity, or which naturally spreads from an area where it is non-native. We did not include those taxa that are only found as escaped from cultivation in botanical gardens or non-accessible areas such as private gardens, or sites closed to public visits. We considered hybrids between native and non-native taxa as aliens. We considered as aliens also those taxa which were involved in domestication processes such as culta and ferals;
- casual (synonym: not established): alien plants that may thrive and even produce offsprings occasionally outside

cultivation, but that usually disappear because unable to form self-maintaining populations; their persistence rely on repeated introductions;

- naturalized (synonym: established): alien plants that occur with self-maintaining populations without direct human intervention;
- invasive: alien plants that occur with self-maintaining populations without direct human intervention, produce fertile offspring at considerable distances from the parent individuals, thus being able to spread over a large area;
- archaeophytes: alien plants introduced to Italy before 1492;
- neophytes: alien plants introduced to Italy after 1492.

For the systematic order and taxonomic circumscription of the families and the nomenclature of the taxa, we refer to Bartolucci et al. (2018) and literature cited therein. The list was carefully checked to reduce as much as possible the numerous errors found in several studies involving alien species (Jacobs et al. 2017).

The distribution of taxa on a regional scale was updated based on the records published between 2005 and 2017 in the columns *Notulae alla checklist della flora vascolare italiana*, *Notulae alla flora esotica d'Italia*, and *Notulae to the Italian alien vascular Flora*, and on floristic contributions and taxonomic revisions.

The distribution data (for details on the regional distribution, see Appendix S2) are coded following the same criteria given in Bartolucci et al. (2018); for each taxon it is given with the following symbols, for Italy as a whole and for each administrative region:

- occurring as a casual alien: "CAS" in the main text, "P A CAS" in Appendix S2;
- occurring with an undefined invasion status, likely as casual alien: "CAS?" in the main text, "CAS?" (whole Italy) or "P A" (regional level) in Appendix S2;
- occurring as a naturalized alien: "NAT" in the main text, "P A NAT" in Appendix S2;
- occurring as an invasive alien: "INV" in the main text, "P A INV" in Appendix S2;
- no longer recorded (historical, reliable, record; it is unclear whether it is a casual alien or a naturalized alien possibly extinct in Italy): "NC" in the main text, "NC A" in Appendix S2;
- extinct or possibly extinct: "EX" in the main text, "EX A" in Appendix S2;
- data deficient (unknown regional distribution; unknown alien status): "DD" in the main text, "DD A" in Appendix S2;
- doubtfully occurring: "D" in the main text, "D A" in Appendix S2;
- recorded by mistake: "NP".

Other abbreviations or symbols used in the list before the species/subspecies name are:

- taxonomically doubtful: "T";
- archaeophyte: "A";
- neophyte: "N".

Taxa involved in former domestication processes have been distinguished in two categories:

- culton (Hettterscheid and Brandenburg 1995) (synonyms: *planta culta*, cultivated plant): plant distinct from its wild relative(s) and capable to conserve its taxonomic

independence in cultivation only; records from the wild are regarded as casual occurrences: "CLT";

- feral: wild plant originated from a culton escaped from domestication and usually taxonomically distinct from the culton's wild relative; it can either belong to the same taxon of the culton or belong to a different taxon: "FER".

The origin of each culton and feral is explained as follows:

- "Directly domesticated from": when the crop selection took place from a single wild starting taxon, without collateral genomic contributions. In this case, when available, the subspecies rank was used according to Harlan and de Wet (1971);
- "Parentage": when more than one taxon is involved starting from the wild and/or during the crop selection processes. The parentage is also indicated for all hybrids.

In the checklist, families are ordered taxonomically, while respective genera, species, and subspecies are listed alphabetically. The taxa doubtfully occurring in Italy are indicated only in italics (not in bold italics). The list includes hybrids, but not varieties. Taxa alien to some regions (alien in Italy, regional aliens) but native to Italy and cryptogenic taxa or doubtful aliens (Carlton 1996) were not considered here, but included in the native checklist (Bartolucci et al. 2018).

Taxonomic references concerning one or more genera are added below the families. Notes on taxonomy, nomenclature, and distribution are included in the list after each taxon. The lists of synonyms, misapplied, and included names (Appendix S3), along with the list of taxa to be excluded from Italy (Appendix S4), are available as supplementary material.

Results

The checklist includes 1597 species, subspecies, and hybrids (including NC, EX, D), belonging to 725 genera and 152 families. The lycophytes are represented by 2 families, 2 genera, 2 species, and ferns and fern allies by 5 families, 9 genera and 11 species. The gymnosperms are represented by 4 families, 20 genera, and 33 species, subspecies, and hybrids. The angiosperms include 1551 species, subspecies, and hybrids grouped in 694 genera and 141 families. The most represented families (≥ 50 taxa) and genera (≥ 20 taxa) are respectively (Table 1): Poaceae (163),

Table 1. Most represented families (>30 taxa) and genera (>10 taxa) of the vascular flora alien to Italy.

Native + casual regional aliens): total native flora; Tot. Flora (Tot. Aliens + Tot. Native): total flora. LOM: Lombardia; PIE: Piemonte; TOS: Toscana; VEN: Veneto; EMR: Emilia-Romagna; SIC: Sicilia; FVG: Friuli Venezia Giulia; SAR: Sardegna; CAM: Campania; TAA: Trentino-Alto Adige; LAZ: Lazio; LIG: Liguria; ABR: Abruzzo; CAL: Calabria; PUG: Puglia; MAR: Marche; MOL: Molise; BAS: Basilicata; UMB: Umbria; VDA: Valle d'Aosta; ITA: Italy. Numbers about native taxa are derived from Bartolucci et al. (2018).

possibly (locally) extinct (*Plantago patagonica*, *Sagittaria platyphylla*, *Themeda triandra*), and 40 are doubtfully occurring in the country (Table 2); 86 were recorded by mistake (Appendix S4). Looking at the taxa involved in past domestication processes, 102 taxa are culta, 40 are ferals, while additional 1 taxa are regarded as doubtful culta.

The Italian alien flora includes 1440 neophytes and 157 archaeophytes (Table 3). By considering the native taxa reported by Bartolucci et al. (2018), the whole Italian flora includes 9792 taxa (native hybrids excluded), i.e. 8195 native and 1597 aliens (19.49% of native flora), of which 791 are established aliens (9.65% of native flora) (Table 4).

As many as 14 out of the 23 alien species of Union concern (Regulation (EU) 1143/2014, Commission Implementing Regulations (EU) 2016/1141 and 2017/1263), occur in Italy; 13 are invasive also at national level, while one (*Asclepias syriaca*) is considered as naturalized (Table 5).

The administrative regions showing the highest number of alien taxa are Lombardia (776, of which 359 established), Veneto (618, of which 250 established), Toscana (580, of which 265 established), Trentino-Alto Adige (577, of which 176 established), Emilia-Romagna (537, of which 246 established), and Piemonte

(526, of which 301 established) (Table 4). Aliens of Union concern mostly occur in Veneto (11), Lombardia (10), Emilia-Romagna (8), Piemonte (8), and Toscana (8).

Table 5. Alien taxa of Union concern in compliance with Regulation (EU) 1143/2014, Commission Implementing Regulations (EU) 2016/1141 and 2017/1263.

Taxon	Status	Name appearing in the Regulations
<i>Alternanthera philoxeroides</i>	INV	Same
<i>Asclepias syriaca</i>	NAT	Same
<i>Baccharis halimifolia</i>	INV	Same
<i>Cenchrus setaceus</i>	INV	<i>Pennisetum setaceum</i> (Forssk.) Chiov.
<i>Eichhornia crassipes</i>	INV	Same
<i>Elodea nuttallii</i>	INV	Same
<i>Heracleum mantegazzianum</i>	INV	Same

Notes: INV: invasive alien in Italy; NAT: naturalized in Italy.

Checklist of the vascular flora alien to Italy

	Lycophtyes
N CAS	Lycopodiaceae <i>Lycopodiella cernua</i> (L.) Pic.Serm.
N CAS	Selaginellaceae <i>Selaginella kraussiana</i> (Kunze) A.Braun
	Ferns and fern allies
N INV	Salviniaceae
N NC	<i>Azolla filiculoides</i> Lam. <i>Salvinia adnata</i> Desv. – Note: de la Sota (1995) pointed out that the earlier name <i>S. adnata</i> should replace <i>S. molesta</i> D.S.Mitch. However, Moran and Smith (1999) argued that <i>S. adnata</i> is of uncertain application, possibly pertaining to either <i>S. biloba</i> Raddi or <i>S. molesta</i> . Although Desvaux's type specimen is vegetative, de la Sota (2001) provided some hints for distinguishing <i>S. biloba</i> and <i>S. molesta</i> also from vegetative parts, demonstrating that the name <i>S. adnata</i> should be applied to the plants formerly known as <i>S. molesta</i> . Schwartsburd and Miranda (2017) proposed to reject this name, but their proposal has not yet been considered by the Nomenclatural Committee for Vascular Plants.

N NAT	<i>Eleocharis atropurpurea</i> (Retz.) J.Presl & C.Presl – Note: This species is doubtfully native to Europe (Walters 1980).
N INV	<i>Eleocharis obtusa</i> (Willd.) Schult.
N NAT	<i>Eleocharis olivacea</i> Torr. – Note: This name has been subsumed under <i>E. flavescens</i> (Poir.) Urb. (Jiménez Mejías and Luceño 2007) or treated as a variety of the latter species (Smith et al. 2002). We consider this unit at species rank, as an alien. On the contrary, we regard <i>E. caduca</i> (Delile) Schult. as a native plant (Bartolucci et al. 2018). Verloove and Soldano (2011) reported another taxon, namely <i>E. flavescens</i> , as a weed in the hethlands of PIE. However, in a sample of these hethland plants, we detected the typical characters of <i>E. olivacea</i> (Smith et al. 2002), with the achenes just tending to be slightly darker. However, the global taxonomic treatment of this group is confusing: Old and New World plants assigned to <i>E. flavescens</i> or <i>E. caduca</i> seem poorly distinct and the type materials of <i>E. caduca</i> and <i>E. flavescens</i> are virtually undistinguishable. Also the putative geographical separation of these two taxa (Old vs. New World) seems a weak argument, since a number of tropical and subtropical Cyperaceae show a circumglobal distribution. Additional biosystematic studies, including DNA sequences, may clarify the taxonomic relationships within this complex.

T N INV	Taxonomic references: <i>Vitis</i> L. (Ardenghi et al. 2014, 2015a, 2015c; Vázquez Pardo and García Alonso 2017). <i>Parthenocissus inserta</i> (A.Kern.) Fritsch – Note: This name is sometimes regarded as a heterotypic synonym of <i>P. quinquefolia</i> (L.) Planch., but it seems well distinct on molecular grounds (Lu et al. 2012). <i>Parthenocissus inserta</i> can be distinguished, besides the 3–5-branched tendrils without adhesive disks (Laguna Lumbreras 2005, a feature not always clearly noticeable), for the structure of the inflorescence. <i>Parthenocissus inserta</i> shows a compound dichasium, while <i>P. quinquefolia</i> shows an elongated axis bearing numerous lateral dichasias (Pringle 2010; Lu et al. 2012). The distribution area remains to be defined; this species is possibly more spread and invasive than <i>P. quinquefolia</i> .
N INV	<i>Parthenocissus quinquefolia</i> (L.) Planch. – Note: This species is often confused with <i>P. inserta</i> (A.Kern.) Fritsch; the occurrence in the wild of hybrids between the two species is also possible.

Discussion

The vascular flora alien to Italy includes 1597 species, subspecies, and hybrids; according to DAISIE (2017), higher numbers in Europe can be found only in Belgium (2801 taxa) and Great Britain (1834 taxa). Considering the 791 naturalized and invasive neophytes occurring in Italy, only the United Kingdom (857 taxa; Pyšek et al. 2009) shows higher numbers.

More than half of the invasive alien species of Union concern (14 out of 23) occur in Italy; most of them (13) are invasive also at national scale (Table 5) but, despite this, they are reported as invasive only in a limited number of regions, i.e. no more than four regions per taxon (Appendix S2).

The neophytes constitute 90.17% of the Italian alien flora. The overall percentage of alien species over the native Italian flora (19.49%) is similar to that of the Italian endemic taxa (20.84%, see Bartolucci et al. 2018). With respect to the statistics of the previous inventory of the alien flora to Italy (Celesti-Grapow et al. 2010), we found an increase in 56.11% of non-native taxa. Although various natural causes for this trend certainly exist, the growing awareness toward biological invasions has clearly contributed to their closer description, as evidenced by the great flow of new records in scientific publications (see also “Introduction”).

A comparison with data published in Celesti-Grapow et al. (2010) reveals that Sardegna (121.66%), Puglia (112.35%), Toscana (88.31%), Sicilia (70.70%), and Emilia-Romagna (61.26%) were

interested by the highest increase in alien records in the last eight years.

In recent years, the knowledge of the Italian alien flora took full advantage from the growing interest on the general topic of biological invasions (e.g., Celesti-Grapow et al. 2016, 2017). The number of taxa not confirmed in recent times, doubtfully occurring in Italy, or with still undefined regional distribution and invasion status is in fact relatively low (see Table 2). On the other hand, the data resulting from the comparison with other European countries and with the previous checklist of the Italian non-native flora (Celesti-Grapow et al. 2010) disclose a dramatic increase in alien plant invasion in Italy. The amount of data provided by the present inventory establishes a solid starting point for thoroughly investigating this phenomenon. Impacts on native and endemic taxa, habitats, and human activities, introduction pathways, taxonomic diversity, geographic origin, and temporal trends, traditionally examined in the context of alien plant invasion in Europe (Verloove 2006; Lambdon et al. 2008; Pyšek et al. 2009), need to be explored within a more specific research framework for Italy.
